Specially painted for the New Universal by Stephen Bone

GLASGOW UNIVERSITY, founded in 1450, attained high fame during the 18th century, when many great Scotsmen studied there. The present buildings surmounting Gilmore Hill, the most dominating site in the city, were opened 1870. They are here seen from Kelvingrove Park.

Fraction (Lat. *fractio*, from *frangere*, to break). Arithmetical expression of the relation of a part to the whole. The simplest fractions express this relationship in the case where the whole contains the part an exact number of times; e.g. if there are seven equal parts each part is a seventh of the whole. The next step is the adding together of several such simple parts, to form a fraction like three-sevenths.

The handling of such fractions is greatly facilitated by their expression, in the Arabic notation, by two numbers separated by a bar; thus, three-sevenths is written $\frac{3}{7}$; 3 is technically called the numerator and 7 the denominator. Such a fraction as $\frac{3}{7}$ is called a vulgar fraction, in contrast with a decimal fraction, the denominator of which is either ten or a power of ten. This denominator, being understood, may be suppressed; thus .39 is interpreted to mean $\frac{39}{100}$. The decimal system affords great advantage in the comparison of fractions with different denominators (e.g. it is not immediately obvious that $\frac{1}{11}$ is greater than $\frac{1}{12}$, but when expressed decimally as .636 . . . and .625 respectively, the fact is at once evident), and in computations where exact accuracy is not required, but it has the disadvantage of being cumbersome for the exact expression of some of the commonest fractions, such as one-third, which is expressed as .3, one-eleventh .09, or one-seventh .142857. See Arithmetic; Decimal System.

Fractionation. The process in chemistry of separating into fractions mixtures whose components differ in such details as boiling point, rate of crystallisation, solubility, precipitation, sublimation, combustion, diffusion, etc. Fractionation is more difficult the closer the properties of the substances to be separated; an extreme case is the separation of isotopes (*q.v.*) such as those of uranium. See Distillation.

Fractionating Column. Chemical apparatus used in distillation. Of three main laboratory types, the dephlegmator type is most widely used. In this the ascending vapour from the still bubbles through the vapour that is already condensed. Thus intimacy of contact between vapour and liquid increases the efficiency of separation. A fractionating column used for separating nitrogen and oxygen from liquid air consists of a series of trays, their temperatures rang-

ing from 196° C. (top) to 183° C. (bottom). At each temperature when vapour and liquid are in equilibrium, the vapour is richer in nitrogen, the liquid in oxygen. Overflow pipes from each tray lead to the tray below, so that the successive downward overflows become progressively richer in oxygen; while holes in the floor of each tray allow the vapour to rise from the tray below, so that the upward-passing vapour becomes progressively richer in nitrogen. See Distillation.

Fracture (Lat. *fractura*). Word meaning breakage, but specially applied to breakages of the bones. These are usually caused by external violence, which may be direct or indirect. A fracture caused by direct violence occurs at that part of the bone lying beneath the tissues which are actually struck. Indirect violence breaks the bone at some other part. A blow on the side of the chest will break the ribs at the spot actually struck and drive the fractured ends inwards; but if a cartwheel passes over the chest of a person lying on his back on the ground, the ribs break by indirect violence at the point of maximum curvature, and the fractured ends tend to turn outwards. Powerful muscular effort sometimes causes fracture.

Conditions predisposing to fracture are diseases which cause atrophy or weakness of the bones,

Fracture. Three types of this bone injury. 1. Simple fracture of the humerus. 2. Compound: skin torn by fractured leg bones. 3. Comminuted and compound: splintered bones in leg fracture

such as rickets. In certain forms of lunacy the bones may be so weakened as to fracture from a slight effort or accident, a condition which has several times given rise to groundless accusations of ill-treatment. In a simple fracture there is no communication between the seat of fracture and the external air; in a compound fracture the skin or mucous membrane is so torn or injured as to bring about this communication. In a comminuted fracture the bone is broken into more than two pieces, and in an impacted fracture the ends of the bones are driven into each other. A fracture which does not completely break the bone, but bends and splits it, is termed a green-stick fracture, and is most often seen in young children whose bones are relatively soft. A fracture of the skull which has resulted in the driving in of a piece of bone is a depressed fracture.

The general treatment of a fracture consists in first setting the broken bone, i.e. bringing the broken ends into opposition with each other in the normal position. This is done by manipulation, and as the process may be painful, and muscular spasm may hinder the replacement, it is usually desirable to place the patient under an anaesthetic. The broken bone is next secured in normal position by means of bandages, splints, and perhaps plaster of Paris. The limb must be kept at rest while reunion is occurring, but as disuse leads to considerable weakening and atrophy of the muscles, the limb should be massaged daily. Gentle passive movements of the limb are also begun early in order to prevent contraction of the ligaments and stiffness in the joints.

With single fractures in which the bones are readily maintained in good position, these methods are usually sufficient, but for more complicated fractures, operative measures are often desirable, the fragments of bone being bound together by silver wire or, in appropriate cases, united by metal plates. Compound fractures demand thorough cleaning of the injured tissues and removal of all loose fragments of bone, which are apt to undergo necrosis if left in the wound. If suppuration has occurred, the insertion of drainage tubes is generally necessary. Flattening or wiring is not as a rule desirable in such cases. See Bone; First Aid; Surgery.

Fracture. Metallurgical term. When a piece of metal is broken, in use or in testing, the surface of

the break is seen to be irregular. Examination of numerous fractures of different metals shows many different types. An experienced metallurgist can very often determine the cause of a failure from the appearance of the fractured surface. A coarse, crystalline fracture often indicates that the metal has been over-heated during annealing or casting, while a fibrous character may be due to the presence of slag. Other types show silky, vitreous, or granular fractures. Failure from fatigue (*q.v.*) gives a fractured surface with two distinct areas, one smooth and one granular. See Detector.

Fra Diavolo (1771–1806). Nick-name of Michele Pezza, an Italian brigand. Originally a monk, he became an outlaw chieftain in the mountains of Calabria, where his atrocities earned him his nickname (Brother Devil). Ferdinand of Naples made him a colonel, and with Cardinal Ruffo he raised a revolt against the French in 1799. In 1806 he made a similar attempt but was caught and hanged in Naples as a bandit, Nov. 10.

Fra Diavolo. Opera by D. F. Auber, nominally founded on the misdeeds of the brigand of that name. The full title of the opera is *Fra Diavolo, ou l'Hôtellerie de Terracine*; the libretto was by Scribe; and it was first performed at the Opéra Comique, Paris, Jan. 28, 1830.

Fragonard. *The Swing*, one of the artist's most delicately executed masterpieces, painted about 1768
Wallace Collection, London

J. H. Fragonard,
French painter
After Gérard

won the Grand Prix in 1752 at Rome, in 1763 he returned to Paris, was received into the Academy in 1765, and shortly afterwards abandoned classical painting for the freer style appreciated by the court, portraying scenes of pleasure and voluptuousness. During the Revolution he retired to Grasse, where he completed the five paintings of *The Lover's Progress*, now in the Pierpoint Morgan collection and exhibited at the Guildhall in 1902. He returned to a changed Paris, and died there poor and neglected, Aug. 2, 1806. Apart from the Grasse pictures, his most famous works are in the Louvre and the Wallace Collection: *Coresus and Callirrhoe*, *The Music Lesson*, and *The Storm*, in the Louvre, and *The Swing*, in the Wallace Collection. His crayons and water colours are charmingly facile.

Fram (Norwegian, forward). Three-masted schooner of 402 tons built in 1892 for Nansen's Arctic expedition. She was 117 ft. in length, with triple external planking ranging from 24 ins. to 28 ins. in thickness, and auxiliary engines driving a screw propeller. Nansen sailed in her in 1893, and entering the ice at the New Siberia Islands, drifted northward. In 1895 he left the ship and marched N. as far as lat. 86° 13' 6". In 1897 he fell in with the Jackson-Harmsworth expedition, with whom he returned in the *Windward* to Norway, whither the *Fram* also returned

Fragonard, JEAN HONORÉ (1732 – 1806). French painter and engraver. Born at Grasse, in Provence, April 5, 1732, he studied under Boucher and Chardin, and, having

safely. In 1899 the ship was used by Sverdrup in his exploration of Jones Sound, in the N. of Baffin Bay.

In 1910 Roald Amundsen (*q.v.*) left Norway in the *Fram*, intending, like Nansen, to drift across the North Polar basin, but, changing his programme, made his way to Madeira and the Antarctic regions. The ship was next heard of in the Bay of Whales, where R. F. Scott discovered her while cruising along the Ice Barrier. Amundsen wintered near King Edward VII Land, and having accomplished his march to the South Pole, rejoined

Fram. The polar exploration ship after she had been converted from steam to oil for Amundsen's expedition in 1910

the *Fram*, arriving at Hobart, Tasmania, March 7, 1912, and later returning to Norway. See Nansen.

Framboesia or **YAWS** (Fr. *framboise*, raspberry). Infectious and contagious disease caused by a minute spiral-shaped organism, *Treponema pertenue*, discovered by Castellani in 1905. The disease is almost confined to tropical and sub-tropical regions, being most prevalent on the W. coast of Africa, in Tripoli, the Malay Peninsula, Assam, Java, Ceylon, the West Indies, Samoa, and Fiji.

Frame. Term used in building. Almost every building must of necessity be constructed as an "unclothed" frame, or a "clothed" frame or on massive (monolithic) principles. Typical unclothed frames are steel girder bridges and latticed steel towers carrying high tension cables. Clothed frames in large buildings consist of steel or reinforced concrete skeletons around which brickwork, concrete, or masonry forms the walls and floors. Prefabricated houses are also usually built on the clothed frame principle. Typical "mass" buildings are cathedrals, masonry arch bridges, dams, and brick houses.

The purpose of a frame is to support the weight of a structure

and all superimposed loads applied to it, including the weight of people, materials, machinery, or vehicles, and externally applied forces such as the tension in overhead cables, wind and snow loads; and to assist in transferring these forces to the foundation (q.v.).

Plane frames are those such as bridge girders and roof trusses which are built in a flat plane. They usually consist of a series of rigid triangles, so enabling applied forces to be resisted without use of unnecessary materials. The joints may be made of large single bolts (pin-jointed frames) or by riveting or welding. Latticed towers are constructed as space frames in which the essential element is a pyramid comprising four triangles. These can resist forces from any direction.

The steel and reinforced concrete skeletons used in building construction are usually incomplete frames, built up of a series of rectangles in two directions at right angles to each other. As a pin-jointed rectangle is unable to resist without distortion the application of a force at any corner, the joints must be rigidly constructed, by riveting or welding, to provide the necessary stability against lateral forces.

Framework Knitters' Company. London city livery company. It came into existence with the invention of silk stockings, and was granted its first charter by Cromwell in 1657. A second charter was granted by Charles II in 1663 to "the wardens, assistants and society of the art and mystery of Framework Knitters in the cities of London and Westminster, the kingdom of England, and the dominion of Wales." The powers were limited by parliament in 1753, the hall in Red Cross Street, E.C., was sold in 1821, and the plate in 1861, the proceeds being devoted to the Bourne almshouses in Kingsland Road. Corporate income, £310; trust income, £352;

Framework Knitters' Company arms

offices, 3, Albany Court Yard, Piccadilly, W.1. Consult The Framework Knitters, H. C. Overall, 1879.

Framlingham. Market town of Suffolk, England. It has a railway station, 19 m. N.E. of Ipswich and 90 m. N.E. of London. S. Michael's church, with a tower 95 ft. high, contains tombs

of some of the Howards, including that of the earl of Surrey, the poet. The castle is a ruin. The remains include a gateway, the outer walls, 13 towers, and a moat; it was the stronghold of the Bigods, and later of the Howards, both families in turn holding the earldom of Norfolk, in the lands of which the castle and dependencies lay.

Framlingham College is a public school for about 280 boys. Built to commemorate the Prince Consort, it was opened in 1865 as the Albert Memorial College. In 1947 Brandeston Hall (16th century, rebuilt 1854) was bought for housing a junior school. Framlingham is an old place, having existed before Roger Bigod built a castle here about 1100. Its history is really that of the castle, which was more than once forfeited by the Howards, but restored to them. They lost it finally in the 17th century. Market day, Sat. Pop. 2,101.

Frampton, SIR GEORGE JAMES (1866-1928). British sculptor. He studied under W. P. Frith, and at the R.A. schools; later under P. Mercié and Dagnan-Bouveret in Paris. He first exhibited at the R.A. in 1884, was elected A.R.A. 1894, and R.A. 1902, and knighted in 1908. As a decorative sculptor he is in the front rank, excelling in polychromatic figure work and architectural skill. Among his works are the bronze memorial to Charles Mitchell, 1898; S. George, 1899; statues of Queen Victoria, Calcutta and Delhi; Peter Pan, in Kensington Gardens; the lions at the British Museum; and the Edith Cavell memorial. He died May 21, 1928. His son Meredith Frampton (b. 1894) was elected R.A. 1942.

Sir George Frampton, British sculptor

Franc. The unit of the French decimal monetary system. The name comes from the inscription Francorum Rex, king of the Franks, on the obverse of the gold coin issued by John II in 1360.

Framlingham, Suffolk. Walls of the ruined castle, with the workhouse built when the castle was dismantled in the 17th century
Frith

It was then the equivalent of the livre, and consisted of 20 sols. Gold francs were also coined by Charles V of France, and in 1575 Henry III issued silver francs. In 1641 Louis XIII substituted the silver louis, but the name of the franc survived the actual coin and was long synonymous with the livre. In 1795 the franc was again established, superseding the livre, and, consisting of 100 centimes, is the unit of French currency.

A coin of the same name is current in Switzerland; it also is divided into 100 centimes. Belgium formerly adhered to the franc as a currency unit, but in 1926 abandoned it in favour of the belga, value 5 francs. Changes in the Second Great War led to the substitution of cheaper metals and of paper for the silver coinage, and after the 1949 devaluation of currencies the British pound sterling equalled officially 980 French francs, 12.24 Swiss francs, and 140 Belgian francs, i.e. 28 belgas. The Belgian rate was still always quoted in francs.

Franglais, FRANÇOIS LOUIS (1814-97). French painter. Born at Plombières, Vosges, Nov. 17, 1814, he studied art under Corot and Jean Gigoux. Among his works are A Song under the Willows, with figures by Baron; In the Park of St. Cloud, with figures by Meissonier; An Italian Sunset, in the Luxembourg; and decorations in the Church of the Trinity. He died May 28, 1897.

Francatelli, CHARLES ELMÉ (1805-76). British cook. Born in London of Italian parentage, Francatelli became, in turn, cook to several noble men, to Crockford's Club, and to Queen Victoria. His fame as a cook of the highest skill was widespread, and he published The Modern Cook, 1845; The Plain Cookery Book for the Working Classes, 1861. Died Aug. 10, 1876.

FRANCE: THE COUNTRY AND ITS CULTURE

E. STERN-RUBARTH, Ph.D., GUSTAVE COHEN, Professeur-en-Sorbonne; and Others

This article covers in brief the geography, industry, art, literature, and history of France. A separate section is devoted to her history during and after the Second Great War. See also D-day; Europe, Liberation of; First Great War; France, Battle of; Napoleonic Campaigns, etc.

France is the largest and, in natural resources, the richest country of western Europe. Its area is 212,659 sq. m. By the First Great War France won back from Germany the 5,600 sq. m. of Alsace-Lorraine, lost in 1870. With the

France. Arms of the Republic

English Channel to the N., the Atlantic to the W., and the Mediterranean to the S., with the protection of the Vosges and Alps along more than half of her E. border, and of the Pyrenees in the W. half of her southern frontier, and with her almost quadrangular shape, France is an extremely well balanced geographical and political unit. She possesses, too, many navigable rivers leading to good harbours, and vast fertile plains.

Her economic life is based on agriculture; but her wealth, though much affected by war, political upheaval, and long periods of internal conflict, has assisted the acquisition of a vast colonial empire and the development of a refined civilization which, in turn, has favoured the growth of profitable luxury trades and specialised industries. The savings of her thrifty population long made French capital of world importance in international loans and investments; and though the First Great War heavily taxed her manpower and her resources, and left her financial position unbalanced, France was approaching recovery when overwhelmed by the Second Great War, defeat, and occupation.

Roads, Canals, and Railways

Most of the excellent roads—constructed in the main for Napoleon's military needs—and waterways, including a widespread canal system, are in the hands of the state, which created a body of civil service engineers for their maintenance. The railways, which were until the Second Great War mainly privately owned, left much to be desired, except for a few international luxury trains, and the magnificent natural ports were not all maintained at the standard of the time. In their geographical order, starting from the Belgian border, the chief ports are: Le Havre at the mouth of the Seine, Cherbourg, Brest, St. Nazaire at

the mouth of the Loire, La Rochelle, Bordeaux on the Garonne, Marseilles, and Toulon. The main canals link the Rhine with the Saône, Rhône, and Marne; the Seine with the Loire; the Loire with the Saône; and the Garonne, flowing into the Atlantic, with the Mediterranean.

Navigable Rivers

With a length of 650 m., the Loire is France's greatest river, navigable for almost its whole length. Next in length comes the Rhône, 507 m. long and navigable for some 300 m. The Seine, with a length of 485 m., is navigable for three-quarters of its length, and the Garonne, 378 m. long, is navigable up to the Pyrenees range from which it flows. Including the Rhine, which between, roughly, Basel and Lauterbourg is a French river, and the comparatively small but navigable Charente, the chief rivers of France thus number six. Their most important tributaries are the Allier, Vienne, and Sarthe, joining the Loire; the Saône, Isère, and Durance, entering the Rhône; the Marne and Oise, which join the Seine; the Ariège, Tarn, Lot, and Dordogne, which flow into the Garonne or its estuary the Gironde. The Somme in the N.E. and the Adour in the extreme S.W. are small rivers with no tributaries of any importance.

Sea coasts of more than 1,000 m. total length favour deep-sea fishing and attract valuable international tourist traffic. Some of the world's most famous health resorts are found on the French coast, including Trouville and Deauville, in Normandy; St. Malo, Dinard, and Quiberon, in Brittany; Sables d'Olonne, Biarritz, and St. Jean de Luz, on the Bay of Biscay (*Côte d'Argent*); Cannes, Nice, and Mentone, on the Mediterranean (*Côte d'Azur*). The main fishing ports are Boulogne, Dieppe, Fécamp, St. Malo, Paimpol, Lorient, La Rochelle, Bayonne, and Cette; fishermen from the N. ports seek herring and mackerel, from St. Malo cod as far as the Newfoundland bank and Iceland, and from the S. ports sardines and tunny; oysters, at Cancale, lobsters, and langoustes are taken in large quantities.

AGRICULTURE. The peculiar salty grass along France's N.

shores lends itself to sheep-breeding; there originated the famous *présalé* lamb. But animal husbandry is not otherwise of great importance. Apart from breeds of heavy cart-horses, including Normans and Percherons, draught-oxen, widely used in the S., are the most characteristic product of French breeding. Goats are, in large areas of the mountainous S., an important source of milk, cheese, and meat. Farming in an age of mechanisation is handicapped in general by the strong individualism of the countryfolk and the small size of their holdings. Nearly 40 p.c. of the farms are less than 2½ acres, another 45 p.c. less than 25 acres, while only 0.5 p.c. exceed 250 acres. About 79 p.c. of all the farms are worked by their owners, 13 p.c. by tenants, 8 p.c. by *métayers*, who share their produce with the owners. Large properties, with castles and manors, survive mainly in the rich wine-lands of the W. More than 9 million persons, representing 23 p.c. of the total and 42 p.c. of the working pop., earn their living in agriculture and forestry, as against 7½ millions, or 35.5 p.c. of workers, in industry, transport, etc. Trade, banking, the professions, etc., give work to another 3 millions, or 13.5 p.c., and the remaining 2 millions serve the state, or local administration, or are in the forces. Thus, it is clear, agriculture is by far the leading industry.

Vineyards and Market Gardens

Wheat is the chief crop, averaging about 9 million tons a year; all other grains together yield about another 9 million tons; sugar beet comes to about 7 million tons, and potatoes to between 14 and 18 million tons. The vineyards, which in such regions as the Gironde, Champagne, Burgundy, etc., are of primary importance, vary greatly in quantity of production, yielding between 600 and 1,800 million gallons of wine, of which up to 95 p.c. is consumed by the French. The havoc wrought by the phylloxera epidemic was largely overcome by grafting Californian vines upon affected French plants. Fruit-growing, and the production of cider, form another important branch of French agriculture, the latter especially in Normandy. Peaches,

France. General map, showing the departments. Inset, the island of Corsica

nuts, almonds, cantaloupes, figs, oranges, and lemons grow in the sunny S., plums, cherries, and apricots everywhere. The culture of mushrooms, truffles in Périgord, mustard near Dijon, onions in Brittany, asparagus, beans, and other early vegetables, flowers for export and scent manufacture, olives for oil and soap making, and mulberry trees for silkworm rearing, indicates the extent of the highly developed French market gardening.

INDUSTRY. With her recovery after the First Great War of the iron ore mines and iron and steel works of the Lorraine basin, France became the European country richest in industrial raw

materials. Though her capacity was never fully exploited, she produced between 5 and 10 million tons of pig-iron and about the same of steel per year and, from being the fourth (after the U.S.A., Germany, and Great Britain), became the third of the world's iron and steel producers. Her coal production, however, was insufficient for her new industrial capacity; from a peak of nearly 60 million it fell to about 46 million tons in the early 1930s. Industries relying upon these basic materials were unequally developed; the motor industry, electrical engineering, and bridge building were highly developed, while others were comparatively

backward. The French do not readily take to mass production, but excel in individual creative work, frequently leading in industrial innovation, as in motoring and aeronautics, but seldom keeping the lead.

For high finish and artistic taste French products are outstanding, e.g. fine textiles, especially silk, and women's wear—dresses, hats, bags, shoes, and accessories. While Lyons is the centre of the silk industry, the finished products bear the stamp of Paris, the fashion centre; perfumes come from Paris, and from Grasse in Provence, where flower growing and the distilling of scents is an old established craft.

France. Map showing the main railway lines and the principal canals

Other regions contributing to the luxury trade are Valenciennes and Le Puy with lace, Roubaix and Tourcoing with fine woollen cloth, Troyes with hats and hosiery, and St. Etienne with its well known velours and ribbons.

Further industries of specific character are cut glass at Baccarat, porcelain at Limoges and Sèvres, carpets and tapestries, the Gobelin and Savonnerie at Arras and Tournai, and the widespread gold, silver, and jewelry industries. Foodstuffs particularly associated with France include truffled goose-liver paste, produced in Strasbourg and Périgord; chocolates and sweets from Paris; Roquefort, Camembert, Brie, and Pont l'Évêque cheeses; Reims and Commercy biscuits; Bénédictine, Chartreuse, and Grand Marnier liqueurs, as well as many Champagne and brandy products known internationally. Watch-making in the Jura mountains, adjacent to the Swiss centre of that industry, has reached a high standard. French foreign trade in general is fostered by a highly developed system of chambers of commerce, with honorary commercial councillors everywhere; until the Second Great War regular fairs were held several times a year, notably at such places as Lyons, Paris, and Bordeaux.

COMMUNICATIONS. Except for the massif just S. of the centre of France—consisting of the Cévennes, Auvergne, Mont Doré, Puy-de-Dôme, and Causses mountains, with heights up to 6,300 ft.—the country is mainly flat and therefore easily provided with good communications; nevertheless, its thinly spread population and its high degree of centralisation have prevented the development of a perfect railway system. Though more than twice the size of Great Britain, France, with between 38,000 and 39,000 m. of rly. (including 30 p.c. local lines) exceeds the British mileage by less than 60 p.c. She early developed, however, a full road transport system and made good use of her rivers and 3,600 m. of well-kept canals for heavy transport. Favoured by the great resources of water power in the Alps, Pyrenees, etc., France began rly. electrification shortly after the First Great War, and until about 1930 her air lines were credited with the greatest length of miles flown, and the greatest weight of freight carried in any part of Europe.

POPULATION. The total population of France remained virtually unchanged at about 40 millions from 1900 onwards, the surplus of births over deaths

being between nil and 0.13 p.c. By the Second Great War a slight increase of up to 2 millions had been recorded; this was the result of increased immigration.

Homogeneous Population

Non-naturalised foreigners represented 2.8 p.c. of the pop. in 1910, 6.1 p.c. in 1926, nearly 8 p.c. before the Second Great War, but only 4.1 p.c. in the census of 1946—1,670,729 out of a total pop. of 40,517,923. The French population proper is today comparatively homogeneous, descended from an early mixture of Nordic, Mediterranean, and Alpine races, of Celts, Latins, Germans, and Iberians. There are small remnants of Germanic origin in Flanders, a million Bretons in Brittany, Italians in Corsica and on the Riviera, and the Basques, an indigenous Iberian people with a language and customs of its own, in the W. Pyrenees and on the Bay of Biscay. The Alsatians, who speak a dialect of German, are a distinct but loyal section of the French people; as are the small remnant of pure Celts surviving in the central plateau. An essentially rural character of France appears in the facts that France, before the Second Great War, had only 19 towns of more than 100,000 inhabitants, as against Great Britain's 46; that only 16 p.c. of the French people lived in these larger towns, as against 54 p.c. in Great Britain; and that nearly half the people lived in parishes of fewer than 2,000 inhabitants.

CONSTITUTION AND GOVERNMENT. The constitutional laws of the Third Republic, promulgated in 1875, and revised in 1879, 1884, 1919, and 1926, distributed the executive power between the president, the senate, and the chamber of deputies, fixed the electoral age at 21, and, after 1919, required that elections be held under a system of proportional representation, later abandoned in favour once more of simple majorities. Following the liberation in 1945, a new constitution was elaborated and, in Oct., 1946, accepted by a majority in a special referendum, about one-third of the electorate abstaining from voting.

The Fourth Republic

In its preamble this constitution of the Fourth Republic established equal rights for women; the right of asylum for political and other refugees; the duty and the right of work for all; no discrimination for reasons of origin,

opinion, or belief; confirmation of trade union rights; the right to strike, within the legal framework; nationalisation of public services and monopolies; health and old age insurance as a national task; equality of education by the state; adherence to international laws and reciprocity in limiting sovereignty for the defence of peace; and the unity of all French people, overseas or metropolitan, without racial or religious discrimination. It provided for the settlement of constitutional matters by referendum and of all others by the deputies, who were elected by equal, direct, secret, and universal suffrage.

Under the 1946 constitution, parliament consisted of the national assembly, equivalent to the former chamber of deputies, and the council of the republic, replacing, with much reduced powers, the former senate. While the former was elected on a basis of proportional representation by secret, direct, universal suffrage, the council was indirectly elected by (a) communal and departmental councils, and (b) as to one-sixth of its numbers by the national assembly itself. It could only give advice and pronounce upon bills and propositions presented by the assembly; laws were made by the assembly alone. There was also an economic council.

Administration of Government

The president was elected by parliament for seven years, and was merely representative, but had the right to refer laws back to parliament. Many functions previously held by the president were vested in the prime minister. New constitutional articles provided that a vote of no confidence could be made only by a majority of all deputies, and by way of safeguard against the former frequent changes of government, that the cabinet could dissolve the assembly in the event of two crises arising within 18 months. A high court of justice was elected by the assembly at the beginning of each legislature. The constitution also provided for the French Union, a new imperial parliament, which served to bind France and her overseas territories, and other parts of territories or associated states, by a special citizenship, assembly, etc., under the president. There was a special court of magistrature of 14 members, under the president, and there were articles providing for the expansion of departmental and municipal liberties; for revision of the constitution, etc.

France. Map indicating the areas devoted to the chief products and industries

The long-established system of administration remained on the whole unaltered. Each of the 90 departments had a prefect, selected by the minister of the Interior and appointed by the president; he was head of the government authorities in his area and chairman of an elected council. Each department was sub-divided into *arrondissements*, under sub-prefects assisted by elected advisory councils. Thus the whole administrative machinery was under the authority of the cabinet. The administration of the local units (*communes*) was, however, entirely elected and self-governing, with authority within the town or borough area, inclusive of local police except for Paris and Lyons where the police were under government appointed prefects. Since many decisions of the municipal council and its elected chairman, the mayor, might affect outside interests, they were subject to approval by the prefect, who, in turn, might refer decision to higher authority. The administration was thus centralised in Paris; yet, handled with care and tact by well trained and expert officials, it worked smoothly and satisfactorily on the whole, without depriving the citizens of their interest and active participation in public affairs.

RELIGION AND EDUCATION. In consequence of the Combes-Briand laws which separated church and state in 1905, all religious denominations possess equal rights and none enjoys any state support. The large majority of the nation adheres to the R.C. Church which has 17 archbishoprics and two "exempt" bishoprics in metropolitan France, and three archbishoprics in the colonies: Algiers, Carthage, and Pondichéry. The Protestants, numbering about two millions, belong, so far as they are organized, to three reformed groups with, respectively, 411, 270, and 56 parishes. The Paris faculty of theology belongs to them in common. There are also several hundred thousand Jews and Mahomedans, the latter mostly N. African and other colonial subjects settled in France after their term of military service.

Church and State in Education

The numbers and the importance of religious orders have been much reduced by emigration after their expropriation in 1905. On the other hand, the R.C. Church continues to maintain five academies, at Paris, Lyons, Lille, Toulouse, and Angers. They have the standing of *écoles libres* of which several others, of a secular character, enjoy great reputation as complementary institutions for

special studies on the highest plane. Education was for a time, especially during the struggle for the separation of church and state, a source of conflict, although the complete authority of the state in this respect had been established during the French revolution and ratified by Napoleon. Free, obligatory, non-religious primary education was introduced in 1882; a state monopoly, proposed in 1905, was not accepted. Before the Second Great War an average of 3.5 million pupils attended the state primary schools, while slightly over 800,000 were educated at free religious primary schools, financially supported by fees and by church organizations. Secondary and public schools, known as *lycée* if state-owned, and *collège* if under local authority, and partly clerical institutions, have together between 150,000 and 200,000 pupils, one-third of them girls.

Training of School Teachers

There is an elaborate system of state-owned *écoles normales* and *écoles nationales* for the training of future teachers, state engineers, professional officers, etc., linked with the 17 state-owned universities, of which the Paris Sorbonne with 40 p.c. of all French students is the chief. Other institutions are the *École pratique des hautes-études*, teaching the methods of scientific work, the *École des chartes*, for librarians, etc., the *École des langues orientales*, and the famous *Collège de France*. The intellectual leaders of France are assembled in the *Institut de France*, dating back to 1634 and comprising the five *Académies*—*Française*, *des Inscriptions et Belles-Lettres*, *des Sciences Morales et Politiques*, *des Sciences*, and *des Beaux-Arts*, with 40 members each, except the *Académie des Sciences* which has 66 members.

NEWSPAPERS AND PERIODICALS.

France has had newspapers since the surgeon Théophraste Renaudot in 1631 created the weekly *Gazette*. A daily *Journal de Paris* began in 1777. Before the Second Great War, about 6,000 daily, weekly, and other newspapers were published, some, like the *Petit Parisien*, the *Paris Soir*, and the *Journal*, with circulation figures of over a million. Newspapers devoted to a party or a particular trend of opinion had much smaller circulations, though some enjoyed international fame; they included *Le Temps*, *Le Figaro*, *L'Écho de Paris*, *L'Oeuvre*. Most of them ceased during the

Second Great War; others were suppressed after it in consequence of collaboration with the enemy. Some reappeared after it under a different title and management; thus *Le Monde* took the place of *Le Temps*. Others which had not collaborated came out again under their old names, e.g. *Le Figaro*. There are also important provincial papers, in Lyons, Marseilles, Toulouse, Bordeaux, etc. *La Revue des deux Mondes*, *Revue de Paris*, *Le Mercure de France*, and other monthlies and weeklies gained international reputations. Journalism was always one of the professions leading to political success in France, and many statesmen and intellectual leaders began as journalists.

LEGAL SYSTEM. The administration of justice was laid down in the Code Napoléon. This separates criminal from civil jurisdiction, but both are administered by courts at three levels—the courts of *assizes*, of appeal, and of *cassation*. Minor criminal offences are dealt with at police courts and correctional tribunals, small civil cases come before commercial tribunals (of three business men) and justices of the peace. For disputes between employers and employees, courts of *prud'hommes* (experts) are held. Appeals to the court of *cassation* (q.v.) are allowed on legal points only, and are previously examined by a *chambre des requêtes*. In criminal law, the examining magistrate, *juge d'instruction*, plays an important part; he has to do his utmost to induce the accused to confess, but can release him on his own authority if the evidence against him seems insufficient.

The Public Prosecutor

The public prosecutor, who takes the place of a prosecuting counsel, is a state official called *procureur de la république* and can, in order to enforce observation of the law, intervene in civil suits. Both counsel attempt to influence the emotions of jurors, judges, and public by oratory; the judges themselves are not presumed to act as impartial referees, but assume the guilt of a prisoner, the examining magistrate having provided an indictment. Women have been admitted to the bar for many years. The prison system has undergone several reforms since the 19th century, and the penalty of deportation was finally abolished in 1938.

SOCIAL INSTITUTIONS. France has an obligatory old age insurance paid for by employers, employees,

and the state; insurance against invalidity, enforced since 1910; sickness insurance; and a free old age, sickness, and invalidity provision paid for by state department and local authorities under a law of 1905 for the poorest people. There are government welfare offices and, since 1913, allowances for mothers with children, with premiums for families of four and more children.

Military Service

The first French law for the protection of children was passed in 1873. Special advantages are granted on public transport services for families with children, cripples, and war victims. Military service is universal and compulsory. Reforms of 1927 reduced the term of service from 1½ years to one year—later increased again to 1½ years; introduced a three-year period of *disponibilité* (availability) during which trained soldiers could be called up by simple order at any time; and established a period of 16 years in the first and another 8 years in the second reserve. They also provided for a complete mobilisation of national resources and every citizen irrespective of sex or age, and for an army of up to 750,000 coloured subjects in case of war. The potential in manpower of France was then estimated at 8,000,000 men in the fighting forces. The peace-time establishment (as in the 1920s) was 733,500, plus 198,000 colonial troops and a naval establishment of 57,500 officers and men. At an expense estimated at up to £400,000 a mile, the Maginot Line along the frontier with Germany was built to a length of 250 m. and, shortly before the Second Great War, further extended.

COLONIAL EMPIRE. Second only in extent to the British commonwealth, the colonial empire of France (renamed the French Union in 1946) dates back to the 16th century when Rio de Janeiro (1555–66), parts of Florida (1562–67), and Canada (as from 1598) were occupied. In the 17th and 18th centuries it included the southern part of what became the U.S.A., especially Louisiana, and large territories in India; its present form, especially in Africa and Indo-China, is the result of conquests between 1830–1900. By 1939 its different units—colonies, protectorates, and mandates—were grouped as shown in the table on the opposite page.

Syria and Lebanon which, as so-called A-mandates, had been

entrusted to France after the First Great War, were granted independence during the Second. Some former colonies and protectorates, especially those of French Indo-China, were later granted a degree of autonomy approaching full independence; and with the creation, under the constitution of 1946, of the French Union and a French empire citizenship, a fundamental revision of the whole relationship between metropolitan France and what were previously her colonies was inaugurated.

HISTORY. Though generally described as a Latin nation, France is Latin only in so far as she took the basic elements of her civilization—her language and her ori-

After a number of attacks on Roman territory (one, in 390 B.C., ending in the capture of Rome itself), the Gauls, or Celts, were subjugated by Julius Caesar, 58–50 B.C. Previously, the S., together with what is now N. Italy, had been organized as a Roman province (hence the name Provence for part of S. France) and settled by Roman colonists. First there, and later throughout the country, the Romans introduced the arts and industries of the Mediterranean. During the third century A.D., however, Germanic tribes (Franks, Burgundians, and Visigoths) began to penetrate into the country. Eventually, the Franks gained a hold over it all;

peror at S. Peter's in Rome; by forcing Christianity on such parts of the empire as had remained pagan after Christianity had spread into Gaul from the 2nd century; and by himself learning to read, write, and speak foreign languages, Charlemagne supported his claim to a universal monarchy. He conquered large areas of Spain, N. Italy, the Saxon regions of Germany; but, in contrast to the centralised authority exercised by the Romans, he ruled his diverse and mainly uncivilized subjects by assimilating their tribal and regional habits and loyalties to the requirements of the state. This was done by an ingenious system of instructions, preserved as Charlemagne's "capitularies"; by his demand of a personal oath of fealty and service wherever he visited his vast domains; and by installing gifted or powerful noblemen as the emperor's servants, under the titles marshal, seneschal, chamberlain, constable, etc.

The Empire Divided into Three

That system, and the schools created by Charlemagne, became the common foundation of all western state constitutions, with the seigniorial or feudal system based on homage to the king, and the grant of fiefs in exchange for the supply of horses and men for military service. Charlemagne, whose capital was Aix-la-Chapelle (Aachen), might have secured the permanent unification of Europe, had not his son Louis, following Frankish custom, divided the empire among his three sons. By the treaty of Verdun (843) Charles II received W. Francia, the territory of present France less a strip left to his elder brother Lothair, which formed part of the region later known as Lotharingia, from which the name of Lorraine, the area long in dispute between France and Germany, is derived. Charles and his successors had to combat Norman invaders and rebellious noblemen; one of these, in 987, succeeded to the Carolingians as the first of the Capet dynasty. But this house also proved unequal to subduing the great vassals—dukes of Burgundy, Normandy, Aquitaine, counts of Blois, Champagne, Anjou, Flanders—or the great clergy, who had enriched themselves by acquiring vast lands and privileges. These frequent conflicts promoted a division in language and ways of life, which produced the *langue d'oc* (Romance) and *langue d'oïl* (Frankish) trends.

The conquest of England by William, duke of Normandy, and

ginal administration—from the Romans. In fact, her people are descended from a remarkably heterogeneous racial mixture. The Gallic tribes inhabiting the territory when recorded history begins were Iberians, Ligurians, and Celts by origin, presumably to a large extent immigrants from the Danubian plains in the 6th century B.C. who had annihilated or assimilated native populations dwelling in what is now France during the Palaeolithic and Neolithic ages. They were numerous, organized, and sufficiently settled to provide Caesar's armies regularly with grain and cattle; there was at least one town, Massilia (Marseilles), founded c. 600 B.C. by Greek sailors and merchants from Asia Minor.

and the dynasty named Merovingian, after an otherwise unknown founder Merovech, virtually inherited the Roman Empire in the West. It ruled until the 8th century, including Bavaria and Thuringia within its realm; then was replaced by the hereditary mayors of the palace—the Carolingians, named after Charles Martel, the victor at Tours and Poitiers over the Arabs who had conquered Spain.

Charles's son Pepin and grandson Charlemagne (742–814) made the Frankish empire the greatest world power of the time. By strengthening the authority of the pope, whose spiritual supremacy Charlemagne emphasised by having himself in 800 crowned em-

FRANCE: MAPS ILLUSTRATIVE OF THE HISTORICAL DEVELOPMENT OF THE COUNTRY

later the marriage of Eleanor of Aquitaine, divorced wife of Louis VII, with Henry II, William's great-grandson, created links between England and France which provoked conflicts over seven centuries. It was Philip II (Augustus) who regained, in 1203-04, all the lands previously lost to English rivals with the exception of a part of Guienne; he also curbed the independence of the great peers, established the hereditary monarchy, and created an efficient and far-reaching administration of the crown. The crusades in which he, like his predecessors and his grandson Louis IX (St. Louis), took part, were helpful inasmuch as they diverted the interest and forces of the nobility to an external task. Along with these changes in the political and social structure, a refined and complicated code of chivalry established itself which made French nobility, its offshoots in England, Spain, Sicily, and the E. Mediterranean, and its counterparts in the church—like St. Bernard of Clairvaux—the examples of European society. Romance and Gothic buildings, the songs of the troubadours, and the rise of the bourgeois in strong and wealthy towns were the outward symptoms of French predominance during the 11th-14th centuries.

The Hundred Years' War

The death of the last male Capet in 1328 and the succession of the related house of Valois produced a claim to the crown by Edward III of England who was equally closely related. The consequence was the Hundred Years' War, with French defeats at Crécy, 1346, Poitiers, 1356, and Agincourt, 1415. It was in fact two series of wars separated by an interval of nearly 40 years, and interspersed with what would be called today democratic or socialist revolts against king and nobility by the townsmen in Paris, 1356 and 1382, and other towns, and by the peasantry in the Jacquerie rising of 1358. Intrigues and alliances among rival rulers, especially those of Burgundy, ended favourably for the French dynasty with the appearance in 1429 of St. Joan of Arc, the inspired peasant girl who liberated Orléans and brought about the coronation of Charles VII at Reims. Charles subsequently created a standing army and a new system of taxation; and in spite of the adherents of such factions as the Armagnacs and Burgundians, gained authority

over almost all France. Calais, however, remained in English hands until 1558.

The tendency towards centralised and absolutist monarchy showed itself likewise in French relations with the Church. When a Frenchman, as Clement VI, was elected pope in 1305, he was made to stay in France, and he and his successors resided at Avignon in Provence from 1309 to 1378. Two others, called anti-popes, because rivals ruled at the Vatican, resided at Avignon 1378-1423.

Reformation and Religious Wars

This Great Schism, with the jealousies and corruption it involved on both sides, paved the way for subsequent reforming movements and religious wars. France secured partial independence from the papal authority by the Pragmatic Sanction of Bourges, 1438, establishing the liberties of the French, or Gallican, Church. Strengthened thereby, the monarchy set out to crush the great vassals, and after the most powerful of them, Charles the Bold of Burgundy, had died fighting the Swiss in 1477, Louis XI united all the lands of France except Brittany; warring between the nobles, formerly an established custom, was prohibited, and prominent bourgeois were admitted to the nobility and its privileges.

The great innovations of printing and gunpowder, the discovery of the Americas, and the Reformation favoured what later came to be called the Renaissance in France. Apart from its effect on literature and the arts, this produced close and ambiguous relations with Italy and frequent wars in which the French aimed at the acquisition of Naples and Milan. In a clash with the imperial power of the Hapsburgs, the French king Francis I, after a victory at Marignano, 1515, was defeated and taken prisoner at Pavia, 1525. The wars brought Italian habits and manners to Paris—fencing, astrology, condottieri, and the hired bravo and poisoner—especially after Henry II had married the Florentine Catherine de' Medici and left her as regent after his death in 1559. Under her influence the struggle against the Reformation took the form of a religious civil war. In a deeper sense it was a struggle for or against the arbitrary power of an absolutist regime.

The League, led by the dukes of Guise and supported by the Paris citizens and abroad by Philip II of Spain, represented the

Catholics; the Prince of Condé and Admiral de Coligny the Huguenot represented the anti-absolutist and reformed parts of the nation. After much fighting, bargaining, concession, and retraction, Catherine and her weak son Charles IX tried to solve the conflict by the massacre of St. Bartholomew, Aug. 24, 1572. The wars, notable for the unbreakable resistance of Calvinist La Rochelle—one of the numerous fortresses of medieval France—ended only by the accession in 1589 of the first Bourbon king, Henry IV (of Navarre). A Protestant, practical and well-meaning, he compromised with those among the Catholic nobles and politicians who, like him, wanted to rid the country of war, lawlessness, and foreign mercenaries; and since the majority favoured the old Church, four years after his accession he accepted the Catholic faith. His cynical remark, "Paris is worth a mass," and his dictum, "I want every Frenchman to have a chicken in his pot every Sunday," have never been forgotten; but his edict of Nantes, 1598, granting full religious liberty to all his subjects and state salaries to the clergy of both denominations, as well as the plans for the reconstruction of the country and for a system of permanent European peace and cooperation elaborated by his minister Sully, are greater titles to glory. He failed, largely as a consequence of economic changes brought about by the influx from the New World of gold and silver, which increased the prices without adequately raising wages; and by his failure to abolish the old privilege of the peerage, and of the new nobility "of the robe" (judges, civil servants, etc.), of exemption from taxation.

Cardinal Richelieu's Power

Henry IV was murdered by a fanatic. He was succeeded by his son Louis XIII, a minor, for whom another Medici queen, Marie, his second wife, acted as regent. She entrusted power to Cardinal Richelieu who, from 1624 to 1642, as the first of a long line of chief ministers, tried to subdue the grandees, especially the royal princes and princesses; abolished the privileges of the Huguenots after taking La Rochelle, 1628; and fought the two Hapsburg powers, Spain and the Empire, from 1635 (the Thirty Years' War). While he strengthened the absolute monarchy, Richelieu failed to abolish the old abuses of unequal taxation, sale of

offices, and unbudgeted expenditure. Under his successor Cardinal Mazarin, an Italian favoured by Anne of Austria, widow of Louis XIII, and regent for another minor, Louis XIV, heavy taxation and dishonest finance led to a revolt called the Fronde, 1648-53, during which such parliament as there was took side with princes and clergy fighting against the crown. The crushing of this revolt added to the early glory of Louis XIV, who already at 15 was flattered by his court, proud of having won Alsace from the Empire by the treaty of Westphalia in 1648.

Surrounded by such thinkers and poets as Pascal, Malherbe, Corneille, and La Rochefoucauld, Louis proceeded to secure his absolute power ("*L'état, c'est moi!*") and installed his ministers and regional representatives in such a way that the hard grip of the monarchy ultimately produced revolution. Louvois organized the army; Vauban built fortresses; Luxembourg and Turenne won battles against Spain, Austria, Brandenburg, wresting Lille from the Spanish Netherlands and Strasbourg from the Empire; Colbert planned finance and economies on mercantilist lines; Mansart and Le Nôtre created Louis's palace of Versailles, where with extreme pomp and luxury there grew up a court ceremonial soon aped by nearly all the other courts of Europe. Louis behaved and was treated like a divine personage; he wasted money regardless of the misery of his people; and while his court attracted poets, authors, artists of great merit—the comedies of Molière, the dramas of Racine, the fables of La Fontaine, the thought of Boileau and Bossuet were its products—the population was dragooned, impoverished, and decimated by epidemics and wars.

The Sun King in Eclipse

In his old age, after a lifetime of dissipations (with many famous mistresses, the last of whom, Mme. de Maintenon, he married after the queen's death), he turned to religious zealotism, and then even what spiritual liberties there had been were abolished. In 1685 Louis had abrogated the edict of Nantes and driven many Huguenots to emigration, to the great benefit of the Netherlands, England, and Brandenburg-Prussia. The Jansenists, a liberal group of earnest Catholics, attacked by the Jesuits and the pope, soon followed suit, their seat, Port-Royal, being finally razed to the ground in 1710. Dying in 1715, after a reign of 72

years, 54 of which had seen the personal sway of the *Roi Soleil*, Louis XIV had brought France to the brink of ruin: his defeats by Marlborough, Eugene of Savoy, and the Anglo-Dutch fleet under Lord Russell, between 1692 and 1710, heavily impaired his military prestige; he failed to conquer the Netherlands, which had freed themselves from Spanish rule; and his grandiose colonial empire, lacking systematic support, was soon to wither away under the pressure of the British expansion.

The Mississippi Bubble

With the extremely heavy poll taxes imposed during the last period of his reign, and the loss of man-power during his incessant wars, Louis left to his five-year-old great-grandson, Louis XV, a sadly reduced kingdom. The regent, the absolute duke of Orleans, entrusted the Scottish banker John Law with the task of repairing France's ruined finances by experiments in a state bank and joint stock enterprises (the "Mississippi bubble"); when that failed the prime minister, Cardinal Fleury, had great ado to establish a balance. The king, under the influence of his several mistresses—among whom Mme. de Pompadour and the Du Barry are best known—neglected his duty and, in fits of religious zeal, continued to suppress with fire and sword all religious independence. The "wind of revolution," as d'Argenson called it, was blowing from England and led to "remonstrances" by the parliament of Paris—there were several parliaments elsewhere, but as yet none properly elected—and the spiritual movement later summarised under the title of Enlightenment began to spread. Voltaire became its head, recognized by all Europe. The Encyclopédistes, such as Diderot and d'Alembert; the political philosopher Montesquieu; economists who believed they had discovered the laws of Nature and called themselves physiocrats, and other free thinkers contributed to it. Finally, Rousseau, with his Social Contract, 1762, proclaimed full democracy.

Military losses in the Seven Years' War against the Prussian Frederick the Great, and also in colonial wars against England, in Canada, Louisiana, and India, combined with the new ideas and the American revolt, were too heavy an inheritance for Louis XVI, who succeeded his grandfather in 1774. Ignorant if well-meaning, he allowed his ministers—the physiocrat Turgot, then the

economist Necker, and finally Calonne—to experiment with reforms which brought some favourable results. But the American example, together with public opposition to social and economic inequality and to the luxury of the court dominated by his pleasure-loving queen Marie Antoinette, forced more drastic measures.

On May 5, 1789, the states-general assembled for the first time since 1614. Formerly a purely advisory body, its form was revolutionised by the inclusion of the Third Estate in numbers equivalent to the total representation of the two previously decisive bodies, clergy and nobility. This date in effect, and the storming of the Bastille (July 14) in the popular mind, mark the outbreak of the French Revolution (*q.v.*). On June 17 the Third Estate declared itself the constituent assembly of the nation. Three days later, inspired by the example of America, by the oath of the tennis court, it swore not to dissolve before a constitution had been granted. There was no action against the monarchy, but when the king allowed himself to be persuaded to concentrate troops and dismiss Necker, the prime minister, revolt broke out and the Bastille, a royal fortress, was demolished. Paris and other cities raised a National Guard; the intimidated nobility and clergy surrendered their privileges; municipal councils came into being; the peasants took up arms; and the Parisians forced the king, his family, and the states-general to return from Versailles to Paris. The Rights of Man were embodied (Aug. 26) in a declaration which became the basis of succeeding French constitutions. So ended the first chapter of the revolution.

War Declared on Austria

The next phase was dominated by the figure of Mirabeau, the great leader of the moderate constitutionalists. When Mirabeau died, April 2, 1791, the assembly fell under the spell of the radical Jacobins. Louis XVI, accepting the constitution but deeply shocked by anti-clerical measures, tried to escape to his armies on the E. frontier, but was caught and "suspended." He continued to resist steps taken by the assembly against emigrants and the clergy. But he was persuaded to declare war upon Austria, and the initial French defeats and advance of Prussian troops deep into France thoroughly exasperated the masses. The Paris mob broke into the Tuileries palace and

dragged the royal family to prison. Aug. 10, 1792.

The radicals known as the Mountain, because of their seats on the top rank of the chamber, and led by Robespierre, Danton, Marat, and St. Just, now openly proclaimed a republic. There followed massacres of the royalists, the Reign of Terror, and on Jan. 21, 1793, the execution of Louis XVI; nine months later, Marie Antoinette followed him to the guillotine. A new constitution was established, the *levée en masse* was ordered, and, in spite of war abroad, conflicts within the revolutionary groups in Paris, and civil war, especially in the Vendée, far-reaching and partly successful reforms were carried out. Of these, the systematic organization of public instruction, the metric or decimal system, the systems of jurisdiction and administration, survive mostly to this day.

Napoleon Bonaparte

This chapter of the revolution ended in July, 1794, with the extermination of the leaders themselves. The Convention—as the assembly had called itself—was superseded by the Directorate which, with the help of young Gen. Bonaparte, in Oct., 1795, quashed a royalist revolt in Paris. From then on this Corsican soldier, "son of the revolution," marched from success to success, winning victories in Italy, 1796–97, undertaking his Egyptian expedition against England, 1798–99, and on Nov. 9, 1799, overthrowing the Directorate. He replaced it with the Consulate, in which, with two nominal colleagues, he exercised monarchical power. A year later he had vanquished the second European coalition and saw France's Rhenish frontier and the republics his sword had created in Holland, Switzerland, and Italy recognized by the Continental powers in the Lunéville peace of 1801. Within France he brought about centralisation, and the codification of the uncertain and regionally diverse laws. But, bent upon conquest and personal glory, he allowed the finest flowers of French spiritual and artistic life, so far as they had survived the revolution, to wither, and sacrificed in military expeditions much blood and wealth of a country scarcely recovered from the havoc of the Terror and the swindle of the *assignats* (q.v.).

After securing the consulate for life, Napoleon made himself hereditary emperor of the French, May 18, 1804, and prevailed upon

the pope to come to Paris and crown him, Dec. 2. His rule was despotic and, in his choice of means, unscrupulous. Bribery, by means of titles of nobility, decorations, and valuable gifts, censorship, espionage, state prisons, were its characteristics. The French Revolution had ended in a military dictatorship, whose very nature forced it to go on making war. In 1806 Napoleon devised the Continental System to blockade England, but the result was privations for France and for the host of satellite and subject states and kingdoms which the emperor had created around her borders and provided with sovereigns from his own family or friends. He broke asunder the ramshackle Holy Roman Empire and, though only half conscious of this mission, spread the ideas of the French Revolution with its slogan—Liberty, Equality, Fraternity. Finally, in 1812, he attacked Russia and failed.

Napoleon's empire collapsed more rapidly than it had emerged from the ashes of feudal France consumed by the fire of the Revolution. Another European coalition advanced victoriously and, on March 30, 1814, captured Paris.

France Defeated at Waterloo

The emperor was banished to Elba and replaced by Louis XVIII, who created a liberal constitution with two legislative chambers and electoral rights based upon property qualifications and indirect polling, and was brilliantly represented at the Vienna congress by Talleyrand. On March 1, 1815, Napoleon escaped and returned, but was defeated at Waterloo (June 18) and banished to St. Helena. The main lasting results of the Revolution and the Napoleonic exploits were an independent and mainly well-to-do peasantry settled on the former feudal estates now held by small farmers in adequate allotments; public budgets, annually published; a fair system of taxation; the Bank of France; a codified judicial system; the institution of the National Guard, the basis of obligatory military service; the territorial division into departments, which fostered centralisation; equality of personal rights.

What liberalism there had been at first following the royalist restoration rapidly vanished. Such reactionary measures as censorship of the growing press and electoral privileges for the landed gentry, reintroduced by Louis XVIII and maintained by his

brother and successor Charles X, brought about another revolution in 1830. Though it was fought out at the barricades, overthrew the senior line of the Bourbon dynasty, and restored most of the constitution of 1814, only one section of the French people benefited from it: the bourgeois. They replaced nobility and clergy as the ruling class, made the National Guard—to which every able-bodied man belonged who could afford to equip himself—their instrument of power, and, in [Louis Philippe, set up a bourgeois king, with the slogan "Enrich yourselves." His uneasy regime lasted until the 1848 revolution. The Second Republic emerged, with universal male suffrage that increased the electorate from 250,000 to 9,000,000; with a daily allowance for deputies; and with a powerful president at the head of the executive.

Napoleons II and III

The first elected president was, significantly, another Napoleon, nephew of the first; ambitious like his uncle, but without his outstanding gifts. By winning over the army, the clergy, and the provincial conservative elements who feared the industrial and increasingly socialist masses of Paris, he obtained first restrictions of the universal suffrage; then, following a vain attempt to have his reelection secured by the chamber, arranged a *coup d'état* on Dec. 2, 1851, which, after sanguinary street-fighting, established him as dictator. A year later, a plebiscite made him emperor as Napoleon III (this title suggesting that Napoleon I's son, the duke of Reichstadt, should rightfully have been Napoleon II, 1821–32). Kind-hearted and possibly liberal at heart after his many experiences in exile and comparative poverty, Napoleon was not equal to the role of tyrant or conqueror. He created institutions modelled upon those of his uncle and purporting to introduce a democratic regime: elections, with engineered majorities for the government; powers of suspension or suppression of newspapers that were supposedly free from censorship; much curtailed rights of the legislative body, which became the mere mouthpiece of a council of state.

Marrying the ambitious Spanish countess, Eugénie de Montijo, Napoleon soon started a series of military adventures abroad, with success in the Crimean War, which strengthened the ties with Great Britain. The Paris exhibition of

1855 gave lustre and the appearance of prosperity to his regime. He won Savoy and Nice, 1860, by siding with Piedmont against Austria; and increased France's colonial empire by adding to her Algerian and Senegalese and conquering Indo-Chinese territories. But he failed to uphold Maximilian, the ruler of the Mexican empire established by French bayonets. His rule, apparently consolidated by concessions he had made during the preceding ten years to the growing spirit of liberalism, collapsed under the first blows of Bismarck's Prusso-German armies. Taken prisoner, Sept. 1, 1870, the emperor was succeeded by the Third Republic, proclaimed in Paris, Sept. 4.

The republic put up a brave resistance under Gambetta and Thiers, but after Paris had capitulated, Jan. 28, 1871, had to sue for peace. Signed at Frankfurt-on-Main, May 10, the treaty robbed France of Alsace and Lorraine and ordained the payment of an indemnity of £200 million. In spite of these losses, and of ten weeks of civil war in Paris between the *Commune* and the government, France recovered rapidly, though incessant political strife for many years threatened the republic with the restoration of a monarchy. Recovery was due to technical innovations and industrial habits and experiences borrowed from Great Britain, combined with the thrifty and industrious character of the French population. The *rentier*—ideal of the middle and lower middle classes—entrusted his savings to the state at a low rate of interest, or favoured such enterprises as visibly catered for the public—the new department stores, big banks, transport, tourist or health resorts—while supplementing his income on the other hand by adventurous foreign investments promising a high rate of interest, and thereby contributing to the rise of Paris as an international money market.

The Dreyfus Case

In 1877, under the cabinet of the duc de Broglie, with Marshal MacMahon as president, and again during the anti-republican campaign in 1889 of the former minister of War, Gen. Boulanger, the parliamentary and democratic regime was endangered. These dangers once overcome, the reactionary or anti-republican powers began to wane; a systematic and successful colonial policy contributed towards French power and prestige; and the German danger

was countered by a policy of *rapprochement* with tsarist Russia, 1891-93. The Panama scandal, 1892, and the ugly case of Alfred Dreyfus (*q.v.*) provoked passionate conflicts within the nation and embittered normal political rivalry to a disastrous degree. The result of the latter was the reduction of the extra-parliamentary influence of the military parties, with the formation, under Waldeck-Rousseau, of the *Bloc républicain*.

This was in 1899, and it was soon followed by an attack upon the Church as a political power. Under Combes and Briand, 1902-1905, the separation of Church and state was voted and, with some disturbance and resistance, carried out.

The Entente Cordiale

The public mind was more exercised by the German danger, personified by the restless and ambitious William II. This led to the Entente Cordiale, April 8, 1904, by which the Anglo-French dispute over Fashoda (*q.v.*) was resolved and all other colonial matters were amicably settled. In subsequent conflicts with Germany over North Africa—William II's landing at Tangier in 1905, the Algeiras Conference of 1906, and the dispatch of a German gunboat to Agadir in 1911—British support proved of great value to French policy. Meanwhile French Socialism had made great progress. Its greater and more cooperative sector, under Jean Jaurès, had ever since the Dreyfus case supported the bourgeois Radicals; but when strikes with a revolutionary tendency occurred, Clemenceau, and after him Briand, suppressed them by force of arms and other drastic measures. It needed the danger of impending war to draw the Left together again. In 1913 conscript military service, which had been fixed at two years in 1905, was extended to three years.

When war broke out on Aug. 3, 1914, even the Socialists, whose leader Jaurès had been murdered on July 31 by a nationalist fanatic, voted for the war credits and joined the *Union Sacrée*. This unity held throughout the four years of struggle, despite initial defeats and retreats, the "miracle of the Marne," and the endless bloodshed on the Somme and at Verdun. When some despondency was spreading in 1917 and here and there mutiny seemed likely, the entry of the U.S.A. into the war and the acceptance of the premiership by Clemenceau steadied France's nerves and revived her characteristic *elan*. Despite Rus-

sia's breakdown and the loss of a large part of French savings invested in loans for the tsar, and in face of the devastation of her N.W. provinces, France held on to help secure victory for the Allies.

Clemenceau was not to reap his harvest. After many months of dispute with his allies, the peace treaties with Germany and her satellites were settled in the summer of 1919; yet, when the "Tiger" stood for president, Jan., 1920, he was defeated. Nor was there much inspiration about the reconstruction of war-stricken France, corruption and abuse damping the idealism left among the people by their heroic stand and victory.

Edgar Stern-Rubarth

BETWEEN THE WARS. Despite the difficulties attending the signature of the Versailles peace treaty, few Frenchmen doubted that their country would regain its position as the leading power in Europe. Though Clemenceau and Foch had been unable to obtain the annexation, or at least transformation into a buffer-state, of the German lands W. of the Rhine, security seemed established by the covenant of the League of Nations and military alliances with Great Britain, the U.S.A., and the E. and S.E. neighbours of Germany who all looked to France for financial and military support. Financially, the unfortunate slogan of Clemenceau's minister of finance, Klotz: "*Le Boche payera*" (the Germans will pay), and treaty clauses which left indefinite claims open, promised recovery and prosperity. The territorial loss of 1871 had been made good; and the occupation of the Saar for at least 15 years promised rich returns, as did the principle of "reparations in kind"—coal, chemicals, timber, etc.

Failure of Versailles Treaty

These pleasant prospects were soon shattered. The U.S. congress failed to ratify the Versailles treaty, and, consequently, the military guarantees to France, in which latter respect Great Britain followed suit; the League's structure was irreparably damaged by the American refusal to join; and the flow of gold and goods from the war-exhausted, inflation-ridden Germany soon began to slacken. Four years of uncertainty brought recriminations against the recent allies and their financial claims on France; attempts to gain by pressure or by political manipulation the safeguards against Germany that had been given up at Versailles; con-

ferences and negotiations, financial abuses and malpractices. Lloyd George offered at Cannes, 1922, a new security pact; but Aristide Briand, in his seventh premiership, was overthrown during his absence from Paris before these negotiations matured.

Poincaré succeeded him as premier. His attempt to disrupt German unity and to secure the more material benefits of "reparations in kind" by occupying the Ruhr area on Jan. 10, 1923, only estranged Great Britain and led the German government to adopt a policy of passive resistance and reckless inflation which destroyed her ability to pay reparations. When they became aware of the facts, the French people turned against Poincaré, who had already lost favour by increasing taxes. The *Cartel des Gauches* (Left coalition) led by Édouard Herriot, won the 1924 elections; and for two years cabinets under Herriot, Poincaré, and Briand tried a fresh approach in German policy.

The Treaty of Locarno

The Dawes Plan (*see* under Dawes, Charles Gates), Aug., 1924, attempted a reparations settlement; the treaty of Locarno, Oct., 1925, gave a five-power guarantee of the Franco-German frontier; there were the re-assertion of the Entente Cordiale between Herriot and Sir Austen Chamberlain, and the favourable Mellon-Béranger arrangements in Washington, and the Caillaux-Churchill arrangement in London, over the payment of war debts. In spite of trouble arising from relations with the Vatican, rebellion in Morocco, and a revolt in Syria, a more hopeful international era seemed to have dawned. But a sharp depreciation of the franc unsettled the Left and Poincaré reappeared as head of a new *Union Nationale* of all the bourgeois groups. His drastic measures immediately applied gave him the title of the "saviour of the franc." He retained Briand as foreign minister, but slowed the pace of international conciliation. He also began in 1928 to build the huge line of supposedly impregnable fortifications in the E. called after his war minister, André Maginot.

Poincaré's activity underlined France's role as protector of her smaller allies, the Little Entente (*q.v.*), Poland, and Belgium against potential German aggression, and filled the gap which Herriot, against British objections, had tried to stop with the frustrated Geneva protocol of 1924. His

three years in office to July, 1929, were the most happy and prosperous period France was to know between the two Great Wars, marked by successful industrialisation, growing exports and tourist trade, a boom in the motor car, cinema, and building industries, and a surplus in the exchequer.

Evacuation of the Rhineland

Briand, premier for the tenth time, lasted three months, and was replaced by André Tardieu, who, however, left foreign affairs in Briand's hands. A revised reparations plan, the Young Plan (*q.v.*), was signed at The Hague in 1930; total evacuation of the occupied Rhineland followed. Tardieu's display of intransigence, however, which was meant to appear patriotic and to win support from the Right but was rarely maintained against pressure, exercised an adverse effect upon Franco-British relations. Briand's foreign policy was discredited thereby, and still more by a mismanaged attempt at forming a German-Austrian customs union in March, 1931. Financial disasters in rapid sequence—repercussion of the American financial disaster of 1929—beginning in Austria, shattered the whole structure of European economics. When Briand stood for president he was beaten by his Right-wing opponent Doumer, but Pierre Laval, who succeeded Tardieu in 1931, retained him in his government. In Washington, Laval tried in vain to obtain from President Hoover assurances as to the "interdependence" of the latter's moratorium for Germany's reparations payments and France's own war debt payments; at the beginning of 1932 Laval dropped Briand, who died March 7, after Tardieu had taken the helm.

Triumph of the Socialists

Financial scandals and large-scale bankruptcies shattered public confidence in semi-Right governments of the Laval-Tardieu type, and the general elections of May, 1932, returned the Radicals triumphant. Their leader Herriot was supported by the Socialists and was unaffected by efforts by the Right to turn into a "Red scare" the murder of President Doumer by a Russian maniac on May 8. But he was confronted with a new phenomenon in Germany, the semi-dictatorial cabinet of von Papen. At Lausanne, in July, under the chairmanship of the British premier, Ramsay MacDonald, agreement was reached regarding the cancellation of Germany's reparations payments;

but a split over disarmament estranged not only the Socialists but some of Herriot's own party and laid the foundations for that fissure of the Left in French opinion that was to last out the ramshackle peace.

Through Paul-Boncour, Herriot presented at Geneva a plan of mutual assistance by special forces of the member states earmarked for League requirements, and the international control of civil aviation. The cold reception of this plan, together with a conflict over the payment of another instalment of the French war debt to Washington—since France was no longer receiving reparations from Germany she jibbed at continuing to pay her war debt to the U.S.A.—overthrew Herriot's cabinet, Dec. 15, 1932. Paul-Boncour succeeded him for a bare six weeks.

Short-lived Governments

Just before Hitler assumed power in Germany, Édouard Daladier, a former teacher, a Radical and supposedly a strong man, took office. He was to remain, with interruptions and vicissitudes, a leading figure for five years. His first cabinet, Jan. 29–Oct. 23, 1933, has been described as the last comparatively stable and normal government of the Third Republic. Thereafter, the numerical majority of the Left began to destroy its own governments. It began in Oct. with a violent conflict over the budget. It then overthrew a short-lived Sarraut government and another under Camille Chautemps (Nov., 1933–Jan., 1934), after the riots caused by the Stavisky (*q.v.*) scandal. Nor was a second Daladier government more fortunate, for on Feb. 6 it was driven out by street brawls—for whose consequences the extremist nationalist groups, especially the *Croix de Feu* under Col. de la Rocque, claimed the doubtful glory.

The clamour for a strong man led to the appointment of Doumergue, whose cabinet, including Herriot, Tardieu, Barthou, and Chéron, had the appearance of solidity and balance. Attacked by the Socialists under Léon Blum, deserted by the Radicals who tried to save parliamentary government, it fell in Nov. and was immediately followed by the government of P. E. Flandin. This cabinet closely resembled that of Doumergue, but omitted Marshal Pétain, who had held the portfolio for War, and included Mandel, once Clemenceau's intimate. The foreign minister, Barthou, in company with King Alexander of Yugoslavia, fell

victim at Marseilles to the bullets of a Croat assassin. He was succeeded by Laval, who made contact with Ribbentrop, Abetz, and other Nazis; smoothed the path for the Saar plebiscite which returned that rich area to Germany, Jan. 13, 1935; and was the father of *rapprochement*. Before signing a pact with Moscow, May 2, 1935, he went to Rome to re-establish the "Latin sisterhood"; Mussolini reaped the fruits of this agreement in his attack on Abyssinia. The doubling of the period of military service in France gave Hitler a pretext for the reintroduction of conscription in Germany. Laval and Flandin sent a protest to Geneva and went to Stresa to confer with Ramsay MacDonald, Sir John Simon, and Mussolini, whose forces were already on the way to Abyssinia.

Penetration of Fascism

On May 31 the Flandin cabinet fell, following the introduction of deflationary measures demanded by the Banque de France. After some difficulties, Laval formed a government. Cuts in the budget were accepted; labour troubles ensued; the *Croix de Feu* staged more demonstrations; and the outcome was the rise of the *Front Populaire* (people's front) embracing Radicals, Socialists, and Communists. Passions began to run high over the Anglo-German naval agreement, the question of sanctions against Italy, the Hoare-Laval plan for the partition of Abyssinia, and the increasingly visible penetration of fascism into French political life. On Dec. 28 Laval resigned. He was followed by Sarraut, with Flandin as foreign minister. France was next confronted with Hitler's reoccupation of the Rhineland, March 7, 1936, in violation of the Versailles treaty and the Locarno pact. But the opportunity thus presented for legally breaking the Nazis' power and the myth of their invincible success was missed. General elections strengthened the *Front Populaire*, mainly by doubling the Communist figures, which were equal to those of the Radicals, with the Socialists, strongest of the three Left groups, clearly holding the balance. Blum became the first Socialist premier of the French republic, June 4. He held this office just one year; then served under Chautemps as vice-premier; then, March 13-April 10, 1938, led another cabinet.

Blum was faced with one of the most disastrous strike waves France had known; the "sit-

down" strike, in which the workers remained in the factories, but did not work, spread like an epidemic. A forty-hour week, paid holidays, and collective contracts were the result; devaluation of the franc followed. Nationalisation of the armament industry was decided upon, but never carried out. In foreign politics, Blum and his foreign minister Yvon Delbos undertook *rapprochement* with London, toleration of the *fait accompli* of Mussolini's Abyssinian conquest, and, when the Spanish civil war broke out, support for the legitimate Republican government. In the last aim, however, the Blum government was obstructed by the non-interventionist attitude of other nations. A less enthusiastically *Front Populaire* government under Chautemps followed in June, 1937, including Blum and Delbos, but with Georges Bonnet as finance minister. Bonnet further devalued the franc, but was so disliked by the Socialists that they left the government in Jan., 1938, Chautemps resigning in March.

Wave of Defeatism

In that month the Nazis moved into Austria. A wave of defeatism swept France, nurtured by pro-fascist ideologists and by traitors. Blum tried to assemble a national government wider and stronger than the weakening *Front Populaire*, but had to be content with a Socialist-Radical coalition that survived only four weeks, after making a brave attempt at rearmament and stabilisation of finances by means of a capital levy. Another Daladier cabinet followed, with Bonnet as foreign minister. Bonnet accepted Mussolini's conquest by appointing a new ambassador to the "king of Italy and emperor of Abyssinia"; then went with Daladier to London for conversations with Neville Chamberlain and Lord Halifax. In London "staff contacts" were arranged, with "assurances" to both Berlin and Rome; the Spanish Republicans were abandoned; and a compromise over the Nazis' claims in Czecho-Slovakia was at least envisaged. The visit to Paris of George VI and Queen Elizabeth in July confirmed Franco-British friendship and solidarity. When the Czecho-Slovak crisis broke it was Bonnet rather than Daladier who prevailed over the remnants of French pride and military self-confidence, discarded France's treaty obligations towards Prague, and her pact with Moscow, and helped to foster the compromise of

Munich (*q.v.*). The mobilisation (Sept. 23, 1938) had been expensive, and Paul Reynaud, finance minister, asked for drastic measures to cover both this expense and a huge rearmament programme. Among these necessary steps was the abolition of the forty-hour week.

Visits to Paris by Ribbentrop, and by Chamberlain and Halifax on their way to Rome, were followed by the recognition of the Franco regime in Spain. But when Hitler's occupation of Prague, March 15, 1939, revealed the uselessness of appeasement, France partially regained her old vigour. Within a month nearly a million men had been mobilised; the minister of Colonies, Mandel, was working hard to bring the resources of the empire into play.

Weakness in the Air

Preparedness for war, however, was insufficient, especially in the air. The person mainly responsible was Pétain, president of the supreme council of national defence, who believed neither in aeroplanes nor in the armoured cars advocated by a certain Capt. Charles de Gaulle, whose writings had created a sensation on the other side of the Rhine. For a time the French people were confident in their leaders and chiefs. But anxiety succeeded the careless satisfaction that had followed the Munich agreement, and by mid-Aug. the reasons for anxiety grew clearer. The technicians and reserve officers appointed for the key positions were already at their posts on the Maginot Line. Shortly after the ultimatum of Germany to Poland came the mobilisation, Sept. 1, 1939.

LANGUAGE AND LITERATURE. One of the Romance family of languages, French had its origin in the popular Latin (*sermo plebeius* or *rusticus*) spoken by the Roman soldiers, merchants, and colonists in Gaul. Scarcely affected by Celtic influences, this popular Latin tongue, one distinguishing feature of which was the substitution of analytical forms for the elaborate case and verbal inflections of literary Latin, had already established itself by the end of the first century of the Christian era.

As they amalgamated with the Gallo-Roman people, the Frankish conquerors adopted it in their turn, adding to its vocabulary a small infusion of words chiefly of political or military significance, e.g. *vassal*, *fief*, *haubert* (*hauberc*), *heavme* (*helm*), *guerre* (*werra*), but contributing little to its phonetic or syntactical development. By the 7th century this *lingua romana rustica*, spoken by all classes and accepted by the Church, though not yet committed to writing, had passed into a form which can be recognized as embryonic French.

The character of this transitional tongue may be judged from the first important monument of it, the Strasbourg Oath, by which, in 842, Louis the German entered into alliance with his brother Charles the Bald: *Pro Deo amur et pro christian poblo et nostro commun salvament, d'ist di en avant, in quant Deus savir et podir me dunat, et salvarai eo cist meon fradre Karlo, et in adjuha et in cadhuna cosa, si cum on per dreit son fradra salvar dift, in o quid il mi altresi fazet. In modern French this is: Pour l'amour de Dieu et pour le salut du peuple chrétien et notre commun salut, de ce jour en avant, autant que Dieu me donne savoir et pouvoir, je soutiendrai mon frère Charles et en aide et en chaque chose, ainsi qu'on doit, selon la justice, soutenir son frère, à condition qu'il m'en fasse autant.*

Langue d'Oc and Langue d'Oïl

But though now the common language of the country, the prevailing feudal confusion was fatal to its uniform development, and for a time it was broken up into a number of independent dialects. The principal division was into the *langue d'oc* of the south, which approximated to the Italian and Spanish modifications of the Romance stock, and the *langue d'oïl* of the north, the parent of modern French; but in the *langue d'oïl* itself there were at least six well-marked varieties—e.g. those of Normandy, Burgundy, and

the Ile de France. But the election to the monarchy of Hugh Capet, duke of France, in 987, made Paris the capital of the kingdom and gave the dialect of the Ile de France, or French as it was specifically called, an enormous advantage over its rivals, and with the steady political unification of the country from the 12th century onward this gradually became the official language of the entire people. The other dialects of the north, and later the *langue d'oc* or Provençal, sank into the condition of mere patois. It was not, however, till the 15th century that the triumph of the French tongue was complete and its stability and uniformity definitely assured. By this time the case-endings and other synthetic features of the *lingua romana*, which had lingered in Old and Middle French, had entirely disappeared.

Evolution from Latin

Philology has established the fact that the evolution of French out of Latin was governed by certain fundamental laws, of which the most important are: (1) the persistence of the Latin tonic accent; thus *amāre* became *aimer*, *pōrticus*, *pōrche*; (2) the contraction or loss of the Latin termination, as in the examples just given; (3) the disappearance of the short vowel immediately preceding the stressed syllable; e.g. *bonitātem* = *bonté*, *claritātem* = *clarté*, *septimana* = *semaine*; (4) the suppression of the medial consonant: e.g. *māturus* = *māurus* = *mûr*, *confidentia* = *confiance*. These morphological rules, however, apply only to the natural and spontaneous evolution of the language and lapse entirely in respect of that large portion of the modern vocabulary which consists of words afterward imported from the Latin by scholars and writers (*mots savants*). Hence we can at once decide in the case of the many existing doublets, or words slightly differing in form though ultimately derived from the same sources, e.g. *chōse* and *cause*, *hōtel* and *hôpital*, *confiance* and *confidence*, which belong to the primitive and popular foundations of the language and which are of later and artificial origin.

LITERATURE. Though a few religious poems of earlier date have come down to us, French literature really begins with the epic poetry of the 11th, 12th, and 13th centuries. This poetry, which is full of the chivalrous spirit and is essentially aristocratic in character, falls roughly into two divisions: the *chansons de geste* and the *romans épiques*. Of the former,

largely concerned with the fabulous exploits of Charlemagne and his paladins, the most famous example is the *Chanson de Roland*, dating from the second half of the 11th century. Such chansons are supposed to rest upon slight historical bases; the *romans épiques* were legend or fiction.

The Arthurian Cycle

Most of these belong to the Celtic legend-cycle of Arthur and the Round Table, e.g. the poems of Chrétien de Troyes, of the second half of the 12th century. Others deal, albeit in a most extravagant way, with classical antiquity (*romans antiques*): e.g. the *Roman d'Alexandre* of the 12th century, which is specially interesting because it introduced the twelve-syllable verse, later the standard measure of French poetry and hence called the alexandrine.

After this epic poetry the most important branch of medieval French literature is the allegorical-didactic poetry which reached its culmination in the *Roman de la Rose*, the first part of which, written c. 1237 by Guillaume de Lorris, contains a courtly "art of love"; while the second, written by Jean de Meung, some forty years later, with its bold satire upon contemporary society, illustrates the rising reaction of the practical bourgeois spirit against the fantastic idealism of the aristocratic classes. This reaction further appears in the *fabliaux*, or short humorous stories in verse, of the 13th and 14th centuries, but its fullest expression is to be found in the *Roman du Renart* (12-14th centuries), which is indeed a kind of anti-romance or burlesque of the fashionable *chansons de geste*.

Although in the N. narrative and didactic poetry flourished most, lyrical verse was cultivated in the S., notably by the Provençal troubadours, who sang of courtly love in elaborate and intricate stanza-forms; but as the old chivalrous sentiments waned the poetry of the latter became increasingly vapid and unreal. The note of sincerity was however, struck by Rutebeul (d. c. 1280) and 200 years later by the great François Villon. Concurrently the drama, which in origin was the offspring of the liturgy of the Church, evolved through *miracle*, *mystère* and *moralité* into two popular forms of secular play—the *sottie*, a short satiric piece resembling the *moralité* in its allegorical machinery and didactic intention, and the *face*, which may be broadly defined as dramatised *fabliau*. Meanwhile prose developed slowly, and it was not until the 13th century

that with Villehardouin's *Conquête de Constantinople* it began to displace Latin in the writing of history. Of the many other chroniclers of the Middle Ages three are particularly noteworthy: Joinville with his *Histoire de S. Louis*, written 1305-09; Froissart with his *Chroniques*, written c. 1373-1400; and Commines with his *Mémoires*, written c. 1488-1500. Prose was also employed for fiction, as by Antoine de la Salle. The exquisite *chante-fable*, Aucassin et Nicolette, of the later 12th century, is an interesting connecting link between the verse and the prose *roman*.

Renaissance Influence

In the 16th century French literature, thus far thoroughly medieval in character, was transformed by all the liberalising influences of the Renaissance and especially by the revived study of the literatures of Greco-Roman antiquity, to which the new writers turned for their inspiration and models. In poetry the transition is marked by Marot, and soon after his death the revolution was completed by a group of writers, collectively called La Pléiade, whose leading spirit was Ronsard. The manifesto of this brotherhood is contained in *La Défense et Illustration de la Langue Françoyse* (1549), the author of which, Du Bellay, advocates the enrichment of French by the free importation of words and idioms from various sources and particularly from the classic tongues. In regard to literature, he insists that the poet should abandon entirely all the older native forms of verse and devote himself to the production of eclogues, epics, elegies, dramas, etc., in the classic style.

Ronsard himself attempted to naturalise some of the "great types" of ancient poetry in his *Odes*, 1550-53, and his unfinished epic, *La Franciade*; and Pléiade principles were also adopted by an outsider, the protestant Du Bartas, in his Biblical epics, *Judith* (1573) and *La Semaine* (1578). The dramatic part of the Pléiade programme was carried out by Ronsard's young disciple, Étienne Jodelle. His comedy, *Eugène*, 1552, has little historical importance; but in his two tragedies, *Cléopâtre captive* and *Didon se sacrifiant*, he laid the foundations of that Senecan or classic type of tragedy which was to flourish in France for nearly 300 years. His lead was followed by other writers, notably Garnier, while Larivey, influenced by his Italian models, made a significant innovation by the substitution of prose for verse.

Meanwhile prose literature, hitherto little more than experimental, developed rapidly in many directions. Calvin's *Institution de la Religion Chrétienne* (1st French ed. 1541), though in subject-matter interesting only to the theological student, and Amyot's version of Plutarch (1559), though a mere translation, deserve mention among the monuments of the new prose. This was now freely used for biography and history (e.g. Blaise de Montluc's *Commentaires*, written 1570-77), and for political purposes (e.g. La Boétie's *Discours de la Servitude Volontaire*, first printed 1576, and the *Ménippée* satire, 1594, by Pithou, Passerat, and others). But in general literature the two outstanding names are those of Rabelais and Montaigne, both of whom, despite their fundamental differences, are representative exponents of the emancipated spirit of the Renaissance.

With the 17th century we pass into what French historians call *le grand siècle*, during which the consolidation of the power of the crown, begun by Richelieu, was completed by Mazarin and absolute monarchy finally established by Louis XIV. In literature the triumph of classicism was the concomitant and in large measure the result of this culmination in politics of the principles of centralization and autocracy.

The Classic Period

Under the influence first of the salons and then of the Academy, founded in 1635, and the court, literature, too, was reduced to law and order; the individualistic tendencies of the 16th century were checked, and general standards of judgement and taste were prescribed; with the result that, while an artificial unity and great brilliancy and polish were attained, they were attained only at the cost of originality and independence. In poetry the classical movement was initiated by Malherbe, who set out to clear the language of the archaisms of the Pléiade and the conceits which had more recently been introduced from Italy, and to regulate versification by the severest rules of technique.

But while Malherbe thus laid down the lines which poetry was to follow for the next 200 years, the real master of the classic school was Boileau, whose *L'Art Poétique* (1674) was long accepted as its authoritative text-book. Only a few writers, one the satirist Régnier, were bold enough to resist the new tendencies. But one great poet of the century, the inimitable fabulist La Fontaine,

though claimed by the classicists, occupies a place apart. While under the dictatorship of Malherbe and Boileau pure poetry declined, the drama, on the other hand, flourished in great splendour. After Jodelle and Garnier little progress had been made in tragedy, though the prolific Alexandre Hardy had done something to popularise it; but the classic type now reached perfection in Corneille and Racine, with whom we may also mention the minor writers, Rotrou, Thomas Corneille, and Quinault. At the same time the comedy of manners and social satire, which had slowly been emerging out of the popular farce, assumed its most brilliant form in the work of the greatest comic playwright of the modern world, Molière, among whose numerous followers two—Regnard and Dancourt—have substantial claims to distinction.

In the general prose of the century the foremost names are those of the moralists, La Rochefoucauld, Pascal, and La Bruyère; and of the preachers and religious writers, Bossuet, Bourdaloue, Massillon, and Fénelon. But letter-writing and memoir-writing were also cultivated with great success; the former in particular by the incomparable *épistolaire*, Mme. de Sévigné; the latter, e.g., by the two famous chroniclers, De Retz and Saint-Simon.

To the 17th century also belong the beginnings of the novel. For its first 75 years indeed prose fiction was mainly represented by the prolix and hopelessly unreal pastoral romance, typified in *L'Astrée*, 1610, of Honoré d'Urfé, and by such *romans précieux* as Gomberville's *Polexandre*, 1638-41; La Calprenède's *Cléopâtre*, 1647, and Mlle. de Soudéry's *Grand Cyrus*, 1649-53. But a bourgeois reaction against these fantastic products of the aristocratic salons soon appeared in Charles Sorel's burlesque, *Le Berger Extravagant*, 1627; and in the same writer's earlier *Francion*, 1622; in Scarron's *Roman Comique*, 1651-57; in Furetière's *Roman Bourgeois*, 1666; and in a different way in Mme. de la Fayette's *Princesse de Clèves*, 1678, we mark the emergence of the novel in its modern form.

The Eighteenth Century

While not altogether unchallenged, the classic ideal held sway until the death of Louis XIV in 1715. In the period of growing political and intellectual unrest which followed, though the established theories were maintained, the fundamental character of French literature underwent an

entire transformation, to which the popularity of English literature, especially among the bourgeoisie, greatly contributed. In particular, under the influence of the critical and utilitarian tendencies of the age, literature came to be valued less for its aesthetic qualities than as a means of diffusing ideas, and for this reason the representative masterpieces of the century belong rather to the literature of polemical and propagandist purpose than to that of creative imagination. In prose the transition is marked by Bayle, Fontenelle, and Montesquieu. But as early as 1718 the most brilliant exponent of the 18th century spirit, Voltaire, had already opened his long career of prodigious activity and striking success in almost every field. Vast as was his influence, however, it was less profound than that exerted by Rousseau, who passionately attacked all the dominant ideals of his age, and who, in his subjectivity, sentimentalism, and love of nature, may be regarded as the first great precursor of romanticism. After these two the foremost prose writer of the century is Diderot.

Meanwhile, in this uncongenial atmosphere, poetry languished; Voltaire's epic *La Henriade*, 1728; the didactic verse of Louis Racine; the descriptive poems of Saint-Lambert, Roucher, and Delille; and the odes of Jean-Baptiste Rousseau adding little of interest to the possessions of French literature. Some excellent light verse is indeed to be found in the minor poems of Voltaire; in J. B. L. Gresset; and in the *Fables* of Florian; but in its higher forms 18th century poetry had only one acknowledged master, André Chénier, the last great product of the classic school. Tragedy, represented at its best by Crébillon and Voltaire, suffered from a similar dry rot; but comedy, on the other hand, maintained its vitality in the plays of Destouches, Piron, Marivaux, and Beaumarchais.

Innovations in Drama

The most significant feature in the history of the 18th century drama is the appearance of a new type of serious play, the *tragédie bourgeoise* or *drame*, in which the conventions of classic tragedy were repudiated and the truth of nature was sought. The way for this had been prepared by Marivaux and by the *comédie larmoyante* of La Chaussée, but its founders were Diderot and Sedaine. This innovation was closely connected with the progress of the democratic

movement, the influence of which is also conspicuous in the further development of the novel in the hands of Le Sage, Marivaux, Prévost, Jean-Jacques Rousseau, and Bernardin de Saint-Pierre.

While the Revolution overthrew the old social order, it did not at once destroy its art, and the literature of the revolutionary period represents in the main the final exhaustion of classicism. Two great writers, however—Mme. de Staël and Chateaubriand—herald the romantic movement of the second quarter of the 19th century. Romanticism, defined by Hugo as "liberalism in literature," was at bottom the result of the extension to art of the revolutionary principles of freedom and individuality; whence its rejection of classic convention and all external authority, its assertion of the right of genius to be a law unto itself, its extreme subjectivity, and its frequent extravagances; while the medievalism, picturesqueness, and emotionalism by which it was also characterised arose from a sweeping reaction against the scepticism and aridity of the 18th century.

The new note in poetry was first clearly struck by Lamartine, but most powerfully sounded by Hugo, the paramount personality of the entire movement. Vigny, Musset, and Gautier were others who were pre-eminent.

The Rise of Romanism

Moribund classic tragedy was now displaced by a drama of the free romantic or Shakespearian type. Here the real pioneer was Dumas, but its principles were formulated by Victor Hugo in his preface to *Cromwell* (1827), the first great trumpet-call of romanticism, and it was his Hernani (1830) which assured its triumph on the stage. While, however, the glorified melodrama of Dumas had all the qualities which make for popularity, the finest art of the romantic drama must be sought in the plays of Vigny and Musset.

In fiction the historical romance, inaugurated by Vigny and Mérimée, attained enormous success with Hugo, Dumas, and a host of others, and side by side with this appeared the idealistic novel of George Sand in direct line from Rousseau's *Nouvelle Héloïse*, and the realistic novel founded by Balzac and Stendhal. Among the critics, Nisard held tenaciously to classical standards and methods, but the quickening and broadening influences of the time are clearly seen in Villemain and the

greatest of all French critics, Sainte-Beuve. The period was also rich in religious and philosophical literature, e.g. Joseph de Maistre, Lamennais, Cousin, and Comte; and in history, e.g. Thierry, Guizot, and Thiers.

By the middle of the 19th century romanticism had spent its force; the pendulum of taste swung in the opposite direction, and in response to new social and intellectual tendencies and the rapid spread of the scientific spirit, literature became for a time predominantly anti-romantic and realistic. The change is shown in the drama by the *comédie de mœurs* (a descendant of the later 18th century drama) of Augier and the younger Dumas; and the *drame naturaliste* of Becque and Mirbeau; in fiction by the *roman réaliste* of Flaubert and the brothers Edmond and Jules de Goncourt; and by the *roman naturaliste* of Zola, Maupassant, Daudet, Jules Vallès, and Charles-Louis Philippe.

Outside fiction, much of the prose of this period belongs to the literature of the particular subjects; but in Renan and Taine even specialised history was by the technical qualities of form and style raised to the highest level of art. Another noteworthy feature of the time was the immense development of criticism by many writers of striking merit, e.g. Taine, Brunetière, Gaston Paris, Jullian, Scherer, Faguet, and Lemaitre.

W. H. Hudson

Parnassians and Symbolists

Poetry meanwhile passed through several well-defined phases largely associated, in consonance with the systematising habit of the French mind, with recognized schools. Two of Gautier's disciples, Banville and Baudelaire, mark the transition from the ideas of the romantics to those of the *Parnassiens*—Leconte de Lisle, Hérédia, Sully-Prudhomme, and others, who were broadly neo-classic in principle; and these in turn were succeeded by the *Symbolistes*. The acknowledged leader of symbolism was Verlaine, one of France's great poets. With him, Rimbaud, a young eccentric, wrote between the ages of 15 and 18 a few poems of fantastic brilliance.

Another young man, the insane Lautréamont, left a prose poem of hallucination from which surrealism was born 50 years later. Mallarmé composed a few rare and elevated poems whose refine-

ment of mystery completed the revolution of poetry. The other poets of the close of the 19th century have paled into insignificance, but of great importance was the Belgian school (*Le Jeune Belgique*) to which belonged a great creator, Emile Verhaeren, and Maurice Maeterlinck. A few isolated survivors of the romantic tradition were the novelist Barbey-d'Aurévilly, the esoteric dramatist Villiers de l'Isle-Adam, and the Catholic polemist Léon Bloy.

The 1890-1914 period is marked by two tendencies: first, a rational literature clearly written and comprehensible by the public at large, on which it left a deep impression; secondly, a literature of a very esoteric order.

The most typical writer of the first group is Anatole France, heir at once to the Parnassiens, to Renan, and to the realistic novelists; the perfect representative of French irony, embodied in a classical style. With the same style Pierre Louys endeavoured to give life to decadent antiquity, while Charles Maurras applied it to a royalist and traditionalist ideology. In the opening years of the century the reading public was moved by the works of three novelists: Pierre Loti with his tender grace and enchanting nostalgia, Romain Rolland with his noble idealism, and Maurice Barrès, most artistic of the three, with his proud and troubled disillusion. Master of the psychological novel and inheritor of 19th century tradition was Paul Bourget, and a rare success was Alain Fournier's *Le Grand Meaulnes*, a novel of adolescence. Of the provincial school the ingenious writings of Jules Renard (*Poils de Carotte*) are notable for subtle humour. Outstanding in verse were Richepin and Mme. de Noailles; in the theatre the greatest triumph was that of Edmond Rostand (*Cyrano de Bergerac*, *L'Aiglon*).

Rise of the "Isms"

The second, more esoteric, group of writers gathered round Mallarmé.

These young authors, who gained literary fame only after the First Great War, included Gide, Valéry, and Claudel. In poetry, the novel, and the theatre they introduced a philosophical type of lyricism which expressed the dramas and mysteries of the subconscious, and made of language and versification a supple instrument; but their obscurity was disconcerting to the general reader. Charles Péguy of

the *École normale*, a writer whose work is charged with misery and despair, alone in his time expressed an epic feeling in his *Mystère de la Charité de Jeanne d'Arc*. A philosopher whom Péguy acknowledged as his master, Henri Bergson, created in crystal style a new conception of the universe which brought fresh life to culture. This period saw an increase in the number of literary "isms": naturism, paroxysm, integralism, futurism, and, more interesting, the unanimism of Jules Romains, which revealed the latent lyricism of collective life and urban civilization.

Schools and Rebels

The schools of the 1914-1930 period were fewer but more influential; they included dadaism, surrealism, and populism. Great influence was exercised by the literary review, *La Nouvelle Revue Française*, inspired by André Gide; with the greatest writers of the day as its contributors, it laid down the law in the world of letters and became a fervent supporter of innovation. Its two first and greatest discoveries were Valéry and Proust. Valéry published *La Jeune Parque*, 1917, and *Charmes*, 1922, a small collection of verse; his prose works, *Eupalinos* and *Variétés*, are examples of French intelligence in its most refined form. Proust's voluminous work *À la Recherche du Temps Perdu* introduced into the novel the hitherto unrealized wealth and splendour of the inner life. Gide's limpid narrative set out the cruellest moral problems with frankness, while Claudel's poems and dramas revealed a cosmic inspiration of a greatness hitherto unknown in France. Innumerable young writers of undoubted talent followed these four masters, and the fruitfulness of this period made it one of the most magnificent of French literature.

In poetry, Apollinaire expressed in original verse an acute feeling for death; the Bohemian Max Jacob and the subtle Jean Cocteau made ingenious discoveries. The surrealists included Breton, Aragon, Tzara, and Éluard. Paul Morand wrote skilful novels in a dazzling, tinsel style. Far more refined were Giraudoux's prophetic utterances written for the stage. Followers of Gide were the more catholic Mauriac, whose *Désert de l'Amour* was one of the great novels of his generation; Montherlant, the champion of a sportive chivalry and misogyny;

Malraux, who exalts the ardour of revolutionary fighting; and Roger Martin du Gard, whose Thibault cycle gives a powerful picture of contemporary society.

Quite outside this literary school were the woman novelist Colette; Jules Romains, with his vast realistic fresco, *Les Hommes de Bonne Volonté*; Duhamel, a doctor best known for his Pasquier series of tales; and Bernanos, a poignant Catholic novelist. More widely read were André Maurois's biographies; Claude Farrère's adventure stories; Pierre Benoît's complex plots; Simenon's detective stories; and the war novels of Barbusse and Dorgelès. The naturalist school was developed more fully by Céline, whose *Voyage au bout de la Nuit* is sensational in its brutality, and others.

In the realm of criticism *La Nouvelle Revue Française* presented the most original group. Foremost were the philosopher Alain and the critic Thibaudet; next the pamphleteer Julien Benda, the critics Paulhan and Jean Prévost, and the philosopher G. Marcel. Independent and academic criticism varied from the literary journalists Sondag, Léon Daudet, and Thérive, to learned scholars like the Abbé Brémond and Baron Seillière. History became more scientific than literary; nevertheless two historians were widely read, Bainville on the right and Mathiez on the left. The work of the Catholic philosopher Maritain had a profound influence.

Experiments in Drama

After 1914 the drama was the object of a variety of experiments, the *mise-en-scène* having been modernised and enlivened by Copeau, Jouvet, and others. Notable plays are those of the author-actor Jean Sarment, and of Lenormand who was inspired by Freud; but the greatest dramas were those of Jules Romains, especially *Knock*. Works worthy to endure were produced by writers who were not specialists in the theatre, Giraudoux and Claudel. Later authors, who showed a tendency to mix cynicism with fantasy, were Anouilh and Sartre, who was at once philosopher and novelist and leader of the existentialist school. The doctrine of existentialism (*q.v.*) with its emphasis on the individual, and human salvation by the force of the individual will, provoked violent controversy during the years of the French

resistance movement, and those immediately following the Second Great War. Its leading writers Sartre and Albert Camus (*qq.v.*) attempted to solve the separate problems of existentialism, its validity as a philosophy of life, and its claim to inspire an art. Camus's *L'Étranger* provided an important analysis of the negation of human values.

During the Second Great War French poetry found a new source of inspiration in the resistance movement. Aragon (*Crève Cœur* and *Les Yeux d'Elsa*), Paul Éluard (*Liberté*), Pierre Emmanuel (*Jour de Colère*), and Jouve are the heroic bards of the occupation.

ART. It is generally conceded that French art, more than that of any other country, reflects the national aesthetic judgement and feeling. Just as a Frenchman can be identified as such before he begins to speak, so is a French painting or piece of sculpture unmistakable by its particular qualities. For a long time, indeed, in the fine arts at any rate, the national quality overshadowed the personal; and though of late years the cosmopolitan spirit has affected French art like everything else, it is still true that the idiosyncrasies of individual French artists are much less remarkable than their mutual affinities.

The outstanding characteristic of French art is its high standard of competence. Nowhere in the world is so high a level of accomplishment reached. On the other hand, the predominant element in that competence is an intellectual one; and this leaves little room for spirituality such as is found in the best Italian work, or for the poetry inherent in a good deal of British art. The intellect of the Frenchman is clear cut, extremely logical, almost untouched by sensuousness,

and his art is endowed with precisely parallel qualities.

Hence comes his devotion for classicism. The main stream of French art has always been classic, whatever sporadic manifestations there may have been of other tendencies, romantic, impressionist, expressionist, and so forth. In no phase is the strength of the classic ideal more clearly shown than in architecture. French Gothic certainly had its own character and beauty, but it was a style imposed on France by the religious orders, and fostered by a temporary religious exaltation, rather than the product of the national genius. The great French cathedrals began to be built in the second quarter of the 12th century; but though these still remain as monuments to the period, Gothic, as a building style in France, had exhausted its strength before the end of the 15th century, and was extinct by the middle of the 16th.

The French Renaissance

The classic revival, spreading out of Italy, appealed at once to French national aspirations, and, first introduced into the country by Italian workmen, was quickly assimilated by the French builder-architects. This "French Renaissance" was the foundation of the classic style of building that has held the field in France, virtually without interruption, up to the present day, and, lasting from about the reign of Charles VIII (d. 1498) to the end of the 18th century, was an era of splendid accomplishment. The 16th century saw De l'Orme and Jean Bullant at work on the Tuileries, the 17th the building of the Royal Palace at Versailles, and the completion of the Louvre by Lemercier, as well as the career of François Mansart, one of the most individual geniuses of French and world classicism.

If the neo-Renaissance buildings of modern Paris seem paltry compared with the older masterpieces, it is not the less true that French architecture continues to exercise an immense influence on the building of other countries. The tradition of classicism, balance, perfection of form, justness of proportion, persists very palpably in this phase of French artistic expression, and no survey of other phases would be complete without reference to the general principles it so clearly embodies. The same principles reappear in the more permanent examples of French painting and sculpture.

French painting owed its beginnings to Flemish and Italian

artists, in the same way as French architecture was indebted to the Italian craftsmen. An attempt has been made by patriotic French critics to establish the existence of an important national school at Moulins towards the end of the 15th century, and the identity of the "Maître de Moulins," the painter of a well-known triptych at that town, with Jean Perréal, a contemporary artist of French nationality. But apart from the uncertainty surrounding the personality of this Primitive and others, it is difficult to trace any material difference between their work and that of the Flemings of the same time.

Even Jean Fouquet, the illuminator of the Chantilly Book of Hours, is credited with several paintings that are Flemish or German in character, and the School of Tours, in which he was the outstanding figure, seems to have been almost entirely directed by northern masters. In the art of Nicholas Froment, of the School of Avignon, who flourished in the third quarter of the 15th century, Italianate influences manifest themselves as well as those of the Low Countries. Jean Clouet (d. c. 1540) and his son François (d. c. 1572) were Netherlanders domiciled at Tours. Both became court painters and helped to carry on the Flemish manner as opposed to the Italian manner which was then being fostered by Rosso and Primaticcio in the decoration of the royal buildings at Fontainebleau. The most notable "French" artist of the Fontainebleau group was Jean Cousin (d. c. 1584), called "The French Michelangelo." Modern criticism however, has dubbed him a mediocre follower of Primaticcio.

Poussin and Lorrain

The Fontainebleau decorative school died rapidly, and shortly after the dawn of the 17th century French painting had passed out of the stage of apprenticeship and was evolving on vigorous and characteristic lines of its own. The principal foreign impulse came from Rome. It was there that Nicholas Poussin (d. 1665), the real founder of the Classical school of French painting, found his inspiration. Poussin's art, nevertheless, represents the most typical expression of the purely intellectual side of French genius. Based on a definite theory of design and composition, it is coldly classical, wholly unemotional. Even his landscapes testify his devotion to the severely classical ideal, though

they also show a genuine, if austere, love of nature. In landscape, however, he was easily surpassed by his great contemporary Claude Lorrain, who, adopting the same classical model in his combinations of both architectural and landscape elements, clothed his work in light and atmosphere. Ruskin said of him that he effected a revolution in art, which revolution "consisted mainly in setting the sun in the heavens"; and in this respect he was the founder of modern French, and, indeed, of all modern landscape art.

A variant on the severe classicism of Poussin and Lorrain was introduced by Simon Vouet (d. 1649) in the form of naturalism based on that of Caravaggio; and his pupil Charles Le Brun (d. 1690) succeeded in imposing on French painting a pompous character that checked for a time the growth of independent genius. This was the fruit of the minister Colbert's avowed policy, of which Le Brun was the instrument, of directing French art into industrial and decorative channels; and it was followed, in the 18th century, by a not unwholesome reaction.

Chardin, Fragonard, Watteau

Meanwhile, the genre painting of the brothers Le Nain, who flourished in Paris during the first half of the 17th century, had kept alive an older and simpler tradition than the Italian one. They painted the daily life of the people, very much in the manner of contemporary Dutch and Flemish schools, but with a certain southern grace in their realism. In much the same way Jean Siméon Chardin (d. 1779), an isolated figure among his flamboyant and sentimental contemporaries, concerned himself only with the aesthetic aspect and significance of the humble life he painted, and relied on delicacy of treatment and beautiful pigment to achieve beauty. French 18th century painting, however, as shown by Fragonard, Lancret, Pater, Boucher, and others, is essentially the mirror of the artificial mode of life and thought that had followed the heaviness of Louis XIV's reign. J. B. Greuze painted genre with a certain naturalness that did not enter into the sham shepherd and shepherdess compositions of the rest; but even he is not free from the charge of sentimental affectation. Watteau's temperament gave a seriousness to his *Fêtes Galantes*, which renders them unique of their kind.

The basis of this irresponsible and momentarily charming art

was Classicism. But it was covered with a pseudo-romantic veneer. The sculpture of the time partook of the same character; that is to say, its aim, first and last, was to please. French sculpture in the Gothic period was entirely subordinate to architecture. The Renaissance emancipated it, only to confine it once more within the rigid classicism of the 17th century. Then came the Bernini influence, and a host of rococo imitations of that Italian master. Seemingly the Revolution was needed to bring about a further emancipation both in painting and sculpture. For the first, this event produced Jacques Louis David; for the second, Houdon. David's classical formula was cold and repellent, and his historical compositions are bombastic; but the famous unfinished *Mme. Récamier* reveals the artist unchained from his conventions. Houdon was the first of a long line of French sculptors who, while working at first on the Greek and later the Renaissance models, designed with personal freedom and feeling. David d'Angers, Rude, Carpeaux, and Barye are names that most readily occur in this distinguished sequence, which, lasting throughout the 19th century, was only interrupted—roughly, perhaps—by the advent of Rodin.

In painting, the dull and lifeless classicism of David and his school waned in the early years of the 19th century. The Romantic movement of 1830 virtually demolished it. Romanticism, of course, was not confined to France, and was as much a literary movement as an artistic one; but it exercised an enormous influence on the future development of French painting. Headed by Eugène Delacroix and Théodore Géricault, it took the form of a revolt against the abstract and impersonal character of Classicism.

The Barbizon Group

It was an awakening to the objects of the external world, to the relations of those objects to each other and to their environment. In pure landscape it made possible the emergence of the Barbizon group, of Corot, Rousseau, Daubigny, Millet, and the rest, who in their turn became the forerunners of the Impressionists. Romanticism, in short, was the beginning of the sharp cleavage between academic and independent art which still persists. J. A. D. Ingres and, in a different way, Puvis de Chavannes, were the principal stalwarts of the Classical reaction that made itself

felt from time to time during the century; on the other side, Manet, Degas, and their Impressionist followers bore the brunt of an official persecution bitter enough to act as a tonic to men with new ideas.

As the century drew to a close, the development of French independent painting accelerated its pace. Claude Monet, once acclaimed as the last word in modern art doctrine, lost his supremacy, through the rise of a new group—the Post-Impressionists. This movement, commonly attributed to Paul Cézanne, Vincent van Gogh, and Paul Gauguin, is described under a separate heading.

F. J. Maclean

ART SINCE 1900. In the opening years of the century academic tradition reigned supreme. Its practitioners produced society portraits, subject pictures, military or costumed subjects, historical displays and pageants, decorative work in town halls. The academicians of the Société Nationale des Beaux-Arts were more liberal; they included the etcher Helleu (1859–1927), the painter of Breton subjects, Cottet (1863–1925), and, best known, Forain (1852–1931), whose caustic depicting of society manners in the tradition of Degas remains the most original work of this school.

The "Modernist" Movements

In contrast, the "modernists" or innovators adopted and adapted all that the academies rejected, finding inspiration in the sculptors of old, the Gothics and Aegaeans, also the Hindus, Africans, and Oceanians, as well as in primitive or eccentric painters like El Greco. They followed in the wake of the great revolutionary artists of the late 19th century who, almost unknown before 1900, belong to the history of 20th century art. They revered especially Cézanne as the master of "authentic" painting, but the last works of Renoir (those from 1900 to 1919) and those of Cagnes played an important part in orientating their art. Amongst the neo-impressionists, the "pointilliste" technique of Seurat (1859–1891) had been influential, while strength of brush-work was the contribution of Toulouse-Lautrec (1864–1901). Dream hallucinations were transposed on to canvas by a subtle artist and man-of-letters, Odilon Redon (1840–1916).

By 1910 three groups of outstanding importance were established: the Symbolists, Fauvists, and Cubists. The first mark a reaction against the objective,

analytical, and clearly-expressed art of the Impressionists. Their founder was Gauguin, and its theorists were Sérusier (1865-1927), a mystic, and Maurice Denis, a great religious painter whose frescoes represent the peak of 20th century decorative painting. Vuillard (1868-1940), painter of cosy interiors, and Bonnard (1867-1947), creator of homely visions abounding in rainbow colours, were men of high talent.

The Fauvist school, which received its name in 1905, laid emphasis on expression, intensity of sensation, and temperament. Taking inspiration from Cézanne and Van Gogh, and reacting against all intellectualism, it instituted the cult of pure colour. Its champions were Matisse, Dufy, Vlaminck, Derain, Marquet, Friesz, Van Dongen, and Rouault. From the last derives the French tendency towards expressionism.

The Modern Movement

The third school, Cubism, founded in 1908, was the most revolutionary. Its object was to depict volume—rejecting light and colour and reducing everything, even the human face, to cubes and cylinders. Its intention was to substitute intellectual truth for the deformation of the senses, whence its multiplicity of warped perspectives—objects seen full-face and in profile at the same time. This school is represented principally by the Spanish painters Picasso and Juan Gris, and the French artists Braque, de la Fresnaye, Léger, Delaunay, and Lurcat. The square-ruled compositions of Jacques Villon were much appreciated about 1940 by a new Cubist school which took up the quest of 1910. Marie Laurencin sketched feminine groups in pinks, blues, and greys, which curiously combine perversity and freshness.

Surrealism, coming after the First Great War, was above all a literary and philosophical school, and almost all its representatives in painting were foreigners resident in Paris. Their investigations were directed not towards new techniques but weirdness and systematic horror in subject matter, in particular the dream world, where they sought to rediscover the freshness and "purity" which they declared to have been dissipated by the intellectualism and conformism of civilization. The Italian Chirico launched the movement and, with his successors, affected a glossy, painstaking style. The best known of these is the Spaniard Salvador Dalí. Max

Ernst and Tanguy cultivate apocalyptic dream styles. Others, such as Joan Miro, Masson, and Arp, show touches of abstract art. Lastly, Lurcat and Contaud became interested in tapestry.

The pioneers of art gave attentive curiosity to children's art, the art of eccentrics and of the Oceanic savages, and popular art. Apollinaire and Picasso brought to light the customs official Henri Rousseau (1844-1910) whose views of city suburbs and docks, exotic compositions, and bright colours used in primitive style, scandalised the public.

EXPRESSIONISM. Many talented artists, after passing through or skirting Fauvism and Cubism, attached themselves above all to expression, whence the name Expressionists sometimes given to some who came into prominence in the 1920s. They had a love of sober tints and crude caricature-like figures, as in the works of Gromaire, Yves Alix, and Georg. Certain artists delighted in working the thickness of the paint, e.g. Bouche, whose canvases stand out in clear relief. Others, like Dufresne, became attached to a strange type of arabesque. But far above these artists is Dunoyer de Segonzac, master of rich thick colouring and a sumptuous green style; his most notable compositions are broad landscapes painted with great depth and intensity. In contrast to these sombre painters, others delight in depicting the sunny open air. Laprade obtained a lasting success with his light and verdant arabesques. Puy, Manguin, and Favory lay special emphasis on the charms of the feminine figure. More originality is shown by the pure landscape painters—notably Utrillo, who gets on to canvas the very soul of Montmartre. His portrayals of the suburbs of Paris and of village churches reveal perfect intimacy with their atmosphere and suffice to class him as the greatest painter of city life.

ENGRAVINGS, POSTERS, AND DÉCOR. French art has always been attached to design, which in the 20th century took the form of illustration, prints, and sketches. In this sphere the naturalist or academic traditions are found at their best in Forain and Sem. Several of the most famous artists, Matisse, Picasso, Segonzac and Dufy, are remarkable for their lithographs, etchings, sketches, and water colours. Amongst those specialising in engraving, new styles were created by Laboureur

and Louise Hervieu. The poster and theatrical décor acquired an artistic value hitherto unknown. The genius of Toulouse-Lautrec and Bonnard, and the prolific and brilliant work of Chéret and Cappiella, gave birth to the poster. Décor was brought up to date by the intelligence and venturesome spirit of the Russian ballet, whose producer Diaghilev employed first Bakst and later such famous artists as Picasso and Derain. His example was followed by almost every theatre. Among the artists who specialised in stylised settings must be mentioned Touchagues and Christian Bérard.

SCULPTURE. In this period sculpture was far less successful than either painting or drawing. There were as in painting two opposing schools: academic and independent. The only noteworthy representatives of the former are Bartholomé, Landowski, and Bouchard. The independents succeeded in creating a style that rediscovered the great sculptural traditions of the pre-Renaissance era, the Middle Ages, and Ancient Greece. After the magnificent work of Rodin (1840-1917), his successors, several of whom had worked in his studio, reverted to the direct dimensional figure with beautifully expressed attention to volume; they include Bourdelle (1861-1929) and Joseph Bernard (1866-1931). But the artist who towered over 20th century sculpture was the Mediterranean Aristide Maillol (1861-1944). A painter until he was forty, he became after that a sculptor of female figures whose smooth grace and freshness, at once supple and generous, equalled in poetical expression the finest works in the French tradition.

Weird Arabesques

Despiau (1874-1946) devoted himself to portraiture, in which he was unrivalled. A pioneer school pursued a subtle line of research in geometrical planes and volumes, producing weird arabesques in which occur wood-shavings and bundles of wire; Henri Laurens, Zadkine, Brancusi. Lastly must be noted the sculpture of the painters Picasso, Modigliani, and Matisse.

ARCHITECTURE. At the beginning of the century official architects wasted their talents on imitations of the past, but there appeared a number of creative spirits who made use of new materials and methods such as reinforced concrete, rationalising methods of construction in accordance with the needs of living con-

ditions and social usages, providing wider openings, suppressing roofs, increasing the number of balconies, utilising fresh ideas of decoration. The most illustrious of these innovators were the brothers Auguste and Gustave Perret who, in the Théâtre des Champs Élysées in Paris and in the church of Raincy provided models of a new pure style. Tony Garnier in Lyons, Mallet-Stevens, Louis Sue followed in this new

path. Lurçat and, above all, Le Corbusier, pushed the process of simplification even further. In every domain, 20th century French art was marked by two tendencies of the period: the never-ending search for technical invention, of an audacity prone to overreach itself; and a depth of inspiration, in which appeared the constant desire to express both the physical and the spiritual life of mankind.

Gustave Cohen

FRANCE: SECOND GREAT WAR & AFTER

Georges Gombault, French Political Journalist and Broadcaster

The internal civil history of France during 1939-1947 is described in this section. For military history, see British Expeditionary Force; Europe, Liberation of; France, Battle of; Maginot Line; Paris, etc. See also biographies of Pétain; Laval, etc.

From the beginning of Nazism in Germany, far-seeing minds in France predicted that it would lead to war. This feeling was confirmed when, in the spring of 1936, Hitler reoccupied the Rhineland. Some Frenchmen declared for a policy of firmness, others inclined towards appeasement. In the first camp were patriots anxious for the future of the country and republicans who wished to defend democracy against Nazism. In the second were men of good faith who believed sincerely that Hitler could be appeased by concessions; but the party also included adversaries of the republic and of social reform who were prepared for the German dictator to put their country in order.

The Forces of Defeatism

Hitler, applying the methods set out in *Mein Kampf*, employed many agents in France to develop this latter tendency, the pretext being pacifism. Social and political circles, journalists, and syndicated papers were especially worked upon under the direction of Otto Abetz. A Franco-German committee was set up, presided over by Fernand Brinon, who eventually became the Vichy govt.'s ambassador to the Germans in Paris. Belin, a secretary of the Confédération Générale du Travail, who became one of Marshal Pétain's ministers, endeavoured to ruin the spirit of resistance among the workers. Defeatism had its adherents in all classes and even in government councils. The collaborators triumphed, after the Munich agreement, 1938, when the foreign minister, Georges Bonnet, received Ribbentrop at the quai d'Orsay.

In spite of these efforts, France followed Great Britain in declaring

war on Germany on Sept. 3, 1939, two days after the invasion of Poland. But the defeatists did not give up their attempt to sap the nation's morale. Moreover, communist workers in the armament factories, who had opposed Hitlerism and Fascism, changed their attitude after the conclusion of the German-Soviet pact of non-aggression, Aug., 1939. The first months of hostilities were calm. During the attack on Poland, Gen. Gamelin, the commander-in-chief, conducted a small offensive by the army of Alsace, but the troops were soon withdrawn to their bases, and only minor operations, by volunteer units, the "free corps," took place. The Maginot Line was occupied, and work was begun on the fortification of the unprotected N. frontier. Angered by the understanding between the U.S.S.R. and Germany, most Frenchmen registered their sympathy when Finland was attacked by the U.S.S.R. Edouard Daladier, the prime minister, accused of weakness, was replaced by Paul Reynaud in March, 1940. The latter at once signed with Great Britain a pact agreeing that there would be no separate peace, and when Norway was invaded in April, organized the French share of the expedition to that country.

The Military Defeat

On the night of May 9-10, 1940, the German army invaded Belgium and the Netherlands, and Gen. Gamelin sent his armies to meet it. But on May 15, German divisions crossed the Meuse at Sedan, at a point which had not been fortified; this was the beginning of the destruction of the armoured divisions in the direction of Amiens. The troops were demoralised by a kind of war for which they had not been prepared.

The combination of tanks and aeroplanes disconcerted them, the thunderous noise of pursuing machines terrified them. There were many acts of heroic resistance; armoured divisions, notably that commanded by Gen. de Gaulle, fought valiantly. But in the main it was full flight in front of German tanks, which drove them far from their bases.

Reynaud relieved Gamelin of his command, replacing him by Gen. Weygand. But the Germans reached the North Sea and the Channel, occupied Normandy, and on June 14 entered Paris, which had been declared an open city the day before. The French army was cut in pieces; the higher command was no longer in contact with the main forces, and general staffs were cut off from the troops. On the roads, the population of the overrun areas, and many Parisians, fleeing southwards from the invasion, mingled with and obstructed the military convoys. Amid the chaos the unarmed crowds, with old people, women, and children in the majority, were machine-gunned from aircraft.

The Armistice of 1940

When Sedan fell, Gamelin had informed the government that he could no longer guarantee the safety of Paris, and the government proposed to leave the capital. The chamber sitting that day refused to leave, and the official exodus was adjourned. But by June 10, when Paris was immediately threatened, the government and all public services had moved to Tours.

At a cabinet meeting in the neighbourhood of this town, Weygand asked the government to seek an armistice. Reynaud, supported by the majority of his ministers, refused; he told the general that the army could capitulate, but this solution was expressly rejected by Weygand. The premier consulted with Winston Churchill, who had arrived by air. Convinced that Great Britain, in the present state of her forces, could no longer give immediate help, Reynaud asked Churchill to release him from the engagement not to seek a separate peace. Churchill did not insist on strict fulfilment of the agreement, but imposed the condition that the French navy should not be surrendered.

With the Germans hard on their heels, the government moved to Bordeaux. Weygand now insisted on an armistice, and Pétain, who had been appointed vice-premier on May 18, gave him full support,

1. German parade past the city, carriage in which the armistices of 1918 and 1940 were signed at Compiègne.
 2. Oradour-sur-Glane church in which the women and children were burned to death, June, 1944.
 3. Pétain's motto, Patrie, Famille, Travail, taught in school. 4. Pétain, Darlan, and Laval outside their

seat of government at Vichy, 1942. 5. Germans, with white flag, on the balcony outside the chamber of deputies, Paris, Aug. 1944, discuss surrender with the F.F.I. 6. Gen. Leclerc, commander 2nd French armored div., reaches the Boulevard Montparnasse Paris, Aug. 25, 1944

FRANCE, 1940-44: ARMISTICE—OCCUPATION—LIBERATION

threatening otherwise to resign. Reynaud again resisted, being supported by Georges Mandel, minister of the interior, and several others. It appeared that certain divisions were still intact; but Weygand alleged that the Communists had established a revolutionary government in Paris, and that he must reserve these divisions for re-establishing order. Mandel ascertained by telephoning the Paris prefect of police that this was not true, but Weygand, supported by Pétain, still insisted. By way of negotiation, Camille Chautemps, deputy premier, proposed that the Germans should be asked for their armistice terms, which could be refused if found unacceptable. Reynaud, Mandel, and others objected that, once an armistice had been asked for, it would be accepted, and counter-proposed that the war be continued from N. Africa.

The cabinet was inclined to support Chautemps, which would have satisfied Weygand and Pétain. Reynaud, finding his new proposal unacceptable to the majority, handed the resignation of the cabinet to President Lebrun June 16. Pétain was charged with the formation of a new ministry and was barely in office before he asked Hitler for an armistice, through the Spanish ambassador. Hitler delayed his reply and advanced his troops as far as the

gates of Bordeaux, which was severely raided from the air. Pétain begged for a reply from Hitler, who replied that he might send plenipotentiaries who would be in a position to discuss the armistice. They duly met the German delegates in the forest of Compiègne, where Hitler laid down his conditions on the spot where Foch had received the plenipotentiaries of defeated Germany in Nov., 1918, and in the same railway coach, which Hitler had had sent from Paris.

The armistice was signed, June 22. It was severe: France was bereft of Alsace and Lorraine, subjected to a daily tribute of 500 million francs (about £2,800,000 at the then rate of the franc) for the upkeep of an army of occupation

within a defined area corresponding to about half of the country, and required to pay other charges.

Lebrun had expected to leave for Algeria, with the government and parliament, on the assumption that the navy and what remained of the army would rally in N. Africa. But Laval staged a violent scene with the president. Individual members of parliament, including Mandel, who had embarked for Morocco, were arrested. The govt. itself refused to go to N. Africa, preferring to remain in France and carry out a policy of submission to the Germans.

THE VICHY GOVERNMENT. At Vichy, to which Pétain's government moved on June 30, Laval, now vice-premier, asked the cham-

nation. In "Vichy" France the individual had no security, for by a simple order of a prefect anybody could be interned; newspapers were subject to the strictest censorship, instructed to write about certain subjects, and told where to place the articles and the sizes of the headlines; democratic associations like freemasonry and the league of the Rights of Man were forbidden and robbed of their funds; racial legislation was established (French Jews were excluded from the administration, forbidden to practise any profession, and had their property and businesses seized); syndicates were forbidden, and a so-called charter of work set up a kind of cooperative movement on the fascist model.

The leaders of the Left and the most ardent patriots were arrested and interned, including Léon Blum, Vincent Auriol, Mandel, Daladier, Reynaud, Léon Jouhaux, and later Edouard Herriot. Former Radical or Socialist ministers were condemned to severe penalties. Dormoy was assassinated by the Cagoullards, members of a terrorist organization of the extreme Right, whom he had exposed in 1937 when minister of the interior. Proceedings were taken against Blum, Daladier, Gamelin, and several associates, who were brought to trial at Riom in 1940. But the accused became

accusers, and so clearly exposed the responsibility of the generals and the champions of the new regime that the proceedings were abruptly stopped and the accused imprisoned in Le Portalet, an unhealthy fortress in the Pyrenees. Most of them were later sent to camps in Germany.

The Vichy government also tried to organize their followers on the German and Italian models. Pétain created the *Legion Tricolore*, which members of various dissolved ex-servicemen's associations were compelled to join. The government also opened workshops where all youths of 20 had to spend several months instead of being on military service, receiving physical training and indoctrination. At Uriage there was a

France. Map showing the occupied, unoccupied, and demilitarized zones in France after the signing of the Armistice with Germany, June 22, 1940, until November 11, 1942

her and the senate, met in national assembly, to give Pétain full power to modify the constitution. A few deputies and senators tried in vain to oppose the motion, which aimed at the suppression of the republic. Laval's agents threatened opponents with arrest, and gave warning that in the event of continued opposition the generals would step into power. Full powers were granted to Pétain, only 80 deputies and senators opposing. The marshal proceeded to take total power; he abolished not only the reality of the republic, but also its name and motto, substituting the title of French State and the motto Work, Family, Fatherland. After suppressing both chambers, he instituted a national council of his own nomi-

selective school, which was to form the *élite*. In the primary schools and in colleges teachers were continually invited to adulate Pétain, but often declined. In the youth camps and even at the selective school the resistance had many followers. Propaganda for Pétain produced a contrary effect to that which was intended. Few believed in the myth of the national revolution.

France Divided into Three Zones

After annexing Alsace and Lorraine, the Germans divided France into three zones: (1) the forbidden zone of the N., which was cut off from the country and formed part of Belgium; (2) the occupied zone, which ran from the Swiss frontier to Bordeaux and from Bordeaux to the Spanish frontier, and took in all the W. coast; (3) the so-called free zone outside (2). The passage from one zone to another was possible only with German permission. Paris was in the occupied, Vichy in the free zone; the government resided at Vichy and made de Brinon ambassador to the German authorities in Paris. Vichy policy was that of collaboration with Germany. In July, 1940, the foreign minister, Paul Baudouin, repudiated the alliance with Great Britain. On Oct. 22, Hitler received Laval, and on Oct. 24 Pétain, whom he asked for help in Africa, "against Great Britain and Gen. de Gaulle." According to a statement made later by de Brinon, the marshal consented. On Oct. 28, Laval became foreign minister, and two days later, in a message to the French people, Pétain declared: "It is with honour and to maintain French unity in the framework of constructive activity of the new European order that I am today entering into collaboration."

At Pétain's trial in 1946 it was alleged that on Dec. 23, 1940, he had broken with Laval, and had even had him arrested. But Laval's successor, Admiral Darlan, also visited Hitler and placed himself under his orders, and Pétain recalled Laval as soon as Berlin expressed the wish that he should do so. The marshal raised no objection when Gen. von Stulpnagel, in command of the occupation army, ordered the massacre of hostages or when the Germans, in violation of the armistice terms, occupied the whole of France, Nov. 11, 1942. On the contrary, he stigmatised resisting Frenchmen as terrorists; encouraged the formation of such bodies as the "league of anti-bolshevik volun-

France. A German poster in occupied France calling upon the French people to "Have confidence in the German soldier."

teers," who fought in German uniform; received Doriot, a fascist who was fighting in the German ranks; and appointed Darnand, virtually his minister of the interior, chief of the militia created by the Germans to help the Gestapo. Nor were the ministers less enthusiastic. Darlan gave every assistance to the Germans during the Syrian campaign; Laval represented the "voluntary" removal of French workmen to the Reich as an advantageous measure, since it would lead, according to German promises, to the repatriation of prisoners, of whom there were more than a million and a quarter, and enable France to take her place in the "new Europe." The Vichy government was a mere tool of Berlin, and when in 1944 the Germans fled before the Allies, Pétain, Laval, and a group of partisans followed them as far as Sigmaringen.

THE RESISTANCE. Stupor was the first effect of the armistice, followed by indignation. It was in London, where a broadcast appeal was made on June 18, 1940, by Gen. de Gaulle, that the first core of resistance was formed in the Free French (later renamed Fighting French) forces. Volunteers became the nucleus of a small army, a fleet which cooperated with the Royal Navy, and an air force whose pilots flew with the R.A.F. In France resistance developed first among the intellectuals—Paris students demonstrated Nov. 11, 1940—and among those of the political Left, while those

of the Right, together with the dignitaries of the church, followed Pétain, though there were exceptions on both sides. Broadcasts from Great Britain brought great comfort, and "Gaullism" became synonymous with patriotism.

Organized resistance began in the winter of 1940-41; it took three forms—helping British and French men and women to escape from France; giving information to Great Britain; and editing, printing, and distributing clandestine tracts or newspapers to enlighten opinion. The movement was particularly strong in the N. The Germans savagely repressed it. Scientists of the Musée de l'Homme, Paris, a centre of resistance, were arrested and shot. But the movement grew, and gradually its various branches adopted symbolic titles, e.g. *libération*, *combat*, *franc-tireur*. Activities became more and more military, and later the civil and military organization and the National Front were formed. Only after June 22, 1941, however, the day of the German attack on Russia, did the Communists adhere to the resistance movement; they were especially active in sabotage and in the Maquis.

Relations were early established between the movements in France and in London, where de Gaulle had formed a national committee in June, 1940. In June, 1943, the French committee of national liberation, at first under the joint presidency of de Gaulle and Giraud, later under de Gaulle alone, was set up at Algiers, and in Aug. was recognized by the Allies as the provisional government.

National Council of Resistance

Collaboration between all sections of the resistance movement inside France led to the formation of the national council of resistance. Its first president, Jean Moulin, was arrested, tortured, and killed by the Germans; the second was Georges Bidault, who became head of the shadow provisional government in France. In his council were Socialists, Communists, Radicals, popular democrats, members of the democratic alliance, the republican federation (Louis Marin's party), the Confédération Générale du Travail (trade unions) and the Confédération Générale des Travailleurs Chrétiens (Christian workers). The council drew up a political programme which went far to the Left and was the basis of measures taken by the provisional governments after liberation.

The Gestapo arrested, imprisoned, tortured, and killed many

members of the resistance; hundreds of thousands were placed in concentration camps or prisons in France and sent from there to death or to Germany. Jews were sent to the gas chambers. Other savage measures were the massacre at Chateaubriant, Oct. 22, 1941; the execution of Gabriel Péri, a Communist deputy handed over by Vichy Dec. 15; the assassination of writers, scientists, and professors such as Jacques Decour, Pollitzer, Jacques Solomon, Jean Cavailles; the razing of Oradour-sur-Glane, June 10, 1944. Seeking auxiliaries, the Germans created the militia which organized punitive expeditions against the Maquis and committed many individual crimes. Two former ministers, Mandel and Jean Zay, were killed; so were the 80-year-old president of the league of the Rights of Man, and several senators and deputies. In 1944 the Gestapo started a new campaign, arresting members of parliament, journalists, and officials whose patriotic sentiments were known; many died under torture. French victims of the German repression must be counted in hundreds of thousands.

THE LIBERATION. June 6, 1944, marked the beginning of France's deliverance. At the same time as the Allies disembarked on the Normandy coast the order to rise was passed to the Maquis troops, under the command of Gen. Koenig; they cut enemy communications, creating confusion in the rear. (For the course of the fighting, see Europe, Liberation of.) On Aug. 15 a U.S. army, including French troops which later formed the basis of the French 1st army, landed in the S.; these were also helped by the Maquis, who came into action in the Alps, the Cévennes, and the Jura, destroying railway lines and attacking the enemy; in Savoy the Forces Françaises de l'Intérieur (F.F.I.) took 18,000 prisoners. Thus the German army was caught between the Allied forces in the N. (the French 2nd armoured division, under Gen. Leclerc, forming part of the U.S. 3rd army) and the U.S. and French armies in the S.

By Aug. 19 revolt was stirring in Paris. The F.F.I. came into action and erected barricades. The police went on strike. The police headquarters and the town hall, seat of the national council of resis-

tance and the Parisian liberation committee, were the patriots' headquarters; the Germans used tanks against these buildings. When the fight spread to all quarters the enemy tried to fire the Grand Palais. The poorly-armed insurgents had begun to reach the end of their tether when on Aug. 24 at 9.30 p.m. the first elements of Leclerc's division, to whom the Allied high command had given the honour of completing the liberation of Paris, arrived at the gates of the capital. The next day the full division cleared Paris, the German general signing his sur-

request of the French, Gen. Eisenhower decided that Strasbourg should be held. By the end of March, 1945, French soil was clear, except for the invested ports, whose garrisons surrendered only after the German capitulation in May. By May 17, 1945, all Germans remaining in France had been made prisoner. A French army of ten divisions had played its part in the deliverance and the help of the F.F.I. was estimated by S.H.A.E.F. at 15 divisions.

THE FOURTH REPUBLIC. The republic was again proclaimed on the day Paris was liberated, Aug. 25, 1944, and republican legislation again came into effect. De Gaulle remodelled the provisional government, over which he had presided in Algiers since 1943; war destruction having made communication with the provinces difficult, republican commissioners, armed with full powers, represented the government in the various regions. Advising the government, on which all parties and the National Resistance Council were represented, was the consultative assembly, whose members were appointed by the resistance committee. The first task was to re-establish communications, organize revictualling, and bring order into a country thoroughly ravaged by four years of occupation, two military campaigns, and frequent bombings of installations and communications.

A purge of those who had collaborated with the Germans was also necessary. In the early days summary execution of collaborators took place, but justice soon intervened and the most notorious collaborators were taken before proper tribunals. Administration, journalism, and the world of letters and art were systematically purged by committees set up for the purpose; search was made for economic collaborators, and illicit profiteers had their gains confiscated; tens of thousands of death, forced labour, or prison sentences were passed. Pétain and Laval were condemned to death; the latter was executed after attempted suicide; but Pétain's sentence was commuted to life imprisonment on account of his age.

During 1945-46 France lived under provisional governments. On Oct. 21, 1945, a constituent assembly was elected, whose prin-

render at the Montparnasse station and handing over to Leclerc and Col. Rol-Tanguy, chief of the F.F.I. On Aug. 26 de Gaulle entered Paris; acclaimed by the populace, he went to Notre Dame, where snipers in its galleries and on the roof of the town hall fired at him.

The greater part of France was free by Sept. But the enemy still occupied Alsace, and the Germans were still resisting in invested "pockets" at La Rochelle, St. Nazaire, Lorient, and Dunkirk. The French 1st army, commanded by Gen. de Latre de Tassigny, in cooperation with the U.S. 7th army, took the offensive on Nov. 14, captured Belfort, turned the German positions in the Vosges, and forced a general retirement in Alsace. The French 2nd armoured div., operating now with the 7th army, forced the Saverne gap, entering Strasbourg on Nov. 23. During the enemy counter-offensive in the Ardennes (Dec. 1944-Jan., 1945), the Americans wished to withdraw to the Vosges, but at the urgent

cial purpose was to draw up a new constitution. The Communist party secured 150 seats, the Socialists 139, a new party, the Mouvement Républicain Populaire (Catholic and democratic), 149. The Radicals won only 25 seats. The constitution it proposed was rejected, May 5, 1946. On June 2 a new constituent assembly was elected, wherein the Communists were the most numerous, with M.R.P. next, then the Socialists. The constitution (see pp. 3510-11) drawn up by this assembly, was accepted by the country with a weak majority, Oct. 13. In addition to drawing up a constitution, the assemblies had carried out nationalisation of mines, gas, electricity, insurance, and the big credit banks.

General de Gaulle, at variance with the constituent assembly both over constitution-making and foreign policy, had resigned, as head of the provisional government, Jan. 21, 1946; Gouin, the Socialist president of the assembly (a position approximating to that of the speaker of the house of commons), succeeded him, Jan. 26. He supported the constitution which the country rejected, and resigned after the election of the second constituent assembly. Georges Bidault, leader of the M.R.P., came in on June 23, and himself retired according to custom when the new national assembly started to function, Nov. 10. It proved difficult to form a ministry. Neither the M.R.P. nor the Socialists wanted to collaborate with the Communists. Finally, pending the election of the new president of the republic, Blum formed a Socialist ministry; its life was known to be limited to six weeks, but it gave a vigorous direction to policy, stayed the tendency towards a general rise in prices, and opened negotiations for a treaty of alliance with Great Britain. On Jan. 16, 1947, the first president of the Fourth Republic, Vincent Auriol, was elected at Versailles by the two assemblies. Following the usual custom, Blum handed his resignation to the president, and P. Ramadier became prime minister.

During 1947-50 he was succeeded in turn by R. Schuman, A. Marie, H. Queuille, and G. Bidault, each at the head of a coalition of

middle parties and endeavouring to establish the efficacy of the "third force" in politics, as distinct from the communists on the one hand and on the other a new organization of the extreme right, Rassemblement du Peuple Français, led by Gen. de Gaulle. Throughout, France played her part in the movement leading to Western Union, as signatory to the treaties of Dunkirk and Brussels and the North Atlantic Treaty, and as member of customs unions.

France, BANK OF. Central bank of France, founded in 1880

Bank of France. The head offices in Paris

by Napoleon I and having the monopoly of issuing notes. It exercises a large measure of control over other banks in France, most of which have been nationalised and was itself completely nationalised in 1946. It has a number of provincial branches and a large share in the clearing arrangements of the country. Its head offices are in the Rue de la Vrillière, Paris.

France, BATTLE OF. Name popularly given to the fighting between the German and (mainly) French armies which lasted until the end of organized French resistance in June, 1940. On May 15, 1940, German mechanised columns, advancing with a speed hitherto thought impossible in warfare, forced crossings over the Meuse at Dinant and between Sedan and Mézières, and totally destroyed Gen. Corap's 9th French army. At first there was some doubt whether the enemy would push on to Paris, take the Maginot Line (*q.v.*) in the rear, or thrust W. to sever the communications of the Allied armies in Belgium. The German command decided on the latter plan. For the campaign that followed ending with the evacuation of the B.E.F. and 1st French army from Dunkirk, see British Expeditionary Force; Dunkirk, Evacuation from. See also Belgium in the Second Great War; Netherlands in the Second Great War.

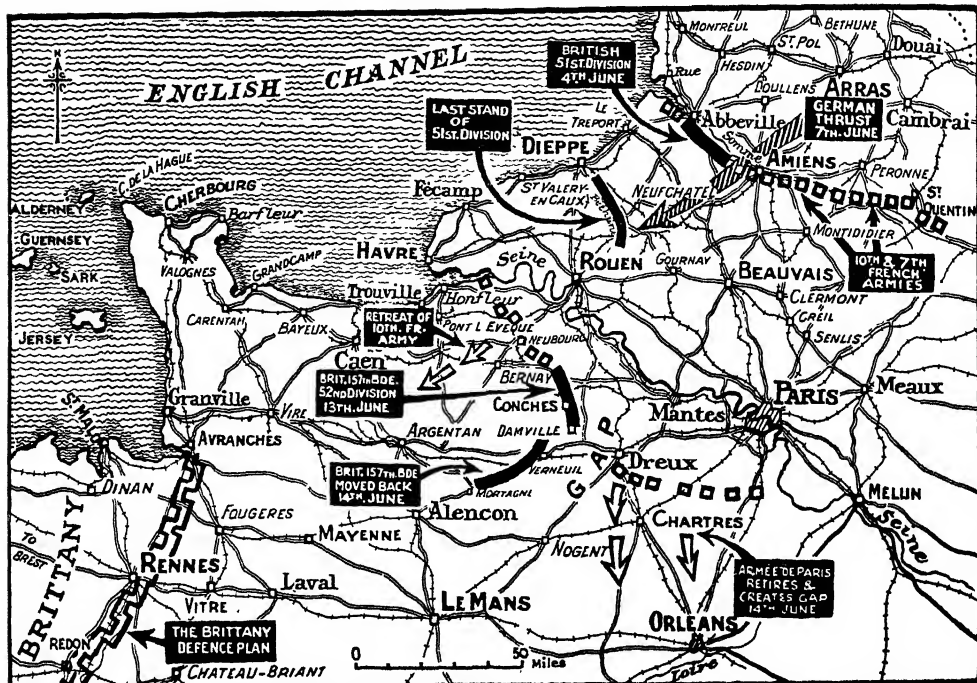

After the Allied evacuation from Dunkirk the German command was able to throw its full strength against the French, and on June 5 launched armoured and motorised infantry thrusts which in less than two weeks totally defeated the armies and put France out of the war.

When Gen. Weygand replaced Gen. Gamelin as c.-in.-c. on May 19, he had considered mounting a major counter-attack against an enemy whom he felt sure must halt to reorganize after the battles in Flanders. But by the beginning of June, Weygand lacked the necessary support of armour, artillery, and aircraft. Even had such support been available, the disruption of his communications by air attack and the chaotic condition of French rail and road transport, due in large measure to the disorderly fleeing of refugees, made it impossible to concentrate men and materials for an offensive operation. Moreover, the Germans did not halt to reorganize; despite the length of their communications and the opposition they had met in Flanders, their advance had lost none of its momentum.

The Weygand Line

Weygand managed to establish a defensive line across France from the Somme estuary to Montmédy, where the Maginot forts had successfully withstood all German attacks. The "Weygand line," which followed approximately the course of the Somme and Aisne and their interconnecting canals, consisted mainly of hastily-fortified villages and other makeshift defences. But the position had considerable depth, and some effort had been expended in making the villages pivots which, properly held, might have resisted tank assault. The Maginot Line, still unattacked in front, protected the position from a rear attack. The French hoped to hold the line until their reserve armies had been reorganized and equipped and a new British force landed in France.

But the Germans had already secured bridgeheads across the Somme at Abbeville and Amiens, and on June 7 the main German assault was made from Abbeville, where the British 51st (Highland) div. and the incomplete 1st armoured div. formed part of the French 10th army holding the line of the Somme. The 51st div. fell back towards Rouen, but, cut off from that city by the German advance, retired to St. Valéry-en-Caux, where it was surrounded by superior German forces and forced to capitulate on June 12.

Battle of France. Map illustrating the withdrawal of French and British troops before the rapidly advancing German army in northern France between June 4 and June 18, 1940

Further attacks developed in the next few days, chiefly on the Aisne, where the French offered gallant resistance. But the Germans were able to throw in fresh armour, and penetrated deep into and through the Weygand line. The Germans Panzers carried out their policy of by-passing strong centres of resistance, leaving them to be reduced by the infantry and artillery.

French resistance was well organized at first, and the withdrawals so coordinated that some semblance of a continuous front was maintained. But with the breakdown of communications, whole divisions were compelled to fight and retreat without orders or plan. Italy declared war on the Allies on June 10, and the French, realizing they could not hold the line any longer, fell back on the Seine. By June 12 the Germans had reached and crossed the Seine between Paris and Rouen and captured Reims, while in the centre German troops were within 12 m. of Paris.

East of the Aisne, the French—outnumbered, outgunned, and outmanoeuvred—fell back on the Marne, hoping to establish yet another defence line there. But the pursuing enemy gave no pause and, crossing the Marne from

Château-Thierry eastwards, occupied Châlons. On June 13 Paris was declared an open town. The following day the Germans entered it, the French government having moved to Tours some days earlier.

After the fall of Paris, the main German drive developed S.E. between Paris and the Maginot Line. Verdun fell on June 15, and a frontal assault penetrated the Maginot Line near Saarbrücken. Although plans were made for a rally on the Loire, nothing came of them. Nor did the landing at Cherbourg of fresh British troops, including a Canadian brigade, have any effect.

On June 7, the British 1st armoured div., which had lost so heavily in vehicles and men during the defence of the Somme that it consisted of only 50 tanks, was ordered by Weygand to hold the line of the river Andelle N.E. of Rouen against an anticipated Panzer attack. Without air or artillery support, the 1st div. was compelled to withdraw across the Seine, where it joined the 52nd (Lowland) div., which had arrived in France on June 9 by way of St. Malo, Brest, and Cherbourg to form part of the covering force for the contemplated withdrawal from the lines of communication.

When the German armies crossed the Seine, the French position became hopeless; to the E. the defences in Champagne had been overrun and the Maginot Line outflanked. With the German drive into central France, whole divisions were cut off in Alsace and Lorraine and the line of retreat of all French forces retiring from the Rhine and Saar was cut.

In the N. sector, British armour and infantry were fighting desperate rearguard actions, and on June 13 Gen. Sir Alan Brooke arrived at Le Mans to take command of all British troops in France which were embodied in a single corps, the 2nd. On the previous night the 157th brigade of the 52nd div. took over a position E. of Conches, which had been exposed by the retreat of the French 10th army. At the same time the armée de Paris was falling back on Orléans, leaving the 52nd division in grave danger of being surrounded.

On June 14 Weygand informed Brooke that the French army was no longer capable of organized resistance; but that, in accordance with a decision of the Allied governments, Brittany was to be defended by a line held across the peninsula in the vicinity of

Rennes. Sir Alan issued instructions for the participation of the British troops in this plan, but on returning to his H.Q. and ringing up the C.I.G.S. found that neither the C.I.G.S. nor the British prime minister had heard of such a plan, and he was ordered to arrange the evacuation of all British troops not actually serving with the French 10th army. The same evening he was told that he was no longer under Weygand's orders, and that the British forces, apart from those with the French 10th army, were to withdraw to England at once. Withdrawal began June 15 through Brest, Cherbourg, St. Malo, St. Nazaire, La Pallice, and Nantes.

The British troops remaining were the 157th brigade of the 52nd Lowland div. and what was left of the 1st armoured div. On June 16 the French 10th army began to retire on the Alençon-Rennes line, but as cooperation with this movement was contrary to the instructions given to the British commander, the British disengaged and fell back on Cherbourg. On June 17 Gen. Brooke was informed from London of the French request for an armistice. In confused fighting the armoured div. was split, one half making for Cherbourg, the other for Brest. From these two ports the remnants embarked June 17-18. When the last troopship left Cherbourg at 4 p.m. on the 18th German guards were within 3 m. of the harbour.

Increasing Number of Surrenders

While the armistice negotiations dragged out, the remnants of the French armies continued fighting gallant but hopeless battles. In the W. their forces were withdrawing into Brittany and S. of the Loire; the armies still fighting around Paris halted to give battle on the middle Loire, thence continued their retreat in the hope of gaining more favourable positions; the armies in Champagne (outflanked on both sides by German armour) endeavoured to break through to Dijon; in Lorraine, troops were fighting in squares and progressing slowly S., as was the army of Alsace. By June 20, the Germans had captured Lyons and penetrated the Jura as far as the Swiss frontier. Thereafter city after city fell into German hands, and in increasing number French divs. were surrounded and forced to surrender.

The armistice was signed at 6.50 p.m. on June 22, but hostilities did not cease until 6 hours after the Italian government had notified the German High Com-

mand that a Franco-Italian armistice had also been concluded. Not until June 25 had Mussolini completed his inglorious little campaign on the French-Italian border and signed the armistice. In six weeks the battle of France had resulted in the complete defeat of the French army, considered at the beginning of the war to be the strongest in Europe. *Consult* The Six Weeks' War, T. Draper, 1946.

David Le Roi

France, ANATOLE (1844-1924). Pen-name of Jacques Anatole Thibault, French author. Born in

Anatole France
Elliott & Fry

Paris, April 16, 1844, he was the son of a bookseller, whose shop was much frequented by literary men. Educated at the Collège Stanislas, Paris, he published his first book, a study of Alfred de Vigny, in 1868. After producing two volumes of poems in 1873 and 1876, he turned to prose work with the tales, *Jocaste* et le Chat Maigre, 1879.

So far he had been only mildly interested in writing. But then came a long succession of works of fiction, satire, and criticism of which the following are noteworthy: *Le Crime de Sylvestre Bonnard*, 1881; *Le Livre de mon Ami*, 1885; *Balthazar*, 1889; *Thais*, 1890; *La Vie Littéraire*, a series of reprinted essays, 1888-92; *La Rôtisserie de la Reine Pédauque*, 1893; *Les Opinions de M. Jérôme Coignard*, 1893, and *M. Bergeret à Paris*, 1901, two satiric studies of contemporary French affairs; *Pierre Nozière*, 1899; *Crainquebille*, 1902; *Histoire Comique*, 1903; the sceptical but brilliantly written history of *Jeanne d'Arc*, 1908; the satirical survey of modern French history, *L'Île des Pingouins*, 1908; *Les Dieux ont Soif*, a story of the Revolution, 1912; and another great satire, *La Révolte des Anges*, 1914; reminiscences, *Le Petit Pierre*, 1918, and *La Vie en Fleur*, 1922.

Anatole France was a staunch supporter of Zola in the Dreyfus affair, and a prominent supporter of socialist, radical, and anti-militarist causes. He was elected a member of the French Academy in 1896, and was an officer of the Legion of Honour. He visited England in 1913. He strongly supported his country's entry into the First Great War, even offering him-

self as a volunteer in 1914, and strove always to uphold the idealism of the French cause, publishing a striking appeal to this end in 1920. He received the Nobel prize for literature in 1921.

Sceptical, erudite, and keenly interested in actuality, he was perhaps the leading figure of his day in French letters. It is hardly fair to call Anatole France a novelist; rather was he a kindly satirist, using the novel—the *récit*, as he would have styled it—as his medium for dissertation and analysis. A master of the impersonal and almost wholly impartial method which only a few of the greatest French writers have successfully compassed, he took history ancient and modern as his theme; but his delight was in turning ancient or legendary tales inside out and showing that the same characteristics are common to humanity in all ages. In a sense he resembled Bernard Shaw, or even Wells; but he was less ruthless and restless than either, perhaps because he did not indulge either in destruction or in reformation. His work leaves not the somewhat acid taste of exposure or disillusion, but the pleasant conviction that we now know the humorous as well as the conventional side of whatever subject or personality he put before us. He died at Tours, Oct. 13, 1924.

Bibliography. Complete works, trans. and ed. F. Chapman and J. L. May, were published by The Bodley Head. Lives include those by L. P. Shanks, 1919; J. L. May, 1924; H. de Noussanne, 1925; H. Stewart, 1929; B. Cerf, 1927; J. J. Brousson, Eng. trans. J. Pollock, 1934; E. P. Dargan, 1937.

France and Germany Star. Campaign medal of the Second Great War. The medal was awarded for operational service on land between June 6, 1944 and May 8, 1945, in France, Belgium, Holland, and Germany. The ribbon is striped vertically in red, white, and blue, the colours of the Union flag and of France and the Netherlands. The medal is a six-pointed star, identical with other campaign stars except that it carries its own title on the surrounding band. *See* illus. Campaign Stars.

Francesca, PIERRO DELLA (c. 1416-92). Italian painter. He was born at Borgo San Sepolcro, where he died. In 1439 he was employed by Domenico Veneziano on the frescoes of Sant' Egidio, Florence. Later he collaborated with Bramantino at the Vatican, and in 1469 entered the service of Duke Federigo at Urbino. The master

of Perugino and Luca Signorelli, he was learned in the laws of perspective and introduced some improvements in oil-colours. From the geometrical structure of his work he has acquired the appellation of the first Cubist.

Francesca DA RIMINI. Heroine of a famous Italian love-story. Giovanni Malatesta of Rimini (nicknamed Scianciato, the lame) obtained her in marriage from her father, Guido da Polenta, lord of Ravenna, and sent his brother Paolo to fetch her. Francesca and Paolo fell in love and were caught together and slain by Giovanni, 1285. The story was told by Dante in the *Inferno*; it has also been used by Leigh Hunt, 1816, Silvio Pellico, 1818, Stephen Phillips, 1899, and D'Annunzio, 1901. Ingres, 1819, Cabanel, 1870, and G. F. Watts, 1879, have shown the story in paintings; and several operas and a ballet have been founded on it. See Dante; Rimini.

Franche Comté. District of Europe; in full, the free county of Burgundy. It was originally an independent state, then part of the duchy of Burgundy, and finally part of France. Its early capital was Dôle, but after 1878 Besançon; it lay between Lorraine and Switzerland, while through it ran the Saône. After the dissolution of the Frankish Empire the free county was one of the many little states which arose on its ruins. It had its own counts, who retained a practical independence, in spite of occasional interference from the kings of France and Germany, until the 14th century, when it was included in the duchy of Burgundy.

In 1477, on the death of Charles the Bold of Burgundy, it was seized by Louis XI of France, but a few years later it was regained by the emperor Maximilian, the son-in-law of Charles. From Maximilian it passed to Charles V and Philip II of Spain, and then in 1668 it was conquered by Louis XIV of France, who formally secured it by the treaty of Nijmegen in 1678. The last remains of its independence were then extinguished, and since then it has been part of France. Since the Revolution it has been divided, and now forms the depts. of Haute Saône, Jura, and Doubs, and part of Ain. See Burgundy.

Franchet d'Esperey, LOUIS (1856-1942). French soldier. He was born May 25, 1856, at Mostaganem, Algeria, and entered the army in 1876. He took part in the Tunis operations, 1881-82, in the Tongking expedition, 1885-87, and

served in China, 1900-01, and in Morocco as general of division in 1913. He was placed at the head of the French 5th army in Sept. 1914, and in 1916 was given command of the eastern group of armies in France. In 1918 he was appointed to command the Allied armies at Salonica. A uniformly successful general and a typical fighting soldier, he completely defeated the German-Bulgarian forces, drove the Germans and Hungarians out of Serbia, and quelled the resistance of the Hungarians. He was awarded the baton of a marshal in 1921, and died July 8, 1942.

Franchise (late Lat. *francus*, free). Originally something to which the idea of freedom was attached, i.e. the free grant of a privilege. It is now used in two narrower senses, one in law and the other in politics. In law, a franchise is a privilege granted by the crown to an individual, or more usually to a corporation, such as the right to hold a market or fair, or rights of fishing. This use of the term persists in the U.S.A., where franchises are public rights handed over to private or semi-private bodies. In politics, the franchise is the right to vote, especially at elections of members of parliament.

In England the franchise was at first the privilege of all freeholders, who voted in the county court; but by an Act of 1430 it was restricted, as far as the counties were concerned, to those whose freeholds were worth 40s. or more. In the towns the franchise varied, each borough having its own custom, usually conveyed to it by royal charter. There were variations, too, in the franchise in Scotland and Ireland. Uniformity was first introduced by the Reform Act of 1832. In England, in the counties, it was given to the existing freeholders, and in addition to copyholders and those renting land worth £50 a year. The total electorate numbered about 1,000,000. In the boroughs a uniform franchise was introduced, the vote being given to all householders whose premises were worth £10 a year and upwards. In 1867 a second Reform Act reduced the qualifications in the counties to the holders of land worth £12 a year, and in the boroughs gave it to all householders. In addition a lodger franchise was introduced. For Scotland and Ireland there were also Reform Acts, the main principles being the same as in England.

In 1884 a Reform Act introduced uniformity, not only in county and

borough, but in England, Scotland, and Ireland. All householders were given the franchise, as were lodgers in counties as in boroughs. Certain classes were disqualified as before, e.g. aliens and criminals, and women were still excluded. In addition there was still a university franchise, based on the possession of a degree.

The fourth considerable extension of the parliamentary franchise took place in 1918 when women who had attained the age of 30 were allowed the right to vote. (Women ratepayers of 21 had received the municipal franchise in 1869.) "Universal" adult suffrage was introduced in 1928. Each new Reform Act added millions to the electorate, which by 1945 had grown to 33,679,041. In that year the parliamentary and the municipal franchise were placed on the same basis and a person of 21 of either sex, not subject to any legal disability, and qualified by 3 months' residence, occupation of business premises of at least £10 a year in value, or marriage to a person having the business premises qualification, became entitled to be entered on the electoral register. An Act of 1948 abolished all plural voting including the university franchise and the business premises vote. See Election; Reform Acts; Vote.

Francia, FRANCESCO (c. 1450-1517). An Italian painter. He was born at Bologna, his real name

Francia. Madonna, Infant Jesus, and St. John, an example of the artist's work in the Dresden Gallery

being Francesco Raibolini, and was apprenticed to a goldsmith. He achieved distinction as a worker in metal, in niello, and in type-founding—he devised the first italic type—but shortly after the coming of Lorenzo Costa to Bologna, 1483, he became a painter. Costa and

Francia were associated in an altarpiece for the Church of the Misericordia, Bologna, Francia's earliest dated work. Though at first he followed Costa's style he quickly surpassed that master in power of conception and colour. The Madonna and Saints, with S. Anne enthroned, in the National Gallery, London, is one of his masterpieces, but he is best studied at Bologna.

His famous Baptism of Christ is at Dresden. Among his portraits are those of Bartolommeo Bianchini (Salting collection), The Marchese Bovio (Lichtenstein Gallery, Vienna), Prince Federigo Gonzaga (Leatham collection). In fresco two episodes from the life of S. Cecilia survive in the chapel of that saint at Bologna. Francia died at Bologna, Jan. 6, 1517. *Consult* Life, G. C. Williamson. 1901.

Francia, José GASPARD RODRIGUEZ (1757-1840). Dictator of Paraguay. Born at Asunción, of Portuguese origin, and educated at the university of Córdoba de Tucumán, he first studied theology, but after taking his degree practised law. In 1811 Paraguay declared itself independent of Spain, and Francia, the ablest of its revolu-

tionary leaders, became secretary of the national junta, joint dictator, 1813, joint dictator for three years, 1814, and sole dictator for life, 1816. In 1816 he dissolved congress, and for the rest of his life ruled tyrannically but beneficially. His vigorous opposition to intercourse with other countries resulted in the development of Paraguay's resources. He died Sept. 20, 1840.

Franciade. Name given to each period of four years in the new calendar set up by the authors of the French Revolution in 1793. The idea and form of the word were derived from the Greek Olympiad. *See* Calendar.

Francis. Christian name, used by both males and females. It is derived from the word frank, free, and was first used in France in the form François. It passed over to England about the time of Henry VIII, in the form of Francis. In the 18th century the form Frances began to be used for girls. Frank is a variant. The German equivalent is Franz, a popular name in Germany; the Italian is Francesco, the Spanish Francisco. Francesca is the Italian feminine, and Franziska the German.

began a life of religious vagabondage — or rather, knight-errantry. We find him repairing S. Damiano with his own hands, tending the lepers and living among them, preaching in the streets and public squares, and often treated as a madman. At last, apparently on Feb. 24, 1209, the gospel for the day suggested a more definite rule of life (Matt. x, 7-10). Thenceforward he took as his ideal the literal imitation of Christ, and became perhaps the most Christlike of all the figures in Church history.

Foundation of His Order

At the end of 1209, or more probably in 1210, having already a small group of disciples, he went to Rome and begged Innocent III to confirm a brief rule which he had drawn up, and thus to authorise a new religious order. The monks were individually poor, but held corporate endowments. The friar was to be moneyless, not only individually but also in the mass; he was to live by the labour of his hands if possible, and, where that failed, by begging. The pope, after some natural hesitation, consented. The new order multiplied rapidly, thanks to the personal influence of Francis and to the crying need of the times.

Many reformers, in the latter half of the 12th century, had aimed at a return to apostolic life; but, sooner or later, all of these came into conflict with the Church. S. Francis combined the most extraordinary religious zeal and charity with a spirit of complete devotion to the hierarchy, and was thus able to renew religious life in Europe without breaking with the Church. There can be little doubt that he and his followers postponed the religious revolution of the 16th century by several generations. Yet this reconciliation was not effected without considerable sacrifices of ideal.

Suffering and Self-Sacrifice

As time went on S. Francis rose to even greater heights of suffering and self-sacrifice, but he lacked the more ordinary qualities required in the general of a religious order. Here his zeal for conversions actually stood in his way. Apart from his frequent missionary journeys in Italy, he planned others abroad. In 1212 he started for Palestine, but was driven by storms to the N.E. coast of the Adriatic. In 1214 he went to preach in Spain; in 1217 he was with difficulty restrained from a similar journey to France. In 1219 he at last found his way to Syria and Palestine, and was away more than a year.

FRANCIS: THE SAINT OF ASSISI

G. G. Coulton, Author of *From St. Francis to Dante*

The life and work of this saint is a necessary introduction to the articles on Monasticism; Franciscans; and on the other religious orders

Francis of Assisi was born in or about the year 1182. His father, Pietro di Bernardone, was a cloth merchant, and belonged to the commercial aristocracy of Assisi. Pietro was travelling in France when the son was born to whom on his return he gave the then unusual name of Francesco. The saint's youth was marked by a love of pleasure, society, and song; all his life he retained a strong affection for the French language — then the literary language of Europe — though he could never speak it well. As he grew up he began to repent of his irregularities, which had always been those of a generous and refined nature.

In 1202 Francis was taken prisoner in battle against the Perugians, and remained in captivity for a year, during which he was noted for his gaiety and his forbearance towards his fellow-prisoners. Returning to his former dissipations, he fell seriously ill, and, in a moment of convalescence, gazing out upon the landscape beneath the walls of Assisi, he found that "neither the beauty of the fields, the pleasantness of the vineyards, nor anything that is fair to see could in any wise delight him. . . . And from that day he began to despise himself, and in some

sport to hold in contempt what he had admired and loved before; yet not altogether, for he had not yet been loosed from the bonds of vanity." He dreamed of military fame, and had actually started on an expedition to Apulia when a vision recalled him. His gaiety now became more fitful; he was penetrated with a deeper pity for the poor, and especially for lepers; the self-conquest which first enabled him to kiss a leper marked a fresh step in his spiritual life.

A Religious Knight-errant

Francis now spent much time in solitary prayer, and at one of these moments, in the little half-ruined church of S. Damiano, the crucifix seemed to speak to him with an articulate voice: "Francis, go repair My House, which as thou seest is wholly falling into ruin." Taking these words too literally, he sought to assist the reparation of S. Damiano by selling one of his father's horses with a load of valuable cloth. The result was a complete rupture between him and his father, and the saint went forth naked into the world. "Henceforth I may say freely 'Our Father which art in heaven,' and no longer 'father Pietro di Bernardone.'"

This was in 1207. Francis then

During his absence in Palestine, his vicars joined with other notables in a policy which tended to bring the Franciscans into line with the older orders. At this news he suddenly returned (summer of 1220), but was unable entirely to check the movement, which had considerable support from the papal court. Recognizing his own want of strictly business qualities, he resigned the direction of the Order to Pietro dei Cattani as vicar-general, and from this time forward could only protest against the formalism which was creeping steadily into his Order. The rest of his life was spent in missionary journeys about Italy, and in remote hermitages where he gave himself up increasingly to the contemplation of Christ's passion. At one of these (La Vernia, Sept., 1224) he is said to have miraculously received the Stigmata, or five wounds of Christ. He died Oct. 3, 1226. He was canonised in 1228 and his festival is kept on Oct. 4. *See* Assisi.

Bibliography. *The Mirror of Perfection*, ascribed to Leo of Assisi, Eng. trans. S. Evans, 1898; *The Little Flowers of St. Francis*, Eng. trans. T. W. Arnold, 1908; *Lives*, Thomas of Celano, Eng. trans. A. G. F. Howell, 1908; G. K. Chesterton, 1923; A. Bonnard, 1930; *Father Cuthbert*, new ed. 1933; P. Sabatier, new ed. 1942; R. C. Petry, 1942.

Francis of PAOLA (c. 1416-1507). Saint and founder of the Order of Friars Minims. Born at Paolo, of poor parents, when 15 years old he became a hermit. Being soon joined by others, he founded an order in 1436. Their first monastery was built in 1454, and the new order was authorised by Pope Sixtus IV in 1474. Other monasteries were founded in Italy, Sicily, France, and Germany, before Francis's death at Plessis-les-Tours, April 2, 1507.

Francis DE SALES (1567-1622). Saint and writer. Born of a noble family at Annecy, Savoy, Aug. 21,

Francis de Sales,
French saint

1567, he was educated at Paris and Padua. He was a great champion of the Roman Catholic faith, had several friendly but fruitless discussions with Beza, and won many Protestants to his own church, especially by his preaching in the Calvinist province of Chablais, 1594-98, and in Paris, 1602. In Sept., 1602, he became bishop of Geneva. In 1610 he founded the order of Nuns of the

S. Francis of Assisi, when dying, carried upon a litter to bless the town of Assisi. From a painting by L. Benonville

Visitation. He was a man of saintly life. His *Introduction to the Devout Life*, 1609, is translated into many languages, and highly esteemed by Christian people generally. He died at Lyons, Dec. 28, 1622, was canonised in 1665, and adopted as the patron saint of writers and journalists in 1923. His festival is kept on Jan. 29. His Works were edited by H. B. Mackay, 1892. There are *Lives* by H. L. Lear, 1871; M. M. M. Scott, 1913; H. Burton, 1926; H. Bordeaux, 1929; M. Muller, 1936.

Francis I (1708-65). German king and Roman emperor. The son of Leopold, duke of Lorraine, and

Francis I,
German king

through his mother, a grandson of Philip, duke of Orleans, he was born Dec. 8, 1708. Related to the Hapsburgs, he was educated in the court circle at Vienna, and a marriage was arranged between him and the future empress, Maria Theresa. In 1729 he became duke of Lorraine, but in 1735 he exchanged that duchy for Tuscany, of which he became grand duke when the last Medici ruler died in 1737, having in the meantime (1736) been married to Maria Theresa. In 1740 his father-in-law, the emperor Charles VI, died, and the war of the Austrian succession began. In the struggle against Frederick the Great, Maria, not her husband, was the dominant figure, and her efforts resulted in 1745 in the election of Francis as emperor. He died at Innsbruck, Aug. 18, 1765, having been merely the assistant of his wife. From the pair the existing Hapsburgs are descended, hence the family is known as Hapsburg-Lorraine. *See* Maria Theresa.

Francis II (1768-1835). Emperor of Austria and last ruler of the Holy Roman Empire. Born in

Francis II,
Emperor of Austria

Florence, Feb. 12, 1768, he was educated there and in Vienna. His father, hitherto grand duke of Tuscany, became Roman emperor as Leopold II in 1790, and two years later (March 1, 1792) Francis succeeded him. A little earlier the French Revolution had begun. Francis's aunt was Marie Antoinette, and on both public and private grounds he was soon committed to the war against France. One disaster followed another. He was forced to make the treaty of Campo Formio, and later that of Pressburg. The Netherlands were in revolt; Russia and Turkey were willing to take advantage of his difficulties. The states of Germany lost their last vestiges of unity, and in 1804 Francis took the title of emperor of Austria, thus seeking to unite more closely the various lands, Hungary and Bohemia among them, over which he really ruled. In 1806 the Holy Roman Empire, of which he was the nominal head, ceased to exist.

Although he had Metternich for his minister, Francis took a leading part in controlling the policy of Austria, both domestic and foreign. He came to terms with Napoleon, giving him his daughter in marriage; but in 1813 he joined the Allies, and his armies assisted in Napoleon's defeat. He died March 2, 1835. He was four times married, and left his successor, Ferdinand I, and other children, one being the father of the emperor Francis Joseph. *See* Europe: History; Vienna, Congress of.

Francis I (1494–1547). King of France. Son of Charles of Valois, he was born at Cognac, Sept. 12, 1494, and in 1515 succeeded his cousin Louis XII,

Francis I,
King of France

whose daughter he had married in 1512. He invaded Italy and defeated the duke of Milan at Marignano in 1515. In 1519 he made an unsuccessful bid for the imperial crown, which Charles V obtained, and the famous rivalry of the two monarchs began. Francis's attempted alliance with Henry VIII of England, at the Field of the Cloth of Gold, 1520, came to nothing, but he again invaded Italy, 1525, and was captured at Pavia, Feb. 24. Kept prisoner at Madrid, he was set free in 1526 on surrendering Burgundy and abandoning various claims in favour of Charles. Once free, however, he renewed hostilities, and won certain modifications from Charles in 1529, whose sister Margaret he married, 1530.

The struggle was resumed in 1536, Francis making useful alliances with the German Protestant princes, and with the sultan Solymann I (1542), but had reached no definite conclusion on his death at Rambouillet, March 31, 1547. Despite the jealousies and vacillations of his foreign policy, Francis greatly strengthened the royal power. He secured for himself the nomination of bishops, reduced the judiciary powers of the nobility, strengthened provincial administration, reformed the national exchequer, and reconstituted the permanent army. A patron of many notable artists and writers of the Renaissance, including Benvenuto Cellini and Francesco Primaticcio, he founded the Collège de France, 1530. *Consult* Lives by J. D'Orliac, 1933; F. Hackett, 1934.

Francis II (1544–60). King of France. Born at Fontainebleau, Jan. 19, 1544, he was the eldest son of Henry II. He was married to Mary Stuart, Queen of Scots, 1558, and became king on his father's death in a tournament, July 10, 1559. His reign only

Francis II,
King of France

lasted for a year and a half, and during that time the government was conducted by his mother, Catherine de' Medici, and his kinsmen, the Guises. He died suddenly in Paris, Dec. 5, 1560.

Francis I (1777–1830). King of the Two Sicilies. Son of Ferdinand I, he was born in Naples, Aug. 19, 1777. In 1812 his father made him regent of Sicily and in 1820 regent of Naples. He came to the throne in 1824 and placed himself under the tutelage of Austria, inaugurating an era of oppression and corruption which reduced his subjects to despair. An insurrection in 1828 was put down with unexampled cruelty, the commune of Bosco being razed to the ground. His alarm at the French revolution of 1830, and the fear of the vengeance of his own people, caused his death, Nov. 8, 1830.

Francis II (1836–94). King of the Two Sicilies. Son of Ferdinand II (Bomba), he was born Jan. 16, 1836, and ascended the throne in 1859. Characterless and weak, he rejected all proposals of reform until Garibaldi's invasion of Sicily, 1860, when his tardy offer of a constitution was rejected by his people. He fled to Capua and thence to Gaeta, which, after a brief siege, surrendered, Feb. 12, 1861. The kingdom was incorporated with Italy and Francis took refuge in Rome. After 1870, Francis lived in Germany and Austria. He died Dec. 27, 1894.

Francis I (1853–1938). Prince of Liechtenstein. He was born Aug. 28, 1853, and succeeded his brother John II in 1929, the eleventh of his dynasty to rule over the principality. Francis continued the benevolent traditions of his predecessor. When the annexation of Austria to Germany brought the National-Socialist regime to his borders, without actually abdicating he entrusted his reigning powers to his great-nephew, Francis Joseph, March 31, 1938. He died at Feldsberg, Moravia, July 16, 1938.

Francis, JOHN (1811–82). Publisher. Born in Bermondsey, July 18, 1811, and apprenticed to a London newspaper agent, he entered The Athenaeum office as a clerk, 1831, and became business manager and publisher of that paper 1832. He retained this post for nearly 50 years, also supervising the commercial side of Notes and Queries from 1872. He took an active part in the campaign for the repeal of the advertisement, stamp, and paper duties, 1853–61. He died April 6, 1882.

Francis, KAY (b. 1899). Professional name of Katherine Edwina Gibbs, American actress. She was born in Oklahoma City, Jan. 13, 1899, and educated at convents at Roxbury and New York. Making her entrance on the professional stage in 1925 as the Player Queen in Hamlet, she entered films in 1930. She appeared in many Warner productions, in nine years making over 50 pictures. These included *Cynara*; *Trouble in Paradise*; *Wonder Bar*; *I Found Stella Parish*; *The White Angel*. In 1946 she appeared in *Woman in the Case*.

Francis, SIR PHILIP (1740–1818). British civil servant and supposed author of *The Letters of Junius* (q.v.). The only son of Philip Francis (c. 1708–73), translator of Horace, he was born in Dublin, Oct. 22, 1740. Educated at St. Paul's School, London, he filled several minor government appointments and was first clerk at the war office, 1762–72.

After J. Lonsdale

A member of the council of Bengal, 1774–81, he quarrelled with Warren Hastings, who wounded him in a pistol duel, 1779. He paid 50,000 rupees as defendant in a marital action brought by G. F. Grand, an officer in the East India Company's service, whose young wife, after living for a time under the protection of Francis, became in 1801 the wife of Talleyrand, and returned to England with a large fortune. Francis was M.P. for Yarmouth, I.O.W., 1784; Bletchingley, 1790; and Appleby, 1802; assisted Burke in impeaching Hastings; incurred the enmity of Pitt; became an intimate of the prince regent; and supported Wilberforce against the slave trade. In 1793 he founded the Society of Friends of the People; in 1806 received a knighthood; in 1814 married Emma Watkins, whom he encouraged in her belief that he was the author of the *Junius Letters*. He died in London, Dec. 22, 1818. *Consult* *Memoirs*, J. Parkes and H. Merivale, 1867.

Francis Ferdinand (1863–1914). Austrian archduke. Son of the archduke Charles Louis and nephew of the emperor Francis Joseph, he was born at Graz,

Dec. 18, 1863. After inheriting, in 1875, the wealth and titles of the house of Hapsburg-Este, formerly dukes of Modena, he became, by the suicide

Francis Ferdinand, Austrian archduke

of the crown prince Rudolf in 1889, heir-apparent to the crown of Austria-Hungary. On his morganatic marriage in 1900 to the Countess Sophia Chotek, who was created Princess Hohenberg, he renounced for the children the right of succession, but his own position remained, and for the next fourteen years he was one of the directors of the policy of Austria-Hungary. He was making a tour in Bosnia when he was assassinated by a Serbian at Serajevo, June 28, 1914, a crime which served to precipitate the First Great War.

Francis Joseph I (1830-1916). Emperor of Austria. The eldest son of the archduke Francis and a grandson of the emperor Francis II, he was born at Vienna, Aug. 18, 1830. He was educated carefully but narrowly, like all the Hapsburgs. In 1848 the shaking throne was occupied by Ferdinand, a childless imbecile. The hopes of the Hapsburgs were therefore centred on Francis Joseph, his nephew, and it was decided that he should be placed upon the throne.

Francis Joseph reigned from Dec. 2, 1848, until Nov. 21, 1916, one of the longest reigns in the world's history. But its interest is not so much in its length as in its vicissitudes. He saw Austria lose her possessions in Italy, 1859, and, defeated by Prussia, 1866, driven from the German confederation. A hated rule disrupted Hungary and Bohemia. The acquisition of Bosnia and Herzegovina, 1908, hardly compensated for endless difficulties with the Balkan states, for the growing suspicions of Russia, or for disorder in the national finances, while Austria's adherence to the Triple Alliance made her more than ever subordinate to Prussia.

His private life was even more tragic. His wife Elizabeth,

daughter of Maximilian Joseph, duke of Bavaria, was assassinated at Geneva in 1898; his only son, Rudolf, committed suicide, or was killed, in 1889; his nephew and heir, the archduke Francis Ferdinand, was murdered at Serajevo, June 28, 1914, with the most momentous consequences.

The emperor took a real part in ruling his empire with its warring races and inherited difficulties, and but for him it is probable that it would have fallen to pieces before it did. He was diligent and up to a point capable, but he could hardly be expected to understand, still less to sympathise with, the liberal movement that shook Europe during his earlier years. His earliest troubles were with Hungary; it was not until 1867 that he was there recognized as king. His life story is that of Austria-Hungary, and to a large extent that of Europe, including Germany, which before the war of 1866 he tried hard to unite under his own overlordship. He died Nov. 21, 1916, and was succeeded by his grand-nephew, the archduke Charles, who abdicated, Nov., 1918. *See* Austria-Hungary; Hapsburg.

Francis Joseph II (b. 1906). Prince of Liechtenstein. He was born Aug. 16, 1906, and succeeded on the death of his great-uncle Francis I, July 16, 1938, though he had been acting as regent since March 31 that year. An enlightened ruler, he preserved the independence of the principality through the Second Great War.

Franciscans. Order of friars, also known as Friars Minor or Minorites, or Grey Friars, founded in 1209 by S. Francis of Assisi (*q.v.*). The first general chapter, in 1219, was attended by upwards of 5,000 members. The rule was solemnly ratified by Honorius III in 1223. A year later the order was established in England, at Canterbury. Following a relaxation of the strict rule of poverty, the order was divided into Conventuals, who lived in large convents under modified conditions; and Observantines, who adhered to the original rule. Known

in France as Cordeliers, the Observantines subsequently divided into Observants, Reformed, Discalced, Recollects, and Capuchins.

In 1897, as a result of the efforts of Leo XIII, while the Conventuals and Capuchins remained distinct, the other branches or families of the order were united under the name of *Ordo Fratrum Minorum*, or Friars Minor. The original dress of the order consisted of a coarse grey cloth habit, with pointed hood, under-tunic, drawers, and waistcord. Five popes and more than 50 cardinals have belonged to the order, which numbered among its members Cardinal Ximenes, S. Bonaventure, Duns Scotus, Alexander of Hales, Roger Bacon, and William of Ockham. Allied to it, as a second order, were the Poor Clares, and, as a third order, the Tertiaries. In the second half of the 14th century its monasteries were computed at 1,500 with 90,000 friars. At the dissolution the houses in England numbered 64. *See* Monasticism; Poor Clares; Tertiaries; *consult also* *Annales Minorum*, L. Wadding, 1625-54; republ. with additions, Rome, 1731-1887.

Francistown. Town of the Bechuanaland Protectorate, S. Africa. In the Tati Concession, it stands near the Shashi river, 50 m. N.W. of Tati, and near the border of S. Rhodesia.

Franck, CÉSAR AUGUSTE (1822-1890). Belgian-born French composer. Born at Liège, Dec. 10, 1822, he was intended by his father for a musical career, and after studying at Liège conservatoire he went to Paris with his family to find wider scope.

His progress at the Paris conservatoire, which he entered in 1837, was rapid and brilliant, but his unconventionality shocked the examiners. This official disapproval of his style as composer and performer (he was one of the finest organists of his age) was to last throughout his life. Owing to a quarrel with his father, he became a teacher, and was appointed organist at S. Clothilde in 1858. In 1872 he became organ professor at the conservatoire. Though he received the Legion of Honour for teaching work, his compositions received neither official nor popular approval. He died Nov. 8, 1890.

Francis Joseph, emperor of Austria
After L. Horowitz

César Franck, French composer

Franciscan. Dress of the order

Franck's fame was established within 14 years of his death. Many works were neglected, but his symphonic variations for piano-forte and orchestra became one of the most popular pieces in the concert repertory. His symphony; sonata for violin and piano-forte; the poem-symphony, *Redemption*; and choral work, *Les Béatitudes*, have been repeatedly performed, and influenced many of the younger French musicians. His quartet, 1889, is considered his masterpiece. *Consult* César Franck, V. d'Indy, Eng. trans. R. Newmarch, 1910; Sparks Among the Stubble, C. Maud, 1924.

Franck, JAMES (b. 1882). German-American physicist. Born at Hamburg, Aug. 26, 1882, he studied at Heidelberg, and in 1915 was appointed associate professor of physics at Berlin university. Professor of physics at Göttingen in 1920, his researches (with Gustav Hertz) in ionisation of gas molecules brought about a new method of investigation of the structure of atoms. He was awarded, with Hertz, the Nobel prize for physics in 1925. Of Jewish extraction, Franck was compelled to leave Germany with the advent to power of the Nazis, and taught as guest professor at Copenhagen. He held an appointment at Johns Hopkins university, Baltimore, 1935-39, and became Hitchcock professor at the university of California in 1941.

Franck, SEBASTIAN (c. 1499-1542). German writer. Born at Donauwörth, he was trained for the priesthood at Ingolstadt and Heidelberg. He had already taken orders when, about 1525, he became a Protestant. He was banished from Strasbourg on account of his opinions in 1531, and settled at Ulm; but the publication of his *Gulden Arch*, 1538, led to his expulsion therefrom in 1539. He went to Basel, where he died. His collection of German Proverbs, 1541, enjoyed a long popularity.

Francke, AUGUST HERMANN (1663-1727). German educationist. Born at Lübeck, March 23, 1663, he was trained at Erfurt and Kiel, and studied Hebrew at Hamburg. Settling at Leipzig, he established a kind of literary club, under the name of *Collegium Philobiblicum*. He taught Greek and Oriental languages at Halle, where he established a paedagogium and orphans' house (1698), the success of which attracted much attention among philanthropists in England. Francke became famous through his lectures on the Bible.

Franckenstein, SIR GEORGE (b. 1878). Austrian-born diplomat. The son of Baron Karl Franckenstein, Austrian diplomat, he was educated in Vienna and entered the Austro-Hungarian diplomatic service. After serving in Washington, St. Petersburg (Leningrad), Rome, and Tokyo, he came to London in 1920 as Austrian envoy extraordinary and minister plenipotentiary. Franckenstein was head of the loan commission entrusted with negotiations for the League of Nations loan for the reconstruction of Austria in 1922. He was still occupying his post in London in 1938 when Germany annexed Austria. A bitter opponent of National Socialism, he resigned and became a naturalised British subject, receiving a knighthood the same year. Also in 1938 he published *Facts and Features of My Life*.

Franco BAHAMONDE, FRANCISCO (b. 1892). Spanish dictator, known as General Franco. He

Gen. Francisco Franco, Spanish dictator

was born in Galicia, Dec. 4, 1892, and entered the army. He saw service in Spanish Morocco, was promoted colonel in 1926, and served under the republic of 1931 in the Balearic Is., later being transferred again to Morocco. In 1935 he was appointed chief of staff. Franco organized in July, 1936, the military uprising against the Azafia government of the Left that led to civil war. He assumed the leadership of the insurgents on the death of Gen. Sanjurjo and proclaimed himself leader of the state (caudillo) and commander-in-chief on Oct. 1. His party adopted the title of Nationalists, while the supporters of the government were known as Republicans. On April 19, 1937, various political groups were united by Franco into one single party, which included the Falangists created in 1933. A government headed by Franco, with dictatorial powers, was proclaimed Feb. 1, 1938.

The civil war was waged with terrible bitterness by both sides. (See Spanish Civil War.) When it terminated in 1939, Franco entered upon a policy of repression, making little effort to reconcile the vanquished section of the people. In May he joined the Anti-Comintern Pact; but negotiations

for an alliance with Germany and Italy made no progress. In Aug. came his second government which named him president and prime minister. The grand council of the Falange replaced the Cortes, and the reconstruction of the devastated regions was begun. The conclusion of the Russo-German pact on Aug. 23 shocked Franco, and Spain issued a declaration of strictest neutrality at the outbreak of the Second Great War; but after the capitulation of France, June, 1940, he announced Spain's imperative claim to the possession of Gibraltar. On Oct. 23 he met Hitler on the French border, the latter being anxious for Spanish cooperation in his "new order." The German high command prepared a plan for an assault on Gibraltar by a German-Spanish army.

Franco conferred with Mussolini at Bordighera on Feb. 12, 1941, and next day met Marshal Pétain and Admiral Darlan at Montpellier. When addressing the national council of the Falange on July 17 he made a strongly pro-German speech. But a disrupted economy, social cleavages, and dependence upon anti-Axis powers for needed supplies precluded participation in the war. On the entry of the U.S.A., Spain took over German and Italian diplomatic relations with Spanish-American countries united with the Allied cause, and intensified a campaign for the revival of Spain's influence in her former American empire.

On July 1, 1942, Franco announced the reinstitution of the Cortes, and in Sept. removed his pro-Axis foreign minister and replaced him by a monarchist. The Allied successes in N. Africa modifying his attitude, in May, 1943, he suggested the war should be brought to a close as a deadlock. As the military position of the Allies improved, Franco was faced with a demand that Spain assume a real neutrality, and orders were issued for the withdrawal of a Spanish division supporting the Germans in Russia.

Various acts still caused the Allied governments to question Spain's intentions, and an embargo was laid on shipments of petroleum. The ban was lifted in May, 1944, after Franco had agreed to cut by 90 p.c. the wolfram exported to Germany. On the liberation of France and other German reverses, he stated that his regime had nothing in common with National Socialism, but his bid for an invitation to

the peace conferences met with a frigid reception.

The postponement of free elections announced for 1945, the persecutions of political opponents, the expulsion of French nationals, and the publication of documents disclosing Franco's undertakings to the Axis powers, caused the governments of Great Britain, France, and the U.S.A. to issue a joint declaration on March 4, 1946, condemning Franco's regime. In Dec. the United Nations general assembly adopted a resolution calling on all members to withdraw their ambassadors or ministers from Madrid as long as the Franco regime remained in power; by the end of the year, this had been done by most countries, including Great Britain. On July 27, 1947, Franco promulgated a succession law making Spain a monarchy without a king until his own death or disablement, but with himself as head of state. *See Spanish Civil War*; Spain: *consult* Gen. Franco, G. R. Farquhar, 1939; Franco's Black Spain, L. Quintanilla and R. Watts, 1946; Ambassador on Special Mission, Lord Templewood, 1946.

François-Poncet, ANDRÉ (b. 1887). A French politician and diplomat. Born June 12, 1887, at Provins, near Paris, he specialised in German history and served on economic committees and missions. A moderate of the right in politics, he entered the chamber of deputies 1924, serving as an under-secretary of the ministry of arts under Tardieu and Laval. Ambassador in Berlin 1931-38, and in Rome 1938-40, he was for a time minister of information in the Vichy govt. Resigning on principle, he was arrested in 1943, and freed from imprisonment in Germany by French troops May 5, 1945. Sent as envoy extraordinary to Gen. Koenig's h.q. in occupied Germany in Nov., 1948, in Dec. he was made adviser on German affairs to the French foreign minister, and in May, 1949, French high commissioner in Germany.

Francolin OR SPUR-LEGGED PARTRIDGE (*Francolinus*). Group of game birds, of which over forty species are recognized. Most of them are mottled with black, brown, and white; they are found in Africa and S. Asia, living in the high grass in the valleys.

Franconia (LAND OF THE FRANKS). Name given in the 9th and 10th centuries to one of the great duchies into which Germany was divided. It was the one founded and inhabited, as the people be-

lieved, by the Franks. The west-central part of Germany, it was the district through which the Main runs, although a portion of it, including the cities of Mainz, Worms, and Spire, was on the W. side of the Rhine. Its capital was Frankfurt.

The duchy had only a short life, as a few years after 1024, when its duke, Conrad II, became German king, it was broken up among various princes, especially the archbishop of Mainz, and the bishops of Worms, Spire, and Würzburg.

FRANCO-PRUSSIAN WAR, 1870-71

J. Markham Rose, D.S.O.

In addition to this general sketch there are articles on Metz, Sedan, and the other great battles of the war. See also Bazaine; Bismarck; Moltke; Napoleon III; William I; and the articles France; Germany

Prussia, desiring to lead the movement towards German unity, had an ambitious king in William I; a clever and not too scrupulous statesman in Bismarck; a great strategist in von Moltke; and a sound military organizer in von Roon. The short campaign of 1864, in which Austria and Prussia overwhelmed Denmark and robbed her of Slesvig-Holstein, served Prussia as a practical lesson in her scheme of mobilisation, which she now laboured to improve. Two years later she showed Austria how much she had benefited by the experience, and taught the rest of Germany to look to Prussia as their head. The four great leaders of Prussia again used this war of 1866 as a training ground for perfecting their military organization, and prevailed upon the other German states, secretly, to place their troops under Prussia.

France was ruled by Napoleon III, who had gained a small military reputation through the Crimean War and his campaign in Italy in 1859; but the world generally, and Bismarck in particular, had discovered that he was not a great general. He wished to push the French frontier to the Rhine, and hoped by military glory to remove his subjects' growing dissatisfaction with his inefficiency as a ruler. He further thought that Austria would join him to revenge 1866, and that Italy might also help him.

Thus there were the makings of war if anything occurred to start it. On July 3, 1870, Prince Leopold of Hohenzollern-Sigmaringen was selected for the vacant throne of Spain. Napoleon feared a Prussianised state on his Spanish frontier, and demanded that the idea should be abandoned. Bismarck knew that Germany was ready for war,

The name, however, remained in use for the eastern part of the old duchy, that on the E. of the Rhine. It was given in 1500 to one of the circles into which Germany was divided, and for over 300 years before 1802 the bishops of Würzburg called themselves dukes of Franconia. The Bavarian portion of old Franconia is now divided into three parts: Franconia, capital Baireuth; Middle Franconia, capital Ansbach; and Lower Franconia, capital Würzburg.

and that France was not as ready as Napoleon believed; and by suppressing part of a telegram so that it did not truly represent King William's words to the French ambassador, sent French feeling to fever point. Rulers on both sides desired war, and war was declared on July 15. Both Austria and Italy declined to intervene. Napoleon believed his ministers' assurance that his army was "ready to the last gaiter-button," whereas in reality it was badly trained and the mobilisation plans were imperfect; he showed his inability as a strategist in that his initial plan was to cross the Rhine and endeavour to separate the South German states from the Prussians, whom he could not believe they really loved. Could he have been ready first, this separation was a possibility.

The Germans were organized in three armies: the first or northern one, under Steinmetz; the second under Prince Frederick Charles, the "Red Prince"; the third or southern army, under the crown prince. The first actual conflict of forces larger than reconnoitring parties took place at Saarbrücken on Aug. 2, when the French drove back a few battalions and crossed the frontier. This fight was given undue prominence as a French victory, because it was the *baptême de feu* of the little Prince Imperial.

The positions of the opposing forces on Aug. 4 were as follows: The French were strung out along the frontier in Alsace-Lorraine, from Strasbourg in the S. to Saarbrücken in the N.; perhaps 150,000 E. of Metz; but the mobilisation was so incomplete and so confused that not even the high command knew where battalions were, or the precise number of troops in any division. Strasbourg

and Metz were important fortresses, which should have been well supplied for a siege.

The crown prince's army was S. of Landau, assembled for the march which carried it over the frontier. The second army was marching through the Haardt Wald by Kaiserslautern. The first army, held back by von Moltke, was cantoned between Neunkirchen, Tholey, and Lebach, making altogether a total of some 450,000 men.

On Aug. 6 came the first real clash of arms. To the S. the crown prince's army, which had driven in MacMahon's outposts from Wissembourg on Aug. 4, defeated him severely on this day at Wörth, and drove his force headlong from the field. On the same day there was an important battle near Spicheren, where the advanced guards of the first and second armies forced back Frossard. So severe were these blows that nothing remained for Napoleon but to form "the army of the Rhine" round Metz, under Bazaine, while MacMahon gathered together fragments into another army at Châlons; thus abandoning the whole of Alsace-Lorraine, except the fortresses, to the enemy.

Disaster of Sedan

The Germans, not entirely untouched by the two battles, for the French soldiers had fought well, and confronted by the new situation, paused for a moment before they pressed forward in overwhelming strength. By Aug. 14 the German advanced guards interrupted a commencing retreat of Bazaine's troops from the E. of Metz, and brought about the battle of Colombey-Neuilly, which seriously interfered with French plans. Two days later the second army, which had crossed the Meuse S. of Metz, again interfered with the proposed retreat on Verdun, by the battle of Vionville-Mars-la-Tour, and compelled Bazaine, on Aug. 18, to fight the battle of Gravelotte. Unsuccessful in this, he was driven inside the Metz fortifications.

With these reverses the second empire was tottering to its fall. The moral of the French troops was infected by the cry of "We are betrayed," and this feeling had its reflection, or its origin, in Paris. The emperor was with the army, doing little to save the situation; while the empress Eugénie in Paris was doing her best in a falling cause. MacMahon was now directed to effect the relief of Metz, and commenced the desperate march N. and E. which ended at Sedan.

The Germans, well informed of French movements, had left a sufficient investing force to hold Bazaine, and so liberated a for-

midable army to deal with MacMahon. Caught up at Beaumont on Aug. 28, and forced back on Sedan with the Belgian frontier behind him, MacMahon fought a desperate losing action on Aug. 31 and Sept. 1. MacMahon was wounded, and on Sept. 2 de Wimpffen signed the surrender of the last imperial army in the field. Napoleon was present and became a prisoner of war. On Aug. 31 Bazaine made a desperate attempt to break out of Metz, but was driven back under the guns of the place, where he remained until the surrender of his whole army on Oct. 27. Strasbourg, after a ferocious bombardment, had undergone a regular siege. Its commander, General Urich, held out until the inhabitants were in a state of starvation and his defences were pierced. He surrendered to General Werder on Sept. 27.

On Sunday, Sept. 4, the empress fled from the Tuilleries, and thereupon a republic was proclaimed, with General Trochu as president and governor of Paris, with full military powers for national defence; Jules Favre became minister of foreign affairs and Gambetta minister of the interior. Energetic measures were taken for the defence of the capital and for the formation of a national army, but there were enormous difficulties to contend with. The German forces were moving forward practically unresisted to invest Paris, and probably at this time an opportunity was lost which would have saved both nations a vast amount of suffering and expense. On Sept. 19 negotiations for an armistice were almost concluded by Bismarck and Jules Favre, but the chancellor demanded the surrender of Strasbourg, Toul, and Verdun; and these conditions the provisional government would not accept.

The Siege of Paris

The French position was practically hopeless. On Sept. 20 Paris was closed in. In the fortnight possible for preparation, Trochu had swept into the place all available food, guns, and troops; raised volunteer corps from the inhabitants; and had done all that a man might to hold out for a long siege. The fortifications were formidable, but so were the German forces. The defence of a large town is no easy problem, since starvation is such an invaluable ally to the besiegers, yet Paris had a great spirit, and hoped greatly for relief from newly formed armies.

Gambetta escaped from Paris in a balloon, and from Tours roused the country to arms; but

it is no easy task hastily to improvise armies, however many high-spirited men may be available. There were no great generals, no trained officer corps; arms and stores were lacking. An army of the north was formed about Soissons and Amiens under Faidherbe, and a numerically stronger Loire army about Orleans. By the beginning of December the Germans had the northern half of France in their grasp. They had taken the large and important fortified towns of Nancy, Strasbourg, Metz, Reims, Dijon, Laon, Soissons, Orleans, and Rouen, and were operating under the able direction of von Moltke with well-fought armies in every direction. The army of the Loire was driven from Orleans on Dec. 3, and from that time became a negligible factor for the relief of Paris.

An army had been formed in the Vosges under the leadership of Garibaldi, and fighting in the neighbourhood of Dijon afforded a little distraction, but no real effect. The army of the north was severely defeated early in Jan., 1871. In the S.E. General Bourbaki had collected a considerable force to raise the siege of Belfort, but equal failure attended its efforts; and early in Feb. his army was compelled to retreat over the Swiss frontier and give up its arms.

Germany's Peace Terms

It was a terribly severe winter and the sufferings of the ill-found French soldiers were appalling, while the Germans were able to fight in comparative comfort. Paris during January was being regularly bombarded, and in addition was enduring the pangs of hunger. Disease and death were rampant, and the necessity for capitulation had become evident. General Trochu resigned, and Jules Favre was sent to arrange terms of surrender at Versailles, where William, now crowned as German emperor, had taken up his headquarters. Negotiations were opened on Jan. 24; a general armistice was proclaimed and the terms of surrender were definitely settled on the 28th. By the peace treaty, France lost her provinces of Alsace and Lorraine, and paid Germany a war indemnity of £200,000,000.

Chuquet, 1895; Bibliographie Générale de la Guerre de 1870-71, B. E. Palat, 1896; Saarbruck to Paris, 1870, a strategical sketch, S. C. Pratt, 1904; The Franco-German War, 1870-71, F. B. Maurice, 1909 (in Camb. Modern History, vol. 11).

Franc-tireur (Fr. free-shooter). Term for one of an armed band who, though unconnected with the regular forces, harassed the Germans during the Franco-Prussian War of 1870. These bands wore no uniform, and, if detected, posed as civilians. Francs-tireurs were also organized bodies of volunteers, notably the Gardes Mobiles and an Italian contingent who cooperated with French troops round Orléans. During the First Great War the Germans made accusations especially against the Belgians of the employment of francs-tireurs. The Germans treated members of various resistance movements in occupied territory as francs-tireurs during the Second Great War, though Russian guerrillas and members of underground parties in France were officially recognized as part of the armed forces of their countries. On July 15, 1944, Gen. Eisenhower issued a warning to the German high command that the F.F.I. had been provided with a distinctive emblem and were to be regarded as an army. On the formation of the British Local Defence Volunteers in 1940, it was announced over the German wireless that members would be treated as francs-tireurs. Such irregular forces are given protection by the Hague Regulations. The underground movement in Paris published a paper called the *Franc-Tireur* during the German occupation.

Franekeer. Town of Holland. In the province of Friesland, it is 10 m. W. of Leeuwarden, and is served by both rly. and canal. It has a celebrated school, the successor of the university that flourished here from 1585 to 1811. S. Martin's, a 15th century building, is the chief church. There is a 16th century town hall and an observatory. The town has small manufactures and a trade in agricultural produce.

Frangipani. Name of a powerful Roman family. It arose in the 11th century, and was conspicuous in the struggles of Guelph and Ghibelline in the two following centuries. Members of it still exist in Italy. Frangipani, sometimes spelt frangipane, is also the name of a powerful scent, and of a kind of sweetmeat.

Frank, BRUNO (1887-1945). A German dramatist and novelist. Born at Stuttgart, June 13, 1887, he was educated at German universities. Several of his comedies were translated into English and performed in London and New York, chiefly *Sturm im Wasserglas*,

1930, adapted by James Bridie as *Storm in a Teacup*, which made a popular play and film. His other plays included *Nina*, 1931. Frank later lived at Beverly Hills, Calif. He died June 20, 1945.

Frank, HANS (1900-46). German administrator. Frank joined the National Socialist party early and became head of the legal department in 1927. He was Bavarian minister of justice and Reich commissioner for justice, 1933-35, and in the Hitler government continuously from Dec., 1934. As governor-general of Poland, 1939-45, he was responsible for the mass slaughter of hundreds of thousands of Poles and Jews; on Jan. 30, 1942, he issued a decree depriving the Polish people of their nationality. He was captured on May 5, 1945, by U.S. troops near Berchtesgaden, and indicted as a major war criminal at Nuremberg. Sentenced to death by hanging, he was executed Oct. 16, 1946.

Frank, KARL HERMANN (1898-1946). German politician. A bookseller by trade, he was an original member of the Sudeten German party in Czecho-Slovakia and 'one of its directors from 1936. Frank was deputy *Gauleiter* for Sudetenland in 1938 and state secretary for the German protectorate of Bohemia-Moravia in 1939. He was responsible for much bloodshed among the Czechs on Oct. 28, 1939, and for the massacre at Lidice (*q.v.*), June, 1942. He was captured by Allied troops in May, 1945, and tried by Czech authorities a year later. Found guilty of crimes against humanity, Frank was publicly hanged at Prague May 22, 1946.

Frank Almoign. Term of French origin, meaning free alms. It is used for the kind of land tenure by which religious houses and corporations held their lands, and to some extent do so still. The idea behind it is that the land is held on the condition that, instead of military service, religious offices shall be performed. This form of tenure is very old, and was not confined to England. There it was largely stopped by the famous Act of 1290, which forbade any such tenures to be created save by the king. See *Land Laws*; *Quia Emptores*; *Tenure*.

Frankau, GILBERT (b. 1884). British novelist. His father was a tobacco merchant, his mother the popular novelist who wrote as Frank Danby. Gilbert was born April 21, 1884, educated at Eton, and entered his father's firm. A

first novel, *One of Us*, was published in 1912, and he established his reputation as a best-seller with *Peter Jackson, Cigar Merchant*, in 1919 (to which he wrote a sequel, *Concerning Peter Jackson and Others*, 1931). Later novels included Gerald Cranston's *Lady*, 1924; Christopher Strong, 1932; *The Lonely Man*, 1932; *The Dangerous Years*, 1937; *Winter of Discontent*, 1941; *World Without End*, 1943.

His daughter Pamela became a well-known journalist, author, and broadcaster. His younger brother Ronald (b. 1894) was an entertainer of stage and radio, specialising in patter songs and stories whose wit lay in what he did not say. His cross-talk act as Mr. Murgatroyd to Tommy Handley's Mr. Winterbottom made them a popular pair.

Frankenberg. Town of Germany, in Saxony. It stands on the Zschopau, an affluent of the Mulde, 32 m. S.W. of Dresden. It is a manufacturing centre, and among its products are cotton, woollens, and silk stuffs. Pop. 13,646.

Frankenhausen. Town of Germany in Schwarzburg-Rudolstadt (Thuringia). It stands on a branch of the Wipper at the foot of the Schlachtberg, 27 m. N. of Erfurt. It has extensive natural deposits and salt springs celebrated for the cure of rheumatic complaints, which are employed locally for thermal baths and exported for use as the basis of laxative salts. The buildings include a palace and three medieval churches. There was a local market for undressed wool. Near here the rebellious peasants under Münzer were defeated in one of the last battles of the Peasants' War (1525). A cave in which Barbarossa, surrounded by his warriors, is said to sleep, is in the neighbourhood. Pop. 7,010.

Frankeniaceae. Small family of herbs and small shrubs. Natives of temperate and warm regions, they are chiefly seashore plants. They have joined branches, small, opposite leaves, and small, solitary, regular flowers. The familiar sea heath (*Frankenia laevis*) of salt-marshes is a type.

Frankenstein. Novel by Mary Wollstonecraft Shelley, first published anonymously in 1818, with the title *Frankenstein, or the Modern Prometheus*. It is the story of a man who succeeds in making a monster, and giving it life, and of the awful consequences. Frankenstein is the name of the man, not of the monster he creates. Boris Karloff portrayed the monster in a film, 1932.

Frankenthal. Town of Germany, in the Palatinate. It stands on the Isenach, 7 m. S. of Worms. It received a charter of township in 1577. It has a communication by canal with the Rhine, $3\frac{1}{2}$ m. distant. The place is distinguished by the width and regularity of its streets and its imposing public buildings. It had a considerable trade in wine and its light beer was famous. The town was destroyed by the French in 1689 and severely damaged in 1945 during the Allied advance.

Frankenwald. North-western spur of the Fichtelgebirge Mts. in Bavaria, situated between the rivers Saale and Main. The highest peak is the Döbraberg (2,605 ft.). See Fichtelgebirge.

Frankfort. City of Kentucky, U.S.A. It is capital of the state and the co. seat of Franklin co. On the Kentucky river, here spanned by a fine suspension bridge, 55 m. E. of Louisville, it is served by the Chesapeake and Ohio and other rlys. In addition to the capitol, there are an arsenal, reformatory, and a coloured industrial college. Daniel Boone is buried here. In the heart of the "blue grass" country of tobacco, maize, hemp, and horses, Frankfort manufactures lumber products, furniture, barrels, brooms, and shoes. The city dates from 1786, became the state capital in 1792, and was chartered in 1839. Pop. 11,492.

Frankfort-on-Main. City of Germany. From A.D. 1356 it was the coronation town of the German emperors, free city, capital of the German federation from 1815 until its annexation by Prussia in 1866, and Germany's main financial and trading centre until, about the turn of the century, superseded by Berlin. Situated on both banks of the river Main, 24 m. from its junction with the Rhine, Frankfort was on the main trade route from Italy and the Near East to Flanders and Britain; a situation that not only brought great wealth to the city, but also an international spiritual development in advance of most other German towns. Architectural and artistic remnants of many centuries testified to that richness until, during the Second Great War, most of them were destroyed.

Frankfort—Frankfurt, the ford of the Franks, in German—had in 1935 a pop. of 555,857, 315,000 Protestants, 185,000 R.C., 30,000 Jews, about 25,000 others. It was an important inland shipping centre, since by way of the Main-Danube canal a through traffic of barges up to 1,200 tons was pos-

sible, and the junction of six main railway lines. Its industrial importance derived from the fact that the huge chemical and dye trust, I. G. Farbenindustrie, had its seat there; while several large motor car, electrical, and engineering factories, as well as leather, shoe, furniture, etc., plants were established in and around Frankfort. Finance and trading, however, the latter largely by way of two annual fairs, were yet more important; there were no less than 30 important banks, including until 1901, when their Frankfort branch died out, the original firm of Rothschild. Frankfort's historical associations include the birth of Goethe.

The inner town, north of the river, held most of the city's historic buildings, foremost among them the Roemer, an old town hall embracing several buildings of the early 15th century, with the election chamber, where the electors chose the German kings, and the Kaisersaal, the imperial banqueting hall for the coronation feast vividly described by Goethe. This banqueting hall held a gallery of portraits of all the Holy Roman Emperors from Charlemagne to Francis II. The fountain of justice, from which wine ran freely during a coronation, stood on the Roemerberg, the market place in front of the Roemer; it dated from 1543. Near by is the cathedral, heavily damaged in the Second Great War, an impressive Gothic pile built from 1239 onwards on the site of a 9th century church. S. Leonard's, 1219, S. Nicholas's, 1270, restored in the 15th century, and two heavy towers once guarding the walls of the city, with a number of fine patrician houses, were other surviving remnants of Frankfort's medieval glory. Our Lady, a fine old R.C. church of 1318, reconstructed, and S. Catherine's, a Protestant church, erected in the 17th century, the Saalhof with a Romanesque chapel, likewise re-

Frankfort-on-Main. Fifteenth century tower of the cathedral, which escaped serious damage in the Second Great War

newed in that period and said to be Frankfort's oldest edifice, deserve mention; the palace of the Thurn and Taxis princes, seat of the federal parliament 1816 to 1866 and later part of the central post office, and, finally, S. Paul's, completed 1833, and 1848-49 seat of the Frankfort parliament (*g.v.*), were other piles with historical associations. The Old Bridge, one of the seven crossing the Main, dated back to the 14th century and carried a mill and a statue of Charlemagne.

The town outside the former walls, which had been transformed into a pleasant, encircling garden with numerous lakes, good monuments, and wells, had broad streets and avenues, and many

impressive buildings: the splendid opera house (1873-80), the city's theatre, the main railway station, the law courts, a huge hall for festivals and exhibitions, the buildings of the university, established in 1912 on the basis of old seats of learning such as the Senckenberg museum of natural history, an ethnological and several art and aircraft museums, and great hospitals. The outstanding Frankfort gallery was the Stædal museum in the S. suburb of Sachsenhausen, with numerous world-famous pictures and a neighbouring collection of sculptures.

Frankfort's schools were famous for their buildings as well as for their progressive methods, in particular the Goethe gymnasium whose former headmaster, Carl Reinhardt, reformed all the secondary teaching in Prussia before the First Great War. In the suburbs the house of the Teutonic Knights, in Sachsenhausen, and the town hall, formerly a palace, as well as the 9th century church of S. Justinus, in Hoechst, deserve mention. The Frankfurter Zeitung, a leading German democratic paper, enjoyed a world reputation; so did the botanical

Palmergarten, the zoological garden, and the Rothschild library.

Originally a Roman military post, Frankfort, as Franconofurd, is first mentioned in A.D. 793. Here Charlemagne held a diet in 794; Lewis the Pious built the Saalhof, as an imperial palace, in 822, and many of his successors resided there. In 1220 the town received its freedom, later privileged fairs and, by the Golden bull of 1356, was established as coronation seat. In 1533 the Reformation reached Frankfort, which joined the Schmalkalden pact against the Catholic league in 1536. The wealthy city suffered heavily during the Thirty Years' war, the wars of Frederick the Great, and the wars of the French Revolution; it was taken by Napoleon in 1806 and embodied in a grand duchy of Frankfort, but became a free city again in 1815, and the seat of the federal parliament. After having been the scene of Germany's earliest attempt at democracy and union in a new empire, Frankfort was allied with the S. German states and Austria in the 1866 war against Prussia, and annexed by Bismarck after the Prussian victory. The peace between France and Germany was concluded there, May 10, 1871. The spirit of democracy of the Frankfurters never vanished; they always sent left-liberal or socialist deputies to the Reichstag, and neither William II nor Hitler showed any favour to the old city.

Frankfort, owing to its industrial importance, was heavily bombed by the Allied air forces during the Second Great War. Columns of the U.S. 3rd army fought their way into the S.W. suburbs on March 26, 1945, but the city was not cleared until the 29th. Hardly a house was undamaged. The ancient town hall, the adjacent market place, Goethe's birthplace and the museum next door, and the fashionable shopping centre were in ruins. The opera house and the cathedral were heavily damaged, although the cathedral tower had suffered comparatively lightly. The Supreme Headquarters of the Allied Expeditionary Force was transferred to Frankfort in May, 1945, until its disbandment the following July. The city became headquarters of the U.S. zone of occupation in Germany, and in 1947-49 the centre of administration of the joint Anglo-American zone.

Frankfort-on-Oder (Pol. Slubice). Town of the former Brandenburg, Germany, which, al-

though on the left bank of the Oder, came under Polish administration in 1945. It is about 50 m. E.S.E. of Berlin. Its chief old buildings were the 13th cent. church of S. Mary and the town hall. Its numerous more recent buildings suggested a modern city. The university, founded 1506, was transferred in 1811 to Breslau. Frankfort had manufactures of machinery, chemicals, etc., but its prosperity was chiefly due to its trade; it was a port on the Oder, and also a big rly. junction. Frankfort was settled by merchants from Franconia in the 13th century. It was then part of the electorate of Brandenburg, and for a time was a member of the Hanseatic League. Its situation has brought many sieges and sufferings upon it, and made it an important military centre before the First Great War. In the Second it was taken by Russian troops, April 23, 1945, after a protracted battle which burnt out the centre of the town. Pop., pre-war, 75,831.

Frankfort Parliament. Meeting of representatives of the German people at Frankfort-on-Main in 1848. It was a constituent elected representation resulting from the German revolution. The previous federal diet of the autocratic German governments had to give way when the deputies of the diets of the individual states met in Frankfort and enforced a general election by ballot. With one deputy to 50,000 electors, the parliament, assembling on May 18, had 568 members, Germany's intellectual *élite*. It split into groups of Republicans, Liberals, Constitutionalists who wanted a copy of the British system, and Roman Catholics. Although the project elaborated by the committee of the governments tended towards an empire led by Prussia and excluding Austria, the assembly chose Archduke John of Austria as provisional regent.

The Prusso-Danish war, during which Prussia disregarded an order from the Frankfort parliament to withdraw, led to a sanguinary revolt in Frankfort, during which two Right-wing deputies were killed; this showed the assembly unable to prevail against the bigger member states. Discredited thereby, it continued its constitutional work and, after long debate as to whether Austria, with her large non-Germanic population, should be included in the empire, and whether the crown was to be offered to her ruler or to the king of Prussia,

found a compromise in a formula proposed by the chairman, von Gagern. Prussia would hold the crown, but the empire would be linked with Austria by a permanent treaty of alliance. Austria as well as Prussia objected; but on March 27, 1849, the bill creating a hereditary imperial power was accepted and Frederick William IV of Prussia was elected with 290 votes and 248 abstentions.

Austria, thereupon, recalled her deputies; Frederick William refused because he did not want an honour by "the grace of rebels." Only the smaller states accepted the new constitution; Gagern's shadow cabinet resigned; Prussia ordered her deputies back, while in Central and S. Germany revolts broke out to enforce the new constitution on reluctant governments. After the Hanover and Saxon deputies had been called back, a rump parliament, mostly of the Left, transferred itself to Stuttgart where on June 18 it was dissolved by force. The first German attempt at establishing democracy had failed. But its labours were not entirely lost; after solving by force the knotty problem over which the Frankfort parliament had perished, the question of "Greater Germany" or "Little Germany," Bismarck was to build the German empire of 1871.

Frankfurter Zeitung (Frankfort Gazette). Founded in 1856 as the *Frankfurter Handelszeitung* (Trade Gazette) by Leopold Sonnemann, it became the first paper in the German empire in authority and influence, the leading financial organ, and on foreign affairs a mouthpiece of the foreign office in Berlin. It was abolished in the Second Great War.

Frankincense (old Fr. *franc encens*, true incense). Fragrant gum exuded from several trees of the genus *Boswellia*. It is abundant on the Somali coast and in South Arabia. A cut is made in the tree trunk, and the weeping resin coagulates in breast-shaped globules which are scraped off and shipped to Bombay. Here the commodity is graded and re-exported to the various markets.

The ceremonial religious use of frankincense is of great antiquity, having been practised by the Egyptians, Persians, Babylonians, and Assyrians; by the Jews as a constituent of the incense of the sanctuary (Ex. 30, v. 34), and by the Greeks and Romans. Although European medical science today discounts its medicinal value, it was

long employed in the East as an external application for tumours and sores, and, in China, as an internal remedy for leprosy and other diseases. See Incense.

Franking (Fr. *franc*, free). Free use of the postal service. To the extent of sending ten letters a day and receiving fifteen, it was a privilege granted to both the house of lords and the house of commons in 1764. With the introduction of penny postage in 1840 it was abolished, but letters are still franked by the public departments, and, if so franked, can be sent thereto free of charge. See Post Office.

Frankland, Sir Edward (1825-99). British chemist. He was born at Churchtown, Lancashire, Jan. 18,

Sir E. Frankland,
British chemist

1825, and educated at Lancaster grammar school, Royal School of Mines, London, and the universities of Marburg and Giessen. In 1850 he discovered the zinc compounds of methyl and ethyl, and next year was appointed professor of chemistry at Owens College, Manchester.

He was professor of chemistry at S. Bartholomew's hospital, London, 1857-63; and at the Royal Institution, 1863-67. His chief work was done as a member of the royal commission on the Pollution of Rivers, in a laboratory provided by the government. He died in Norway, Aug. 9, 1899.

Franklin (late Lat. *francus*, free). A freeman. The word was used in medieval England as a mark of distinction, though without any exact meaning. It seems to have referred primarily to a class of landholders between the noble and the more or less unfree; the country squires of a later day. Such doubtless was the franklin in The Canterbury Tales.

Franklin, Battle of. Fought in the American Civil War (q.v.), Nov. 30, 1864. General Schofield, with 25,000 Federal troops, was retreating to Nashville, Tennessee, when, as he was crossing the Harpeth river at Franklin, he was attacked by a Confederate army of 40,000 men under Hood. At first thrown into confusion, the Federals rallied, and, after a furious resistance, Schofield succeeded in withdrawing his men across the river. In no battle of the Civil War was greater determination or resistance shown on either side. The losses were very heavy; those

of the Federals being 2,326 killed, wounded, and missing, those of the Confederates more than 6,000.

Franklin, Benjamin (1706-90). American statesman and scientist. The son of an English immigrant, a tallow chandler, Benjamin Franklin was born at Boston, Mass., Jan. 17, 1706, and was apprenticed in 1719 to his eldest brother, a printer. He moved to Philadelphia in 1723, and while working there as a compositor attracted the attention of the governor of Pennsylvania, Sir William Keith (1680-1749), who encouraged him to go to England to buy printing materials wherewith to set up in business. Franklin accordingly made his way to London in 1725, but Keith's promises proved illusory and he had to take employment as a compositor. After a troubled eighteen months in London, he returned to Philadelphia, again as a printer's assistant.

Benjamin Franklin

After J. H. Duplessis

In 1729 he purchased a weekly journal, The Pennsylvania Gazette. Three years later he issued his Poor Richard's Almanack, which continued to appear for 25 years, and was widely popular for its wealth of prudent maxims on industry and thrift. He became postmaster of the city in 1737, clerk to the General Assembly from 1736-51, and a member from 1751-64, attracting notice by his scheme for intercolonial union at the Albany Convention, 1754.

Meanwhile Franklin had added scientific research to his many activities. About 1746 he began to investigate problems connected with electricity, his work leading

to the invention of the lightning conductor in 1749. Earthquakes, meteorology, stoves and chimneys, ocean currents and navigation were all among the many subjects of his inquiries during these years; his experiments with the pouring of oil on stormy water and with agricultural fertilisers showed the versatility of his mind.

In 1757 he once again crossed to England; this time as the agent of Pennsylvania in the colonial dispute with the Pennsylvanian proprietors. Franklin was widely welcomed, became known to many distinguished figures in political and literary life, and received degrees from the universities of Oxford, Edinburgh, and St. Andrews. In 1762 he went back to America, but 1764 found him again in London in his former capacity. In 1766 he gave evidence before the house of commons which was largely instrumental in the repeal of the notorious Stamp Act. The unfortunate publication of certain letters entrusted to him for private circulation led to difficulties in London, and he returned to Philadelphia in the spring of 1775.

His old affection for the English connexion, weakened perhaps by this rebuff, turned into an active sympathy with the separationist policy. He was one of the five members commissioned to draft the Declaration of Independence in 1776, and in that year he went to Paris as commissioner for the colonies. He negotiated the alliance between America and France, and was then appointed plenipotentiary in Paris, where he remained throughout the war, negotiating the treaty of peace finally signed in 1783. He returned to America in 1785 and took some part in framing the new constitution of the United States, retiring from public life in 1788. He died at Philadelphia, April 17, 1790.

Bibliography. Complete Works, inc. correspondence and autobiography, ed. J. Bigelow, 10 vols., 1887-88; Lives, J. T. Morse, 1890; J. Parton, 1892; S. G. Fisher, 3rd ed. 1927; P. Russell, 1927; B. Fay, 1930; C. van Doren, 1939; E. S. Scudder, 1939; Autobiography continued from 1759, N. G. Hoodman, 1937; B. F. as an Economist, W. A. Wetzel, 1895; B. F., Printer, J. C. Oswald, 1917; B. F. in Scotland and Ireland, E. J. Nolan, 1938.

Franklin, Sir John (1786-1847). British explorer. Born at Spilsby, Lincolnshire, April 16, 1786, and educated at Louth grammar school, he entered the navy as a midshipman in 1801, being present at the battle of Copenhagen. He

took part between 1818-27 in three Arctic expeditions, during which he surveyed many thousand

John Franklin

miles of Arctic - American coast-line and the Saskatchewan, Coppermine, and Mackenzie river basins. He was promoted captain, knighted 1829, and awarded scientific distinctions at home and abroad. During 1836-43 he was governor of Van Diemen's Land (Tasmania).

A new British expedition, consisting of the ships *Erebus* and *Terror*, with Franklin in command, intended to explore the N.W. Passage, sailed from the Thames on May 19, 1845. The vessels were last sighted in Baffin Bay. Franklin had proposed to return in 1847, and, no tidings being received from him, no fewer than 39 expeditions, four at Lady Franklin's expense, were sent forth from Great Britain and America in ten years. Some traces of them were found by Captains Ommanney and Penny, and Dr. Rae. In 1857 Lady Franklin equipped the yacht *Fox* and dispatched it to N.E. America under Captain, afterwards Sir, Leopold McClintock; and in June, 1859, a cairn was found at Point Victory in which was a record of Franklin's expedition down to April 25, 1848, with definite proof that he had discovered the N.W. Passage, and that he had died on June 11, 1847. Parliament voted £2,000 for the statue in Waterloo Place, London, and Lady Franklin erected the monument in Westminster Abbey. See Arctic Exploration.

Bibliography. Franklin's Narrative of a Journey to the Shores of the Polar Sea, 1823; his Narrative of a 2nd Expedition, 1828; The Career, Last Voyage, and Fate of Sir John Franklin, S. Osborn, 1860; The Voyage of the *Fox* in Arctic Seas in Search of Franklin and his Companions, Sir F. L. McClintock, pop. ed. 1908; Life, H. D. Traill, 1896.

Franklinite. Ore mineral of zinc containing up to 23 p.c. of that metal. It is abundant in the zinc mines of Franklin, New Jersey, where it occurs with other zinc and manganese minerals in crystalline limestone. Chemically an oxide of zinc, manganese, and iron, it is a member of the magnetic series in the spinel group. In appearance franklinite resembles magnetite, occurring in black,

opaque, isometric crystals and granular masses, but is only feebly magnetic.

Frankpledge. System by which a group of men were held responsible by the state for each other's misdeeds. The Anglo-Saxons called these associations *frithborhs*, and membership was imposed by law upon all freemen. William the Conqueror ordered every freeman to be in a frankpledge, which appears to have consisted of ten or twelve men, and later kings made like regulations. Sheriffs held periodical "views" of frankpledge, i.e. courts to see that the law was being obeyed. After a time the unfree were admitted to membership, and the free dropped gradually out. The system did not survive the advent of the Tudors, although courts for the view of frankpledge remained for some time longer. See Jury.

Franks (late Lat. *francus*, free). Group of tribes dwelling in Europe in the 3rd century, who founded the kingdom of France, to which they gave their name. They are first mentioned in writing in reference to a victory obtained by Aurelian over some of them near Mogontiacum (Mainz) in 241.

The Frankish tribes were of Teutonic origin and were first found in what is now N.W. Germany and the Netherlands. They bore various names until by one of the accidents of history that of Franks began to prevail over the others and gradually supplanted them.

In the 4th century or a little later the Franks were divided into two main branches: the Salian Franks around the mouth of the Rhine and the Riparian Franks higher up the river. They were first enemies and then tributaries of the Romans, and the decay of the Roman empire was their hour. The man to use it was Clovis, descendant of one Chlodio, who had led the Salian Franks into what is now France and had made Tournai his capital. Thirty years before he became king in 481 his tribe had sent warriors to that vast host that defeated the Huns in 451.

Clovis united many of the Salian Franks under his rule, and conquered much of Gaul. He made the Riparians, who had spread up the Rhine as far as Alsace, own his authority, and when their own king was murdered they took the Salian in his stead. Clovis was baptized as a Christian, and nominally at least the Franks were no longer pagans. His sons continued his career of conquest, and soon Frankland was a great district

lying on both sides of the Rhine, the name being perpetuated in the German district of Franconia. Like Anglo-Saxon England, it was divided into more or less independent kingdoms, such as Austrasia and Neustria, but, in spite of civil wars, there was a certain brotherhood between them.

This union of Frankish tribes under Clovis and his descendants formed that Frankish realm which has so greatly influenced European history. It existed in one form or another from about 500 to about 900 reached its height in the great but transient empire of Charlemagne, and from its ruins both France and Germany arose. It included parts of both, but soon a cleavage showed itself between E. and W. Franks, and early in the 9th century the one folk could not understand the speech of the other.

A definite division was made in 817 and soon afterwards the E. Franks became Germans and the W. Franks became French. The boundary between them was not easily drawn; indeed, it may be said to have been a prime cause of a thousand years of intermittent European warfare. There was usually a "middle kingdom"—Lotharingia, Lorraine, or Burgundy. France added Celtic elements from the S. and W. to her Franks: Germany added Slavonic ones from the E. to hers, and the two developed into distinct nations.

Gregory of Tours, the chief authority for the early history of the Franks, and other writers, describe the customs and habits of these people in peace and war, which do not seem to have differed much from those of other Teutonic tribes.

Franks, SIR AUGUSTUS WOLASTON (1826-97). British antiquary. Born at Geneva, March 20, 1826, he was educated at Eton and Trinity College, Cambridge. After being assistant in the department of antiquities in the British Museum, he became keeper of medieval antiquities and ethnography, 1866. He was fellow director, and during 1891-97, president of the Society of Antiquaries, was made F.R.S., 1874, and K.C.B., 1894. He enlarged the Henry Christy ethnographical collection and gave his own collection of Oriental and medieval art to the British Museum. He died in London, May 21, 1897.

Franks, SIR OLIVER SHEWELL (b. 1905). For biography of this British diplomatist, see N.V.

Franzen, FRANS MIKAEL (1772-1847). Swedish poet. Born at Uleåborg (Oulu), Finland, Feb. 9,

1772, and educated at Åbo (Turku) university, where he was later a professor of history, he left Finland in 1811, after the country had passed into the hands of Russia. He was for many years rector of a parish in Stockholm, and in 1834 was made bishop of Hernösand. He was one of the most widely appreciated of Swedish hymn-writers, and his ode to Count C. P. Creutz, the Finnish poet, was crowned by the Swedish Academy. He died Aug. 14, 1847.

Franzensfeste. An old fortress one of a line of fortifications constructed to defend the Austrian frontier in Tirol. It commanded the railway line which passes between Innsbruck and the Brenner Pass and through the valley of the Puster to Klagenfurt.

Franz Josef. Glacier in the Southern Alps of New Zealand. It flows to within 600 ft. of sea level and discharges into the Waiho river over 15 m. from the sea. It is $3\frac{1}{2}$ m. long.

Franz Josef Land OR FRIDTJOF NANSEN LAND. Archipelago in the Arctic Ocean, lying N. of Novaya Zemlya and N.E. of Spitzbergen in lat. 80° to 82° N. and long. 42° to 64° E. The archipelago consists of about 100 small islands, chief of which are Graham Bell Land, Wilczek Land, McClintock Island, Alexandra Land, and Crown Prince Rudolf Land. They are mountainous, of volcanic origin, and largely glacier-covered; but on the shores and other favoured spots, mosses, poppies, saxifrages, and other Arctic plants grow. The loftiest point rises to 2,800 ft. Bears, walruses, seals, foxes, and birds inhabit the islands, but no human beings.

Discovered by the Austrian explorers, Payer and Weyprecht, in 1872-73, the islands were further explored by Leigh Smith in 1881-82, the Jackson-Harmsworth expedition in 1895-96, and by the duke of Abruzzi's expedition in 1899-1900. The sea on the N. is called Queen Victoria Sea; the wide opening S. of it is known as the British Channel, and its westernmost point is Cape Mary Harmsworth.

Franzos, KARL EMIL (1848-1904). German novelist. He was born, the son of a Jewish doctor, in Podolia, Oct. 25, 1848. Having educated himself, he entered the legal profession, but left it for journalism. After living for some years in Vienna, he settled in Berlin, where he founded, in 1886, the fortnightly review, *Deutsche Dichtung*. His many works of

fiction deal largely with Jewish life, and abound with pathetic incidents. Notable are *The Jews of Barnow*, 1877, Eng. trans. 1882; *For the Right*, 1882, Eng. trans. 1887; and *Der Präsident*, 1884, Eng. trans., *The Chief Justice*, 1890. In his *Aus Halb-Asien*, 1876, are sketches of life in S. Russia and Rumania. He died Jan. 28, 1904.

Frascati. City, episcopal see, and summer resort of Italy. In the prov. of Rome, it stands on the

Frascati, Italy. Colonnade and cascade in the gardens of the Villa Aldobrandini

slopes of a wooded hill, at an elevation of about 1,050 ft., 15 m. by rly. S.E. of Rome. The cathedral, founded in 1700, contains a tablet to the Young Pretender, interred here in 1788. The building was badly damaged by bombing from the air during the Second Great War, as were the villas Aldobrandini, Ruffinella, Torlonia, Lancelotti, and the oldest of them all, Falconieri (earlier than 1550). Near by are the remains of numerous ancient villas, an amphitheatre, a theatre, and a reservoir belonging to the town of Tusculum, which was destroyed in 1191. Between the ruins of the ancient city and Frascati, the villa of Cicero once stood, and on its site some monks in the 11th century built a convent. Frascati is famous for its wine. Pop. 11,000.

Fraser. River of Canada, in the prov. of British Columbia. Rising in the Yellowhead Pass in two branches, it flows N.W. for the first 277 m. of its 785 m. course; it then takes a hairpin bend round the head of the Cariboo Mts., receiving the waters of the Nechaco at Fort George, and flows almost due S. 413 m. to Hope, after which it flows W to its outlet in the Strait of Georgia at New Westminster. Important

tributaries are the Thompson, Stuart, Nechaco, Chilcotin, Bridge, and Blackwater; among the lakes drained are the Stuart, Fraser, François, and Quesnel. It is notable for its salmon fisheries and hatcheries, but is navigable only 80 m. from its mouth. The area of the basin is 88,698 sq. m.

Fraser. Name of a famous Scottish family. It is supposed to be a corruption of Frisell and to be of Norman origin. Early Frasers settled in the S. of Scotland in the 12th century, but soon they moved N. and established themselves in the shires of Inverness and Aberdeen. They became one of the most powerful of the Scottish clans. Among the places owned by the Frasers was Lovat, and one of them, Hugh Fraser, was made Lord Lovat about 1430. He was a grandson of Sir Simon Fraser, sheriff of Tweed-

dale, and from him are descended the later lords Lovat and a number of other branches of Frasers. Another branch of Frasers is now represented by Lord Saltoun, whose family name is commemorated in Fraserburgh.

Fraser of NORTH CAPE, BRUCE AUSTIN FRASER, BARON (b. 1888).

British sailor. He was educated at Bradfield. A specialist in air-sea strategy, Fraser was given command of the aircraft carrier *Glorious* (q.v.) in 1936. He later became chief of staff, Mediterranean Fleet, and at the outbreak of the Second Great War was 3rd sea lord and controller at the Admiralty. In 1942 he was second in command of the Home Fleet, and on March 23, 1943, succeeded Admiral Tovey as c.-in-c. Fraser was in personal command of the units which on Dec. 26, 1943, sank the German battleship *Scharnhorst* (q.v.) off the North Cape (whence his title). He was also responsible for the tactics which twice put the Tirpitz (q.v.) out of action. He

Lord Fraser.
British sailor

organized many convoys to Russia and accompanied one in his flagship *Duke of York*. Promoted admiral in 1944, he commanded the new British Pacific Fleet. In 1946 he was made a peer and chief naval A.D.C. to the king. C.-in-C. Portsmouth, 1947, he became in 1948 1st sea lord and admiral of the fleet.

Fraser, CLAUD LOVAT (1890-1921). British artist. Born May 15, 1890, he studied painting under Sickert (*q.v.*) and before the First Great War achieved success as an illustrator and designer for the theatre. His bold, simple décor and vivid sense of colour greatly contributed to the success of

Claud Lovat Fraser,
British artist

of *The Beggar's Opera* in 1920. Although strongly influenced by the rococo style, his work showed an 18th century robustness that was wholly English. An authority on the history of costume, he died June 18, 1921. *Consult* Study by J. Drinkwater and A. Rutherford, 1921; *The Book of C.L.F., H. Macfall, 1923.*

Fraser, SIR IAN. This British administrator is noticed under his full name, Sir W. J. I. Fraser.

Fraser, JAMES (1818-85). British prelate. Born at Prestbury, Glos, Aug. 18, 1818, son of a merchant, he was educated at Shrewsbury School and Lincoln College, Oxford. Having been a tutor at Oriel, he was ordained in 1846. He held livings in Wiltshire and Berkshire, and was chancellor of Salisbury. In 1870 he was chosen bishop of Manchester, and worked in that diocese until his death there, Oct. 22, 1885. He was the real founder of the diocesan organization, was chosen as arbitrator in several industrial disputes, and was unwillingly the defendant in a case arising out of ritualistic practice. Specially interested in education, Fraser had studied this subject thoroughly as an assistant commissioner in Salisbury diocese.

Fraser, MARJORY KENNEDY (1857-1930). Scottish writer. Daughter of the singer David Kennedy, she was born at Perth, Oct. 1, 1857, and was taught singing by her father, and by Mathilde Marchesi in Milan and Paris. In 1905 she visited the Outer Hebrides, and devoted the rest of her life to collecting and editing Hebridean folk-songs; the first

vol. appeared in 1909, the second in 1917, the third in 1921. She wrote the libretto for Bantock's *The Seal Woman*, 1924, the music of which was founded on Hebridean melodies. Her autobiography, *A Life of Song*, appeared in 1929. She died Nov. 22, 1930.

Fraser, PETER (b. 1884). New Zealand statesman. He was born at Fearn, Ross-shire, Scotland, and worked as a docker, joining the Independent Labour party in London in 1908. Fraser went to New Zealand in 1910 and identified himself with the Labour movement in that country. He entered the house of representatives in 1918 as member for Wellington Central and held the portfolios of education, health, marine, and police between 1935 and 1940. Fraser became prime minister on the death of M. J. Savage, 1940; he visited Washington 1942 and 1945, and London for war cabinet meetings 1941, for the first U.N. general assembly 1946, and for the Commonwealth premiers' conferences 1948 and 1949. He lost office after his party's electoral defeat 1949.

Peter Fraser,
New Zealand
statesman

Fraser, SIR (WILLIAM JOCELYN) IAN (b. 1897). British administrator. Educated at Marlborough and Sandhurst, he enlisted in 1915 in the First Great War, in which he was blinded. As chairman of St. Dunstan's from 1921, he became famous for his great work on behalf of the blind and for overcoming this disability in pursuing his personal career. He was Conservative M.P. for North St. Pancras, 1924-29 and 1931-36, and for Lonsdale from 1940; a governor of the B.B.C., 1937-39 and 1941-46; and a barrister of the Inner Temple from 1932. Knighted 1934, he published an autobiography, *Whereas I was Blind*, 1942.

Sir Ian Fraser,
British administrator

Fraserburgh. Police burgh, seaport, and fishing town of Aberdeenshire, Scotland. It stands on the W. shore of Fraserburgh Bay, and on the S. side of Kinnaird's Head, 47 m. N. of Aberdeen, on the railway. It is the chief centre

of the Scottish herring fishery, and exports agricultural produce and imports coal. It has a large and good harbour, with piers and a breakwater. There are remains of the castle of the Frasers, while the town cross is worthy of notice. The town was named from Sir Alexander Fraser, who in 1613 made it into a burgh. He also obtained permission to found a university here, and the buildings were begun, a tower erected for this purpose still standing. The council owns the gas and water works, an isolation hospital, public abattoir and a free library. Market day, Tues. Pop. 10,203.

Fraser-Simson, HAROLD (1878-1944). British composer. Educated at Charterhouse, he abandoned a commercial career for music. He had a gift of easy, flowing melody, and his chief works were musical comedies; the first, *Bonita*, 1911, was succeeded by the most successful, *The Maid of the Mountains*, 1917. Later came *A Southern Maid*, 1920; *The Street Singer*, 1924; *Betty in Mayfair*, 1925. His most ambitious work was *Toad of Toad Hall*, 1929, an operetta based on Kenneth Grahame's *The Wind in the Willows*. His most popular songs were those with words from A. A. Milne's *When We Were Very Young*. He died as the result of an accident, Jan. 19, 1944.

Fraternity. Society of students in the U.S.A. Fraternities in colleges have the object of promoting social intercourse, good scholarship, and athletic ability. Greek letters are used to name them, and each has a distinguishing badge, bearing the symbols and monogram. The first society, Phi Beta Kappa, was instituted in 1776, and there are more than 40 men's fraternities, the women's sororities numbering 20.

Fraticelli (dim. of Ital. *frate*, brother). Group of religious orders in medieval Italy. Originating in the Franciscan order in the 13th century, when the more zealous members of that order discountenanced the possession of money or property, it took a powerful hold on the popular imagination and gained many recruits. Carried away by their zeal, they regarded themselves as the true representatives of the Catholic church and elected popes, thereby bringing upon themselves the heavy hand of the Inquisition. Persecutions increased until 1449, when the constant imprisonments and executions deprived them of their leaders, and the Fraticelli died out.

Fratricide (Lat. *frater*, brother; *caedere*, to kill). Killing a brother or sister. In English law it is on the same footing as any other homicide, but in some ancient systems was a special species of crime, punishable more severely than killing a stranger. See Murder.

Fraud (Lat. *fraus*, deceit). An English legal term, for which no comprehensive definition exists. The essence of the matter is deceit—some statement or suppression of fact in word or deed with intent to deceive. When a man sues on the ground of fraud, or claims property fraudulently withheld from him, his right of action begins to accrue from the time he discovers the fraud, and not from the time it was perpetrated upon him. Some frauds are criminal, but not all. But a conspiracy to defraud is always criminal. If a person has been induced to enter into a contract, or to transfer property by fraud, he can always, on discovering it, have the contract or transfer set aside; but he must be careful to take steps immediately. And he cannot recover his property as against some innocent purchaser who has bought it without notice of the fraud.

Frauds, STATUTE OF. English law passed in 1676. Its design was to substitute written for verbal evidence in large classes of transactions, and so diminish liability to fraud and perjury. Conveyances, wills, and leases of land, except tenancies of less than three years, were required to be in writing and signed by the party or his agent. It was also enacted that no action should be brought upon certain agreements unless the plaintiff could prove the agreement by writing duly signed by the defendant or his agent.

These agreements were: (1) A promise by an executor or administrator to pay the deceased's debt or damages out of his own pocket; (2) a guarantee; (3) an agreement in consideration of marriage; (4) a contract, sale of lands, or tenements or hereditaments, or any interest in or concerning them; (5) an agreement not to be performed within a year from the making thereof. As to (3) it was soon held not to include a promise to marry; the consideration for which is not marriage, but a promise to marry by the other party. (4) has been substantially re-enacted by the Law of Property Act, 1925. A law revision committee in 1937 recommended its repeal. The section dealing with contracts for the sale of goods of the value of £10

and upwards has been repealed and almost re-enacted by the Sale of Goods Act, 1893; and other sections, which made writing necessary for a will of lands, have also been repealed, and the subject of wills generally dealt with by the Wills Act, 1837.

The statute and its policy have led to much litigation and difference of opinion. No doubt it was advisable to make written instruments and evidence compulsory, at any rate for wills, guarantees, leases and conveyances of land. It is questionable whether it was politic, having regard to mercantile usages, to include sales of goods within the purview of such a statute.

Frauenburg. City and port on the Baltic. It stands where the Bande falls into the Frisches Haff, 42 m. by rly. S.W. of Kaliningrad (Königsberg). Heavily bombed by the Red Air Force in March, 1945, Frauenburg was overrun by Soviet troops in that month. It lies in the part of the former prov. of E. Prussia incorporated in Poland as the voivodship of Masuria after the Second Great War. Its interest lay in the Gothic cathedral and its associations. This, the cathedral of the bishops of Ermeland, was built in the 14th century, and had a fine W. front. Copernicus was a canon here when he died in 1543.

Frauenfeld. Town of Switzerland, capital of the canton of Thurgau. It stands on an eminence overlooking the river Murg, near its confluence with the Thur, 26 m. by rly. N.E. of Zürich. Its old castle has a 10th century keep, and its parish church dates from the 13th century. A prosperous town, it has iron industries, and manufactures of machinery, leather, and cotton fabrics, besides a thriving trade in farm products. During 1712–98 the diet of the Thirteen Cantons, the virtual government of the old Swiss Confederation, met at Frauenfeld. The inhabitants are German-speaking. Pop. 8,795.

Frauenlob. Nickname by which Heinrich von Meissen (c. 1250–1318), German poet, came to be known. He is sometimes described as a Minnesinger, and also as the founder of the Meistersingers at Mainz. He died at Mainz, and was carried to the grave by women of that city. He is supposed to have been called Frauenlob (praise of women) from his using the word *Frau* for woman rather than *Weib*.

Fraunhofer, JOSEPH VON (1787–1826). German optician and physicist. Born at Straubing in Bavaria,

the son of a glazier, he was apprenticed to a glass polisher, and eventually set up for himself as a maker and polisher of achromatic lenses. While working at this craft, at which he attained great skill, he taught himself mathematics and optics. In 1806 Fraunhofer was appointed optician in the mathematical institute at Munich, and in 1818 became the manager of another such institute, which he had helped to found. He died there, June 7, 1826.

Fraunhofer was responsible for great advances in the manufacture of lenses for telescopes and microscopes, while at the same time by his invention of the diffraction grating he opened up a new and fertile field of development for theoretical optics. But the discovery that has immortalised his name was that of the Fraunhofer lines. These lines had previously been noted by the English physicist Wollaston; Fraunhofer not only discovered them independently, but studied them deeply, publishing a map of 576 and assigning to the seven most prominent lines the letters A to G, by which they are still known. He also mapped the lines which he found in the spectra of several of the fixed stars, and from the fact that in no two cases were the lines exactly the same, he concluded that they must correspond to some definite property of the sun or star, and that they were not due merely to the effect of the earth's atmosphere. Fraunhofer thus became the founder of the science of spectroscopy (*q.v.*).

Fraunhofer Lines. Lines discovered by Fraunhofer. When a beam of sunlight that has been admitted through a thin slit is passed through a prism, so as to be drawn out into a spectrum, and this spectrum is examined through a telescope, it is found to be crossed by a multitude of dark lines. Careful investigation has revealed the existence of some 20,000 lines in place of the 576 originally counted. The position of each line corresponds to a definite angle of refraction of the light, and thus to a definite wavelength, and the presence of any given dark line implies that light of that wavelength has failed to reach us. The reason for this failure is the absorption of a particular wavelength by some element in the sun's atmosphere or in that of the earth.

It was established by Kirchhoff that the characteristic wavelengths of light which an element gives out when heated to incan-

descence are just those which it absorbs when cooler. For example, the flame of burning sodium examined through a spectroscope shows a bright double line, which corresponds in position to the dark double line in the solar spectrum known as the "D" line. The presence of the "D" line in the solar spectrum thus indicates the existence of sodium vapour in the sun's atmosphere. See Spectroscopy.

Fraustadt (Polish, Wszowa). Town of Silesia. It is 14 m. N.E. of Glogau, and lies in the part of Germany placed under Polish jurisdiction at the Potsdam Conference, Aug., 1945. It was an important commercial centre where sugar refining, tanning, dyeing, and milling were carried on, and the nucleus of a mining district. In the vicinity King Augustus of Poland was defeated by Charles XII of Sweden (Feb. 13, 1706).

Fray Bentos. River port of Uruguay and capital of the dept. of Rio Negro. It stands on the Uruguay river, on the frontier with Argentina, 250 m. N.W. of Montevideo. It is a pleasant modern town, laid out in 1859, with wide thoroughfares and fine public buildings and abattoirs. In the centre of a stock-raising district it has a large export trade in extract of meat and animal products, and contains the chief factory of the Liebig Extract of Meat Co. Pop. 18,000.

Frazer OR GREAT SANDY. Island off the E. coast of Queensland, Australia. It lies between Hervey and Wide bays, is barren, but has excellent fishing.

Frazer, Sir James George (1854-1941). A Scottish anthropologist. Born at Glasgow, Jan. 1.

Sir James Frazer,
Scottish anthropologist

1854, he was educated at the university there, and at Trinity College, Cambridge. He became a barrister, but with the publication of his work on Totemism, 1887, abandoned a legal career. Three years later the first volume of *The Golden Bough* appeared; the third edition in 11 vols. was published in 1911, and an abridged vol. in 1922. This great work formed the most monumental study in comparative religion, mythology, and folklore yet published. In 1898 Frazer published his translation of Pausanias; he

edited Addison's Essays, 1915. His collected works numbered some 280, the best known including *Studies in the History of Oriental Religion*, 1906, and *Folklore in the Old Testament*, 1918. Professor of social anthropology at Liverpool university, 1907-19, he was knighted in 1914 and in 1925 received the O.M. Probably no other writer so influenced the attitude of his generation towards the supernatural and religious ritual. Frazer died May 7, 1941, leaving his notebooks to the British Museum. His wife (d. 1941), a Frenchwoman, *née* Lilly Grove, translated several vols. of *The Golden Bough* into French.

Freckles. Rounded or irregular spots of yellowish or brownish pigment in the deeper layers of the epidermis, most common in fair and red-haired persons. Freckles are permanent in some people, but in many they appear in the summer months, following exposure to sun, and disappear in the winter. Those desirous of avoiding the condition should wear veils in strong sunshine, and the skin should be protected by a foundation cream and a thick layer of powder. Freckles can be removed or lessened by application of a dilute solution of perchloride of mercury, or by hydrogen peroxide, but this should be done only under medical supervision.

Fredegond OR FREDEGUNDE (d. 597). Frankish queen. Of humble birth, she attracted the attention of Chilperic I of Neustria, who murdered his wife, probably at her instigation, in order to marry her. A forceful character, she dominated her husband, had his sons murdered in order to make a future for her own boy, and carried on a relentless feud with Brunhild, queen of Austrasia. In 584 Chilperic died, murdered probably by his faithless wife, who became the ruler of Neustria in the name of her younger son, Clothaire II. By wars she had added something to its area when she died in 597.

Fredericia. Seaport of Denmark, in the S.E. of Jutland. It stands on the Little Belt, at its N.W. entrance, 14 m. N.E. of Kolding, and is connected with that town and Esbjerg by rly., and with Middelfart in Fyen (Fünen) by steam

ferry. It manufactures cotton goods, hats, tobacco, and chicory, and exports eggs, meat, and fish. Founded in 1652 by Frederick III, Fredericia was destroyed by the Swedes in 1657; refortified in 1709, it was besieged in 1848-49 and 1864, when it was again partly destroyed. A statue commemorates the Danish victory over the Slesvig-Holstein army in 1849. Pop. 19,389.

Frederick. Christian name of Teutonic origin. It means rich in peace, and Friedrich (dim. Fritz), the German form, has been long a favourite name in Germany, borne by many rulers. From Germany it passed into England in the time of the Georges, although similar names, formed from the Anglo-Saxon *frith*, peace, had been in use in early times, e.g. Frideswide. The Italian form is Federigo.

Frederick I (c. 1124-90). German king and Roman emperor, known from the redness of his beard as Barbarossa. Son of the duke of Swabia, nephew of the German king Conrad III, and a member of the family of Hohenstaufen, Frederick became duke of Swabia in 1147, and was chosen king on his uncle's death in 1152. Three years later he was crowned emperor by the pope at Rome. His empire included Germany and parts of Italy; the kings of Poland, Bohemia, and Hungary at one time or another recognized him as their superior; and by his marriage he added Franche Comté to the lands inherited from his father and uncle. In Germany Frederick showed himself a strong and able ruler. He

would tolerate no rival to his own power, and easily crushed the rebellions engineered by turbulent princes. The duke of Bavaria was humiliated, and so, in 1181, was the powerful duke of Saxony, Henry the Lion, his duchy being broken up and he himself sent into exile. A little later the pope instigated some of the German prelates to rebel, but again the emperor was too strong for them.

The eventful years of Frederick's life, however, were spent in Italy, where he came into conflict with the rich cities of Lombardy. In 1158 began his long quarrel with Pope Alexander III. In 1160 the emperor was excommunicated,

Frederick I,
German king, from
a relief at Reichen-
hall, Bavaria

but he set up one anti-pope after another, and once entered Rome with an army and secured the coronation of his nominee. This success, however, was transitory, and soon his army was destroyed and he himself became a fugitive. To cow the cities he placed his own officials therein, and in 1162 stormed and humiliated Milan, but a few years later came the central disaster of his reign. The cities formed against him the Lombard League, an association blessed by the pope, and on May 29, 1176, the rival armies met at Legnano.

Frederick was totally defeated and fled from the field, after which no alternative was left to him but to sue for peace. A truce with the league became permanent a few years later, and in 1177 he signed the treaty of Venice with Alexander III. He had various disputes with Alexander's successors, but his power in Italy was never the same again. In 1189 he set out on a crusade, and on June 10, 1190, was accidentally drowned in a river in Cilicia.

Frederick was a commanding personality with marked ability and generous instincts, fearless, just, and devout, and his memory was long cherished by the Germans. But his reign was unfortunate for the Empire, and his costly campaigns in Italy did much to reduce it to impotence. *See* Empire; Papacy.

A. W. HOLLAND

Frederick II (1194–1250). German king and Roman emperor. Son of the emperor Henry VI and grandson of Frederick I, Frederick was born in Italy, Dec. 26, 1194, heir to the splendid Hohenstaufen inheritance and to that of his mother, Constance, the heiress of Sicily. Educated with more than usual care, his varied abilities earned for him the designation of *stupor mundi*, the wonder of the world. In 1196 he was chosen German king, and when his father died two years later he became king of Sicily and a ward of Pope Innocent III.

In 1212, following an invitation from some of the princes, Frederick left Italy to supplant Otto IV in Germany, and was there crowned king by his partisans. After six years the old struggle between Welf and Hohenstaufen ended in his favour with Otto's death in 1218. In 1220 he was crowned emperor at Rome, and after spending some years in governing Sicily and fighting in Italy he tardily fulfilled his promise to go on crusade. In 1228 he reached the Holy Land, and, having already taken the title of king of Jerusalem, was crowned there as

soon as he had obtained possession of the city and its neighbourhood. Returning to Europe, Frederick

Frederick II. The emperor's seal as king of Jerusalem

was faced again with the hostility of the pope. Beginning soon after 1214, this was due chiefly to the emperor's evident intention of uniting Sicily and Germany, a course strongly resented by the papal court. Frederick was strong enough to force the peace of San Germano on Gregory IX in 1230, after which he brought Sicily completely under his personal rule. In Germany he pursued a contrary policy, for there, by the privilege of Worms, 1231, he gave the princes a charter of independence.

The concluding years of Frederick's reign were sad and unfortunate, not unlike those of Henry II of England. In 1231, and again somewhat later, his eldest son Henry had revolted; these risings were easily suppressed, and his second son, Conrad, was named as his successor. About 1239, however, began his last and greatest quarrel with the papacy. Excommunication he faced with a smile of contempt, but it was more serious when the pope allied himself with the Lombards and worked upon the turbulent princes of Germany. War broke out both in Germany and Italy. In the former anti-kings were found and crowned; in the latter the emperor's troops were utterly routed at Parma in 1248. Struggling to the last against a ring of foes, Frederick died at Fiorentino, Dec. 13, 1250. His splendid tomb is in the cathedral at Palermo.

Frederick was thrice married. His second wife was Yolande, the heiress of Jerusalem, and his third was Isabella, a daughter of John of England. Besides his lawful children, he had several illegitimate ones, notably Enzo, king of Sardinia, and Manfred. The emperor, who wore six crowns, made a great impression on his age; his court in Sicily was an intellectual

centre; in religious affairs he was tolerant, and in most other matters also in advance of his age. *Consult* History of Frederick II, T. L. Kingston-Oliphant, 1862; *Stupor Mundi*, Life and Times, L. Allshorn, 1912; Frederick II, E. Kantorowicz, 1931.

A. W. HOLLAND

Frederick III (1415–93). German king and Roman emperor. A Hapsburg prince, b. Sept. 21, 1415, Frederick was chosen German king in 1440, and was nominal ruler of the country for over 50 years. He was lethargic and indifferent, and under him the Empire lost what power and prestige it had retained. His feeble attempts to secure the kingdom of Hungary and Bohemia failed, and he was for a time deprived of Austria, and was unable to check the Turkish inroads. For some time before his death, on Aug. 19, 1493, he had ceased to take any part in the government of the country, which he left to his son Maximilian I, he himself being immersed in study and contemplation of the future greatness of his family. Frederick was the last emperor to be crowned in Rome, 1452.

Another and earlier German king is sometimes called Frederick III. A son of King Albert I, he was a Hapsburg. In 1314 a minority of the electors chose him as German king, and at once he was involved in war with the other king, Louis of Bavaria. He was defeated and taken prisoner, being released on acknowledging his rival. On this account he is not usually reckoned in the succession of German kings. He died Jan. 13, 1330. *See* Louis IV.

Frederick (1831–88). German emperor. Son of the emperor William I, he was born at Potsdam, Oct. 18, 1831.

After studying at Bonn he travelled, and in 1855 was betrothed to Victoria, princess royal of England, whom he married in 1858. In politics he strongly opposed Bismarck. In the Austrian war, 1866, he commanded an army at Sadowa. In command of an army in the war of 1870, he fought at Wörth and Sedan, and took part in the siege of Paris.

Frederick was a strong advocate for the establishment of the German Empire, though his ideals differed considerably from those of Bismarck. The Liberal party hoped great things when he came to the throne, but he was attacked by cancer of the throat, and was obliged to go to Nice in 1887. On

Frederick, German emperor

the death of his father in March, 1888, he succeeded to the throne, which he had only occupied for ninety-nine days when he died at Potsdam, June 15, 1888. He was succeeded by his son William II. His family consisted of two sons and four daughters. The former were William II and Prince Henry of Prussia; the latter were Charlotte, the wife of Albert, duke of Saxe-Meiningen; Victoria, the wife of Adolf, prince of Schaumburg-Lippe; Sophia, wife of Constantine, king of Greece; and Margaret, wife of Prince Frederick Charles of Hesse. He is sometimes known as Frederick III because he is the third Frederick among the Prussian kings. *Consult* Frederick, Crown Prince and Emperor, R. Rodd, 1888; *Life of Emperor Frederick*, S. Whitman, 1901.

Frederick. Name of eight kings of Denmark. Several of them were comparatively unimportant personages, but the more important are noticed separately below.

Frederick III (1609-70). King of Denmark and Norway. Second son of Christian IV, he succeeded his father in 1648, having previously been bishop of Bremen and Verden. In war with Sweden, 1657-60, Denmark lost many islands and her territory on the Swedish part of the peninsula. In 1660 the people granted him absolute powers and made the monarchy hereditary instead of elective. He died in Copenhagen, Feb. 6, 1670.

Frederick IV (1671-1730). King of Denmark. Son of Christian V, he succeeded his father in 1699. His reign was marked by successive wars against Sweden, but he was forced to sign peace when Charles XII besieged Copenhagen, 1700. In 1709 he again went to war, capturing Stralsund and Tönningen. By the Peace of Copenhagen, 1720, he had to surrender his gains for a money payment, and his last years were spent in the work of carrying out many much needed internal reforms.

Frederick VI (1768-1839). King of Denmark and Norway. Son of the insane Christian VII, he acted as regent from 1784, and became king in 1808. His part in the maritime confederation of Denmark, Russia, and Sweden led to the destruction of his fleet by Nelson at the battle of the Baltic, 1801. His unsatisfactory attitude towards Napoleon caused the bombardment of Copenhagen and capture of the Danish fleet in 1807. His alliance with Napoleon brought about the loss of Norway in 1814. Denmark became bankrupt and did not recover for some years. Himself not free from the taint

of insanity, Frederick had capable ministers, and his reign was marked by political and legal reforms.

Frederick VII (1808-63). King of Denmark. Son of Christian VIII, he succeeded his father in 1848.

He promulgated the constitution designed by his father, and restored parliamentary government, but his tyrannical treatment of Slesvig-Holstein led to the revolt of that duchy in 1848. Frederick was the last king of the Oldenburg dynasty. He died Nov. 15, 1863.

Frederick VII,
King of Denmark

Frederick VIII (1843-1912). King of Denmark. Son of Christian IX, he was educated at a Danish grammar school, and at Oxford. He took part in the war against Prussia and Austria over Slesvig-Holstein, 1864. In 1869 he married Louisa, daughter of Charles XV of Sweden. He succeeded his father in 1906 and died suddenly at Hamburg, May 14, 1912. In 1905 his second son became king of Norway as Haakon VII.

Frederick IX (b. 1899). King of Denmark. Son of Christian X, he was born March 11, 1899. On May 24, 1935, he married Princess Ingrid of Sweden. He succeeded his father as king April 20, 1947.

Frederick I (1657-1713). King of Prussia. The son of Frederick William, elector of Brandenburg, and through his mother related to the Orange family, he was born at Königsberg, July 11, 1657. His father married again, and there was some jealousy between Frederick and his stepmother and her offspring; the affair led to the voluntary exile of the young prince, while his father bequeathed parts of his lands to his younger sons. In 1688 Frederick became elector, and by a judicious use of money he persuaded his half-brothers to give up their shares, thus securing the whole of the electorate.

Frederick I,
King of Prussia

The central incident of the reign was the elector's elevation to the rank of king. Taking advantage of the emperor's military needs, he won from him this grant, and on Jan. 18, 1701, he crowned himself king of Prussia at Königsberg. His troops fought for several years against France, and this and other reasons threw the finances of the country into disorder. He died Feb. 25, 1713, leaving an only son, Frederick William I, who was the father of Frederick the Great. The second of his three wives was Sophia Charlotte, sister of George I.

FREDERICK THE GREAT OF PRUSSIA

Major G. W. Redway, Author of *The War of Secession*

With this article may be read those on Prussia; France; Germany; those on Frederick's battles, e.g. Leuthen, Prague, Rossbach, and those on his contemporaries, e.g. Catherine of Russia, the Emperor Joseph II, and Voltaire. See also Europe; Seven Years' War

Born at Berlin, Jan. 24, 1712, Frederick II of Prussia, known as Frederick the Great, was the son of Frederick William I. As a boy he did not share his father's military proclivities, and broke away from the parades of a cadet company of young noblemen which had been established for him to drill, in order to study music and philosophy.

He was to have married in his teens the Princess Amelia of England, but the influence of Austria prevailed with his father, who mated him in 1733 with the princess of Brunswick-Bevern. Meanwhile, Frederick, harassed at home by his royal father, who at table would spit in the dish to prevent his children eating their fill, and once attempted to strangle Frederick for refusing to resign his rights to the succession, ran away from court. He hoped to escape

to Paris, but was caught, tried by court-martial, and sentenced to death. His companion Katte was actually beheaded, Frederick fainting at the sight.

The year after his marriage Frederick joined Prince Eugene in his last campaign on the Rhine. Then he entered into correspondence with Voltaire, and wrote the *Anti-Machiavel*, in which he set forth the duties of a sovereign as "the first servant of his people." He had become reconciled to his father, after whose death—May 31, 1740—he ascended the throne. In the same year the emperor Charles VI was succeeded by his daughter Maria Theresa, who declined to recognize Frederick's claim to Silesia, arising out of political bargains made by his great-grandfather, Frederick William, called the "Great Elector."

The new king of Prussia at once went to war. Marching up the Oder, he took Breslau in December, placed his army in winter quarters, and in the spring of 1741 met the Austrians near Brieg. At the battle of Mollwitz (April 10, 1741) the Austrian cavalry drove the Prussian horse off the field, and the king took flight with them; but Marshal Schwerin had 60 guns and solid infantry with a superior musket, and at sundown the Austrian general, Neipperg, ordered a retreat southwards to Niesse. Frederick was thus left in possession of Silesia. Meanwhile, France, Bavaria, and Saxony had sided with Frederick, and their armies joined him in Moravia. The Austrian army, however, had not been disposed of, and on May 17, 1742, Prince Charles of Lorraine brought the Prussians to action at Chotusitz, S.W. of Königgrätz. Frederick won the battle by a resolute advance with his right wing after his left had been defeated, and so initiated those enveloping movements that have characterised Prussian tactics.

Frederick now hoped to settle down to enjoy his possessions, his flute-playing and literary correspondence, and to improve his army. He rose at 4 a.m. and put on uniform and the high boots which he only discarded once a year—at his wife's court on her birthday. By 9 a.m. he had finished work with his secretaries, and then gave audience to aides-de-camp and private individuals. He dined at twelve, keeping cooks of different nations to prepare special dishes, and drinking champagne. Then he walked rapidly till 4, when he dealt with state and education matters, and at 6 held a concert. By 11 the king was abed.

Meanwhile, Austria, having drawn to her side England and Hanover, was making headway against France, but the Austrian successes were inimical to Prussia, and Frederick, in support of his ally, moved an army into Bohemia. Marching up the Elbe through Saxony, he captured Prague (Sept. 8, 1742), but was outmanoeuvred by Prince Charles and Marshal Traun, and compelled to retreat into Silesia. But on June 4, 1745, at Hohenfriedberg, he attacked the Austrians under Prince Charles, and threw them back into the Riesengebirge. On Sept. 30 Frederick met Prince Charles again at Soor on the Elbe, and again drove the Austrians westward. In Dec. he concerted the measures by which Prince Leopold beat the Austro-Saxons at Kesselsdorf, and then Frederick entered the Saxon

capital, where a treaty was signed on Christmas Day, 1745, by which Austria resigned all claim on Silesia. But in the autumn of 1756 Frederick was compelled to draw the sword against a coalition of all the continental powers, and begin the contest known as the Seven Years' War.

The state of Prussia at the close of the struggle in 1763 has been painted by Macaulay in his well-

Frederick
After O. Vanloo

known essay on Frederick the Great. The king set about the work of reconstruction with his accustomed vigour. He was now fifty, but was to reign for another 23 years as a benevolent despot. No department of church or state was immune from his interference. He would clap a judge into jail, or appoint a cardinal for his Roman Catholic subjects, or keep a general in arrest for weeks. He set up loan offices, built an opera-house, and put his artillery horses to the plough, in the intervals of instructing ambassadors and publishing poetry. History has condemned him for his share in the partition of Poland in 1772, but in fact all but one-seventeenth part of that desolated country went to his two neighbours, and for years Poland had been virtually a province of Russia.

In 1779 Frederick took the field for the last time, for Austria was now ruled by Joseph I, who was bent on reviving the old claim to Silesia. Frederick and his brother Henry attempted an invasion of Bohemia, but the Austrians under Loudon and Lacy had entrenched 50 m. of country so that the two Prussian armies could not unite. The campaign came thus to an inglorious end through the mediation of Catherine of Russia.

Frederick attended manoeuvres in 1785, and caught a chill from which he never recovered. He died childless at his palace of Sanssouci, Aug. 17, 1786, and was succeeded by his nephew, Frederick William II.

Moriarty, repr. 1877; Frederick the Great on Kingcraft (i.e. Les Matinées du roi de Prusse: French original with Eng. translation), ed. J. W. Whittall, 1901; Frederick the Great and the Rise of Prussia, W. F. Reddaway, 1904; Life of Frederick the Great, N. Young, 1919; Life, G. P. Gooch, 1947.

Frederick. Name of five electors palatine of the Rhine. They belonged to the family of Wittelsbach (*q.v.*). Frederick I ruled from 1451 to 1476; Frederick II, called the Wise, ruled from 1544 to 1556, having before his accession been prominent in German affairs; Frederick III, elector from 1559 to 1576, made Calvinism the dominant faith in his electorate; Frederick IV ruled from 1583 to 1610.

Frederick V (1596-1632). Elector palatine of the Rhine and nominal king of Bohemia. A son of the elector Frederick IV, and grandson of William the Silent, Frederick became elector in 1610 and married, 1613, Elizabeth, daughter of James I of Great Britain.

Frederick V, Elector palatine of the Rhine

By descent and training Frederick was a leader among the Protestants, and as their nominee was chosen king of Bohemia, Nov. 4, 1619. His rival, the emperor Ferdinand II, was, however, too strong, and the first stage of the Thirty Years' War was marked by Frederick's defeat near Prague, Nov. 8, 1620.

He was driven from Bohemia, the Palatinate was taken from him, and he was deprived of his position as an elector. From 1623 until his death, Nov. 29, 1632, Frederick remained an exile. He was the father of Sophia, electress of Hanover, and of the cavalier, Prince Rupert. On account of his short stay in Bohemia he is often called the Winter King.

Frederick I (1369-1428). Elector of Saxony. About 1388, when he succeeded to some part of the family lands in central Germany, Frederick began to take a leading part in the affairs of the country.

and assisted the Emperor Sigismund against the Hussites. For these services he received, in 1423, the duchy of Saxe-Wittenberg, the modern Saxony, and the attached dignity of an elector, a connexion of great importance both for Saxony and for Frederick's descendants. He died Jan. 4, 1428, his successor being his son, Frederick II, a comparatively unimportant person, who reigned from 1428 until his death, Sept. 7, 1464.

Frederick III (1463-1525) Elector of Saxony, known as the Wise. Beginning his reign in 1486, Frederick soon became prominent in German politics, and might have succeeded Maximilian I as emperor in 1519 had he so desired. He was anxious to improve the methods of governing Germany, but is best known for his friendship with Luther, whom he appointed to a chair in his own university at Wittenberg. After Luther's memorable defiance of the Church, the elector protected him from his enemies. Frederick died May 5, 1525.

Frederick (1707-61). Prince of Wales. The eldest son of George II, he was born Jan. 6, 1707, his father being then crown prince of Hanover. From 1714, when his grandfather became king as George I, until in 1729 he was made prince of Wales, he was called duke of Gloucester. Frederick is important only as the centre of the opposition to George II, and as the father of George III. He and his father were constantly at variance on financial and other matters, and in 1737 the prince was banished from court. He replied by setting up a court of his own at Norfolk House, St. James's Square, and this became the resort of all who were opposed to George II and Sir Robert Walpole. He died March 20, 1751. In addition to George III he left four sons and two daughters by his wife, Augusta, daughter of Frederick, duke of Saxe-Gotha, who lived until 1772. The sons were Edward, duke of York (1739-67), William, duke of Gloucester (1743-1805), Henry, duke of Cumberland (1745-90), and Frederick (1750-65). *Consult* Memoirs of the Reign of George II, H. Walpole, 1847; Frederick Louis, Prince of Wales, A. Edwards, 1947.

Frederick Augustus I (1750-1827). First king of Saxony. Son of the elector Frederick Christian, he was born at Dresden Dec. 23,

1750. In 1763 he became elector, and in 1769 began personally to rule. His early years were marked

Frederick Augustus I,
King of Saxony

by a wise and just conduct of affairs, leading to a prosperity which was interrupted by the French Revolution. He had gained something by a short war against Austria in 1778, but he kept neutral on other occasions until in 1793, as a German prince, he joined in the war on France. He was out of it from 1796 to 1806, when, after Prussia's defeat at Jena, he made peace with Napoleon, and in 1806 he took the title of king.

As an ally of Napoleon, his Saxons were in arms from then until the end, for which action a high price was paid. The king was present at the battle of Dresden, and after Leipzig his capital and kingdom were in the power of the allies and he himself their prisoner. The congress of Vienna took from him a large part of Saxony, about 7,800 sq. m., but he kept the title of king. Until his death, May 5, 1827, he did his best to help his people to recover from the ravages of war.

Frederick Charles (1828-85). German soldier, known as the Red Prince. A son of Prince Charles of Prussia and a grandson of Frederick William III, he was therefore a nephew of the emperor William I.

Born March 20, 1828, he was trained from a child for the army, both at Bonn and with his regiment. He served Prussia against the Danes in 1848, and was with the Prussian force that invaded Baden in 1849, being there wounded. In 1864 he led a corps into Denmark and was in supreme command during the later stage of the struggle against the Danes.

A scientific soldier and keen on his profession, the prince was closely associated with Moltke and his work. He rose from one command to another, and from 1860 to 1870 he was at the head of the iron corps of Brandenburg, which attained under him its later reputation. In 1866 he was chosen to command an army in the war against Austria, and was largely responsible for the Prussian victory at Sadowa. In 1870 he was

Frederick Charles,
German soldier

put in charge of one of the three armies that marched into France. He had a considerable share in bringing about the surrender of Bazaine and the fall of Metz, after which he conducted the operations against the French on the Loire, his great success here being at Le Mans. Made field-marshal in 1870, his last post was that of inspector of cavalry. He died June 15, 1885.

The prince was a soldier of great energy, sparing neither himself nor his men in his efforts to improve the condition of the Prussian army. He appears to have been somewhat difficult to work with and his relations with his royal kinsfolk were not always harmonious. He married a princess of Anhalt, and one of his daughters became the duchess of Connaught. He owed his nickname to the colour of the uniform he habitually wore.

Frederick William (1620-1688). Elector of Brandenburg, known as the Great Elector. Born in Berlin, Feb.

16, 1620, the son of the elector George William, he passed much of his youth in the Netherlands, a stay that was responsible for his marriage with Louise, a princess of Orange, 1646. In 1640 he became elector, and his first duty was to free Brandenburg from the horrors of the 'Thirty Years' War. He did this, and from the peace of 1648 to his death he saw his land growing in prosperity.

He organized the army, founded the navy, welcomed industrious immigrants, started colonies in Africa, and encouraged trade. He had great influence in European affairs, and helped William of Orange's invasion of England in 1688. He added to his land both east and west. The peace of 1648 gave him part of Pomerania, Prussia was firmly joined to Brandenburg and Cleves, and Jülich was secured. He died at Potsdam, May 9, 1688, and was succeeded by his son Frederick, 1st king of Prussia.

Frederick William was the real founder of Prussia, for which his reign, autocratic though it was, was wholly beneficial. He was a Protestant and a supporter of the Empire, but neither sympathy stood in the way of his main ambitions. *See* Fehrbellin *consult* Origins of the Kingdom of Prussia, A. W. Ward, 1908 (Camb. Modern History); Life, C. E. Maurice, 1926

Frederick William,
Elector of Brandenburg

Frederick,
Prince of Wales

Frederick William I (1688–1740). King of Prussia. Born Aug. 15, 1688, he was a son of Frederick

Frederick William I,
King of Prussia

I, and related through his mother to George I of Great Britain. In Feb., 1713, after a somewhat strict upbringing, he became king of Prussia. In the name of economy, he was continually cutting down expenses, although he spent much on the celebrated collection of giants for his army, which he raised to a high state of efficiency.

Frederick was a successful ruler, and greatly improved the condition of Prussia. He provided a more efficient administration; and with an increased revenue old debts were paid off. Trade was encouraged by restricting manufactured imports, and by other methods in harmony with current theories, while E. Prussia was peopled with industrious settlers. He secured Pomerania from Sweden, and was concerned in the various European alliances of the period. He founded a number of schools and, in a somewhat orthodox way, was a friend of learning. He died May 31, 1740. His wife was a princess of Hanover, and his son was Frederick the Great, and, although the king was by no means a wise parent, the wealth and the army that he left laid the foundations of his son's successes. See *History of Prussia*, H. Tuttle, 1884.

Frederick William II (1744–97). King of Prussia. Born in Berlin, Sept. 25, 1744, he was a grandson of Frederick William I, and a nephew of Frederick the Great. In 1757 his father, Prince Augustus William, died, and for the next 29 years he was the heir to the Prussian throne. Well educated, he passed this period occupied with his pleasures, chiefly music, troubling little about affairs of state. In Aug., 1786, he became king. In external affairs, Prussia was engaged in watching the progress of the revolution in France, and from 1792–95 in fighting against that country, not, however, with any great determination. A share of Poland was acquired, and there was a campaign against Holland. But in these matters the king was not the leading spirit, nor even the head of the army.

Before his accession he had become a Rosicrucian, and it was a member of this curious fraternity, Johann Christof Wollner, who

really ruled Prussia, his chief assistant being another Rosicrucian, Johann Rudolf Bischoffswerder. These men spared no efforts to crush liberty of thought, ostensibly in the interest of the Christian faith, and in so doing they counteracted the popularity gained when the king ordered the abandonment of some of the French ideas introduced by Frederick the Great. Frederick William, who died Nov. 16, 1797, was twice married, and had several mistresses. Consult *A Mystic on the Prussian Throne*, G. Stanhope, 1912.

Frederick William III (1770–1840). King of Prussia. Born Aug. 3, 1770, he was the eldest son of Frederick William II by his second wife, a princess of Hesse-Darm-

Frederick William III,
King of Prussia

stadt. He was well educated and had served in the field when he became king in 1797. He suffered the humiliation of Jena and of the surrender of much of Prussia to Napoleon. But in 1812 he called upon his people to rise, and saw the victories and enthusiasms of the war of liberation. He took part in the European conferences of 1815 and after, but, as a rule, merely as an echo of the tsar Alexander I.

At home he showed a dislike for the current liberal movements, but died before Prussia had been seriously disturbed by them. He did something, however, to improve the administration of his lands, especially those acquired in 1815. He died June 7, 1840. His wife was Louise, a princess of Mecklenburg-Strelitz, and it was she who, more than the king himself, helped the ministers to free the country from the misfortunes of 1807. She died in June, 1810.

Frederick William IV (1795–1861). King of Prussia. The eldest son of Frederick William III,

he was born Oct. 15, 1795. He saw a little military service in 1814, but his main interest was in arts and culture generally. He had been well and carefully educated, and showed a real liking for the society of scholars. In 1840 Frederick came to the throne. Although he had some

sympathy with the liberal movements of the age, he was a strong believer in maintaining the old order, including the divine right of his own position. He showed sense in acting with much more toleration than his father.

In 1848, during the rising in Berlin, Frederick William appeared, with some loss of dignity, as an enthusiast in the popular cause, but this was a passing phase. He refused, probably wisely, the new crown offered to him by the German princes, and the union was delayed until 1871. Next followed a return to the policy of hostility to Austria, but when this meant war he drew back, preferring rather to give way in the convention of Olmütz. Later he carried forward a little the plan of constitutional reform in Prussia and was concerned in the international matters of his time. In 1857 the king's mind became deranged, and until his death, Jan. 2, 1861, his brother acted as regent.

Frederick William (b. 1882). German prince. The eldest son of William II was born May 6, 1882,

Frederick William,
former German
Crown Prince

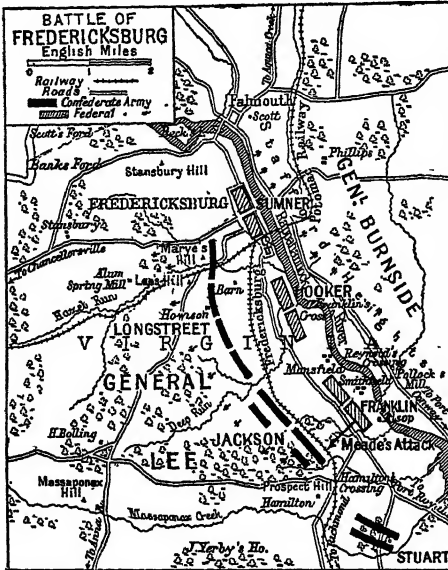

and in 1888, on his father's accession, became crown prince. He was nominally in command of a group of armies on the western front during the First Great War. In 1918 he associated himself with his father's abdication and took refuge in the Netherlands. He married in 1903 Cecile, duchess of Mecklenburg. He published his memoirs in 1922, and in 1923 retired to his estate in Silesia. Though a keen supporter of the National-Socialist movement, he took no active part in the Second Great War, and afterwards lived in the Hohenzollern castle near Sigmaringen in the French zone.

Fredericksburg. City of Virginia, U.S.A., in Spottsylvania co. On the Rappahannock river, 60 m. N. of Richmond, it is served by rly. A city of many historical associations with the Revolutionary and Civil Wars, it is the site of one of the homes of the Washington family, which still stands; Mary Washington college; and a national memorial park honouring those who fell in the Civil War battle fought here (v.i.). Among its products are paper goods, egg crates, railway ties, shoes, and

Frederick William IV,

Fredericksburg. Map showing the disposition of forces in the American battle of Dec. 11-15, 1862

clothing. Captain John Smith landed here in 1608 and negotiated with Indians. Settled in 1671, the town was incorporated in 1727. Pop. 10,066.

Fredericksburg, BATTLE OF. Fought in the American Civil War, Dec. 11-15, 1862, between the Federals under Burnside and the Confederates under Lee. It took place on the S. bank of the Rappahannock, near Fredericksburg. The object of the Federals, who were on the N. bank of the river, was to cross and gain the road to Richmond, the Confederate capital, but the Confederates barred the way. The Federals numbered 125,596 against the Confederates 85,175, an insufficient majority for attack; moreover, the Confederates had a better supply of officers.

General Lee's army was organized in two corps under Longstreet (1st) and Jackson (2nd) respectively, and a cavalry division under Stuart. Burnside had formed his army in three grand divisions under Sumner (right), Hooker (centre), and Franklin (left). A bend of the river enabled the Federals to bring under the fire of their heavy guns on Stafford Heights a considerable part of the opposite bank, including the town of Fredericksburg, which caused the Confederates to withdraw to a range of low hills about 2 m. from the river, where Lee, on a front of 7 m. or 8 m., constructed defence works and emplaced his guns to sweep all the approaches. On the extreme right was Stuart's cavalry, in the centre Jackson's corps, and on the left Longstreet's.

him. For nearly a month the two armies had been face to face, and most careful preparations had been made on both sides, but since Lee could not be certain where the Rappahannock would be crossed, he kept Jackson's corps some 20 m. down the river until Dec. 12, when the enemy, having completed his pontoon bridges, crossed and seized the town, driving out the small Confederate garrison. On Dec. 13 the Federals were on the right bank. In the result Franklin's two corps assailed Jackson's corps and Stuart's cavalry, Sumner's two corps afterwards attacking Longstreet's corps, while Hooker's command assisted Franklin and Sumner in turn.

The left attack under Franklin employed two divisions, or seven brigades, against six Confederate brigades drawn from the divisions of A. P. Hill, Ewell, and Hood (Jackson's corps). The right attack W. of the town was delivered mainly by Couch's 2nd corps, and was crushed by four Confederate brigades from the divisions of Ransom and McLaws (Longstreet's corps). The attackers on this front, although reinforced by four brigades from Butterfield's 5th corps, failed to reach the Confederate defences. On the left Lee's defences were never in actual danger, for the attackers who escaped the fire of Longstreet's artillery were shot down at musket range.

On the right the encounter was less one-sided, for the Federals contrived to break through Jackson's line at "a point of woods" form-

ing a salient where the ground in rear had been deemed impenetrable through a deep ravine and thick undergrowth. This obstacle, however, was overcome by Meade's division, which got in rear of Lane's division, and Archer's brigades, and captured part of the supporting brigades under Gregg and Thomas.

In military history this battle is remarkable as exhibiting the power of passive defence when time has been allowed for entrenching. It shows the natural results of a succession of vague orders and the lack of resolution, and the danger of frontal attacks was once again exemplified. It has been said that the defending general missed his opportunity for a decisive counter-attack, but according to Jackson, the Federal artillery completely dominated the plain over which the Confederates would have to advance towards the river. The Federals, therefore, were suffered to remain on the south bank for two days, under the fire of skirmishers.

After the battle Lee's defences were strengthened and his troops redistributed to meet any further attack. But Burnside withdrew his forces (113,000 men) just when the arrangements had been made by the naval authorities to support him by a feint attack with gunboats at Port Royal; he recrossed the river on the night of Dec. 15. Thus Lee's army was left in peace for the winter, for the attempt known as the Mud March, a month later, to move round his left flank and cross the river above the town, collapsed. Violent quarrels ensued between Burnside and his subordinates, some of whom he dismissed; but in the end Burnside himself was relieved of his command. See American Civil War; Lee.

Fredericton. City and capital of New Brunswick, Canada. It stands on the river St. John, 84 m. from its mouth, and 65 m. N.N.W. of the city of St. John. It is a station on the C.P.R. and C.N.R., while steamships connect it with St. John. The chief buildings are those of the provincial legislature and the government offices, Government House, the city hall, the barracks, an Anglican cathedral, and several churches; also the university of New Brunswick.

Fredericton is the centre of a lumbering and mining district and its industries include boat-building, tanning, and the making of boots and shoes. The city was founded about 1740, and, although not the largest town, was made the capital in 1788 because it was less exposed to attack than St. John. Its first name was St. Ann's. Pop. 10,062.

Frederiksberg. A residential suburb in the S.W. of Copenhagen. The royal palace, erected by Frederick IV, on a commanding eminence, is now utilised as a military college. There are a fine park, zoological gardens, museum, and picture gallery. It is the seat of the royal porcelain factory, and there are also extensive breweries.

Frederiksberg. Royal palace of Denmark. It is built on a group of small islands in a lake near Hillerød, in the district of Frederiksberg, in Zealand, 21 m. by rly. N.N.W. of Copenhagen, and has a fine park. Erected in the 17th century by Christian IV on the site of an older castle, it was restored and embellished after a fire in 1859, and now houses a national historical museum. Several Danish monarchs have been crowned in the chapel.

Frederiksberg, Denmark. Courtyard of the royal palace, as rebuilt after the fire of 1859

Frederikshald (formerly Halden). Seaport of Norway, in the fylke or co. of Östfold. It stands at the mouth of the Tistedal river, at its junction with the Ide Fjord, 58 m. direct and 85 m. by rly. S.S.E. of Oslo. Twice burnt, it has been rebuilt in modern style. A great timber depot, it also exports wood pulp, marble, granite, and fish. It has sugar refineries and tobacco and boot factories. The harbour is safe and commodious. The town, which was besieged by the Swedes for two years (1658-60), is defended by two fortresses, the famous Frederiksten, founded by Frederick III in 1661, and the Gyldeuløve, near which Charles XII of Sweden was killed by a musket ball while besieging the town in 1718. It was surrendered to Bernadotte in 1814.

Frederikshavn. Seaport of Denmark, on the N.E. coast of Jutland. It stands on the Cattegat, 23 m. by rly. E. of Hjørring, and its fine ice-free port, the second best port in Jutland, is a harbour of refuge. Its exports include butter, bacon, eggs, cattle, pigs, meat, and fish. It is connected by regular sailings with Sweden, Norway, and England. A mere fishing hamlet in 1818, it has now a pop. of 15,275. The former name was Fladstrand.

Frederiksstad. Seaport of Norway. It stands at the mouth of the Glommen river, in the fylke or

co. of Östfold, 58 m. by rly. S.E. of Oslo. A centre of the timber trade, it exports pit-props, planks, bricks, tiles, nails, and granite. There are shipbuilding yards and rly. and chemical works. The old town was built by Frederick II in 1570 and strongly fortified. Pop. 14,117.

Free Association. Term used in psychology for the result of relaxing and allowing one's thoughts to drift without any at-

tempt to control them. Such chains of thought begin sooner or later to express unconscious wishes, fears, etc., and their revelation to the psychiatrist without any reservation, is therefore the chief method used in psychiatry to obtain knowledge of the unconscious mind.

Freebench. Term used in English law. It was the dower to which a widow was entitled, by the custom of the manor, out of her deceased husband's copyholds. It was abolished in 1925.

Freeboard. That part of a vessel's side between the upper deck and the water-line or line of flotation.

Free Church. Self-descriptive term adopted towards the end of the 19th century by those religious communities in the U.K. previously known as a general group only as dissenters or nonconformists. The term, intended as an antonym to the term Established Church, came into general use with the establishment of the Free Church Council (*v.i.*), a federal body representing numerous denominations claiming freedom of choice in doctrine, church administration, form of worship, appointment of ministers, etc.

Free Church Federal Council. Central organization in England and Wales the object of which is to federate the various Free Churches.

It promotes united efforts in the evangelisation of the people, and strives to prevent overlapping. It originated shortly before 1892 in a Free Church Congress held in Manchester, and numerous congresses and annual gatherings have been held since. The council has been conspicuous in connexion with many religious and social movements. It has organized district councils or federations all over England and Wales and has employed evangelists to conduct missions throughout the country, amongst whom Gipsy Smith (*q.v.*) was notable. Delegates to its annual conference are chosen locally by the Free Churches. The moderator, a leading minister, is elected annually. The headquarters are at 27, Tavistock Sq., London, W.C.1. See Nonconformity.

Free Church of England. Title assumed at various times by congregations which have separated from the Church of England on doctrinal or other grounds. It is more especially applied to a small sect which originated about 1844 in Devon as a protest against the Oxford Movement. It has bishops, who derive their succession from G. D. Cummins, who seceded from the Protestant Episcopal Church in America in 1873. Its doctrines are ultra-Low Church, and it uses a slightly modified version of the Book of Common Prayer. In 1927 it united with the Reformed Episcopal Church.

Free Church of Scotland. Name adopted originally by those members of the Established Church of Scotland who severed themselves from that body in 1843. In the third decade of the 19th century a controversy arose in the Established Church of Scotland. The outstanding points at issue were patronage and liberty of individual congregations to reject ministers presented to livings. A Veto Act was passed in 1834 by the general assembly, satisfying the objectors on these two questions. The famous Auchterarder case, decided in the court of session, 1838, and confirmed by the house of lords, 1839, deprived congregations of their right to reject a presentee. Controversy between the two parties then became acute.

The dissatisfied group, known as the non-intrusion party, meeting at the annual assembly in Edinburgh, May, 1843, decided to withdraw from the gathering and marched to Tanfield Hall at Canonmills. There they formed the first Free Church Assembly, electing the Rev. Thomas Chalmers (*q.v.*) as

moderator. This constituted what is termed the disruption. In the same month 396 ministers and professors signed an act of separation, renouncing all claims to the benefices held under the Established Church. The signatures ultimately numbered 474. This act of demission represented a voluntary surrender of an aggregate annual income of something like £100,000.

The new Free Church started a sustentation fund, erected new churches, and became a strong body, numerically, financially, and in foreign mission work. In 1900 it was amalgamated with the United Presbyterian Church in Scotland, and was thenceforward known as the United Free Church of Scotland. The present Free Church of Scotland consists of those members of the original Free Church who refused to unite with the U.P. Church 1900.

After the union of 1900 the Free Church made legal claim to the entire property of the original Free Church. This claim led to the famous ecclesiastical law case of *Bannatyne v. Overtoun*. It was argued in the court of session, when judgement was given in favour of the United Free Church. The small Free Church party then appealed to the house of lords, and judgement was given in their favour in 1904. A situation was thus created in which a handful of members were given all the property, churches, manse, colleges, and funds of the original Free Church. In 1905 an Act of Parliament altered this. A royal commission allocated the property between the two bodies, and generally regularised the position. The Free Church of Scotland is strongest in the Highlands, and has about 180 congregations, also a college with five professors of divinity; and missionaries in S. Africa, India, Canada, and S. America. See Presbyterianism; Scotland, Church of; United Free Church; United Presbyterian Church.

Free City. City that is independent of any save the highest authority. The free cities of the Middle Ages were under the rule of none save the emperor himself, being in practice little republics, each with its own form of government. A modern example was Danzig (*q.v.*), under the League of Nations 1920-1939.

The first free cities were towns standing on land ruled by the emperor, but their numbers were augmented when the privilege was found to be a valuable one. Some bought it, to others it was given;

while on the other hand some were deprived of it—an instance of this being Donauwörth in 1607. The free cities were represented in the imperial diet from about 1490, and, as constituted later, one of its colleges was composed of their representatives. They were divided into two groups, Rhenish and Swabian, and played a considerable part in the affairs of Germany. Some of them had forces, many had wealth, so their help was frequently sought by emperors and other rulers, especially in times of war. The hostility of the free cities was feared by the most powerful; their support kept kings on their thrones. Their number varied; in 1521 a list gave 84 of them, after which there was a decrease.

With the changes caused by the French Revolution many of the cities lost their freedom, and in 1803 six only were recognized. They were Hamburg, Lübeck, Bremen, Augsburg, Frankfurt, and Nuremberg. In 1806 Bavaria secured Augsburg and Nuremberg, but the other four lasted until 1866, when Frankfurt, having fought against Prussia, lost its independence. As free cities the other three entered the German empire in 1871 and remained therein after the changes of 1918. See Germany; History.

Free Corps. Fighting troops as distinct from the regular armed forces of a country. They can roughly be grouped in three categories: (a) units of, usually, volunteers, formed by individual leaders with the consent of their governments, for the duration of a war or another emergency; (b) units of similar nature but recruited and employed without consent of or even against the government involved; (c) irregulars, usually not uniformed bodies, waging guerrilla war behind the lines of an invading army.

Though the name of Free Corps was first used during the 18th century, probably referring to the freedom allowed to the leader for recruiting, or possibly to the lax discipline, the characteristics apply to many medieval soldiering bodies. The Austrians had Croats and Pandours; Frederick the Great when fighting against them had similar light forces, mostly of aliens; after Prussia's defeat by Napoleon, officers like Lützow and von der Tann fought him with Free Corps, all coming under category (a). In 1813 Prussia resorted to the improvisation of such forces. After the German defeat of 1918, Free Corps under von der Goltz, Ross-

bach, and others continued a war, mostly against the Bolsheviks, in the Baltic; while similar units under Denikin and others struggled in Russia.

Under the second heading fall the forces of the Tirolese national hero Andreas Hofer who opposed French and Bavarian armies in the mountains until he was captured and executed in 1812; and the redshirts of Garibaldi who, from a mere thousand landing in Sicily in 1860, became the army that liberated and united Italy. Others took part in the liberation of Greece under Alexander Ypsilanti and in the French and Polish revolutions of the 19th century.

Under the third heading come the French francs-tireurs during the Franco-Prussian War of 1870-71; possibly some Belgians during the First Great War; and clandestine troops preparing and finally taking part in the fight for liberation everywhere during the Second Great War. While members of Free Corps as under (a) and (b), if uniformed and provided with proper documents, are entitled to the protection of international law, and if caught should be treated as prisoners of war, those in category (c) risk the death penalty under martial law.

Freedman, BARNETT (b. 1901). British artist. Born in London, May 10, 1901, he gained a scholarship to the Royal College of Art in 1922. He designed posters for the L.P.T.B., Shell Mex, B.B.C., G.P.O., etc., also a postage stamp for the silver jubilee of George V, 1935. Freedman also illustrated Sassoon's *Memoirs of an Infantry Officer*. His paintings and drawings were purchased by the Tate Gallery, Victoria and Albert museum, and provincial galleries.

Freedom of the City. Award conferring the freedom of a city on the recipient. See Freeman.

Freedom of the Press. Liberty to print and publish without official licence. By the Press is usually meant the newspapers, but the term includes printing generally. Before the introduction of the military censorship in 1914 the British press had enjoyed this liberty since 1694, save for restrictions imposed by the paper duty, 1694-1861; stamp duty, 1711-1855; advertisement tax, 1712-1853; and libel laws which unfairly shackled expression of opinion until the middle of the 19th century, even to the restriction of references to foreign rulers.

Partial reports of parliamentary proceedings began to appear in

print in 1729, but were regarded as a breach of privilege for which summary punishment was inflicted. While this parliamentary privilege is still nominally preserved, reporters have been admitted to parliament since 1835.

From the 15th century in Roman Catholic countries the Inquisition of the bishops acted as censors of the press. At the Reformation Henry VIII assumed this control, and it was exercised by the Star Chamber till 1640. In 1640-43 the press was virtually free. In June, 1643, parliament revived the censorship; Milton's *Areopagitica*, or Speech for the Liberty of Unlicensed Printing, was published in 1644. The office of Licensor of the Press was operative in 1655-79 and 1685-94. The later struggles for a free press in Great Britain were carried on largely on political grounds, and the struggle has followed similar lines in all constitutional countries. See Censorship; Defoe; Journalism; Libel; Marprelate; Newspaper; Wilkes, John.

Freedom of the Seas. Term in international law. From earliest times two main doctrines have governed maritime commerce. In peace, the waters of the ocean are free and open to the vessels of all nations; in war every belligerent reserves to itself the right to capture the ships and property of its enemies. On the other hand, belligerents may not interfere with the ships and cargoes of neutrals, unless they violate the laws of blockade and contraband (*q.v.*).

From the beginning of its national existence, however, the U.S.A. has favoured the immunity from capture in time of war of the commerce even of belligerents. A treaty of such immunity was proposed by the U.S.A. to Great Britain, France, and Russia in 1823, but was declined. An attempt was also made to include a similar clause in the declaration of Paris, 1856. At the beginning of the Franco-Prussian War of 1870, Prussia declared her intention to refrain from capturing French merchant ships, if the French granted a similar immunity, but the stronger naval power refused, whereupon both belligerents resorted to customary practice. The question was considered at the first Hague peace conference, 1899, but as no decision was reached, it was remitted to the second conference in 1907 for consideration. The assembled powers expressed the wish that the laws of war on land should apply

as far as possible at sea, so that merchantmen and commerce of belligerents should be exempt from capture. During the First Great War, however, it proved impossible for any belligerent to give practical effect to this aspiration.

Among the Fourteen Points elaborated by President Wilson as the basis for an enduring peace was the following: "Absolute freedom of navigation upon the seas outside territorial waters alike in peace and in war, except as the seas may be closed in whole or in part by international action for the enforcement of international covenants."

There has been much controversy upon the meaning of this declaration. It has been asserted that the freedom was intended to cover neutral shipping only in time of war; conversely, that Wilson was restating the traditional American view. It seems most likely, however, that this article must be directly linked with Wilson's suggestions for a League of Nations, so that freedom of the seas would be assured to all who fulfilled their League obligations, but that the capture of private property of those who resorted to war in defiance of their League obligations could still occur.

The chief opponent of the American claim for freedom of the seas has been Great Britain, urging consistently that as maritime commerce plays such a direct and vital part in a war effort, to exempt it from capture would prolong wars and furthermore deprive a naval power of its most effective weapon. In spite of the humanitarian views of publicists, the hard facts of the First and Second Great Wars demonstrated the truth of this view, whilst they robbed the doctrine of a good deal of its theoretical importance by progressive extensions of the laws of contraband and blockade.

G. W. Keeton

Free Economy. Economic theory introducing a new monetary system, in which money would be devalued every month and replaced by new, so as to ensure a steady circulation. People would

endeavour to pass on the money before it declined in value, and the flow of money would maintain steady employment. Free economists support private enterprise and are opposed to Socialism.

Free France (*La France Libre*).

Title assumed by those Frenchmen who accepted the leadership of

Free French badge, the Cross of Lorraine

Gen. de Gaulle after the surrender of the French government on June 22, 1940. It arose from the British official announcement of June 28, 1940, that "H.M. government recognize Gen. de Gaulle as leader of all free Frenchmen, wherever they may be, who rally to him in support of the Allied cause." The name was officially changed to Fighting France, July 4, 1942. See Fighting France; France in the Second Great War.

Freehold. The tenure on which all land is now held. Formerly (and still in theory) land could not be owned but must be held on some tenure from a lord, and ultimately from the crown. The land might be held on either free or unfree tenure. Knight service and socage were freehold tenures and copyhold was unfree. Knight service was abolished in 1660 and copyhold in 1926, so that all land today is freehold in socage tenure. This gives effect to the modern conception of land as patient of being owned, not merely held of a lord. A freehold must be of indefinite duration.

Freelance (Ger. *freier Landsknecht*, free land trooper). Term originally applied in Germany, and afterwards in other countries, to one who sold his military service to whom he pleased. This usually meant to the highest bidder, without regard to more than inclination or pay. In the later Middle Ages, and for some time afterwards, freelances were numerous in Italy and France, and spread over the rest of Europe. Sometimes called a soldier of fortune, sometimes a mercenary, the trooper wandered from place to place, if a noble, with a following of men-at-arms, or in company with a number of others like himself. Captain Dugald Dalgetty, in Scott's *Legend of Montrose*, was a soldier of this type. The English

form freelance comes from confusion with *Lanzknecht* (lance trooper). (See *Condottieri*; *Franc-tireur*; *Mercenary*.) The term is today applied to anyone who in politics, or any form of contest, preserves his independence of party or association. In journalism a freelance is a writer who earns a livelihood by contributing to newspapers and periodicals without being on the staff of any one of them.

Freeman. One who is free, i.e. one who is not a slave. The distinction between the two classes, bond and free, is an old one. It was found among the Greeks and earlier. In Rome there were two classes of freemen, those who were born free and those who were freed. Among the Teutonic tribes of Europe, including the Anglo-Saxons, the freeman was the one who enjoyed political power and other privileges, who fought, held land, and, in general, formed the dominant class.

Freeman. Person admitted to the freedom of a city. The freedom, except in London, is purely an honour and carries no material benefits. Only a freeman of the city of London can be a candidate for the office of lord mayor there, and certain charitable funds are available for freemen or their dependents in genuine need. Freedom of the city may be obtained by being bound to a freeman according to the custom of the city and serving as an apprentice for a specified term; or by patrimony by sons or daughters (unmarried or widows) of a freeman; or by redemption or purchase by persons on the parliamentary register of voters for the city on their application to the city chamberlain.

The honorary freedom is a gift of the city, conferred upon a person of distinction. This is a token of honour in the form of a public address enclosed, with the roll of freemen, in a gold or silver casket. Medieval privileges that no longer apply were freedom from certain tolls and customs, exemption from military service outside the city, and the right to trade within the city. In the 14th century some foreigners obtained the freedom of the city by making large payments and giving security that Londoners visiting their countries should receive good treatment.

Freeman, EDWARD AUGUSTUS (1823-92). British historian. Born at Harborne, Aug. 2, 1823, he was educated at Trinity College, Oxford, and was elected a fellow. He settled down in the country to the career of a writer, making his

home from 1860 at Somerleaze, near Wells. His first book was *A History of Architecture*, 1849.

Edward A. Freeman,
British historian
Elliot & Fry

He also wrote a great deal for the *Saturday Review*, and travelled much abroad. Freeman's works place him in the front rank of British historians, and are based upon an exhaustive study of original authorities. An unfinished *History of Federal Government*, 1863, was followed by *History of the Norman Conquest*, 6 vols., 1867-99, which remains an authoritative study of the period, although later scholarship has declared against an excessive emphasis on Teutonic origins of English institutions.

In 1884 Freeman was appointed regius professor of modern history at Oxford, but his best work was done, his health was bad, and he died at Alicante, Spain, March 16, 1892. A man of strong and outspoken views, he attained some eminence as a Liberal politician, but failed to enter parliament. He denounced the iniquities of the Turks, and showed warm sympathy with the Greeks.

Freeman, JOHN (1880-1929). British poet. He was born in London, and early began to write for literary journals, contributing regularly after the First Great

War to *The London Mercury*. A first volume of verse was published in 1909; a collection, *Stone Trees and Other Poems*, in 1916. Memories of Childhood came out in 1918-19, and the next year he was awarded the Hawthornden Prize. His prose works included *Portrait of George Moore*, 1922; *English Portraits*, 1924; and a study of *Herman Melville*, 1926. Freeman died Sept. 23, 1929.

Freeman's Journal. THE. Dublin daily newspaper. Started as *The Public Register*, or *Freeman's Journal*, a bi-weekly sheet, Sept. 10, 1763, it dropped its first title in July, 1807. In the opening part of the 19th century it became the organ of the Irish Nationalists. The paper was temporarily suspended in Dec., 1918, by British military authority because of publications calculated to create disaffection; and, on a similar charge, was the subject of two courts-martial in 1920. As a supporter of the I.F.S., it was partially wrecked by I.R.A. extremists in 1922. It ceased publication, 1924.

Free Martin. The sterile member of a pair of unlike-sexed twins in certain species of animal, e.g. cattle. Because the embryonic circulations of the twins may become confluent during their development, the hormones of each may affect the other. The male hormones of the male twin suppress to a greater or less extent the development of the female's sex organs, and often sterile free martins result. The derivation of the term is obscure.

FREEMASONRY: ITS ORIGIN & HISTORY

Dudley Wright, former Editor of *The Freemason*

This article gives some idea of the extent to which freemasonry has spread throughout the United Kingdom and over the civilized world.

See Mark Masonry; Royal Arch Masonry. See also Guild

The origin of freemasonry cannot be traced with certainty. Many of its ceremonies and practices have a striking affinity with the ceremonies and ritual of the Eleusinian, Samothracian, Dionysian, and other ancient mysteries, as well as with the most ancient religious ceremonies known, particularly the initiatory rites and ceremonial proved to have prevailed among Indian races, the Druids, etc. Even the origin of the word freemason cannot be stated with precision. Legend ascribes it to an incident connected with the erection of Solomon's Temple, but O'Brien, in his *Round Towers of Ireland*, says that the word must be traced to Goban-Saer, the supposed architect of those towers,

that the word *Saer* means Freemason, and that those towers were masonic edifices, exclusively appropriated to the worship of the Great Architect of the universe. The existing masonic constitution is also akin to that prevailing in the ancient trade guilds of England and other countries.

The oldest masonic records in the British Isles are in Scotland. Edinburgh Lodge, No. 1, the oldest Scottish lodge, possesses record books from 1599, but these do not record the beginnings of that ancient organization. The famous Kilwinning Lodge is also claimed to have been in existence at that date as a governing body, but its minute books date only from 1642. There is a traditional list of grand

1 and 2. Master Masons' aprons 1, English; 2, Scottish.

FREEMASONRY: JEWELS AND BADGES OF THE CRAFT IN ENGLAND AND SCOTLAND

By courtesy of George Kenning & Son

masters in England, dating from A.D. 290, beginning with Albanus, and ending, before the historical period, with the names of Charles Lennox, the first duke of Richmond, and Sir Christopher Wren. But the historical foundation even for these names, it must be admitted, is slender.

The first freemason to be initiated on English soil, so far as records show, was Sir Robert Moray, also a founder and first president of the Royal Society. He was initiated at Newcastle-upon-Tyne, May 20, 1641, the entry being ratified by the signatures and masonic marks of four brethren, including General Hamilton. Elias Ashmole, also one of the original members of the Royal Society, was initiated at Warrington five years later. Some founders of the Royal Society and its principal officers and members for several years were leading members of the masonic order.

The organization of the grand lodge of England was effected June 24, 1717, by the union of four lodges then meeting in London three of which are still in existence, and since that date grand jurisdictions in various parts of the world have been formed, all of which owe their parentage, directly or indirectly, to the grand lodge of England. The grand lodge of Ireland was formed in 1729; that of Scotland in 1736.

In the grand lodge of England two offices only are elective, *viz.* grand master and grand treasurer, the remaining offices being in the appointment of the grand master,

a similar custom pertaining to the grand lodges of Ireland and Scotland. The practice varies in the U.S.A. and other countries, but most, and in some jurisdictions all, officers are elected by the members of the grand lodges.

In England when a prince of the blood royal is elected grand master, a pro grand master may be appointed. The head of the craft in Scotland is known as the grand master mason. In private or subordinate lodges, the master, treasurer, and tyler are elected by the members, but it is essential that the master should first have served one complete year as warden.

In 1813 the designation united grand lodge of England was adopted as the official title, on the occasion of the union with some rivals of the original body, who, in 1751, had formed an independent grand lodge, known as the "Ancients," and who eventually secured as grand master the duke of Kent, father of Queen Victoria. He, however, reigned over that body for one month only with the object of bringing about the union. The duke of Sussex then became grand master of the united body, holding the office until 1843. Grand masters since then have been the 2nd earl of Zetland; the marquess of Ripon; the prince of Wales (Edward VII); 1st duke of Connaught; duke of Kent (brother of George VI); 6th earl of Harewood; 10th duke of Devonshire.

The office of pro grand master disappears when a commoner is grand master, but recently that of assistant has been created.

The grand lodge of England has within its jurisdiction 46 provincial grand lodges in England and Wales and 35 district grand lodges overseas. There is not, however, inter-visitation between all the major grand jurisdictions, owing to the fact that a few have ceased to regard it as obligatory on the part of candidates for initiation to declare a belief in the existence of a Supreme Being and the doctrine of immortality, two of the most ancient landmarks

of the craft, set forth in the earliest Book of Constitutions, published in England in 1723. This, by the way, speaks of Inigo Jones, one of the names mentioned in the traditional list, as "our great master mason." The discussion of religious and political subjects also is strictly forbidden in British, American, and Asiatic lodges, although it enters largely into Continental masonry.

The growth of freemasonry has been particularly marked since 1914. An exception to this course appeared in Germany, where the movement was persecuted by the Nazi regime. The grand lodge of England has at least 4,000 lodges within its control, while the lodges, throughout the world number more than 30,000 with an aggregate membership of about six millions.

Benevolent Institutions

Freemasonry the world over is noted for its benevolent activities. In England there are three well-known institutions: the Royal Masonic Institution for Girls, founded 1788, which has a senior school at Rickmansworth, with a junior school and convalescent home at Weybridge, opened 1918, with about 1,000 girls receiving benefits; the Royal Masonic Institution for Boys at Bushey, Herts, founded 1798, with as many boys; and the Royal Masonic Benevolent Institution for Aged Freemasons and the Widows of Freemasons at Croydon, founded 1836, which has nearly 16,000 annuitants on its register.

The First Great War brought into existence the Freemasons' War Hospital in Fulham Road, the outcome of the original scheme for the establishment of a masonic nursing home and hospital, to which it has reverted, the institution (now at Ravenscourt Park) being founded on an endowment fund provided by subscription. It remains one of the few hospitals in the U.K. unaffected by the national health service, thus retaining its original character. In addition to these central institutions every English province and nearly every district has one or more funds for local relief. Ireland and Scotland also have their institutions and benevolent funds, whilst all the American jurisdictions have established various hospitals, crèches, and other institutions. The English headquarters are at Freemasons' Hall, Great Queen Street, London, W.C.2.

The term freemasonry is applied strictly only to what is known as Craft masonry. Outside this parent stock there are several branches.

Freemasons' Hall, Great Queen Street, London, headquarters of the grand lodge of England, opened July, 1933, as a memorial to English Freemasons killed in the First Great War

Royal Arch masonry is governed in England by the Supreme Grand Chapter, Mark masonry (including the Royal Ark Mariner degree) by the Grand Mark Lodge. The next largest masonic body is that of the Antient and Accepted Scottish Rite, followed by the Knights Templar. Other branches are the Allied Masonic Degrees, the Royal and Select Masters, the Order of Malta, the Knights of the Red Cross of Constantine, the Royal Order of Scotland, the Order of the Secret Monitor, and the Societas Rosicruciana. Initiation into Craft masonry is indispensable for admission into any of these subsidiary degrees.

Freeport. A city of Illinois, U.S.A., the co. seat of Stephenson co. On the Pecatonica river, 112 m. W.N.W. of Chicago, it is served by several rlys. Here in 1858 occurred the celebrated debate between Douglas and Lincoln, in which the former proclaimed the Freeport doctrine on the right of a state to decide its attitude to slavery. Settled in 1835, the town became a city in 1855. Pop. 22,366.

Free Port. Harbour which ships of any nation may enter to load and unload goods by paying a uniform toll, and in which dutiable goods can be stored free of customs duty. The plan was developed in Italy in the 16th century for the convenience of merchants importing goods for re-export. It was extended to France, Germany, Copenhagen, Hong Kong, and Singapore. By the treaty of Versailles Germany undertook to lease to Czechoslovakia for 99 years areas in the harbours of Hamburg and Stettin as free ports. By a complementary clause parts of the Elbe, Niemen, Oder, and Danube were declared international waterways. Trieste was reconstituted a free port after the Second Great War.

Free ports may be valuable for countries without direct access to the sea. Their functions can be served by bonded warehouses, where dutiable goods are stored under customs supervision, no tax being payable until they are withdrawn for home use. British experience of bonded warehouses suggests that they may be more helpful to the transit and entrepôt trade than free port facilities, since they ensure adequate accommodation.

Free Reed. In musical instruments in which the sound is due to the vibrations of a reed or tongue the reed is termed free when it is

Freesia. Flowers and leaves of this sweet-scented plant

just small enough to pass through the frame on which it is fitted. When it is a little larger and beats against the sides of the opening, as in organ trumpet pipes, it is called a beating reed or striking reed. Most of the tongues used in the harmonium and American organ are free reeds. See Organ.

Freesia. Small genus (two species only) of bulbous herbs of the family Iridaceae. They are natives of the Cape of Good Hope. They have long, narrow, grass-like leaves and large funnel-shaped white or yellow flowers. *F. leichlinii* has yellow or cream-coloured flowers, and *F. armstrongii*

pure white blossoms, marked with violet lines and sweetly scented.

Free Soil. Name given in the U.S.A., before the total abolition of slavery there, to soil on which it was not permitted. Early in the 19th century the Union consisted of an equal number of slave and free states, each entry of a new slave state being balanced by the entry of a new free soil state.

In 1847, the anti-slavery cause having strengthened, it was proposed to make slavery illegal in all the territories, particularly the district recently secured from Mexico, and so confine slavery to the existing slave states. To support this the Free Soil party was formed. It consisted of both Democrats and Whigs, seceders from their own parties, and was strong enough to secure the nomination of its own candidate, Martin van Buren, for the presidency. He failed, however, and they were equally unsuccessful in 1852, but they sent members to congress and were influential until 1856, when they gave up their separate organization and became merged in the Republican party. The party motto was free soil, free speech, free labour, and free men.

Freestone. Sedimentary rock, usually sandstone, but sometimes limestone, which can be easily worked with the chisel and lacks the usual tendency to split along certain planes. It is extensively used in architecture for mouldings.

FREETHOUGHT AND FREETHINKERS

* Joseph McCabe, Writer on Rationalism

The point of view of the freethinker, as that of believers in the various religions, is the subject of an article in this Encyclopedia. See also Apologetics; Christianity; Dogma; Rationalism; Renaissance

Though the appellation "freethinker" has not entirely lost the aspersive sense which generally attached to it among Christians from the time of its coming into common use (c. 1700), the term "freethought" may now be regarded as a scientific label for the attitude of mind which challenges all demands for belief on grounds of traditional or documentary authority. Broadly considered, this attitude reacts in the same way against historical and other propositions as against religious dogmas and narratives; but inasmuch as the latter have always made the most menacing claim to uncritical acceptance, it is to the critical refusal of acceptance in their case that the term has always been commonly applied.

On a wide survey it becomes certain that while the normal

attitude of the untrained mind towards all serious or minatory assertion concerning the unknown is one of credulity, there has occurred at all stages of human development some amount of variation towards rational doubt. Alike among savages, among barbarians, and among the more civilized peoples of all times and countries, there has always been a varying minority of minds who spontaneously doubted more or less the truth of current myths, legends, and dogmas. The "sceptical" attitude is thus a natural variation, like another, and it depends for its spread upon the totality of the circumstances which check or make for free discussion. These may be simply economic, or largely cultural or political.

Inasmuch as religious systems are readily able to employ all three

factors, the assailing doubt generally suffers from that disadvantage; but even in a primitive community the economic factor may at times be negatively on the side of freedom, as when a series of famines may lead to the extinction, as impostors, of all the "rain-makers" of an African people. The primary bias to doubt, however, being by far less common than the contrary, freethought in progressive conditions is always a matter of resort to methods of rational appeal (whether well or ill conducted) as against the common bias to belief reinforced by "authority" on social, political, and economic lines.

That both attitudes are in some degree primarily temperamental is indicated by the significant fact that many adherents of a modern orthodoxy are found to show a spontaneous animus against ancient "freethinkers" as such, though the beliefs which those doubters rejected as false are also rejected as false by their modern assailants, and often described by them as pernicious.

Historically speaking, it is broadly certain that freethought spreads in the ratio of the culture contacts of peoples, whether by way of simple intercourse or of literary communication. The mere differences of early religious beliefs, being so marked and so innumerable, constitute a propulsion to doubt when they are simply noted. Where the doubt has most intellectual elbow-room it will be most developed.

Ancient Times

Thus, while doubt concerning the gods can be seen among the priestly circles of ancient India, Babylonia, and Egypt, to lead to a compromise on the lines of a pantheism which conserved the old cults upon economic motives, in the freer world of republican Greece, which enjoyed the maximum of culture contact and free discussion, and had the smallest development of priestly organization, the critical process was both more general and more searching. Josephus, in his diatribe Against Apion, expressly reproaches the Greeks with the multiplicity and divergence of their historical reconstructions as contrasted with the unquestioned uniformity of tradition among his own race.

The very fact that that tradition had undergone much priestly manipulation in the historic past had passed out of orthodox Jewish knowledge; the Jewish community having come to represent a selection or survival of conformists and devout believers from among a

race which had parted with multitudes of its doubters.

In that case the retaining power had been the successfully established cult of the Sacred Book. In Greece there was neither Sacred Book nor centralized priesthood. And the subsequent history of freethought turns mainly on the faith-commanding power of Sacred Books, whether in subordination to or in alliance with other factors. Roughly speaking, the history of the Catholic Church down to the Reformation consisted in the subordination of the authoritarian claims of the Sacred Book to those of the hierarchy, the former having been found to involve constant risks of destructive schism.

Protestantism and Schism

This was freshly illustrated in the schisms which rapidly overtook Protestantism, when that movement erected the claims of the Sacred Book to belief above all others; and to such schism the Catholic hierarchy were able to point as discrediting Protestantism from the point of view of the general bias of faith.

Since the Reformation, the history of western freethought has been one of more or less continuous gain in intellectual prestige as against the authority of the Sacred Book in Protestant countries and that of the hierarchy in others, the lines of advance being those of science, historical criticism, ethics, and democratic politics. The bias of faith may often be found still subsisting in promoters of all of those movements; but the collective result is a growing proclivity to the critical method, broadly known as that of rationalism.

Perhaps the most generally disintegrating process is that which systematically develops the early factor of culture-contacts by the scientific comparative study of all the primitive forms of religion, from which the later are now generally recognized to derive. Religious beliefs are thus themselves in a state of increasingly rapid change, even among biased believers; and the critical process, grounded on the sciences and rationalistic ethics, becomes increasingly confident, even while growing less polemical.

The historic process has been, as regards the more educated classes or sections, one of action and reaction. In post-medieval and Renaissance Italy, clerical abuses promoted freethought; and in France and England after the Reformation it advanced considerably after periods of religious strife, being active in the later years of Elizabeth, and again after

the Restoration. Yet again, as a result of both scientific and scholarly progress, it spread greatly, under the form of Deism, in the England of the first half of the 18th century.

Commercial and imperial expansion and the Methodist Revival later weakened the intellectual activity, which, however, was taken up in France, then ripening for the Revolution; whereafter political reaction in both countries produced a reign of conformity in the middle and upper classes, leaving the new democratic freethought partly at work among the lower, in so far as they were accessible to propaganda.

An organized freethought propaganda, mainly democratic, is a notable feature of the second half of the 19th century, alike in Britain, the U.S.A., France, Germany, and other European countries. Proceeding as it did on the subversive criticism alike of science and scholarship as against the Sacred Book, it was most active in the period of active religious resistance to such criticism, flagging as a specific activity when the Churches in general began to accept that criticism, thereby weakening their own foundations and turning belief into a passive rather than an active force.

Influence of Freethought

The relative subsidence of specific freethought propaganda is thus a mark of its success, the educative process being thenceforth carried on by the specific activities of science and ethics and general truth-seeking research. Churches which a few centuries ago were shedding blood for supernaturalist doctrines of sacraments, and later were battling against Deism for the divinity of Christ, are now concerned to prove His mere historicity.

Throughout civilized Europe, while a measure of social ostracism still falls in some countries upon those who openly reject the whole body of traditional religion, the shifting of the religious ground has greatly weakened the power of the Churches to resort to forcible suppression of criticism, and the economic and cultural obstacles to freethought are really the more powerful. In Great Britain it has been gradually recognized that persecution merely multiplies the assault, giving it new economic resources through popular interest and sympathy. Alike in the time of Thomas Paine and in that of Charles Bradlaugh, persecution greatly strengthened the popular movement. At the same time, growing knowledge of all kinds weakens

both the temper and the social basis of persecution; and churches whose clergy are pronounced heretics from the point of view of their own official creeds are largely incapacitated for repressive measures. Many eminent literary men of the last generation having committed technical "blasphemy" in a supreme degree, that offence is now never prosecuted in Great Britain save when it contravenes police regulations.

During the 20th century the economic factor has been operative. Between 1920-30 freethought in alliance with Communism captured tens of millions of workers in Asia, Europe, and S. America. Fascism, on the other hand, owing its existence to "regimented" thought, condemned all free thought as such.

Bibliography. History of the Warfare of Science with Theology in Christendom, A. D. White, 1896; History of English Rationalism in the Nineteenth Century, A. W. Benn, 1906; The Censorship of the Church of Rome, G. H. Putnam, 1906-07; Rise and Influence of the Spirit of Rationalism in Europe, W. E. H. Lecky, 1865, repr. 1910; A History of Freedom of Thought, J. B. Bury, 1914; Short History of Freethought, J. M. Robertson, 3rd ed. 1915.

Freetown. Seaport and capital of Sierra Leone, British West Africa. The town is situated on the Sierra Leone river, with wooded mountains to the S. and E., at the N.W. extremity of the Sierra Leone peninsula. European residences are on the highlands, reached by a mountain rly. Freetown was founded as Granville-town in 1788 as a home for liberated African slaves.

The harbour is the finest and one of the most important in W. Africa. A rly. runs inland to Pendembu, a distance of 228 m. Motor roads have been constructed and there is connexion by air with Great Britain. The town possesses a cathedral and several educational establishments. The chief exports are iron ore, palm kernels and oil, kola nuts, cocoa, diamonds, ginger, and hides. Free-

town was a naval and R.A.F. station during the Second Great War and a terminal of the aeroplane ferry route across Africa. Pop. 55,359.

Free Trade. Trade free from any restrictions. The term is used particularly to denote the system in which (a) goods from abroad are allowed to enter a country without payment of customs taxes greater than the excise taxes levied on similar goods produced within the country; and (b) goods can be imported without government licence.

The theory of free trade depends on the belief that all trade is advantageous and increases total wealth because it permits greater division of labour and enables people to specialise according to their aptitudes. Trade between nations makes available to other countries the special qualities of individual countries (minerals, vegetation, climate, etc.). The more trade between countries can be increased, the greater the geographical division of labour and the greater the total wealth produced. Conversely, any restriction causes economic resources (land, labour, and capital) to be used in ways that are not the most suitable, and so lessens total income. A free trade nation can export the goods which it can produce at the least comparative cost and can receive in exchange goods which it could manufacture only with more productive units (land, labour, capital).

Adam Smith in *The Wealth of Nations* (1776) cogently argued the case for free trade, but the Napoleonic wars prevented its immediate adoption. In 1823, however, various import duties were removed, and during the following twenty years this process continued. In 1846 the Corn Laws, designed to keep out foreign wheat, were repealed. By 1860 the U.K. had changed from a highly protected to a free trade regime, and for the next 50 years practised the "policy of plenty."

The country progressed greatly, in population, national income, foreign trade, shipping, etc. But other countries, such as Germany, with a strong protectionist policy, also flourished. The ideal of a free trade world did not materialise. Faith in Great Britain's isolated practice of free trade wavered, and by 1903 Joseph Chamberlain was urging tariff reform and imperial preference; until 1914 these matters were party politics. During 1914-18 the free trade policy was partially abandoned by the imposition of the McKenna duties (1915) to save cargo space, and imperial preference (giving lower duties on Empire produce) was extended to "key industries." In 1921 the latter was intensified, and the Safeguarding of Industries Act was passed. This imposed high taxes on numerous classes of imports in order to protect industries established during the war. In 1932 free trade was fully abandoned by the introduction of a comprehensive protective tariff. Since then the U.K. has found it necessary also to resort to a system of quotas, licences, exchange controls, etc., more elaborate than that ridiculed by Adam Smith.

Great Britain's experience suggests that although free trade may bring maximum income, this may be less desirable to a country than (a) diversified industries; (b) the encouragement and maintenance of industries important for defence; (c) the ability to protect itself against fiscal and political changes in other countries and against inventions, discoveries, and technological changes that might lessen its ability to sell goods abroad and render specialised equipment and skill obsolete. Extreme specialisation is dangerous in a changing world. Thus free trade remains an ideal rather than a practical policy. The expansion of world trade is now being sought within an elaborate framework of protective duties.

Free Wheel. Term given to a gear or pulley wheel which is provided with a clutch or detent in such a manner that the wheel may either turn with the axle on which it is placed or rest idle on the axle, while the latter turns. In the former case the wheel is working, in the latter idle. A now familiar example is provided by the common bicycle and another by certain forms of lawn-mowers in which the wheel "works" when the mower is moved forward, but is idle while the machine is moved

Freetown, Sierra Leone. Panoramic view from the sea of this British West African port; its fine harbour makes it an important trade centre

backwards. The principle of the free wheel has been applied to motor vehicle transmission with the object of making gear changing easy and of allowing the vehicle to run freely without driving the engine on downward gradients. The use of a free wheel between gear box and propeller shaft simplifies gear changing greatly, since the gear box is completely isolated from the transmission and the engine whenever the clutch is disengaged. *See* Cycling; Motor Vehicle.

Free Will. The theory that man is able at any time to take any action physically possible, whatever may be his circumstances, character, or past history. In practice it is now as a rule restricted to moral decisions. Belief in freedom of the will is general for the following reasons. We cannot predict our own future decisions. We have a strong feeling that we are choosing freely between solutions; even the chronic drunkard tells himself that the glass he is drinking now will be the last. During severe mental struggles we suffer from painful doubts, the issue seems uncertain, and may be decided by what appears on the surface to be a trivial coincidence. Free will gives an answer to the unacceptable argument that since God made both man and the universe He must be responsible for the evil in that universe.

The concept is not used in psychology, which is based on the principle that every event has its sufficient cause. The factors which govern moral decisions are known and follow the general laws which govern mental conflicts. Some of the causes of behaviour are compulsive. Many are unconscious, and it is this which makes it impossible for us to foresee the outcome of some moral struggles. The term free is therefore used to mean that reason is being employed in the present situation, and that the decisions of the mind are not dominated by morbid symptoms, misplaced emotions, buried memories, etc. *See* Determinism; Obsession; Unconscious; Will.

Free Will Baptists. Arminian section of the Baptist denomination in America, corresponding to the General Baptists in Great Britain. Originating about 1780 through the preaching of Benjamin Randall, one of Whitefield's converts who joined the Baptists, they separated from the Baptist body, which at that time was strongly

Calvinistic, and taught Arminian doctrines. *See* Baptists; Calvinism.

Freezing. Metallurgical term. When a liquid metal is cooled through its freezing point, the regular drop in temperature is arrested for a time by the change to the solid state. Pure metals and certain alloys freeze at a constant temperature, but most alloys apart from eutectics and inter-metallic compounds freeze over a range of temperature, through which part of the mass is solid and part liquid. Molten metals have amorphous structures, the atoms being distributed at random, but on freezing the atoms arrange themselves into a systematic crystal lattice. X-ray examination shows that the internal structure is beautifully symmetrical.

Solid metals are sometimes frozen in the solid state by immersing in liquid air or carbon dioxide, when advantage may be taken of the resulting contraction. In the engineering industry valve seatings, etc., may be frozen before insertion into the engine body. When the metal returns to normal temperature, it expands and makes a tight, immovable fixture.

Freezing. In finance, the immobilising of monetary assets, particularly those of foreign nationals. Normally vast sums are held in, e.g., London, and in British investments, by foreigners, and these are freely usable by the foreign national and transferable, through the foreign exchange market, abroad. At a time of national emergency it is necessary to prohibit or restrict such operations, and money may, therefore, be frozen by government decree. Frozen funds cannot be used by the holders, even within the country. Their use for his overseas purchases is prohibited, and his own war effort thereby hindered. By restricting the use of money belonging to neutrals, its possible transfer to the enemy is prevented.

Control of foreign funds in Great Britain during the Second Great War was complicated and extensive. Not only were the holdings of the enemy completely frozen, but also those of countries, including the Channel Islands, overrun by Germany. Funds belonging to certain neutral countries could be transferred abroad or used in Great Britain for purchases within limits laid down by the Treasury. By a decree of June 17, 1940, on the capitulation of France, President Roosevelt froze all French assets in the U.S.A. Germany

practised freezing before 1939, and certain Spanish assets were frozen during the Civil War of 1936-39.

Freezing Machine. Double pail for making ice-cream. Ice and salt, broken very small, are packed into the outer pail in layers of three inches of ice and one of salt nearly to the top. The cream mixture is poured into the central pail, which is provided with a dasher, its handle passing through a hole in the top; this is turned until the mixture is set. *See* Ice Cream.

Freezing Mixture. Mixture of two substances, usually ice or snow and some kind of salt, which produces great cold. When common salt is added to snow (or powdered ice) which is at 0° C., its first effect is to lower the freezing point of that part of the snow with which it is brought into immediate contact; some of the snow is accordingly melted and forms a strong solution of salt. In this solution the molecules of water and salt enjoy much greater freedom of motion than in the solid form, and require extra energy, which is provided in the form of great heat from the surroundings. Thus the temperature of the snow is reduced below its normal freezing point, and at the same time the saline solution melts more snow, this process continuing until a limiting low temperature is reached at which the whole mixture freezes. A temperature of -21° C. can be reached in this way with a mixture of snow and common salt, but by the use of other salts which dissolve with greater absorption of heat much lower temperatures can be obtained. For example, calcium chloride in its crystalline form, mixed with snow in the proportion of 10 parts to 7, will produce a temperature of -55° C. *See* Refrigeration.

Freezing Point. Temperature at which a solid and a liquid are in equilibrium at a given pressure. In other words, the freezing point of a liquid is the melting point of a solid. The freezing point of water, that is, the temperature at which it changes into ice, is one of the fixed points on the thermometric scale (0° Centigrade, 32° Fahrenheit). Liquids may be roughly divided into two classes as regards the properties they exhibit in the process of freezing. Water undergoes crystalline solidification, in which there is a change of volume, and the liquid gives out a definite quantity of heat, called the "latent heat," in its abrupt change to the solid form. Molten glass is a liquid which undergoes "amor-

phous" solidification; as the temperature falls the glass ceases to run freely, and becomes viscous, then gradually hardens into a solid. The second class of liquids can hardly be said to have a definite freezing point, although the corresponding solids have a melting point, *i.e.* the temperature at which they begin to run.

With the first type, in which freezing is an abrupt change, it is significant that the freezing point is not absolutely constant, but varies under pressure. Water expands when it freezes, and the effect of pressure is to lower the freezing point. This accounts for the slipperiness of ice, the surface becoming water under pressure. Paraffin wax, on the other hand, contracts in freezing, and here the effect of pressure is to raise the freezing point. Those liquids which can solidify only by expanding are hindered from freezing by external pressure; those which have to contract in order to freeze are helped by external pressure.

The freezing point of a liquid is lowered by the presence of a salt dissolved in it. Thus a solution of common salt in water will not freeze until its temperature has been lowered considerably below the freezing point of pure water. The reason for this appears plainly from the molecular theory. According to this theory the molecules of water, which in the liquid form have considerable freedom of movement, have to occupy definite relative positions when the water assumes the form of ice. When pure water is cooled to 0° C., the energy of the molecules is sufficiently diminished to allow attractive forces to come into play, under which the molecules assume the positions required for freezing, but the presence of particles of salt in the solution hinders this process, and the energy of the molecules of water must be diminished by a further reduction of temperature before solidification can take place. See Freezing Mixture; Temperature.

Freiberg. Town of Germany, in Saxony. It stands on the river Muzbach, a tributary of the Mulde, 20 m. S.W. of Dresden, and was the mining centre of the Erzgebirge. Around are exhausted silver and lead mines, while the town had an old and celebrated school of mines. Other industries are the manufacture of textiles, silver, iron, and brass goods, cigars, thread, chemicals, beer, leather, and china. The chief building is the 12th century

Gothic cathedral, restored in 1893, and containing a famous doorway, called the Golden Door, which has some magnificent sculptures.

S. Peter's church is noteworthy, and there are old houses and remains of the town walls, parts of which have been turned into promenades. The town grew up around the castle of Freudenstein, which became a residence of the dukes of Saxony. One of them rebuilt it in the 16th century. The silver mines were opened about 1250. The town lay within the Russian zone of occupation after the Allied conquest of Germany in 1945. Pop. 36,448.

Freiburg-im-Breisgau. City of Baden, S. Germany. Distinguished by its beautiful Gothic cathedral and famous old university, it stands between the W. slopes of the Black Forest and the Rhine, on the little river Dreisam, 40 m. S. of Strasbourg. A well preserved inner town of mainly medieval character was surrounded by modern outskirts with fine public buildings and thriving industrial suburbs. The cathedral, with the only Gothic tower completed in Germany in the Middle Ages, is built upon Romanesque foundations, begun about 1200; the spire in red sandstone and an altar by Hans Baldung rank among the world's masterpieces. The cathedral was damaged and much of the old town wiped out by heavy air raids during the Second Great War. The French 1st army captured the city April 21, 1945.

Four other old churches built between the 13th and 18th centuries, two town halls (1559 and 1543-82), some fine merchants' halls, archbishop's palace, and the university, mostly modern, though founded in 1457, were other features. Textiles, engineering, electrical and musical industries, a rly. and air line junction, and its rôle as a centre of the wine trade, contributed to Freiburg's importance. Founded in 1120, it belonged to Suabian and Hapsburg rulers, was several times annexed by the French, and from 1805 was in Baden. Pop., pre-war, 111,860.

Freight. Word derived from the Dutch, and meaning originally the burden or cargo of a ship. Hence it came to mean the rate paid for the carriage of goods by sea, and in this sense it is now chiefly employed. It is used in the U.S.A. for the carrying of goods by land, and railway freights is a common term, while a freight train is the equivalent of the goods train of Great Britain.

Freiherr. A German title. It means free man or free lord, its origin being like that of baron. At first it embraced the whole peerage, until in the 16th century the emperors began to bestow it as a special title. All German sovereigns until 1918 retained the right to create *Freiherren*, who rank after the counts or *Grafen*. The title is hereditary. See Baron.

Freiligrath, FERDINAND (1810-76). German poet, born at Detmold, June 17, 1810. His first volume of poems appeared in 1838. Beginning with *Ein Glaubensbekenntnis* (A Confession of Faith), 1844, he wrote some of the finest of Germany's revolutionary songs. After the failure of the revolution, he was an exile in London, until the amnesty of 1866. He died March 18, 1876.

Freising. Town of Germany, in Bavaria. It stands on the left bank of the Isar, 18 m. N.N.E. of Munich, and its chief industries are the making of agricultural machinery, brewing, and printing. Founded in 724 and an important ecclesiastical centre in the Middle Ages, it is famous as the seat of the Bavarian brewing academy, in a former Benedictine abbey. The cathedral, parts of which date from the 12th century, was restored and altered in the 17th century. There are remarkable churches, including S. Benedict's, a Rathaus, and the palace of the bishops. Otto of Freising, the chronicler, was bishop here in the 12th cent. Pop. 15,126.

Fréjus (anc. *Forum Julii*). Town of France in the dept. of Var. It stands on the Gulf of Fréjus, 22 m. S.W. of Cannes, and is an old Roman station containing many Roman remains. It has been an episcopal see since the 4th century, and parts of the cathedral date from the 12th century. Though it was a flourishing seaport in ancient times, the silting of the river Argens has now filled the harbour, and the town is a mile from the coast. It was liberated by the Allies Aug. 16, 1944, the day after the Allied landings in the S. of France. Pop. 12,907.

Fremantle. Seaport of W. Australia. It stands at the mouth of the Swan river, 12 m. S.W. of Perth, with which it has rly. and river communication. It has a well equipped harbour, with depth of 36 ft. at low water, and is a port of call for European mail boats. Surf bathing is available. Among the chief buildings are a fine town hall (1887). Industries comprise smelting, iron founding, engineering, sawmilling, and boat building,

and there are flour mills, dehydrated food factories, breweries, tanneries, and leather manufactures. Wheat and timber are exported. Pop. 29,200.

Fremantle, SIR EDMUND ROBERT (1836-1929). English sailor. He was born in London, June 15, 1836, a younger son of the 1st Lord Cottesloe, and entered the navy in 1849. He saw service in Burma, 1852; New Zealand, 1864-66; and Ashanti, 1873-74. Promoted rear-admiral in 1885, he was commander-in-chief in the East Indies, 1888-91; in China, 1892-95; and at Plymouth, 1896-99. Knighted in 1899, he retired with the rank of admiral, and died Feb. 11, 1929.

His son, Sir Sydney Robert Fremantle, was born Nov. 16, 1867, and entered the navy in 1881. He was promoted captain 1903 and served in the Dardanelles, 1915, later being appointed deputy chief of the naval staff. In 1919 he was given the command of a battle squadron of the Atlantic Fleet and was c.-in-c. at Portsmouth, 1923-26. Knighted in 1919, he retired in 1928.

Fremitus (Lat. roaring noise). Vibration produced in the chest when the patient speaks, and in certain abnormal conditions, such as some forms of pleurisy or catarrh simply by breathing. It is detected by the palm of the hand placed flat upon the chest, and its presence or absence may form a useful diagnostic sign in respiratory disease.

Frémont, JOHN CHARLES (1813-90). American explorer. Of French extraction, he was born at Savannah, Georgia,

J.C. Frémont

Jan. 21, 1813. Graduating at Charlestown College, 1836, he accompanied a survey party through Georgia, N. Carolina, and Tennessee in 1837,

and surveyed Nebraska, Dakota, Minnesota, and Iowa, 1838-40. During 1842-54 he explored Oregon, California, and New Mexico, and did much to open up the far west to settlers.

A senator in 1850, he was nominated Republican candidate for the presidency in 1856, but his anti-slavery sentiments angered the Southern states and he was defeated by Buchanan. In the Civil War, 1861, he was major-general in command of the W. division at St. Louis. The rly. crisis of 1873 ruined him financially, but he was

governor of the territory of Arizona, 1878-81. He died in New York, July 13, 1890. *Consult* Life, A. Nevins, 2 vols., 1928.

Frémont's Peak. Mountain of the Rocky Mts., U.S.A. In Wyoming, it is the highest point in the Wind River Mts., being 13,781 ft. high. It was ascended in 1842 by John C. Frémont, hence its name. Frémont's Pass is in Colorado in the Rocky Mts. It is 11,300 ft. high.

French. River of Ontario, Canada. It drains Lake Nipissing, flowing from it S.W. for about 55 m. into Georgian Bay. This was the route by which early French explorers reached Lake Huron (hence the name), and for 150 years formed the regular approach to the Upper Lakes.

French, SIR JOHN. The leader of the British Expeditionary Force, in 1914, later took the title of earl of Ypres and is so described in this work.

French, LESLIE RICHARD (b. 1904). British actor and dancer. Born at Bromley, Kent, April 23, 1904, he was educated at the London School of Choristers and for four years sang solos at ballad concerts and churches in London. In 1918 he joined the Ben Greet company. Performances as Feste, Puck, and Ariel established his reputation as a Shakespearean actor of grace and originality, and he played for successive seasons at the Open Air Theatre, Regent's Park. In ballet his performance as Everyman was notable.

French Church. The outlook of many generations of Frenchmen on their country's relations with Rome is described under the heading Gallican Church.

French Cricket. Game for any number of players, when restricted space or lack of equipment prevents the playing of cricket. The batsman normally uses a cricket bat; the ball should also be that used for cricket. All those not batting join in trying to bowl the batsman—by striking him on the leg below the knee with the ball—or to catch him out. Runs are scored by passing the bat completely round the legs. The batsman stands with his feet together. He must not move them, and therefore endeavours to score only in front of him.

French Horn. Most important brass instrument used in the orchestra. It is of tenor compass, and of mellow, vocal tone. *See* Horn; Orchestra.

French National Committee. Committee formed in London with the consent of the British govern-

ment by General de Gaulle during the Second Great War. *See* Gaulle, General de.

French Polish. A solution of gums or gum-resins employed to give a polish to wood. The process of producing the polish on the wood is known as french polishing. The composition of french polish varies according to the preference of the worker. Shellac is always the main ingredient, and the solvent is alcohol (spirits of wine, methylated spirit, or finish). Finish is spirit denatured by the addition of shellac (3 oz. to a pint), so that it can be sold duty free and without the seller being licensed.

The simplest form of polish consists of a solution of 6 oz. of shellac in a pint of spirit, but when other ingredients soluble in spirit, such as mastic, sandarac, elemi, thus, or benzoin are included in the formula, the quantity of shellac is correspondingly reduced.

The process of french polishing is really a series of operations consisting of (1) preparation of the wood; (2) polishing; and (3) finishing. The surface of the wood is made as smooth as possible by glass-paper, and is then subjected to a process of filling in the pores of the wood with a paste of plaster of Paris or whiting and linseed oil. The filler is coloured according to the nature of the wood. The colour of the wood is also darkened at this stage if desired by suitable colouring matters. The surface of the wood is again smoothed with sand-paper and the french polish applied. A pledget of woollen rag or cotton wool is saturated with the polish and enclosed in a piece of close-textured cotton fabric, so as to make a smooth, hard surface. A few drops of linseed oil are applied to the face of the pad, acting as a lubricant, and the pad is rubbed on to the wood with a free, continuous and circular movement. More french polish is applied to the cotton wool pledget from the back as it is found necessary.

The spirit evaporating during the polishing leaves a hard surface of shellac on the wood. The first polish may, after an interval, be rubbed down with fine sand-paper, and the polishing repeated until a uniform surface is obtained. This is allowed to remain for a few days when the finishing process is carried out, i.e. wiping the surface with the pad soaked with thinner polish, and finally with a small quantity of spirit. The polishing process demands knack, experience, and skill not often acquired by the amateur.

FRENCH REVOLUTION, 1789-1795

A. D. Innes, Author of *A General Sketch of Political History*

This article deals with a special movement in French and European history. See the articles on Mirabeau, Robespierre, and the great figures of the Revolution; those on Directory; Feuillants; Girondists; Jacobins, etc. See also Europe. France; Louis XVI; Napoleon

The French Revolution is the name given to that period of volcanic upheaval in France, usually reckoned as beginning with the meeting of the States-General in May, 1789, and closing with the establishment of the Directory in Oct., 1795. Its ideal was set forth in the three words Liberty, Equality, Fraternity. In form it was a terrific convulsion; its methods trampled its principles in the mire; it issued, not in democracy, but in Caesarism. Nevertheless it undermined the foundations of the old order of privilege, and inaugurated the long struggle for the political, social, and economic emancipation of the masses of the European population.

France in 1788 had reached the stage at which drastic reforms had become a sheer necessity; failing reforms, the only possible alternatives were a stormy revolution or the establishment of an irresistible tyranny. Her political system, consummated under Louis XIV, was an uncompromising absolutism which allowed the people no share whatever in the government. The king ruled through ministers whom he appointed or dismissed at his own pleasure—ministers nearly always chosen from the aristocracy,

and responsible to no one save to the king himself. Socially, the population was divided into rigid castes, forming primarily three groups, the *noblesse* or aristocracy of birth, the clergy, and the commons. In France all the members of a noble family remained of the *noblesse*, not commonsers at all, from generation to generation. The clergy were separated from the rest not by birth, but by the rule of celibacy and by their sacred functions.

In the towns there was a middle class—the *bourgeoisie*, professional men and traders—and a working class; in the country districts the peasantry were virtually the serfs of the *seigneurs*, the landed proprietors who owned the soil, to whom they were legally bound to render payments and unpaid services, and who exercised a broad jurisdiction over them. Economically, *noblesse* and clergy were almost exempt from taxation. The whole burden of providing the national revenue, the cost of the court, of war, of administration, was on the shoulders of the commons, and pressed most heavily upon the peasantry, who were least able to bear it. There was no liberty of the individual.

But the seeds of change had been sown by the "intellectuals." The mockery of Voltaire had shattered the sense of reverence for conventions. The writers in the *Grande Encyclopédie*, D'Alembert, Diderot, and others, had challenged all the principles upon which the social and political structure was based. Jean Jacques Rousseau had propounded palpably revolutionary doctrines, notably in his *Contrat Social*, teaching that the organization of society rested upon an original contract imposed by the strong, for their own interest, upon the weak, claiming that the ultimate authority is the Will of the People, and insisting upon "natural rights," the Rights of Man.

With a light heart France, in order to injure England, had taken the part of the Americans, and French aristocrats, unconscious that they were sporting on the crater of a volcano, played gaily at advocating those same revolutionary ideas. Meanwhile France was rushing towards bankruptcy, the result of accumulated expenditure upon wars of aggression from which there had been but very brief respites during the last century and a half.

The immediate cause of the cataclysm was this financial chaos. The crushing burden of taxation and forced labour imposed upon the unprivileged classes, the obvious need for reorganization, the opposition persistently offered to any

French Revolution. The mob invading the Tuileries palace in an attempt to intimidate the king and queen, June 20, 1792

From a drawing in the Louvre, Paris

reorganization by the privileged classes, the disastrous failure of a succession of incompetent ministers to discover any remedy for the chaos, led to the suggestion that the Government should consult the nation by summoning an Assembly of the three estates, *noblesse*, clergy and commons, an obsolete form of a National Assembly which had not been called together for the best part of two centuries.

In Jan., 1789, the States-General was summoned. At the beginning of May it assembled, the Third Estate, or commons, appearing by its elected representatives, among whom were included a sprinkling of aristocratic sympathisers. It was apparent that, if the three estates voted as separate chambers, as the government intended, the two privileged chambers would be in permanent agreement, resolved to

French Revolution. Enrolling volunteers to serve in the Revolutionary armies
From a picture by Finchon, at Versailles

14 the mob marched upon the Bastille, the fortress-prison which

Armed Paris organized itself as the National Guard. The fall of the Bastille was hailed as typifying the fall of the old order. The National Guard was placed under the command of the popular nobleman Lafayette; it adopted the tricolour for its colours. All over the country mobs rose, and the down-trodden peasantry turned their fury upon the châteaux of the seigneurs, while payment of taxes was refused. The whole machinery of government had broken down, though some semblance of order was preserved by the efforts of the middle classes and by the organization in the provinces of National Guards after the Paris model.

On the other hand the king, Louis XVI, a man hopelessly lacking in insight, but with the best of intentions and abundant personal courage, won a moment's popularity by boldly presenting himself in Paris, obviously at the risk of

French Revolution. Roll call of the last victims of the Reign of Terror, 1794. The seated figure in the centre is André de Chénier, who wrote his most famous poems in the prison of Saint-Lazare

From a picture by O. L. Müller, at Versailles

surrender no fraction of the privileges which in their view constituted the safeguards of society. The voice of the Third Estate would count for nothing unless all the chambers voted together, giving the preponderant voting power to the preponderant numbers of the Third Estate.

This was the first battle-ground, and the fight was won by the Third Estate, led by the aristocrat Mirabeau. Its delegates assumed the title of the National Assembly, and were joined by many of the representatives of the lower clergy. The sympathies of the whole population of Paris and the whole rank and file of the soldiery were with them. An appeal to force was too dangerous to be attempted; the government gave way and the Estates were constituted as a single chamber.

The court sought to save itself and to overawe Paris by means of mercenary regiments, Germans and Swiss. Paris armed itself; on July

stood as the material embodiment of the old system, and stormed it.

French Revolution. The arrest of Robespierre amidst the turmoil and strife of the night of 9-10 Thermidor, 1794

From a contemporary print

his life, and mounting the tricolour cockade. Popular hostility, however, was directed not against him but against the arrogance and the privileges of the *noblesse*. These, the enthusiasts declared, were at the root of the woes of France; and on Aug. 4 the National Assembly decreed the abolition of the whole mass of the obnoxious privileges; after which it set about formulating a constitution, taking to itself the title of the Constituent Assembly.

While the Assembly continued its work of wholesale abolition and wholesale reconstruction, the king was kept virtually a prisoner in Paris; numbers of the nobility were fleeing or had already fled into a voluntary exile in the hope of eventually recovering their lost privileges by force; and outside the Assembly was organized the political association of reformers known as the Jacobin Club, which derived its name from its meeting place, the Dominican or Jacobin convent of the Rue S. Jacques. The club, affiliating to itself similar clubs all over the country, became a great political power.

Death of Mirabeau

It is conceivable that Mirabeau, if the court party had placed itself unreservedly in his hands, might have succeeded in effecting a reconstruction combining a monarchical executive with a democratic legislature, capable of providing a strong government with popular sympathies; but the court party had few ideas apart from striving to paralyse the activities of the Assembly, in which they were aided by the extremists of the other wing. The last chance, such as it was, perished with the death of Mirabeau on April 2, 1791. The king, finding himself helpless, resolved upon flight. He attempted to execute the design (June), but was detected and stopped at Varennes as he was nearing the frontier, and was brought back.

The flight to Varennes and the documents which Louis had left behind made it clear that the king was antagonistic to the constitution which had been designed, also that it was probable he would seek to evade it or overturn it. There was more than excuse for the suspicion that he and his wife, Marie Antoinette, if they had crossed the border, intended to appeal to the crowned heads of Europe and more particularly to the queen's brother, the emperor Leopold II. The *émigrés*, the fugitive *noblesse*, notable among whom was the king's brother, the count of Artois (afterwards Charles X), were already clamouring for armed intervention from abroad.

Leopold, in conjunction with the king of Prussia, issued the declaration of Pilnitz—a warning that the Powers could not recognize the existing French government until the reinstatement of the king, and threatening intervention should the Powers be unanimous—a perfectly safe threat, since Leopold knew that the Powers would not be unanimous. On the other hand, the declaration was calculated to silence the *émigrés*.

The Legislative Assembly

Meanwhile in France the more advanced democrats were calling for the deposition of the king, even for the declaration of a republic. Moderates like Lafayette, men who two years before had been regarded as the leaders of the advance guard, rallied to the monarchy and urged on the king the adoption of the constitution promulgated by the Assembly. His acceptance reinstated him as king, with limited powers. The constitution provided for the appointment of a new Legislative Assembly in which all members of the National Assembly were prohibited from sitting.

The members of the National Assembly had at least attained some experience of administrative functions; the members of the new Legislative Assembly were without experience at all, and were for the most part doctrinaire republicans. On the reinstatement of the monarchy the declaration of Pilnitz was withdrawn. But it had had a fatal effect upon which Leopold had not calculated. Its subtle intention was misunderstood in France, and it was regarded simply as an insolent attempt on the part of foreign Powers to dictate to France on a domestic question with which they had no concern.

In the Assembly there were three main groups besides the infinitesimal sprinkling of thorough-going royalists: the Feuillants or Constitutionalists, the Girondins, who came from the department of the Gironde and may be described as literary republicans; and the ultra-democrats, now identified with the Jacobins. The Feuillants and the Girondins were both disposed to adopt a highly aggressive attitude towards the foreign Powers and the *émigrés*. Louis found himself forced to discard his royalist ministers and put Girondins in their places. Though the Jacobins held aloof, for which the leaders outside, Danton and Robespierre and Marat, had their own reasons, Louis was compelled to declare war upon Austria at the moment when the emperor Leopold died

and was succeeded by Francis II (March, 1792).

Dumouriez, the new war minister, had again developed Louis XIV's conception that the borders of France should be extended to her "natural boundaries," the Rhine, the Alps, and the Pyrenees. Patriots hastened to join the as yet ill-organized armies on the frontiers. Ill-success was attributed to the aristocratic officers. Riots broke out in Paris, the mob invaded the Tuileries and insulted the king and the royal family. Prussia declared war in alliance with Austria—it must be remembered that at this time the Netherlands belonged to Austria, and the modern Belgian frontier was then the Austro-French frontier. The duke of Brunswick, on behalf of Prussia, issued a threatening manifesto which filled Paris with wrath. The Jacobins had captured the Commune (the government of Paris), and virtually dominated the Legislative Assembly.

The Victory of Valmy

The prisons were crowded with suspects, persons supposed to be under suspicion of collusion with the *émigrés*. The advance of the Prussians created a panic; there was a widespread belief that there was a royalist plot for a royalist insurrection in Paris. The Commune organized a visitation of the prisons, and in the September Massacres hundreds of captives were slaughtered. In a few weeks came the news that the Prussians had been checked in an engagement at Valmy. From that time the armies of the Republic habitually proved themselves more than a match for their enemies.

With the close of Sept. the Legislative Assembly gave way to a new National Convention, part Girondist, part Jacobin, and altogether Republican. It proceeded at once to declare that the monarchy was abolished and a Republic established, and all populations in districts occupied by French troops were proclaimed freed from the monarchies under which they were supposed to have groaned. The French Republic had assumed the character of an aggressive champion of the Liberty which it was determined to impose upon the peoples of Europe in a general war against monarchy. It clinched its position by repudiating treaties, finally challenging England by declaring the opening of the navigation of the Schelde and by throwing down the head of a king as its gage of battle to the kings of Europe. Louis was brought to a sort of trial, and was beheaded Jan. 21, 1793.

Then, while French armies were achieving successes against their enemies beyond the frontier, the parties in Paris fell to devouring each other. The Girondins had now become the party of moderation; the Jacobins won the supremacy, drove them from office, and sent many of them to the guillotine. A Committee of Public Safety was organized which wielded despotic power; its emissaries accompanied the armies, and were scattered all over the country, none daring to dispute their behests. While one of the members, Carnot, was sufficiently occupied as the war minister organizing victories, the Reign of Terror was instituted, and the guillotine devoured its victims in numbers that increased week by week from scores to hundreds. On July 13 Marat was slain by Charlotte Corday, but his death made no difference. The mere accusation of being well affected to the aristocrats was the almost unfailing precursor of imprisonment and death.

On Oct. 16, 1793, Marie Antoinette, the widow of Louis, who had died with kingly calm and dignity, followed her husband to the scaffold. A month later the guillotine claimed among its victims Marie Roland, the heroine of the Girondists. Day by day the tumbrils rolled through the streets of Paris; in the provinces scenes even more repulsive were enacted.

The Fall of Danton

Danton, the inexorable, who shrank from nothing when he deemed that the cause of Liberty would be furthered by frightfulness, sickened of the purposeless slaughter; even Robespierre was nauseated by the vulture flock that was headed by the detestable Hébert. Suddenly he turned on them, and on March 24, 1794, Hébert's own head fell. But Robespierre was minded for no more concessions to the Indulgents, the group of whom Danton, weary of bloodshed, was the leader, his own ascendancy was at stake; on April 5 the great Tribune was struck down. But the carnival of blood was no longer to be endured. A conspiracy was organized. Suddenly, on July 27, Robespierre himself was seized, and on the following morning he was beheaded. With his death and the execution of his partisans which followed, the Reign of Terror was ended.

It remained to evolve one more constitution, a constitution which was to place the administration in the hands of a Directory of five, while legislation was to be en-

trusted to two Assemblies. This scheme, arrived at a year after the fall of Robespierre, did not command universal assent, especially in Paris. But the government were prepared for an insurrection, and when it came they had entrusted the arrangements for its suppression to a young officer of the artillery, Napoleon Bonaparte. His success was complete. The Directory was established by the *coup d'état* of Vendémiaire (Oct. 5, 1795) and Bonaparte was rewarded with the command of the armies of the Republic in N. Italy. Four years were to pass before another *coup d'état* made the young general First Consul, and in effect transformed the French Republic into a military monarchy. Not till 1871 was a republic to be permanently established in France.

Results of the Revolution

But the meaning of the French Revolution is not to be tested by its success or its failure in establishing republican institutions. Republicanism was only one of its accidents; the basic principles on which it rested are no less compatible with a constitutional monarchy than with a republic. Essentially, its political demand was for the "government of the people for the people by the people"; the movement assumed its terrific character because it arose when nearly all the peoples of Europe were governed mainly in the interests of particular classes by absolute rulers. It did not succeed in establishing anywhere the practice of "government by the people"; in Europe generally the force wielded by governments, not by the people, was too strong for them to be readily overthrown, and the actual excesses perpetrated in France checked for the time the moral forces which would naturally have been thrown into the scale on the side of Liberty. But a spirit had been aroused which, though it might be sternly repressed, could never again be completely allayed.

If the French people were still willing to submit themselves completely to a master who could be idealised as a hero, it had yet become impossible after the Revolution to lay upon them the old yoke, to subject them to the absolutism of an hereditary prince or the domination of an hereditary caste. Everywhere the Revolution forced upon privileged and unprivileged classes alike the consciousness that the unprivileged have rights which cannot altogether be ignored, that revolution will always lurk under

the throne of tyranny; the peoples of Europe owe it to the French Revolution that, however slowly, they have yet won in a greater or less degree a hearing for themselves in their own governments.

The French Revolution was the direct cause of the great movement which has turned South America into a group of self-governing states instead of a congeries of provinces administered as the estates of an absolute monarch. Politically, the feudal system of the Middle Ages had perished long before; as a social system it had remained rampantly dominant. As a social system the Revolution shattered it—utterly among the Latin peoples, though not so completely elsewhere. However we may shudder at the methods which the Revolution employed, at a time when elemental forces broke loose which no man could control, its fundamental principles have become part of the creed of civilized humanity.

THE WARS BEFORE NAPOLEON.

France declared war on Austria April 20, 1792, and was fighting almost continuously against coalitions of enemies until 1815. About 1797 the campaigns merge into those of the Napoleonic Wars (*q.v.*). The incidents to that date may be briefly summarised.

Wattignies and Fleurus

At the cannonade of Valmy, Sept. 20, 1792, the French under Kellermann stood firm against the Prussians, who broke off the action. Slight as was this engagement, it is reckoned one of the world's decisive battles, for it made possible the whole Revolutionary achievement. Dumouriez invaded the Netherlands and won a victory at Jemappes, Nov. 6. Great Britain and Spain joined Austria and Prussia, and the French were badly beaten at Neerwinden, March 18, 1793. But the situation was restored in the summer from the Channel to the middle Rhine, principally by the organization of Carnot and the leadership of Jourdan, who won the tremendous battle of Wattignies, Oct. 14-16. Next year brought advances in the Netherlands and a great victory at Fleurus, June 26. Then Pichegru and Moreau won reputations on the Rhine, while Bonaparte was learning his craft in N. Italy. The inter-action of military and domestic events in French politics presents a tangle that is fascinating but too intricate for the scope of a short article.

Bibliography. The French Revolution, T. Carlyle, 1837. The Revo-

lutionary and Napoleonic Era, J. H. Rose, 6th ed. 1907; *The French Revolution*, H. Belloc, 1911; *The French Revolution*, L. Madelin, Eng. trans. 1916; *Twelve Portraits of the French Revolution*, H. Béraud, Eng. trans. 1929.

French Union. Since 1946 the official name for a political union composed, on the one hand, of the republic of France, i.e. metropolitan France, and overseas departments (e.g. Martinique, Guadeloupe, French Guiana) and territories (e.g. French West Africa, French Somaliland); and, on the other hand, of associated states and territories (e.g. Morocco, Tunisia, Vietnam, Laos, Cambodia). There is a high council composed of delegates of the French govt. and representatives of the associated states; and an assembly, of which half the members represent metropolitan France, and the other half the overseas depts. and territories and the associated states. See France, table p. 3513.

Frensham. Village and parish of Surrey, England. It is $3\frac{1}{2}$ m. S. of Farnham, and is noted for its two lakes or ponds. The larger of them covers 90 acres and is visited for boating and fishing.

Frequency OR PERIODICITY. The number of complete cycles or double reversals per second of any vibrating quantity, e.g. an alternating electric current or a vibrating tuning fork. In radio waves it varies from ten to many millions. Its value for the musical note middle C is 256 per sec. The frequency of the commercial A.C. supply is 50 c.p.s. in the U.K., but 60 c.p.s. in the U.S.A.

Frequency Modulation. System of radio transmission in which intelligence is conveyed by causing the frequency of oscillation of the carrier wave to deviate from its steady unmodulated value by amounts depending upon the strength of the modulating sounds. This is in contrast to the usual method of amplitude modulation (A.M.), in which the frequency of the carrier is constant but its strength is made to vary proportionally to that of the modulation.

Frequency modulation (F.M.) simplifies the design of the transmitter, since the power output is constant; in an A.M. transmitter the circuits may be called upon to handle powers varying from zero to four times the average unmodulated power. The F.M. transmitter is less subject to distortion from over-modulation.

Since the output from the receiver is governed primarily by

changes of frequency in the incoming wave, it is feasible to use a "limiter" to keep the amplitude of the input to the receiver constant and so smooth out superimposed noise fluctuations. Impulsive interference such as that arising from the ignition of motor cars is not completely eliminated, but the background noise in a properly designed F.M. receiver is far lower than in a comparable A.M. receiver. Residual noise in the F.M. receiver is high pitched by comparison with that in the A.M. receiver and can be still further reduced by a process of "pre-emphasis" and "de-emphasis." At the transmitter the high-frequency components of the sound modulation are increased artificially according to a known ratio. Complementary reduction at the receiver restores the balance of tone, but at the same time depresses the high-frequency components of the noise.

In the U.S.A. F.M. operates on ultrashort waves. Channels 200 kc. wide have been allotted and the carrier swing limited to 150 kc. This permits transmissions of audio-frequencies up to 15,000 kc. to be transmitted, as against the usual maximum of 5,000 kc. for A.M. Thus, in practice F.M. offers higher fidelity as well as greater freedom from extraneous noise.

Frere, SIR HENRY BARTLE EDWARD (1815-84). British administrator. Born at Clydach, Brecknockshire, March 29, 1815, and educated at Bath grammar school and Haileybury, he entered the Bombay civil service in 1834. For his

Sir Bartle Frere, British administrator

services during the Indian Mutiny he was created K.C.B. He was governor of Bombay 1862-67, and received a baronetcy in 1876. He was sent out in 1877 as governor of the Cape and high commissioner for the settlement of native affairs in S. Africa, with a view to the confederation of the colonies; but his action in relation to the Zulu War was censured by the government, his conduct was violently assailed by Gladstone in the Midlothian campaign, and Frere was recalled in 1880. His justification is contained in his *Correspondence relating to the Recall of Sir Bartle Frere*, 1880, and in *Afghanistan*

and South Africa: a Letter to the Right Hon. W. E. Gladstone, 1881. He died May 29, 1884, and was buried in S. Paul's Cathedral. *Consul Life and Correspondence*, J. Martineau, 1895.

Frere, JOHN HOOKHAM (1769-1846). A British diplomatist and translator. Born in London, May 21, 1769, eldest son of John Frere (1740-1807), the antiquary, he was educated at Eton, where he began his friendship and literary collaboration with George Canning, and at Caius College, Cambridge. He was M.P. for West Looe 1796-1802; foreign under-secretary, 1799; envoy to Lisbon, 1800-02; minister at Madrid, 1802-04; privy councillor, 1805; and minister to Spain again, 1808-09, being recalled after the retreat of Moore to Corunna. He settled in 1818 at Malta, where he died, Jan. 7, 1846.

John Hookham Frere, British diplomatist After J. Hoppner

Frere, who twice refused a peerage, as a writer sought more the critical approval of the few than the applause of the public. At Eton he joined in promoting *The Microcosm*. He was one of the founders of *The Quarterly Review*. His pungent wit and metrical facility show to advantage in his renderings of *The Acharnians*, *Knights, Birds, and Frogs*, of *Aristophanes*, 1840. Byron was indebted to him for the *ottava rima* of *Beppo*.

Fréron, LOUIS MARIE STANISLAS (1754-1802). French journalist, born in Paris, Aug. 17, 1754. A friend of Robespierre and Desmoulins, he founded during the Revolution the violently republican paper, *L'Orateur du Peuple*; but later he became leader of the reactionary *Jeunesse Dorée*, causing the downfall of Fouquier-Tinville, the public prosecutor. After attempting to marry Pauline Bonaparte, Fréron in 1799 became commissioner at Santo Domingo (now Ciudad Trujillo), where he died.

Fresco (Ital., fresh). Method of painting in water colour upon fresh mortar. It was the favourite process of mural decoration before the introduction of oil painting. The plaster must be fresh in order to absorb the colour, and since it dries rapidly, the artist must work with great dexterity, decision, and speed. The wall must be free of saltpetre, and only such colours can be

employed as are not affected by lime—a limitation which excludes certain of the most brilliant greens, reds, and yellows.

The artist first of all drew a cartoon (*q.v.*), and then transferred it piecemeal to as much fresh plaster as he could cover "at a sitting." The palette was dispensed with because it could not hold enough colours, and pots of different colours were used instead. Though regarded as a process of water colour painting without agglutinants, size, or white or yolk of egg was required to fix certain colours. Theoretically, fresco should last as long as the wall which it adorns, but meteorological conditions are vital, a damp climate being fatal. *See* Painting.

Freshfield. Cape or promontory on the coast of King George V Land (*q.v.*), Antarctica. It is in lat. 68°–69° S., and long. 151° E., and separates Cook Bay from Deakin Bay. Discovered by the Mawson Expedition of 1911–14, it was named after the English explorer and mountaineer, D. W. Freshfield.

Freshwater. Parish and watering-place of the Isle of Wight, England. It stands on the river Yar, 1½ m. S. by W. of Yarmouth, and is a terminus of the island rly. Its parish church, on the site of an older edifice, retains a Norman doorway, a 12th century arcade, and a memorial brass of 1390. Lady Tennyson, wife of the poet, was buried here. The chalk and flint cliffs between Freshwater Bay and the Needles attain a height of nearly 500 ft. Lord Tennyson resided for some time at Farringford House, in the neighbourhood, and a monument was erected in his memory on High Down. Pop. 3,124.

Fresh Water Deposits. Sedimentary rocks which can be definitely identified as having been laid down in fresh water, such as lakes, by their containing fossil remains of fresh water organisms. The term is used mainly in contradistinction to deposits of marine (sea water) environment. The Old Red Sandstone of Devonian age are largely of this type. Fresh water beds are represented in S.E. England in the Purbeck and Wealden Beds of the Jurassic and Cretaceous systems. Part of the Oligocene Beds of the Isle of Wight

are also of fresh water origin. Many fossil organisms found in past fresh water deposits bear resemblances to types living today under similar conditions.

Fresnel, AUGUSTIN JEAN (1788–1827). French physicist. Born at Broglie May 10, 1788, he worked first as an engineer, and later made researches in optics, doing valuable work in connexion with the undulatory theory of light. He deduced the mathematical results of Thomas Young's experiments, and explained the interference of polarised as well as ordinary light. He died July 14, 1827.

Fresnillo. Town of Mexico, in the state of Zacatecas. It stands on the slopes of the Cerro del Proaño, about 7,000 ft. above sea-level, and is 36 m. N.W. of Zacatecas by the Mexican National Railroads. The chief industry is

neighbourhood, which produces grain, grapes, figs, peaches, and apricots. Petroleum is obtained, and mining and stock-rearing are carried on. Fruit drying and packing is an industry, while there are foundries, potteries, and brickworks. Founded in 1872, Fresno received a city charter in 1885. Pop. 60,685.

Fret. In heraldry, *mascle* interlaced by a cotice and a baton. A shield fretty is covered with a trellis or interlaced diagonal bands. The trellis may be nailed or cloué. *See* Ordinary.

Fret. Little ridge upon the fingerboard of some stringed instruments to mark the point at which the player's finger must shorten the vibrating length of string to produce a certain note. On the violin and its larger relatives the fingerboards are plain,

Fretwork. Designs showing how carved work may be imitated by the use of a fretcut overlay

the working of the silver and copper mines, discovered in the middle of the 16th century. Agricultural pursuits and stock-rearing are engaged in.

Fresno. A city of California, U.S.A., the co. seat of Fresno co. It lies in the valley of the San Joaquin in the centre of the state, 200 m. S.E. of San Francisco, and is served by the Atchison, Topeka, and Santa Fé and the Southern Pacific rlys. and an airport. Irrigation is largely resorted to in the

and the player's sense of position and pitch is his sole guide; but the older viols had fretted fingerboards as have also the popular plucked instruments such as the lute, mandolin, guitar, and banjo. *See* Fingerboard.

Fretwork (O.F. *frete*). Woodwork or metalwork, fenestrated by sawing in ornamental design, and usually thin in substance. Frets were used in early clock-cases to allow for the more full escape of the sound of the chiming or striking gear. In the 19th century piano panels were fretted for a similar purpose, and today frets are used on radio sets and loudspeakers. In the Chippendale period the tops of afternoon tea or coffee tables were often edged with frets to afford protection to the silver and china, the design being some-

Fretwork. Fretsaw driven by a small motor, as used for industrial purposes
By courtesy of Hobbies

times extended to underframing. Today fretwork design without functional purpose is regarded as redundant, on account of the necessary dusting. Period pieces with frets are in small demand.

Amateur fretwork became popular from 1870. Small articles such as pipe racks were made. Light shelves were fretcut on the back edges to form tenons, which fitted into counterpart fretout mortises. As time proceeded fretcutting be-

came a boy's hobby. In industry, the fretsaw is worked by power, though there are also treadle machines. The hand fretsaw is the shape of a long U, the saw being sprung between the open end, the handle in line with the saw. In all cases fretcutting is done on a "table." A hole is bored in the work, through which the saw is passed, after which the saw is adjusted. Fine wooden frets are stronger when made in plywood.

FREUD AND FREUDISM

Amber Blanco White, Lecturer on Moral Science, Morley College

Some account of the theories developed by the Viennese doctor who revolutionised the approach all over the world to the care and cure of illness of the mind. See also Psychiatry; Psycho-analysis; Psychology, etc.; and entries such as Dream; Pleasure Principle; Super-Ego; Unconscious, etc.

Sigmund Freud was born at Freiberg in Moravia, May 6, 1856. Of Jewish descent, he was educated in Vienna

Sigmund Freud,
Austrian scientist

until he went to Paris to study nervous disease under Charcot. He returned to Vienna, where he became a professor of neurology and divided his time between teaching, the cure of mental illness, and research in the field of psychology. When Germany annexed Austria in 1938, he was allowed to come to London, where he was made a Fellow of the Royal Society. He was ill and the roll of the society was brought to him at his house for signature—an honour paid hitherto only to a reigning monarch. He died in London, Sept. 24, 1939.

His discoveries were unexpected, varied, and far-reaching. He found psychology still a branch of philosophy, it sexperimental side concerned either with the borderland between psychology and physio-

logy, or carried out by introspection. He left it a connected whole, with the main features of the geography of the human mind mapped, including the hitherto hardly suspected pre-conscious and the unconscious. He traced several aspects of the growth of the individual from infancy to maturity, and showed how inherited qualities develop through interaction with environment. Possibly Freud's most important contribution in this field was his account of how conscience (the super-ego) is formed from primitive fears, and the rôle that it comes to play in the life of man.

Development of the Sexual Life

Perhaps of equal value was his work on human instinct and the formation of character. The aspect of this part of Freud's work which has had the greatest influence is his analysis of the sexual instinct. He realized that sex, in its mature or genital form, does not appear out of nothing at puberty, but is built up from components found in early childhood. Evidence for this theory can be found by anyone capable of observing children dispassionately; but it was received

with a storm of abuse, and is still a serious obstacle to the acceptance of his doctrines. His second thesis in this sphere was that all friendly, loving, social impulses depend finally upon the healthy development of the sexual life—a doctrine equally unpopular and with equally important moral implications. His general theory of instinct, however, is not generally accepted even by his followers.

In the narrower field of medicine, Freud's work changed the whole approach to the study of mental illness. For the first time its causes were uncovered, its symptoms—thought hitherto to be a mere inexplicable confusion—given meaning, its forms distinguished, and its lines of development plotted. He also introduced a technique for exploring those regions of the mind in which the origins of mental disease lie hidden, and a method by which many illnesses and defects of personality may be cured; and he carried out wide research into particular forms of mental abnormality.

Nature of the Mind

His theories of the nature of the mind give a meaning to dreams, and explain the unconscious forces which find expression in the customs of savages, in wit and humour, literature and art, and in many of the acts performed and opinions held in everyday life.

He saw the human mind as an organized system of actions and reactions linked together by cause and effect, none of them inexplicable given sufficient data, none the result of mere chance or of supernatural phenomena. Freud believed that a close and constant connexion exists between mental and bodily processes, though he did not attempt to describe its nature. Starting from this basis, he conceived of man as governed from birth by two sets of opposing forces—his endowment of inherited instincts and tendencies, and the demands made upon him by his environment. The instincts seek expression; the environment often prevents or limits this. The child, according to Freud, deals with the situation in various ways. He seeks pleasure and avoids pain, escaping from some of the disagreeable aspects of reality by fantasy and wishful-thinking or by throwing the blame for his actions on to the external world. The child is also endowed with curiosity, which leads him to test reality, including his own body, which has to be distinguished from the external world. As a result of this testing

he learns from experience, and achieves the power to reason, which enables him in increasing measure to delay and control his responses to instinct and take probable results into account. Freud held that reason should be the over-riding arbiter of conduct in the adult.

Children and Parents

While the child is thus learning to adapt himself, his emotional life is developing. He is learning to transfer love from himself to objects which gratify him—e.g. his mother—and is developing hostility whenever his aggression (power of making efforts) is thwarted. The most disturbing of the forces which thwart him are the adults who care for him, both because he is completely dependent upon them and because they can show disapproval and anger. As a result, fear is attached to impulses whose indulgence produces unpleasant reactions on the part of parents, and to the child's own hostile feelings. This fear is the seed of conscience, whose function is to control forbidden impulses and to warn child and man against them by flooding the mind with consequent anxiety.

While conscience is developing, the child is acquiring his notions of right and wrong from the behaviour of his parents, who seem to him, at this stage, omnipotent and omniscient. This view of the parents, especially the father, is later transferred to a divine father, or god, where this conception is accepted. It is also sometimes attached to personalities regarded as heroes.

Repression and Conscience

With conscience appears another mechanism—that of repression. This shields the conscious mind from the reproaches of the super-ego. When more fear is felt—either of real danger, or of being wicked and destructive—than can be tolerated, it is thrust down into the unconscious mind. When this happens the repressed material—which may include in extreme cases all memory of the event that caused the fear—become inaccessible both to ordinary knowledge and to the operations of reason, and can be rediscovered only by such methods as hypnotism and free association. Nevertheless, though sealed away from attention, it is neither inactive nor unimportant. Experiences similar to those which caused the first repression will revivify the memories and feelings connected with it so that they strive to return to

consciousness. But so long as the super-ego brands them as dangerous they will succeed in doing this only in disguised forms whose connexion with their sources is not realized. For example, an unconscious desire to steal may appear as anger with those who "leave their money lying about." Again, repressed hatred of one's father often becomes hatred of all those who seek to impose authority—employers, the government, etc. In this way repressed material exerts a continuous and powerful influence both on beliefs and on much of human conduct. When, owing to the acute or massive nature of the fear felt, simple repression fails to achieve its purpose, either a neurotic symptom will appear or the mind may withdraw itself from reality. Many traits of character are developed as a defence against anxiety due to repressions.

Danger of Excessive Anxiety

Before these mental distortions can be straightened out, it is necessary first to restore the direct connexion between their repressed causes and the rest of mental life and then, by removing the excessive anxiety, to enable the patient to take a reasonable view of his own past behaviour.

Freud's picture of the human mind, therefore, is one of continual even if largely unrecognized conflict—conflict between inherited tendencies and the demands of society as conceived by the individual, between repressed material and the forces which keep it out of consciousness, between all the irrational elements in the mind and that reason which should be their master.

Bibliography. Works by Freud: *Studies in Hysteria* (with Josef Breuer), 1895; *The Interpretation of Dreams*, 1900; *Psychopathology of Everyday Life*, 1901; *Totem and Tabu*, 1913; *Introductory Lectures in Psycho-Analysis*, 1917; *The Ego and the Id*, 1923; *Autobiographical Study* (trans. Freyberg, Sir Bernard Cyril (b. 1890). British soldier and administrator. He was born in London and educated at Wellington College, N.Z., returning to England at the outbreak of the First Great War. He served at Antwerp, in Gallipoli, and in France, being awarded the V.C., D.S.O. and two bars, and C.M.G. He joined the regular army, commanded the 1st Bn., Manchester Regt., 1929–31,

held staff appointments and commands, and retired in 1937.

In 1939 Freyberg returned to the active list as G.O.C. Salisbury

Sir Bernard Freyberg,
V.C.,
British soldier

Plain Area before his appointment as leader of the New Zealand expeditionary force. On May 5, 1941, he became Allied C.-in-C. in Crete to superintend the evacuation.

He served with the 8th army throughout the N. Africa campaign and in Italy, commanding the N.Z. 2nd division which distinguished itself at Cassino and elsewhere. He was promoted lieutenant-gen. and awarded a third bar to his D.S.O. In 1946 he was sworn in as governor-general of New Zealand; he retired from the army owing to disability. He was created K.C.B. and K.B.E. in 1942.

Freyer, Sir Peter Johnston (1852–1921). British surgeon. He entered the Indian Medical Service, and later practised in London, specialising in affections of the bladder, and being the originator of the operation with which his name is connected. He died Sept. 9, 1921.

Freyja. Goddess of love and healing in Norse mythology. Two white cats drew her chariot and she could fly in a magic feather skin. Her house in Asgard was Folkvang, where she received the souls of half the slain from Odin. See Friday.

Freyr or Frey. Norse god of rain, sunshine, and fruitfulness, especially worshipped in Sweden. Brother of Freyja, he possessed the Sword of Victory and also Skidbladna, a ship which could carry all the gods and yet be folded into his bag. He gave away the sword to win Gerda, a giant maiden, and thus was conquered. His house in Asgard was Alfheim.

Friar (Fr. *frère*, brother). Term applied to members of the mendicant orders of the Roman Catholic Church. These have included Franciscans, 1209; Dominicans, 1215; Carmelites, 1245; Augustinians, 1256; Servites, 1233; Trinitarians, 1198; and Crutched or Crossed Friars, 1169. See Monasticism.

Friar's Balsam. Compound tincture of benzoin. Various suggestions have been advanced to account for the still popular name of this preparation. It was mentioned in the schedule to the Medi-

Fribourg. Air view of this important town in Switzerland showing the bridges over the Sarine river

cine Stamp Act of 1812, which suggests that it was regarded as a proprietary medicine. Possibly a Portuguese merchant, Peter de Frias, who in 1581 obtained the fruit of a balm or balsam from the viceroy of Peru, may have been the originator of friar's balsam. A patent medicine called "friar's drops" was sold in 1777. The compound contains benzoin, aloes, storax, balsam of tolu, and alcohol.

Friar Tuck. Character in the stories associated with Robin Hood. He is described as chaplain to the outlaw. In the old-time morris dance of the May games he attended upon Robin and Marian, the King and Queen of the May.

Fribourg or **Freiburg.** Canton of W. Switzerland. It is S.E. of and in parts touching Lake Neuchâtel. Area 645 sq. m. Chiefly in the basin of the Aar, it is watered by the Sarine with its tributaries, and the Broye. Undulating in parts, it is hilly in the S.E., where it impinges on spurs of the Bernese Alps, which rise to 8,000 ft. Mainly pastoral, it is noted for its cattle and Gruyère cheese. French is generally spoken; German in the N.E. section of the canton. Timber and tobacco are produced, watch and paper making are carried on, and there is a chocolate factory at Broc. A Roman Catholic stronghold, Fribourg has many convents; the capital (*v.t.*) is the only town of importance. Seven members are sent to parliament. Pop. 152,053.

Fribourg. Town of Switzerland, capital of the canton of Fribourg, and chief R.C. centre of Switzerland. It stands on the river Sarine, 20 m. by rly. S.W. of Berne. A lofty suspension bridge spans the river at the confluence with the Gotteron stream. The Sarine cuts the town into two parts, that on

the W. side standing on level ground, and the other among rocks and hills. The 13th century church of S. Nicholas is famed for its fine organ and its 15th century belfry. Fribourg possesses a town hall, a new R.C. university, college, lycée, several libraries, and a museum of fine arts. Tobacco, pasteboard, leather, and art objects are manufactured. The town was founded in the 12th century. After its liberation from the Hapsburgs and Savoy, it joined the confederation in 1481. It was taken by the French in 1798. Pop. 26,045.

Frick, Wilhelm (1877-1946). German politician. He was born at Alsenz, Palatinate, March 12, 1877, and educated at Munich, Göttingen, and Berlin universities. A magistrate in Bavaria, Frick illegally joined the National Socialist party and took part in Hitler's unsuccessful "putsch" of 1923. He was the first Nazi to become a minister when he received the portfolio for the interior in Thuringia, 1930. Reich minister of the interior from 1933, Frick was the last Nazi protector of Bohemia and Moravia from 1943. He was captured near Munich by U.S. troops, March 5, 1945; tried as a major war criminal at Nuremberg; found responsible for laws suppressing Jews, trade unions, and the press; and executed, Oct. 16, 1946.

Frick Collection. Art gallery in New York founded by Henry Clay Frick (1849-1919), who had acquired a fortune in enterprises concerned with coal, steel, and railways. He bequeathed to the public his mansion, with an endowment and a collection of art treasures. This consists principally of 14th to 19th century paintings, representing British and Continental masters. It also includes

bronzes, portrait busts, Limoges enamels, porcelains, and period furniture. An oak-panelled library is hung with portraits and landscapes of the English school. A drawing-room contains French 18th century furniture, with wall panels by Fragonard. A reproduction of an 18th century boudoir is decorated with panels by Boucher for Mme. de Pompadour.

Friction. Resistance offered by one body to motion over another. As an example, consider a body resting on a table. It requires a certain force to move it along the surface of the table, and also to keep it moving. The magnitude of this force depends upon two things: (1) the material of which the substances are made, and (2) the normal pressure between the touching surfaces. In 1781 C. A. Coulomb pointed out that the friction was independent of the velocity with which the surfaces moved over one another. Though his statement is now known to be inaccurate, it is, nevertheless, true for all ordinary velocities, though friction increases when bodies are moving very slowly over one another, and decreases when they are moving very rapidly. Friction between two bodies is greatly decreased by the use of lubricants.

It is easier to keep a body moving on a surface than it is to start it moving, and it follows that what is known as static friction, *i.e.* friction at rest, is greater than kinetic friction, or friction of motion. If F is the frictional resistance when a body is on the point of sliding along a given surface, and R is the perpendicular force between the body and surface at the point of contact, then the coefficient of static friction is given by the ratio F/R . The dynamic or kinetic coefficient is given by F^1/R where F^1 is the frictional resistance when steady sliding is taking place. There is a third type of friction usually recognized. When a wheel or cylinder rolls on a surface, there is resistance to motion at the point of contact, called rolling friction.

Without friction it would be impossible to walk, drive a tram along ordinary rails, etc., and all movement would have to be by the use of cogwheels or some similar arrangement. The frictional forces brought into play by relative motion between portions of the same medium are spoken of as viscous forces. See Force.

Friday. Sixth day of the week. The name comes from Frigg, later identified with Freyja (*q.v.*). The name corresponds to Lat. Dies

Veneris, day of Venus (*cf.* French *vendredi*). The day is regarded as unlucky from its connexion with Christ's crucifixion, which is specially celebrated on Good Friday (*q.v.*). In the Roman Catholic church it is a day of abstinence, except when Christmas falls on that day. Friday is the Mahomedan sabbath. The epithet Black is given to various disastrous Fridays, *e.g.* May 11, 1866, when the failure of the banking house of Overend, Gurney & Co. caused a financial panic. Fridays in ember weeks are called Golden Fridays.

Friday. Character in Defoe's novel *Robinson Crusoe* (*q.v.*). A savage rescued by Crusoe from the cannibals about to sacrifice him, he is named from the day on which he was so rescued, and becomes Crusoe's servant.

Frideswide. English abbess and patron saint of Oxford. According to tradition, she was the daughter of Didan, viceroy of Oxford under Ethelbald, and Saxfrida his wife. She made a vow of chastity, and her father built and made over to her a church at Oxford, in connexion with which she founded a nunnery, and became herself its first abbess. Persecuted by a Mercian noble named Algar, she took refuge for a time at Binsey, where she built an oratory. After her death, in the latter half of the 8th century, her shrine became a centre of devotion, as did the well at Binsey, which is said to have originated in answer to her prayers. Her remains are believed to rest in Christ Church Cathedral, where a chapel is called after her.

S. Frideswide's nunnery was taken over by Austin Canons in 1004, and suppressed in 1525 by Wolsey, who replaced it by Cardinal College. Frideswide was canonised in 1481 and has been regarded as Oxford's patron saint since 1180, her festival being kept there on Oct. 19. In addition to the church at Oxford, 1870-72, churches at Frilsham (Berks), Poplar, and at Borny, near Boulogne, are dedicated to her. *See* Christ Church; Oxford; *consult also* The Story of S. Frideswide, F. Goldie, 1881.

Fridtjof Nansen Land. This is another name for the Arctic archipelago of Franz Josef Land.

Friedland, BATTLE OF. Victory of Napoleon over the allied Russians and Prussians, June 14, 1807. The failure of Murat's attack on the Russian entrenchments at Heilsberg, June 10, de-

termined Napoleon to march on Königsberg. Bennigsen resolved to thwart this plan, and early on June 14 met Lannes' corps at Friedland, on the river Alle, 26 m. S.E. of Königsberg. Owing to Lannes' stubborn resistance, Bennigsen could do no more than cross the Alle and hold him in check until the arrival of Napoleon. The Allies were now in a serious position. Behind them, in an irregular arc, lay the Alle, across which their only line of retreat lay over the bridges of Friedland.

The battle began at 6 p.m. Ney was ordered to attack Friedland, but his advance was checked by a furious charge of the Russian cavalry. Victor was hurried to his assistance, and an artillery concentration turned on the Russians, which, seconded by an irresistible dragoon charge, turned the tide of battle. A rout ensued, and the Russians, pursued by Ney, fled through Friedland and across the river. The numbers engaged were: French, 70,000, and Allies, 55,000. The Allies lost 20,000 killed and wounded, the French little over 9,000. On July 7 Napoleon met the tsar Alexander on a raft in the middle of the Niemen, and the treaty of Tilsit was concluded.

Friedrichshafen. Town of Württemberg, Germany. It stands on the lake of Constance, and has a harbour on the lake, built by Frederick I, king of Württemberg, who gave the town its present name. The chief building is the palace, formerly used by Kaiser William II. It stands in wooded grounds to the W. of the town, and has an interesting chapel.

There are a 20th century Rathaus, a fine rococo church (1695), and a meteorological station. Friedrichshafen was a tourist resort, and steamers went from here to various places on the lake, but after 1918 its main interest was as a Zeppelin depot. In the workshops here the dirigibles, later sea planes and aeroplanes, were put together; over the lake they made their trials; for their reception were numerous hangars, bombed by Allied aircraft in both Great Wars. The building of boats and the making of motorcars and aeroplanes were other industries. The French entered the town during the Second Great War on April 29, 1945. It was in the French zone of occupation after the Allied conquest of Germany. As Buchhorn, the town had a Benedictine monastery, and was a free city from 1275. Pop. 11,290.

Friedrichsruh. Manor and village of Slesvig, Germany, 16 m. S.E. of Hamburg. Here was Bismarck's residence, and here he died July 30, 1898, and is buried in the mausoleum. The place is surrounded by the huge Saxon forest. The castle was damaged during the Second Great War.

Friedrichsthal. Mining town in the Saar district of Germany, 11 m. N.E. of Saarbrücken, with which it has rly. connexion. Here are large industrial plants. Pop. 16,400. Many other German villages bear this name, which means Frederick's valley.

Friendly OR TONGA ISLANDS. Group of islands in the S. Pacific Ocean, a British protectorate. The kingdom, consisting of three groups of islands—Tongatabu, Haabai, and Vavau—and the outlying islands of Niuatobutabu, Taofahi, and Niuafao, lies between lat. 15° and 23° 30' S. and long. 173° and 177° W. It is administered by a British high commissioner, with the assent of the king and native chiefs. The islands are partly of volcanic and partly of coral formation, and only one-fifth of the 150 are inhabited. The people are fair Polynesi-ans. Area, 250 sq. m. The capital is Nukualofa on Tongatabu. The produce consists of copra, mats, and green fruit. Pop. 40,668.

The Friendly Islands were so named by Cook in 1773, on account of the courteous behaviour of the inhabitants. Tasman first touched here in 1643. There are numerous reefs and shoals around the islands, which abound in cocoapalms and a kind of fig tree with narrow, pointed leaves. There is steamer connexion with Sydney and Auckland via Fiji. British and Australian coin is the only legal tender. Salote, the queen, succeeded on April 12, 1918, on the death of her father, George II; she was made a G.B.E.

Friendly Society. Organization for the payment of benefits to its members through funds mutually subscribed. Local friendly societies giving sick pay and paying funeral costs sprang up all over England during the 18th century. The first Act for the encouragement of friendly societies was passed in 1793. Subsequent Acts governing their organization were consolidated in the Friendly Societies Act of 1896, amended 1908.

The early friendly societies suffered from having no legal status, no limitation of liability, and no actuarial background to

guide them in assessing contributions and benefits. Their close association with trade unions placed them in real danger of being suppressed under the Combination Acts of 1799 and 1800, as being seditious. As recently, even, as 1834, six men were sentenced to seven years' transportation for forming a friendly society for agricultural labourers.

The rapid growth of these societies, to be compared with that of trade unions, cooperative societies, building societies, and savings banks, was a practical expression of the desire of working men to secure themselves against distress caused by sickness and death. The early friendly societies, like some of the early trade unions, adopted mystic rituals of the kind usually associated with free-masonry. The large and successful orders which grew up, among them the Independent Order of Odd-fellows, the Ancient Order of Foresters, the United Ancient Order of Druids, and the Grand United Order of Oddfellows, provide a mass of statistics which, summarised first in the Ratcliffe Tables, and later in the Watson Tables, laid the foundation of actuarial science, and formed the working basis of later national insurance schemes.

Agents for National Insurance

Friendly societies were among the bodies which, as "approved societies," were made agents for the administration of the National Insurance Act of 1911. Their importance in this scheme is illustrated in the following classified figures of members of approved societies from the fourth valuation:

Members

Friendly Societies ..	5,500,000
Industrial Insurance and Collecting Societies	4,460,000
Trade Unions	1,180,000
Employers' Provident Funds	80,000

The National Insurance Act of 1946, which transferred the administration of health insurance entirely to the state, ended the participation of the friendly societies in national insurance.

The alongside table gives the statistics of societies registered in 1944 under the Friendly Societies Acts.

Societies registered under the Friendly Societies Acts enjoy many privileges—they have important exemptions from income tax; they have a clearly defined legal status; they may hold land and own property, and sue in their own name; they have limited liability,

and members may transfer without making a will sums up to £100 payable at death, and themselves insure for sums not exceeding £300. In return, such societies must submit rules for the approval of the registrar; appoint trustees; submit audited accounts to the registrar annually, and hold revaluations of assets not less frequently than once every five years. The office of the Registrar of Friendly Societies, who will give information, statistics, and advice about them, is 17, North Audley Street, London, W.1.

Friends, SOCIETY OF. The religious body commonly known as Quakers is described under Society of Friends.

Friends of the People. Society formed in England in 1792 by some of the more advanced Whigs to bring about parliamentary reform. Sir Philip Francis was one of its founders and helped to draw up its original programme. The members were influenced by the French Revolution, but proposed to proceed by constitutional means. The society had a short life, although its supporters included Sheridan, James Mackintosh, and Erskine.

Friesland (Dutch. *Vriesland*). Province of the Netherlands. The Yssel Lake (the remains of the former Zuider Zee) and North Sea form its W. and N. boundaries, and it is contiguous on the E., S.E., and S. with Groningen, Drente, and Overijssel; it includes the islands of Ameland and Schiermonnikoog. The flat and in parts marshy country is mainly agricultural, fertile and well watered, but unsatisfactorily managed. Considerable tracts are below sea level. Dairy farming, stock rearing, horse breeding, and peat cutting are important. At Sneek there is busy trade in cheese and butter, and at

Franecker there was a university until 1811. There are several large, marshy lakes, with good fishing, notably the Fleussen, Tjeuke, Sneeker, Slotter, and Bergumer lakes. There are good communications by rly., steam tramways, and canals. The chief town is Leeuwarden (*g.v.*); other centres are Bolsward, Sneek, Dokkum, Harlingen, Franecker, Stavoren, and Hindelopen. Area, 1,291 sq. m. Pop. 436,786.

The German invasion of the Netherlands began on May 10, 1940, and by the late afternoon invading columns had swept across Friesland to the Afsluitdijk, the 25-m. causeway enclosing the former Zuider Zee, but local forces maintained a bridgehead at Kornwerderzand until May 14. During the liberation of the Netherlands units of the Canadian 1st army entered Friesland on April 15, 1945, and by May 17 had cleared the province of the Germans who put up very little opposition.

East Friesland is a district in Hanover, Germany, once a separate principality. Lying between Groningen in the Netherlands and Oldenburg, it is also flat and marshy, and has agricultural and fishery interests. Its chief town is Aurich, others being Emden, Norden, and Leer. A canal runs from Emden to Wilhelmshafen. Troops of the Canadian 1st army took Leer from the Germans on April 29, 1945, and occupied Emden May 4, when the enemy forces in N.W. Germany surrendered. Area, 1,211 sq. m. Pop. (est.), 453,208. See Frisians.

Frieze. In architecture, the middle member of the entablature, between the cornice and architrave. The Greek frieze in its simple form was divided into panels or metopes by triglyphs or channelled blocks, the metopes being sometimes

Class of Society	Number of Societies	Number of Members	Total Funds £

Frieze. Example of ancient frieze from Trajan's Forum, Rome

sculptured with a floral design, and sometimes, as in the Parthenon, with figures. In the earliest temples the metopes and triglyphs were composed of separate blocks of stone, artificially bonded; but the Ionic and later styles aimed at making the frieze a continuous band encircling the building, with the joints practically concealed.

Different varieties of frieze developed in Roman and Renaissance times, and when domestic architecture assumed importance the feature was applied both to exterior and interior decoration. The friezes in Inigo Jones's designs are sometimes divided up by attic windows. Tudor doors, windows, and walls often have classic entablatures with friezes. Exterior friezes are now mainly confined to public buildings, but modern rooms are frequently decorated with a wall-paper frieze, and occasionally with a frieze pattern in low relief. The word, *Fr. frise*, *Ital. fregio*, probably comes ultimately from *Lat. Phrygium (opus)*, Phrygian (work). See Parthenon

Frigate (*Ital. frigate*). Term of Mediterranean origin for a light warship. In Venice during

ship of the third rate. The first English ship to be classed as a frigate was the celebrated *Constant Warwick*, designed by Peter Pett for the earl of Warwick as a privateer, built at Ratcliff on the Thames in 1646, and purchased into the navy in 1649. Later the term was applied to fast vessels of the fifth rate mounting 25-50 guns. Suitable for either attack or defence of seaborne commerce and for scouting duties with the fleet, these ships were the counterpart of the modern cruiser.

Not until 1881 was the designation cruiser introduced into the Royal Navy. Earlier it had been employed only for a ship of any type engaged in cruising. The term frigate did not cease to be applied to ships of earlier date, such as the *Inconstant* and *Raleigh*, until in 1887 it was finally ousted by the more comprehensive term cruiser. During the Second Great War, an improved type of escort vessel in 1942 was classified as a

Frigate. H.M.S. Bendis, a Captain class frigate of the Second Great War. Upper picture, frigate of war in the days of sailing ships

the 15th century the frigate was a swift flush-decked vessel, propelled by sail and oars, told off for duty in war under the superintendents of dockyards; but by the 17th century the Venetian frigate had become a seagoing war-

lochs, and bays, and displacing 1,370-1,600 tons. Armaments varied from one to four 4-in. guns, as well as anti-submarine weapons.

Frigate Bird (*Fregata*). Genus of sea-fowl related to the gannet and the pelican. They have a long,

slender body, ending in a forked tail resembling that of the swallow, and the beak is long and hooked. Found only in the warmer seas, usually far from land, they live upon the fish they catch or rob from other sea-fowl.

Frilled Lizard (*Chlamydosaurus*). Australian lizard. Measuring nearly a yard in length, it is distinguished by a large membranous frill on either side of the neck. This is usually folded back, but can be erected when the animal is alarmed, apparently for the purpose of frightening its enemies. It is a harmless creature, found only in sandy districts.

Frilled Lizard. *Chlamydosaurus kingi* from Australia

Frimaire (*Fr.*, the month of frost). Third month in the year as rearranged during the French Revolution. It began on Nov. 21 or 22. See Calendar.

Friml, CHARLES RUDOLF (b. 1881). Czech-born American composer. Born at Prague, Dec. 7, 1881, he was educated at the conservatoire there, and went to the U.S.A. in 1904. A brilliant pianist, he became a composer of light music distinguished by graceful melody. His most popular musical comedies were *Rose Marie*, 1924; *The Vagabond King*, 1925. The *Donkey Serenade* was a revival of a tune in his operetta *The Firefly*, 1912.

Fringe. Strictly, loose threads forming an ornamental border to anything. The word is also used for hair cut straight across the forehead. It is used by analogy for

Frigate Bird. Specimen of the larger species found in tropical regions

anything on the border, e.g. the fringe of empire.

Fringe Tree (*Chionanthus*). Genus of shrubs or small trees of the family Oleaceae. Natives of China and N. America, they have large, smooth, magnolia-like leaves, and white, sweet-scented flowers which hang in graceful clusters; the corolla is cut into narrow segments, which give it a fringed appearance. *C. virginica*, the American species, is also known as snowdrop-tree.

Frinton-on-Sea. Urban dist. and seaside resort of Essex, England. It is 2 m. S. of Walton-on-the-Naze, on the railway, and has good bathing facilities, golf links, and championship tennis courts. A model garden town, its avenues are wide and are planted with trees. Sea walls and promenades have been constructed, and the greensward and cliffs extend to 50 acres. Pop. 2,196.

Fripp, Sir Alfred Downing (1865-1930). A British surgeon. Born at Blandford, Sept. 12, 1865.

Sir Alfred Fripp,
British surgeon
Russell

he was educated at Merchant Taylors' and London university. In the South African War he was chief civilian medical officer at the Imperial Yeomanry hospital. Surgeon

to Guy's and other London hospitals, he was also surgeon to Edward VII and George V. In 1903 he was knighted, and he died Feb. 25, 1930.

Frisches Haff. Lagoon off the Baltic coast of Europe. It is separated from the Gulf of Danzig by a strip of land 40 m. long and about one mile wide, called the Frische Nehrung. The lagoon or haff is about 50 m. long and of varying breadth; it covers 330 sq. m. The opening to the Baltic is at the N.E. end, where a channel has been dredged for traffic. Before 1510 the lagoon was entirely land-locked, but in that year a storm destroyed a little of the sand barrier. The Elbing, Passarge, Pregel, and Nagot flow into it.

Frisian Islands. A chain of islands off N. Europe, extending from the coast of Slesvig-Holstein to the N.W. corner of the Netherlands. They are the remains of a former coast-border of Jutland and Holland, and their sandy character and lack of vegetation attest the process of erosion they

must have undergone in the course of centuries; local legends tell of old villages now submerged. Most of the coast villages of today are popular sea-bathing resorts.

Fringe Tree. Foliage and drooping flower of the Chinese shrub

The chain may be divided into three groups, N. Frisian, East Frisian, and W., or Dutch, Frisian. The N. Frisian Islands lie off the W. coast of Slesvig-Holstein, from which they are separated by the Watten, an arm of the sea. Interspersed among them are the Halligen, low sandbanks covered with marine grass.

The principal member of the group is Sylt, with an area of 39 sq. m. and a pop. of 6,713. Its capital is Westerland (pop. 3,642), situated on its W. side and in two portions. Together with Heligoland, which the Germans included among the N. Frisian islands, Sylt was a base for the Luftwaffe in the Second Great War. Both islands were bombed by the R.A.F., and the 7-mile Hindenburg dam linking Sylt with the mainland was damaged. Troops of the British 11th armoured division occupied the islands on May 11, 1945.

Next in importance is the island of Föhr, on the E. coast of which lies the village of Wyk (pop. 2,782), which possesses an interesting museum of Frisian antiquities and handsome public gardens. Amrom, 6 m. long by 3 m. broad, lies S. of Sylt.

The East Frisian Islands form an almost continuous line masking the German coast between the mouths of the Ems and the Weser. Norderney (pop. 5,564) is 8 m. long by 1½ m. broad; its mild climate and magnificent stretch of sandy beach make it a favourite summer resort. Borkum (pop. about 3,000), situated at the mouth of the Ems, 9 m. N. of the Dutch coast, is 5 m. long by 2½ m. broad, and is perhaps the most popular holiday resort. Its breed of milch-cattle is much es-

teemed. Wangeroog, 5 m. long by 1 m. broad, is included in Oldenburg. About 2 m. W. of the present village are the ruins of an older inhabited site overwhelmed by a violent storm. Spiekeroog is 5 m. long by 1½ m. broad and attracts comparatively few summer visitors. Langeoog is 8½ m. long by 1 m. broad.

The Dutch Frisian group, of which the most important islands are Terschelling, Vlieland, and Texel, screens the Afsluitdijk enclosing the former Zuider Zee. The inhabitants are chiefly concerned with agriculture and dairy-farming. Frisian, the original speech of these islands, as well as the language of their laws, bears a remarkable resemblance to older forms of English.

Frisians. People of Teutonic stock inhabiting the area now comprising the Dutch provinces of Friesland and Groningen and the German district of East Friesland. They were closely connected with the other Low German peoples along the coast, notably the Angles and Saxons, and the old Frisian dialect survives in the Dutch and German Frieslands and in parts of W. Slesvig, especially in the coastal country near Tondern.

The Frisians were partially conquered by the Roman general Drusus, c. 12 B.C., but their early history is obscure. Numbers of them were probably associated with the Angles and Saxons in their incursions into Britain during the 4th and 5th centuries. Friesland generally was made tributary to the Frankish empire of Pepin II in 689, and after a revolt was reconquered by Charles Martel in 736. It fell to Charlemagne in 784. It retained a fair degree of independence during the Middle Ages. For a short time in Saxon possession, Friesland was ceded to the emperor Charles V in 1523, but joined the United Provinces in 1579, remaining one of these until 1795, when it was merged into the Dutch territories.

East Friesland became distinct from the rest of the Frisian lands in 1430, when it became a fief of the powerful Cirkensa family, by whom it was ruled until 1744, when it was incorporated in Prussia. Transferred to Holland in 1808, and in French possession 1810-13, it was recovered by Prussia and ceded by her to Hanover in 1815.

Frit. Name commonly given to a small black fly, *Oscinella frit* (order Diptera, family Chloropidae). Its larva is highly destruc-

tive to oats and other cereals in Europe, including the U.K.

Frith, JOHN (1503-33). English martyr. The son of a Westerham innkeeper, he was educated at King's College, Cambridge, afterwards becoming a member of Christ Church, Oxford. He helped Tyndal to translate the Bible, and his abilities and scholarship soon made him prominent among the advocates of the reformed faith. This led to his enforced departure from England, and for about six years he lived in Germany and Holland. Having returned to England, he was arrested, but on examination he defended his beliefs. He was burned to death at Smithfield, July 4, 1533.

Frith, WILLIAM POWELL (1819-1909). British painter. Born at Aldfield, Yorks, Jan. 9, 1819, son of

an innkeeper, he studied at Sass's Academy, Bloomsbury, and at the R.A. schools. Founding his style on that of Daniel Maclise, he began to paint literary subjects, his Malvolio being

hung at the R.A., 1840. He was elected A.R.A. in 1845, and R.A. in 1853. He scored popular successes with *Ramsgate Sands*, 1854; *Derby Day*, 1855; *The Railway Station*, 1862; *Private View at the R.A.*, 1881. He died in London, Nov. 2, 1909.

Fritillaria. In botany, name given to a large genus of Liliaceae. (See *Snakeshead*.) Fritillary is also the name given to several species of butterfly of the tribe Argynniidae. Several of these are native in Great Britain. See *Butterfly*, colour plate.

Fritsch, WERNER VON (1880-1939). German soldier. He was born Aug. 4, 1880. He served in the First Great War as a staff officer, and later was instrumental, in association with von Blomberg, in building up a secret staff for training the new illegal armed forces. In 1934 he became c.-in.-c. of the German army, with the rank of colonel-general, but was known to have opposed Hitler on questions of military policy. In Feb., 1938, he was accused of unspecified charges and deprived of his post; a court of honour acquitted him, and he was appointed c.-in.-c. of an artillery regiment. On Oct. 13, 1939, Fritsch was reported to have been killed in the fighting before Warsaw on Sept. 22. His death was later disclosed as assassination by an S.S. man, who was promoted to high rank.

Friuli. District of Italy, part of the compartimento of Venezia. It lies around the head of the Adriatic, covering about 3,300 sq. m. in area, and was before 1918 partly in Austria and partly in Italy. The Isonzo and the Tagliamento flow through it, and there was much fighting here during the First Great War. An inhabitant of Friuli is, in English, called *Furlanian* (It. *furlanio*).

The district takes its name from the Roman settlement of Forum

Julii, the later Cividale (*q.v.*). The Lombards ruled it for some centuries, after which it passed from one ruler to another. Venice secured part, while eastern Friuli was added about 1500 to the lands of the house of Austria. In 1797 Austria obtained the Venetian portion, which she retained in 1815. In 1866 the new kingdom of Italy was given the part that had previously belonged to Venice, and so matters remained until the end of the First Great War, when Austrian Friuli was claimed by both Italy and Yugoslavia. By the treaty of Rapallo (1920) the whole became Italian. The capital of the district is Udine (*q.v.*).

Frobenius, LEO (1873-1938). German explorer and ethnologist, born June 29, 1873, in Berlin. From 1898, as a specialist on African pre-historical finds, he worked in ethnological museums at Bremen, Basel, and Leipzig, and led expeditions into the Sudan, the Congo, the Nubian desert, and S. Africa. He founded the institute for the morphology of cultures at Frankfurt, where he was professor of Ethnology from 1925 until his death, Aug. 9, 1938. A claim, in 1911, to have found the legendary Atlantis in W. Africa, and numerous books, established him as an international authority on vanished civilizations.

Frobisher, SIR MARTIN (c.1535-94). English sailor. Born in Yorkshire, he made a voyage to Guinea in 1564, and spent some years in voyages to the Levant and N. Africa. In 1575 he was commissioned by the Muscovy Company to search for the North-West

William Powell Frith. *Ramsgate Sands*, an example of one of the artist's larger compositions, exhibited at the Royal Academy in 1854 and purchased by Queen Victoria

Passage, and set out on June 7, 1576, with two ships of 25 and 20 tons respectively, sighted Greenland, where he lost the smaller vessel, and reached Frobisher Bay in N. America.

Sir Martin Frobisher,
English sailor
From a print

Returning to England, Frobisher repeated the voyage in 1577 as admiral of the company of Cathay, and brought back 200 tons of pyritic ore, which he incorrectly believed contained gold. In 1578 he made a third voyage, and discovered a new strait, but did not make any survey. In 1586 he was vice-admiral to Drake's expedition to the W. Indies, and, in command of the *Triumph*, helped to defeat the Armada (1588). Knighted for his gallantry, he was vice-admiral to Sir John Hawkins in 1590, being sent by Raleigh to harry the Spanish coast in 1591. Mortally wounded in the sea attack against Brest, then held by the Spaniards, he died at Plymouth, Nov. 22, 1594. *A Life* by W. McFee appeared in 1928.

Frobisher Bay. Inlet off the coast of British N. America. Long and comparatively narrow, it cuts into the eastern end of Baffin Island from the Atlantic. Its length is about 250 m., and its breadth about 20. It is about 200 m. S. of the Arctic circle.

Frock (late Lat. *froccus*): Word used as both noun and verb. In the former sense it is applied to a monastic robe, with loose sleeves, reaching to the feet; to a dress worn by women and girls; to a rough worsted garment (strictly, Guernsey frock) worn by sailors over or in place of a shirt; and to a double-breasted, skirted coat formerly worn by men and properly called a frock coat. As a verb the word to frock means, figuratively, to make a man a monk or priest; to unfrock means to deprive monk or ecclesiastic of his privileges as such. *See* Costume; Gown; Smock.

Fröding, GUSTAF (1860-1911). Swedish poet. Born in Värmland, Aug. 22, 1860, and educated at Karlstad and Uppsala, he afterwards joined the staff of the Karlstad paper, and wrote occasional verse. Spending some time in Germany, he studied English and German lyrical poetry, from which he made translations. His first book, *Guitar and Concertina*, 1891,

was an immediate success. New Poems and other books were issued 1894-98, and in 1901-02; his collected works were published. Much of Fröding's verse was written in dialect.

His original humour and spontaneity, vivid portrayal of Swedish life, lyrical perfection, and pithy language, which has already influenced the Swedish tongue, have placed him first among modern Swedish poets. His last years were spent mostly in hospital, but in 1910 he published a volume of poems, *Second Harvest*. He died Feb. 8, 1911.

Froebel, FRIEDRICH WILHELM AUGUST (1782-1852). German educational reformer. Born at Oberweissbach, Thuringia, April 21, 1782, he spent his youth in the heart of the forest, where his long observation of nature gave

Friedrich Froebel

him many of the ideas which later marked his teachings. He studied at Jena, 1801, and at Göttingen, 1811, teaching in the interval at Pestalozzi's school. In 1813 he served in the War of Liberation in Lützow's corps. In 1816 he opened a school at Griesheim, Thuringia, transferred later to Keilhau.

His book, *The Education of Man*, appeared in 1826, and he did important work in training teachers at Burgdorf, Switzerland, during 1833-37. He opened his first kindergarten (children's garden) in Blankenburg, near Keilhau, in 1837, by which date his principles were making headway. Lecturing, writing, and teaching, Froebel spent his remaining years busily, and died June 21, 1852. *See* Froebel System.

Froebel Foundation. Society formed by the amalgamation of the earlier Froebel Society and National Froebel Union. It organizes lectures for teachers and students, maintains a library and an employment agency for teachers, and publishes periodical proceedings. It issues certificates to teachers of children under 14: the certificate A is recognized by the ministry of Education as conferring the status of qualified teacher. Three years' training is required. The headquarters are at 2, Manchester Sq., London, W.1.

Froebel System. Name given to the theory or plan of children's education enunciated by Friedrich Froebel (q.v.). Convinced of the essential unity of all things human, natural, and divine, Froebel held up as the ideal of education the leading of man to a full consciousness of this unity and the teaching of the ways to attaining it. Like Heinrich Pestalozzi (q.v.), he believed that children should be allowed to develop naturally, in happy and harmonious surroundings, with trained guides and helpers to safeguard the process. His system lays great stress on the value of play, which is regarded as a spiritual activity, and on the educational value of allowing freedom for the natural creativeness of children.

Froebel's theories were mainly put into practice in kindergarten schools, but the underlying doctrines are meant for all stages of education. The detailed methods of teaching recommended by Froebel are no longer used, but his principles find expression in all schools where education is based on the understanding of the child's need for actively following his genuine interests, with the help of abundant concrete material such as clay, paints, wood; for contact with the natural world; and for the social training provided by cooperation with other children. *See* Education; Kindergarten; Montessori System.

Frog. Smooth-skinned member of the order Salientia (tailless), of the class Amphibia. This order includes all the frogs and toads, numbering more than 1,000 species, which are distinguished from newts and salamanders by the absence of a tail in the adult stage. The name frog is restricted to the family Ranidae, of which nearly 200 species are known. The bony structure of all the frogs is peculiar in having the hinder half of the vertebral column modified into a simple jointless bone. The two bones usually found in the fore arm and lower leg of vertebrates are fused together. They possess tongues whose base is in the front of the mouth; and have teeth in the upper jaw and palate only. The fore feet are not webbed; the hind ones partially webbed.

Frogs are found in all parts of the world, except in New Zealand, Papua, the extreme S. of South America, and the frozen regions. As they can live only in damp places, and spend part of their life cycle actually in water they are of necessity entirely absent

Frog. Bottom, the edible variety, *Rana esculenta*. Top, common frog, *R. temporaria*

from deserts and the higher ranges of the mountains.

Like all Amphibia, frogs pass through a series of metamorphoses. The eggs are deposited in a jelly-like mass in fresh water, and hatch out as tadpoles, consisting of an oval body and a long tail. During this stage they breathe by means of gills. The tail and gills are gradually absorbed, and at the same time the four limbs make their appearance. At the completion of this stage they leave the water and take to a terrestrial life, breathing air by means of lungs. The air is taken in by a kind of swallowing action, and if the mouth is kept

open for any length of time the animal will die of suffocation, as it cannot inhale apart from the action of the mouth, owing to the absence of ribs. The food consists of insects and slugs, which are seized by thrusting out the long, sticky tongue. Frogs are therefore valuable to the gardener and should never be destroyed. The winter months are passed in a state of hibernation, in the mud of ponds or in holes and crevices.

Great Britain possesses two species of frogs, of which the common frog (*Rana temporaria*) is found almost everywhere. The edible frog (*R. esculenta*) is found mainly in the eastern counties, and is distinguished from the commoner species by its usually larger size and more mottled appearance, especially on the thighs. There is a distinct fold along each side of the body, and the males have a conspicuous round sac on either side of the head, which is distended when croaking. On the Continent and in N. America the edible frog is often used for the table, the flesh of the thighs resembling that of a very young chicken; but it is rarely eaten in Great Britain.

Frog. In engineering, two short lengths of rail spliced together and forming part of a railway crossing. A wrecking frog is a device with one end raised to form an inclined plane by which derailed rolling stock can be replaced on the track. The frog is laid alongside the rail with the lower end towards a wheel of the derailed vehicle; when the latter is pulled, the wheel mounts the frog, which guides it on to the rail. It is also known as a railway

Frog used in engineering as part of a railway crossing

ramp. The term is also applied to part of a horse's hoof, and to that part of a soldier's equipment which carries the sword or bayonet.

Frogbit (*Hydrocharis morsus-ranae*). Floating aquatic herb, of the family Hydrocharitaceae. A native of Europe and N. Asia, it has long-stalked, kidney-shaped leaves, reddish beneath; and three-petalled white flowers. It sends out runners which produce new plants, and in autumn bulbs, which sink to the bottom of the ponds and ditches and pass the winter in the mud. In spring they rise to the surface, and put out leaves. The male flowers are in clusters of two or three; the females solitary

Frog Hopper. Name popularly given to a large family (*Cercopidae*) of hemipterous insects. Their nymphs may be noticed on plants, where they are covered with the froth known as "cuckoo spit." The adult insects are

Frog Hopper of the Alder, *Aphrophora alni*. Above, spiny-legged frog hopper, *Evacanthus interruptus*

mostly grey or brown, and leap vigorously if disturbed.

Frogmore. Royal residence of Berkshire, England. It is within the Home Park, Windsor, 1 m. S.E. of the castle; and was purchased by Queen Charlotte in 1800. The duchess of Kent died here in 1861.

Frogmore, Windsor. Royal Mausoleum built by Queen Victoria, 1862-70

Since then it has been used by other members of the royal family. A cruciform structure surmounted by an octagonal lantern was erected by Queen Victoria over the tomb of the prince consort. The queen's remains were buried here in 1901.

Frogmouth (*Podager*). Genus of night-flying, insectivorous birds of the family Caprimulgidae, which includes the nightjar. They are notable for their very wide mouths. There are numerous species, distributed over Australia, Malaya, and the eastern districts of India.

Frogs, THE. Comedy by Aristophanes, produced 405 B.C. The god Dionysos goes down to Hades to fetch up Euripides from the dead. A contest for supremacy takes place between the rival tragedians Aeschylus and Euripides, in which each humorously criticises the specimens of style given by his opponent. The palm is awarded to Aeschylus, who returns to earth with Dionysos to offer the benefit

Frogbit. Bulbs rising to the surface. One has developed into a plant with four leaves

of his advice to the Athenians. The play takes its name from the chorus of frogs who accompany the god in his passage over the lake of the underworld.

Frohman, CHARLES (1860-1915). American theatrical manager. Born at Sandusky, Ohio, June 12, 1860,

Charles Frohman,
American theatrical
manager

he was employed in The Daily Graphic offices, New York, and then as box-office clerk at Hooley's Theatre. In 1893 he established himself at the Empire Theatre, New York, and later controlled five other theatres. In 1897 he became lessee of the Duke of York's, London, where he brought out Barrie's plays, *The Admirable Crichton*, 1903; *Peter Pan*, 1904; *What Every Woman Knows*, 1908; and experimented with a repertory system in 1910, producing plays by Barrie, Shaw, Galsworthy, and Granville-Barker. He was drowned when the *Lusitania* was sunk, May 7, 1915.

Froissart, JEAN (c.1338-c.1404). French chronicler. The son of an heraldic painter, Froissart was

born at Valenciennes, and probably started to write the first part of his history about 1358. He became secretary to Philippa of Hainault, queen of

Jean Froissart,
French chronicler

Edward III of England, in 1361, and while in her service visited the court of David II of Scotland. In 1366 he followed Edward the Black Prince to Gascony, and paid visits to several courts of N. Italy. Philippa died in 1369, and he found other patrons in Count Robert of Namur, Duke Wenceslas of Brabant, and Guy de Blois, overlord of Chimay, from whom he obtained the benefice of Lestines-au-Mont. In 1388 Froissart visited Béarn, and travelled with the knight Espaing de Lyon, whose stories gave him much picturesque matter for his *Chronicles*, to the brilliant court of Gaston Phoebus of Foix at Orthez. In 1395 he paid another visit to England. He died at Chimay.

The *Chronicles*, in four books, trace the history of the main events

in England, Scotland, Ireland, France, Flanders, and Spain, as well as happenings at the papal courts at Rome and Avignon, between 1325 and 1400, and form one of the greatest of medieval historical works. The first book, much of its material borrowed from the earlier chronicler Jean le Bel, views the course of events largely from the English point of view, written as it was under English patronage. But on the whole Froissart gives a fair version of events as he saw them, or as the witnesses available at the time described them to him. He spared no effort in the search for reliable testimony.

Modern research has corrected errors of chronology, statistics, and topography, but Froissart shows a great advance on most of his predecessors. He definitely presents his picture as a whole, relating cause and event in due sequence, not content merely to enumerate bald facts. But his work is chiefly prized for its vivacious narrative of the best side of the chivalric age. Froissart was the friend of several notable poets, especially Eustache Deschamps, and probably Chaucer. The first dated edition of the *Chronicles* appeared in 1504; the first Eng. trans. by Lord Berners, 1525.

Frome or **FROME SELWOOD**.

Urban dist. and market town of Somerset, England. It stands on the Frome, 24 m. S.E. of Bristol by rly. Brewing, printing, and the manufacture of cloth are the

chief occupations, the woollen industry having greatly declined. The parish church, a Decorated building of the 14th century, was restored on a magnificent scale in the 19th cent. There are also a museum, market hall, and grammar school. Market days, Wed. and Sat. Pop. 11,000. Pron. Frome.

Frome. Lake of S. Australia. It lies in the Eastern Plains, 50 m. E. of the Flinders Range. About 50 m. long from N. to S., it is 25 m. wide from E. to W. The Wilpena river issues from its S. extremity.

Fromentin, EUGÈNE (1820-76). French painter and writer. Born near La Rochelle, he studied under Cabat and painted Algerian life and landscape, his style showing the influence of Delacroix. He is

better known, however, as the writer of *A Summer in the Sahara*, *A Year in the Sahel*, both models of the art of word-painting, and of *The Masters of Past Time* in the Low Countries, a book of descriptive art-criticism. He died Aug. 27, 1876.

Fronde, THE. Name given to the insurrection and civil war in France under the regency of Anne of Austria and Cardinal Mazarin, 1648-53. Its two phases are known respectively as the parliamentary Fronde and the Fronde of the princes. The name comes from that of a small sling used during the disorders in Paris.

In 1648 Mazarin sought the sanction of the parliament of Paris to fresh and burdensome taxes by offering that body certain fiscal exemptions. This the parliament refused, and drew up forthwith a series of 27 articles of constitutional reform, forbidding the imposition of unauthorised taxes, reducing certain imposts, etc. After momentarily yielding, the queen-regent suddenly arrested the parliamentary leaders, Broussel, Blancmesnil, and Charton. The Parisians raised street barricades and the court party was alarmed into releasing the prisoners and granting the required reforms. Mazarin, however, strengthened by the adherence of Condé, obliged the parliament to sign the peace of Rueil, March 11, 1649, with which the first phase closed.

Frome, Somerset. The High Street, market place, and cross

The next phase was essentially a struggle between Condé and Mazarin. Jealous of Mazarin's power, Condé turned against him, but was arrested and imprisoned with other malcontent nobles, Conti and Longueville. Another foe of the cardinal, Paul de Gondi, a powerful ecclesiastic, stirred up revolt in Paris, forcing the minister to release Condé and to quit France early in 1651. He returned in Jan..

1652, whereupon Condé, with Spanish aid, headed a powerful movement against the court party. Raising an army in the south, he defeated the royal forces at Bléneau, and, despite Turenne's able defence at the Faubourg S. Antoine, occupied Paris. His unpopularity forced him to leave in July, when the court and the cardinal returned. By the summer of 1653 the Fronde, in spite of a determined struggle in Guienne, was crushed, and this singularly unnecessary civil war had ended in the powers of the parliament of Paris being severely curtailed and the monarchical power correspondingly consolidated. See France: History; Mazarin.

Front. Military term. In infantry drill it indicates the direction in which troops face when drawn up in one or more ranks, irrespective of whether the original front rank is in front or in the rear. In warfare it describes an area in which the opposing armies are in fighting contact, and also the rear areas occupied by immediate administrative and supply services of the combat troops and reserves. During the First Great War the term "the front" was generally used to denote the area of operations in France and Flanders (the Western front).

Frontenac, LOUIS DE BUADE, COMTE DE (1620-98). French governor of Canada. He belonged to a noble family of Béarn, and served in the French army with distinction. In 1672 he was sent out to New France as governor, and held that position until 1682, and again during 1689-98. As a ruler he was successful, but his autocratic temper caused constant quarrels with other high officials, especially Laval-Montmorency, bishop of Quebec. Frontenac died at Quebec, Nov. 28, 1698.

Louis de Frontenac
Statue by P. Hébert

Buildings, Quebec

98. As a ruler he was successful, but his autocratic temper caused constant quarrels with other high officials, especially Laval-Montmorency, bishop of Quebec. Frontenac died at Quebec, Nov. 28, 1698.

Frontier. That part of a country which fronts or faces another country. The term is generally used in a military sense to describe a country's fortified border, and is often denoted by the name of the adjacent country or countries, e.g. the Franco-Spanish frontier. Because their delimitation is governed by military reasons, European frontiers follow geographical rather than ethnological lines. The

frontier is also used in undeveloped regions to indicate the farthest point of civilized settlement, e.g. the old-time Indian frontier of the U.S.A., which moved steadily W. until by 1890 it may be said to have disappeared. In India, the North-West Frontier gave its name to a province (now part of Pakistan), as the administrative control of the area was essential strategically in relation to Afghanistan. The only unfortified frontier in the world is the border between Canada and the U.S.A.

Frontiersmen, LEGION OF. British organization of men who have lived in the colonies, dominions, or on the frontiers of the Empire for a continuous period of not less than three years, or have served abroad in the armed forces or the merchant navy, and are prepared to place their services at the disposal of the country in time of emergency. The legion was formed in 1904 by Capt. Pocock and Col. Driscoll, and was originally recruited from men who had served in the S. African War, principally Driscoll's Scouts. F.-M. Lord Birdwood became president of the legion, which has its headquarters at 21, Bedford Street, London, W.C.2.

Frontinus, SEXTUS JULIUS (c. A.D. 40-105). A Roman soldier. While governor of Britain during 75-78 he gained a great victory over the Silures of S. Wales. He was the author of *Strategemata*, a collection of anecdotes of famous military leaders, and of *The Aqueducts of Rome*, an account of their construction and maintenance, written after his appointment as *curator aquarum* or superintendent of the water-supply in 97.

Fronto, MARCUS CORNELIUS (d. c. 170). Roman rhetorician. Born at Cirta in Africa, he flourished in the reigns of Hadrian and Marcus Aurelius, with the latter of whom he was on friendly terms. As an advocate and teacher of rhetoric he amassed a large fortune, and was raised to the consulship in 143.

A number of Fronto's letters, including correspondence with Marcus Aurelius, discovered by Cardinal Mai at the beginning of the 19th century, do not justify his great reputation among his fellow-countrymen, although they exhibit him as a man of honourable and upright character. He was the father of what was called the *elocutio novella*, "partly a return upon the style of the older (pre-Ciceronian) Latin authors, partly a new growth based, as theirs had

been, on the actual language of common life" (Mackail). This was destined to be the parent of the Romance languages.

Front Populaire (Fr.). This grouping of Left-wing parties in France is considered under Popular Front.

Front Range. Name given to a section of the Rocky Mts. It is the most eastern part of the range, hence its name. In the state of Colorado, its chief peaks are Pike's Peak and Long's Peak; both are over 14,000 ft. high. See Rocky Mts.

Frosinone. Town of Italy, in the prov. of the same name; the ancient Frusino. Built on a hill overlooking the Cosa, an affluent of the Sacco, 54 m. by rly. S.E. of Rome, the town has many churches, holds an annual fair, and is noted for its wine. In former times its outskirts were infested by brigands. Near are remains of the Volscian city of Frusino, conquered by the Romans in 304 B.C. Pop. 18,447.

Frost. A condition of the weather. When the temperature of the air is at, or below, the freezing point of water (32° F.) a screen frost is said to have occurred. A ground frost is defined as an occasion on which the temperature registered by a thermometer laid on the grass reaches a value of 30° F. or less. This limit is adopted because it has been found that injury to the tissues of growing plants is not brought about until the temperature has fallen appreciably below the freezing point. Favourable nights for ground frosts have little wind and clear skies. Under such conditions the surface of the grass or soil is cooled rapidly through radiation of heat into the atmosphere. If the temperature of the radiating surface falls to the freezing point, and at the same time the air is saturated with water vapour, ice is deposited in the form of crystalline needles or feathers. This white hoar frost may consist partly of frozen dew. When low temperatures and wet fog occur together, the fog droplets freeze on exposed cold objects, producing a mass of rough crystals known as rime. Glazed frost occurs when rain falls into layers of cold surface air; this is the clear ice which makes roads impassable and brings down overhead wires.

To protect fruit crops from damage by frost, orchard heaters have been widely used. In choosing positions for orchards, natural frost hollows (where cold air collects in pools) must be avoided,

and if slopes are to be cultivated lanes must be provided in order that downward-flowing cold air can be drained away efficiently. Crops may also be damaged in late spring by cold strong winds which produce the so-called wind frosts. Here damage is greater at the higher levels.

Much more serious than the local short-lived radiation frosts are the severe persistent frosty spells due to the influx of dry, cold, Arctic air during anticyclonic weather. Among noteworthy frosts experienced in the British Isles were those of 1683-84; 1740, 1795; Jan.-Feb., 1814, when the last of the famous frost fairs was held on the Thames; 1890-91; Feb., 1895, which was preceded by heavy snowfalls; Jan., 1940, with its great ice (glazed frost) storm; Feb., 1947, in some places the coldest month of the century up to that time. See Dew; Glazed Frost; Hoar Frost; Ice.

Frost, JOHN (d. 1877). English Chartist. He was appointed mayor of Newport in 1836, represented Monmouthshire at the Chartist convention of 1839, and was removed from the commission of the peace for seditious speeches. Hailed as a popular champion, on Nov. 4, 1839, he led an armed mob into Newport. Frost was sentenced to be hanged, drawn, and quartered, but the sentence was commuted to transportation for life. In 1856 he received a free pardon. He died at Stapleton, near Bristol, July 29, 1877.

Frost, ROBERT LEE (b. 1875). An American poet. Born at San Francisco, March 26, 1875, and educated at Dartmouth College and Harvard university, he became a farmer. Professor of English at Amherst College, 1916-20, 1923-25, and 1926-38, he was

Robert L. Frost,
American poet

awarded the Pulitzer prize for poetry, 1924, 1931, 1937, and 1943. His first volume of verse, *A Boy's Will*, appeared in 1913; *The Love-ly Shall be Choosers*, 1929; *The Lone Striker*, 1933; *From Snow to Snow*, 1936; *A Witness Tree*, 1943. Much of Frost's poetry is descriptive of the beauty of the New England countryside, and for simplicity of subject and diction has been likened to that of Edward Thomas, with whom he was intimate in 1914.

Frost-bite. Localised gangrene of the tissues produced by exposure to severe cold. The parts of the body most likely to be involved are the fingers and toes, owing to the more sluggish circulation of the blood in the extremities, and exposed parts such as the nose and ears. The first sign of frost-bite is a patch of redness with slight swelling and sometimes severe pain. If the exposure continues the part becomes white, hard, shrunken, and waxy-looking, but without pain, so that the individual may be unaware of what is taking place. Ultimately the part becomes black and ulcerated.

The old idea that frost-bites should be treated by rubbing with snow and water is now quite exploded, according to A. H. Macklin, surgeon to the Imperial trans-Arctic expedition, and the best treatment consists in gentle massage of the frozen part with a warm hand, after which it should be wrapped in dry cotton wool. Greasy applications should be avoided. Common practice in the Arctic is to place a frozen hand next the skin between the thighs, and to impede the painful renewed flow of blood by warmth combined with gentle compression. If actual gangrene occurs the part must be kept carefully protected and aseptic until a line of separation forms, and the subsequent ulceration heals.

Froude, JAMES ANTHONY (1818-94). British historian. Son of the Rev. Robert Hurrell Froude, he was born at Dartington, Devon, April 23, 1818. Educated at Westminster School, in 1835 he entered Oriel College, Oxford, afterwards becoming a fellow of Exeter. At Oxford Froude was associated with the Tractarians, but he never joined them, although he took Holy Orders in 1844. Influenced by Carlyle's books, he broke with orthodox religion, expressed his changed views in *The Nemesis of Faith*, 1848, gave up his fellowship, and, as soon as the law permitted, became a layman once more.

In 1849 he made the acquaintance of Kingsley and, more important, of Carlyle, and set to work upon his *History of England from the Fall of Wolsey to the Spanish Armada*, 1856-70. It was completed in twelve volumes and is the monument to Froude's life. No historical work was ever more deservedly or more sharply criticised; yet its merits are as conspicuous as its faults. The style is powerful, graceful, and

restrained, for Froude, like Burke is "one of the great masters of the high and difficult art of elaborate composition."

But against this are blemishes of partiality and worse, for critics have asserted that, in pursuance of his aim, the author did not hesitate to misquote his authorities. As pendants to this work Froude wrote *The Divorce of Catherine of Aragon*, 1891; *The Spanish Story of the Armada*, 1892; and *Lectures on the Council of Trent*, 1896.

In other directions Froude's writings led to acrimonious criticism. *The English in Ireland in the 18th Century, 1671-74*, was resented by the Irish and their friends. As the sequel to an intimate friendship, Froude was named as Carlyle's executor, and he published some *Reminiscences*, 1881; *Mrs. Carlyle's Letters*, 1882; and *Life*, 1882-84, which gave a markedly unfavourable picture of the relations between Carlyle and his wife. Froude was accused of misrepresentation, and he replied with two books: *Carlyle's Life in London*; and *My Relations with Carlyle*. Another controversy arose out of Froude's book, *Oceana, or England and her Colonies*, 1886.

Froude took an interest in politics, and was twice sent on missions to S. Africa by Lord Beaconsfield's government. In 1892 he succeeded Freeman as professor of modern history at Oxford. He died at Salcombe, Oct. 20, 1894. Froude's most delightful work is in the four volumes of *Short Studies on Great Subjects*, 1867-82. He also wrote *The Life and Letters of Erasmus*, 1894; an historical romance, *The Two Chiefs of Dunboy*, 1889; and for many years edited *Fraser's Magazine*. Consult Froude and Carlyle, W. H. Dunn, 1930.

Froude, RICHARD HURRELL (1803-36). Anglican divine. Elder brother of J. A. Froude, he was born at Dartington, March 25, 1803, and educated at Eton and Oriel College, Oxford, being a pupil of John Keble. As fellow and tutor of Oriel, he brought Newman and Keble together, and thus began the Oxford Movement (*q.v.*). Ordained deacon in 1828 and priest in 1829, he resigned his tutorship in 1830. While at Rome with Newman he began the *Lyra Apostolica*,

James A. Froude,
British historian

his contributions to which are initialled β . After visiting the West Indies for his health, and lecturing there, he died of consumption at Dartington, Feb. 28, 1836. His Remains were ed. by Keble and Newman, part I, 1838, and J. B. Mozley, part II, 1839.

Fructidor (Fr., month of fruit). The twelfth and last month in the year as rearranged during the French Revolution. It began on Aug. 18 or 19. The 18th of Fructidor is the name given to the

coup d'état of Sept. 4, 1797, when the Directory used military force to check the growing power of the royalists. See *Calendar*.

Fructose, **LEVULOSE**, or **FRUIT SUGAR**. Variety of sugar which occurs together with dextrose in all sweet fruits. It is produced from cane sugar by hydrolysis with dilute sulphuric acid. Fructose is sweeter than cane sugar, and is not readily crystallised. It is frequently used as a sweetening agent for diabetic patients.

FRUIT AND ITS VALUE AS FOOD

H. V. Taylor, D.Sc., and Other Writers

Here is an explanation of what fruits are botanically, and how they are adapted to carry out their work, the dissemination of the seed of plants. This is followed by an account of the nutritional value, growing, and preserving of fruits useful as human food

Fruit (Lat. *fructus*, enjoying) is a general term for that part of a plant which contains the seed. Many fruits are edible, and with this use the word is chiefly associated—the chief fruits being apples, pears, plums, grapes, currants, peaches, etc. Nuts are also fruit. The term is also used for any produce of the earth. A fruiterer is a dealer in fruit; and a fruitarian is one who lives mainly on fruit.

Botanically, the fruit is the structure developed by the plant after fertilisation of the ovules. The process of fertilisation induces the thin, green ovary wall to develop into the pericarp or fruit wall, which may be wholly or partly fleshy, leathery, or woody.

Methods of Seed Dispersal

The function of the fruit is the nourishment, protection, and ultimate distribution of the enclosed seeds. Seed dispersal is active when the seeds are explosively shot from the plant; passive when they are carried away by agents. Wind dispersal is the most common method, as in the grass family, most of the Compositae, and many others. All such fruits present a large surface area to catch the slightest breeze, and this is brought about by wing-like expansions of the pericarp, as in sycamore "keys", or by bracts partially enclosing the fruit, e.g. in hornbeam, or by a pappus of hairs forming a parachute, e.g. in dandelion, willowherb. Dispersal by water is less frequent, an example being the coconut.

Animals and birds disperse fruits and seeds, either by eating the fleshy parts of soft fruits, e.g. apples, plums, and passing out the seeds in their droppings, or by carrying entangled in their fur or feathers barbed fruits which

are subsequently torn out or rubbed off at a distance from the parent plant. Nuts are carried away and stored by squirrels and monkeys; many of course are eaten but others are overlooked and germinate. The seeds of the grass family are often removed by beetles and ants, and larger grains such as wheat and maize by mice and birds.

CLASSIFICATION AND STRUCTURE. Fruits may be separated into two main groups according to whether the mature organ is formed solely by the development of the ovary wall, i.e. true fruits; or whether any other part of the plant (commonly the receptacle bearing the flower) swells and becomes part of the mature structure, i.e. false fruits.

False fruits, almost without exception fleshy, include the *pome* of apples and pears, the strawberry (in which the receptacle bearing the achenes becomes juicy and swollen), the *hypanthodium* of the fig, and the *sorosis* of mulberry and pineapple. The last two consist of a collection of fruits whose receptacles and common axis all become fleshy. In the fig, however, the receptacle forms a fleshy, hollow organ.

Two Types of True Fruit

True fruits may be either dehiscent or indehiscent, i.e. the fruit may expose the seeds by openings in the pericarp, or the seeds may be exposed and disseminated only after the pericarp has decayed. Such fruits may be either dry or fleshy. Dehiscent fruits include the *follicle* (a pod which splits along the seed-bearing margins) as in columbine; the *legume*, which splits along both margins and is the typical fruit of the Leguminosae; the *siliqua* of the Cruciferae (a flattened pod with a false septum within); and

the *capsule* (with examples found in most families), which opens by valves, pores, or splits. Indehiscent fruits of the dry variety include the small, woody *achene*, e.g. buttercup; the *samara* of sycamore and maple; and the *caryopsis* (with fused pericarp and testa) of the grass family. Fleshy indehiscent fruits include the *drupe* with woody stone as in plum, almond, cherry; the *aetereo*, or collection of drupelets found in blackberry, etc.; and the *berry* of tomato, gooseberry, orange, banana, etc.

Helen L. Pursey

NUTRITIONAL VALUE. Fruits belong to the health-protective foods. When fresh, they contain from 75 to 96 p.c. moisture, and so contribute no substantial nourishment to the diet. They provide little body-building protein and no fat. Their calories or fuel value are derived chiefly from carbohydrate in the form of easily assimilated fruit sugars. Their important nutritional value lies in health-protective vitamins and food-minerals, body-regulating cellulose roughage (or bulk), and naturally distilled water.

Vitamin Content

Their special contribution is vitamin C, which helps to keep the teeth and gums healthy and the body agile. Many fruits, particularly dried varieties, provide vitamin A, which fortifies resistance to infection and poor sight at night. Others provide the nerve-steadying vitamin B₁, and growth-promoting B₆. Calcium, phosphorus and iron occur in all fruits, contributing to good blood and sound body structures and functions. The bulk and water content assist in the elimination of toxic and waste matter. Ripe fruits are easily digested, but skins and seeds are not and should be discarded.

Fruits may be roughly divided into four nutritional classes: (1) Pulp fruit (apples, pears, bananas, etc.), moderately energising and laxative. (2) Berry fruits (currants, raspberries, etc.), mineral-rich, kidney and nerve tonics. (3) Citrus fruits (oranges, lemons, etc.), alkalising, digestive tonics. (4) Dried fruits (dates, prunes, etc.), very energising natural sweets and regulatory. (See accompanying table; also Food and Nutrition)

S. B. Whitehead, D.Sc.

FRUIT GROWING. In all climates and most parts of the world fruit is grown for local consumption. In areas where the environment is peculiarly suitable large acreages have been planted and important industries have developed. Re-

cently many dry areas have been made suitable by systems of irrigation, and this is now a common method in the fruit-growing areas in the western provinces of Canada, the U.S.A., Chile, Argentina, and Australia.

The principal fruits are apples, pears, oranges, grapefruit, lemons, bananas, grapes, raisins, and currants. The producing areas are:

Apples (thousand acres): U.S.A., 2,000; Germany, 1,000; U.S.S.R., 1,000; France, 900; U.K., 200; Canada, 200; Australia, 100.

Pears: U.S.A., U.S.S.R., Germany, France, Japan, Argentina, Australia, U.K., S. Africa.

Dried fruits, raisins, and currants are important products of the U.S.A., Greece, Australia, and, to a lesser extent, Turkey.

Fruit Growing in England

In England fruit growing has become a large industry, occupying 60,000 holdings and an area of 272,900 acres. Of this area 242,700 acres are given entirely to fruit trees of apples, pears, or plums; 11,260 acres are planted similarly but undercropped with currants, gooseberries, or raspberries; while 17,304 acres are planted with soft fruits not as an undercrop. Undercropping of trees with bush fruits, formerly

The most important fruit area is in Kent, at Sittingbourne, Faversham, Maidstone, and in the Weald. The second is centred round Wisbech, extending over the Isle of Ely into Norfolk, Cambridgeshire, Hunts, and the Holland division of Lincolnshire. The area known as the West Midlands is centred in Worcestershire, but extends to parts of Herefordshire, Gloucestershire, and Warwickshire. A few acres are given to apples for cider on most farms in Devon, Somerset, Gloucestershire, Herefordshire, and Monmouthshire. Special areas with strawberries for the early markets are

Citrus fruits, including oranges, lemons, and grapefruit (thousands of trees): U.S.A., 40,300; Japan, 33,000; Spain, 28,000; Brazil, 25,000; Italy, 19,000; Palestine, 7,000; S. Africa, 4,200; Australia, 4,000; W. Indies, 1,500.

Bananas are grown, for commercial sale, in Jamaica, Mexico, Honduras, Brazil, Guatemala, Cuba, and the Canary Isles. The fruit is normally an important source of income for the W. Indies and the Canary Isles.

Grapes for table use are produced in Bulgaria, the U.S.A., Italy, Hungary, Netherlands, S. Africa, Belgium, Algeria, and Argentina. The areas of grapes for wine are France, Italy, Spain, Algeria, Portugal, and, more recently, S. Africa and Australia.

popular in England is now thought to be unwise, and modern orchards are planted either to trees or to soft fruits.

English-produced fruits in order of importance are: Apples, 3,800,000 trees; pears, 171,000 trees; plums, 4,725,300 trees; cherries, 666,000 trees; strawberries, 9,084 acres; black currants, 9,091 acres; gooseberries, 6,488 acres; raspberries, 2,232 acres. Loganberries, hybrid berries, cultivated blackberries, red currants, and white currants are also grown.

Those engaged in fruit growing for profit have to choose the areas carefully to avoid unsuitable soils and unfriendly climates. Well drained soils of medium or light texture with annual rainfall between 22 and 28 ins. are preferred.

in the Tamar valley, Cornwall-Devon border; Cheddar, Somerset; and Botley, Hants.

The principal varieties of apples are Early Victoria, Grenadier, Lord Derby, and Bramley Seedling, all culinary sorts, and Cox's Orange Pippin, Worcester Pearmain, Ellison's Orange, and Laxton's Superb for dessert. The most widely planted is the Bramley, but the Cox's Orange and other dessert varieties are preferred. Of plums the chief varieties are the Pershore, Purple Pershore, the Czar, Victoria, and Giant Prune. More recent plantings are of dessert varieties such as Victoria and the Gages. Of pears, Laxton's Superb, Fertility, and Conference are the most important. Strawberries for the main crops

are Huxley and for the early districts the Royal Sovereign. The Norfolk Giant is the chief commercial raspberry, and the Baldwin, Westwick, French, and Wellington are the favourite black currants.

The spraying of fruit trees and bushes has developed immensely, and it is now the practice for growers to carry out a spraying programme. This involves the application of a tar oil winter wash, followed by two or more summer sprays containing lime sulphur and, occasionally, insecticides. The smaller growers, without spraying machines, may have the work done on contract charges by the county agricultural committees. Growers receive guidance from research work done at stations at East Malling, Kent; Long Ashton, Bristol; and Merton, Surrey. National fruit trials are conducted by the Royal Horticultural Society at Wisley, Surrey, in cooperation with the ministry of Agriculture. **H. V. Taylor, D.Sc.**

PRESERVATION OF FRUIT. The most common method is to boil the fruit with sugar until it becomes jam (*q.v.*). But it can be crystallised, the sugar preserving it as in jam; it can be put through a drying process, so that the moisture is entirely evaporated, decay being thus prevented; or it can be hermetically sealed in vessels with syrup or water. The natural flavour and colour are best preserved by the last method, which can be carried out on a small scale at home quite as well as in the factory. That the process was employed by the Romans is proved by sealed jars found in the ruins of Pompeii, with the fruit intact.

Bottling and Canning

In bottling, the fruit may be boiled in the bottles, the vessels filled up with water or syrup, and the caps or stoppers, fitted with rubber rings to render them airtight, screwed on before the cooking process. Alternatively the bottles may be sealed with caps after the boiling.

In preserve factories, tins are more extensively used than bottles, being cheaper, less breakable, and more adaptable to mechanical processes. They are specially prepared with a lacquer coating inside, which prevents possible action of the fruit acids on the metal. The tins are filled with fruit and syrup, the lids rapidly fastened on by machinery, the closed tins then being processed or cooked in huge tanks of water brought to the necessary temperature. After

cooking, they are allowed to cool, washed, and labelled. Bottled fruits are prepared in the same way, but greater care has to be exercised owing to the fragile character of glass, and there is more manual work in the packing, which explains why bottled fruits are dearer than tinned. Tinned fruits are as safe and wholesome as bottled fruits.

Fruit Available the Year Round

Properly preserved as described, the fruits have almost the same flavour as when fresh, and the choicest orchard products, which used to be available for only a few weeks in the year, can now be enjoyed during the whole twelve months, as can the finest imported fruit. Canned or bottled fruit will keep in a perfect condition for years, if the sealing is really hermetic. Sometimes, however, where a joint is defective, fermentation sets up, and the tin becomes "blown," i.e. the gases developed inside cause the tin to swell outwards, and, if left alone, it will eventually burst.

Glacé fruits are first boiled in a strong syrup, and then dried in a moderate oven. The syrup in which the fruit was boiled is then raised to a temperature of about 233° F., and when it is cooled somewhat, the fruit is dipped in until it is well coated, after which it is dried. Crystallised fruits are similarly treated, but when taken out of the syrup are rolled in crushed loaf sugar before being dried.

Fruit Bat. Family of bats (*Pteropodidae*). Much larger than the rest of the order, they are characterised by feeding on fruits instead of insects. The molar teeth are modified in form to suit the change of diet. The head is somewhat fox-like, whence the animals have derived their popular name of flying foxes. Including numerous species, they are found in S. Asia, Australia, Madagascar, and most of the islands of the Pacific Ocean. See *Flying Fox*.

Fruiters' Company. London city livery company. First mentioned in 1292, and granted its first charter in 1605, it took part in the colonisation of Ulster in 1613, and has done much to encourage fruit culture in England, and to

Fruiters' Company arms

promote the interests of the fruit trade. Its offices are at 16, Old Broad Street, E.C.3.

Fruit Fly. This pest is described under *Drosophila*.

Fruit Pigeon. Name given vaguely to a number of large, handsomely coloured pigeons, of the sub-family *Treroninae*, which feed mainly on fruit. The beak is so adapted that it can be widely distended at the base in order to swallow fruits whole. Found throughout S. Asia and Australia, these birds damage crops.

Fruit Pigeon of Oceania, *Carpophaga oceanica*

Fruntsberg, GEORG VON (1473-1528). German soldier. Born at Mindelheim, Sept. 29, 1473, of noble family, he became a soldier, and saw service in Germany and Italy. He is chiefly known for his share in organizing the troops known as Landsknechte, which he led with conspicuous success. His chief exploit was against the French and Venetians in Italy. In April, 1522, he won the battle of Bicocca, and he was present at Pavia, Feb. 24, 1525; he also served Charles V against the rebellious duke of Württemberg, and in crushing the revolt of the peasants in 1525. He died at Mindelheim, Aug. 20, 1528.

Frunze. Capital of the Kirghiz S.S.R. It is situated near the Cher river, about 300 m. N.E. of Tashkent, and was formerly known as Pishpek. There is rly. connexion with Semipalatinsk and the grain producing districts around Lake Balkhash. The city is the centre for a vast livestock breeding region, and manufactures tobacco. Pop. 92,659.

Frunze, MIKHAIL VASSILIEVICH (1885-1925). Russian soldier. He was born in Turkestan and educated at the Leningrad (then St. Petersburg) polytechnic, where he joined the Bolsheviks. After a period of imprisonment Frunze was banished to Siberia in 1914, but escaped and took part in the fighting in Moscow during Nov., 1917. An army commander on the eastern front in 1918, he later directed operations against Admiral Koltchak, and took command of the troops that drove Wrangel out of the Crimea. Vice-president of the revolutionary military council in 1924, Frunze became president and people's commissar for military and naval

FRUIT: EXAMPLES OF THE PRINCIPAL RECEPTACLES FOR SEEDS

affairs in Jan., 1925, but died the same year. The Red Army military academy was renamed after him.

Frustration. Term used in psychology for the state of mind which occurs when instinctual expression is blocked either by conscience or by the environment, and no gratification is available as a substitute. All frustration causes resentment, either overt or repressed; a fact which has important bearings on the theories of ethics and education.

Fry. The young of salmon, trout, and other fish, at the stage when the yolk-sac which surrounds them after hatching has disappeared. The phrase "small fry" in general use comes from this term.

Fry, CHARLES BURGESS (b. 1872). An English athlete and journalist. He was born at Croydon, April 25, 1872, and educated at Repton and Oxford (Wadham College), where extraordinary athletic prowess brought him three blues and the captaincy of cricket and Association football. A brilliant and highly scientific batsman, he played cricket for Surrey in 1891, for Sussex from 1894, and for Hampshire, 1909 to 1921; he exceeded 3,000 runs, with six successive centuries, in 1901, and captained England in 1912 in the triangular series of test matches against Australia and S. Africa. Fry played Association

football for England, and in 1893 set up what was then a world record with a long jump of 23 ft. 6½ ins. In 1907 he helped to introduce the game of

diabolo. As a jour-

nalist, he ran C. B. Fry's Magazine, 1904-14, was athletic editor of The Captain, 1899-1905, and later wrote on cricket for The Evening Standard. An honorary commander, R.N.R., he was director of the nautical school training ship Mercury (*q.v.*). He wrote (with his wife) a novel, A Mother's Son (1907), with descriptions of hunting, steeplechasing, and cricket. Other publications were Cricket, 1912; Key Book of the League of Nations; Life Worth Living, 1939.

Fry, CHRISTOPHER (b. 1907). English dramatic poet. Born at Bristol, Dec. 18, 1907, he was educated at Bedford Modern School and went on the stage in

1927. He attracted attention with a witty verse-play A Phoenix Too Frequent (Mercury theatre, 1946). Later successes in this style were The Lady's Not for Burning (Arts theatre, 1948; with John Gielgud, Globe, 1949); Venus Observed, produced by Sir L. Olivier, St. James's, 1950. Other plays were produced at Edinburgh and Canterbury festivals.

Fry, SIR EDWARD (1827-1918). British lawyer. Born Nov. 4, 1827, of a well-known Quaker family, he

Sir Edward Fry,
British lawyer
Elliott & Fry

was educated at Bristol and London university. In 1854 he became a barrister, in 1869 a Q.C., and in 1877 a judge of the court of chancery. He served on the bench with distinction and dignity for fifteen years, after 1883 as a lord justice of appeal. After his retirement in 1892 he did varied public work. He was made permanent member of the Hague tribunal, and represented his country at the conference of 1907. Fry presided over two commissions on Irish affairs, one on land, in 1897, and one on university education. He died Oct. 18, 1918.

Fry, ELIZABETH (1780-1845). English prison reformer. Born at Gurney Court, Norwich, May 21, 1780, a daughter of John Gurney, Quaker and banker, she was brought up in cultured surroundings, and married Joseph Fry, another Quaker, in 1800. In 1813 Mrs. Fry paid her first visit to Newgate prison. The misery and filth she saw there determined her to devote herself to improving the lot of the prisoners, especially the females, and the rest of her life was spent in this cause.

In 1817 she formed an association for their improvement, and, like Howard, extended her interest to prisons in other parts of Europe.

So successful was she that in 1818 she was called before a committee of the house of commons, and thanked for her work. She organized night shelters for the home-

Elizabeth Fry.
After C. R. Leslie

less and a visiting society for the relief of distress. She died at Ramsgate, Oct. 12, 1845.

Bibliography. Memoirs, ed. by her daughter, 1847; Life, G. Lewis, 1910; Journeys on the Continent, ed. R. Johnson, 1931; E. F., Quaker Heroine, J. Whitney, 1937.

Fry, JOSEPH (1728-87). British manufacturer. Born at Sutton Benger, Wiltshire, he was apprenticed to a doctor at Basingstoke. He settled in Bristol, where he soon had a good practice, but his fame rests upon his business enterprises. He founded the business of cocoa and chocolate manufacturers, now the firm of J. S. Fry & Sons, and also became a typefounder. This concern, having been transferred to London as Joseph Fry & Sons, was responsible for useful typographical innovations, and printed some Bibles. Fry was also interested in soap and chemical works. Like many of his descendants, he was a member of the Society of Friends. He died March 29, 1787.

Fry, ROGER ELLIOT (1866-1934). British artist and critic. Son of Sir Edward Fry (*q.v.*), he

was educated at Clifton and Cambridge, where he took his degree in science. He then turned to art, becoming co-editor of The Burlington Magazine, an authority on Italian

Roger E. Fry,
British artist
Elliott & Fry

art, and a vigorous apologist of Post-impressionism. He helped to organize the first exhibition in London of Post-impressionism, though it was Desmond MacCarthy who coined the term. Fry wrote a study of Giovanni Bellini, 1899; Vision and Design, 1920; Transformation, 1926; Cézanne, 1927; Reflections on British Painting, 1934; and edited Reynolds's Discourses, 1905. In 1908 he was European art adviser to the Metropolitan Museum, New York. He became Slade professor of fine art at Cambridge in 1933. As a painter he was a leading member of the London group (*q.v.*). He died as the result of a fall, Sept. 9, 1934. A biography by Virginia Woolf was published, 1940.

Fry, (SARA) MARGERY (b. 1874). British social worker. Daughter of Sir Edward Fry, she was educated at Miss Lawrence's school, Brighton (afterwards Roedean) and Somerville College, Oxford, at

which college she was librarian, 1898-1904, and principal, 1926-31. She was warden of University House, Birmingham, 1904-14, and a governor of the B.B.C., 1938-39. A leader of the movement for penal reform for child delinquents, she was secretary of the Howard League, 1919-26.

Fryatt, CHARLES (1872-1916). British sailor. Born Dec. 2, 1872, he entered the service of the G.E.R.

Charles Fryatt,
British sailor

as an able seaman. In 1904 he became chief officer, obtained his master's certificate in 1905, and in 1913 was promoted captain. When the First Great War broke out he was in command of the steamer Brussels on the service between Holland and England. He was attacked and escaped from a German submarine on March 3, 1915, but on the 28th was attacked again, and rammed the U-boat.

Bound from Holland to Tilbury on June 23, 1916, he was captured by a German destroyer, taken to Zeebrugge, and thence to Ruhleben. Removed to Bruges, he was tried by a court-martial on July 27, the evidence of his log for March 28 being produced against him, was condemned as a franc-tireur, and shot the same evening. This was an obvious injustice, as Fryatt was wearing uniform and was in government employ. Fryatt's body was brought to England and buried at Dovercourt, July 9, 1919.

Fuad (1868-1936). Egyptian king. He was born at Cairo, March 26, 1868, youngest son of the khedive Ismail Pasha and brother of the first sultan of Egypt, Hussein Kamil, whom he succeeded Oct. 9, 1917. At the termination of the British protectorate in 1922 he was proclaimed king. After the anti-British movement of 1927-28, he dismissed the discredited nationalist ministry of Nahas Pasha and installed a liberal government. Further trouble with the nationalist Wafd party led to the king's promulgation of a new constitution, 1930, vesting in himself almost unlimited powers. This caused such serious discontent that towards the end of

Fuad,
King of Egypt

1934 Fuad was forced to restore the constitution of 1923. He died April 28, 1936, being succeeded by his son Farouk (q.v.). A Life by Ikbal Ali Shah appeared the same year.

Fuad Pasha, MEHEMMED (1814-69). Turkish statesman. Born at Constantinople, Jan. 17, 1814, he entered the diplomatic service, 1835. Having served as secretary at the London embassy, he was sent to St. Petersburg in 1848, and was special commissioner in Egypt three years later. Five times foreign minister, he was delegate to the Paris conference of 1856, and negotiated the end of French occupation of Syria. Grand vizier in 1860, he visited Europe with Abdul-Aziz and was received with distinction in England, to which country he had always shown friendliness. He died at Nice, Feb. 12, 1869.

Fuad Pasha,
Turkish statesman

Fuchsia. Hardy and half-hardy flowering shrubs, of the family Onagraceae. They are natives of

Central America, whence they were brought in 1788. Their colours are all shades and mixtures of white, cream, pink, purple, crimson, and violet. Greenhouse sorts rarely attain a height of more than 2 ft., but in warm open districts, notably

Devon and Cornwall, hardy species frequently grow to 10 ft.-12 ft.

Greenhouse kinds are propagated chiefly by cuttings taken in Jan. or Feb., in sandy soil, in a temperature of about 75°. This should be lowered to 55° until June, when the plants may be put out for summer bedding. The open-air varieties do well in any ordinary rich soil against a wall, and may be planted in autumn or spring. A perfectly hardy and beautiful fuchsia, which may be grown easily in any town garden, is Raccarton's (*F. Raccartoni*). It has bright red blossoms, with violet centres. The shrub is named from the German physician and botanist Leonhard Fuchs (1501-86).

Fuchsin. Aniline dye formerly of great commercial importance, but now little used owing to its poor resistance to light. Known also as magenta red, roseine, aniline red, rubine, azaleine, harmaline, and erythrobenzine, it was discovered by Natanson in 1856. The two methods by which it is made are (1) the "arsenic acid melt" process, consisting of the oxidation of a mixture of aniline, orthotoluidine and paratoluidine, known as "aniline for red," with arsenic acid; and (2) the nitrobenzol process, in which "aniline for red" is heated with nitrobenzene, orthonitrotoluene, and para-nitrotoluene in the presence of iron and hydrochloric acid. The chief use today is for stains for microscopy.

Fucino. Former lake of Italy, in the dept. of Abruzzi e Molise. It is 2 m. E. of Avezzano and is now reclaimed, being the largest lake ever drained by artificial means. With a circumference of about 36 m. a depth of over 60 ft., and an alt. of 2,172 ft., it had no outlet, and was liable to great and dangerous fluctuations in volume. To remedy this the Emperor Claudius, in A.D. 52, had a tunnel, 3½ m. in length, cut so that the water could find its way into the river Garigliano or Liri (anc. Liris). This fell into disrepair, but Trajan repaired it.

In 1854 the Roman banker, Prince Giulio Torlonia, for the consideration that the land reclaimed should become his property, undertook to make a new channel. This he did at an enormous expense, and the lake was finally drained in 1876. The reclaimed area of 40,000 acres was laid out in a series of model farms, mainly occupied by tenants of the Torlonia estates. During the Second Great War, the area was cleared of Germans in June, 1944, by N.Z. troops.

Fucoid (Lat. *fucus*, seaweed; Gr. *eidos*, likeness). Filamentous structure found in rocks of all ages. They are supposed to be remains of seaweed-like plants, but are probably worm-casts or totally unconnected with any organisms. They are common in Cambrian rocks. Fucoid beds are a group of shales and mudstones of Cambrian age in the N.W. of Scotland.

Fucus (Lat., seaweed). Genus of brown seaweeds of the family Fucaeae (class Phaeophyceae). They are abundant on all rocky shores in shallow water. They have long, leathery fronds, often exposed for hours at low water, and forming a large percentage of the seaweed gathered for manuring

the land. Examples are the bladder-wrack (*F. vesiculosus*) and the saw-edged wrack (*F. serratus*).

Fuegians. South American Indian tribes inhabiting Tierra del Fuego. The primitive race are the central Yahgans, who use rude wind-shelters, skin aprons, and mantles, and bone and shell implements. They have no canoes. Their kitchen-middens indicate a remote Stone Age culture.

Fuego. Active volcano of Guatemala, Central America. It is 45 m. S.W. of Guatemala City and 21 m. W. of the Volcán de Agua. Its snow-capped cone rears to a height of 12,577 ft., and there was a considerable eruption in 1880.

Fuel. Matter which produces heat by the chemical combination of its constituents with oxygen, in the process commonly known as combustion. With the exception of hydrogen gas, all fuels consist of more or less organic compounds of carbon and hydrogen, with the occasional addition of sulphur and some incombustible matter. A number of intermediate reactions take place during the combustion of a hydro-carbon fuel, but if the combustion is complete the final result will be carbon dioxide (CO_2) and steam (H_2O) mixed with all the nitrogen and any unconsumed oxygen in the air supplied for combustion.

Heat Necessary for Combustion

The heat generated by the combustion of 1 lb. of hydrogen with a minimum of 8 lb. of oxygen is 62,100 British thermal units; 9 lb. of steam is produced. The complete combustion of 1 lb. of carbon with a minimum of 2.67 lb. of oxygen generates 14,590 B.Th.U.; 3.67 lb. of carbon dioxide is produced. For each lb. of oxygen required approximately 5 lb. of air must be supplied, so that 1 lb. of fuel oil containing 0.85 lb. of carbon and 0.14 lb. of hydrogen must be supplied with at least 12 lb. of air if combustion is to be complete. In this case the heat generated would be 21,000 B.Th.U., but about 2,000 of these units are expended in splitting up the hydro-carbon compounds in the fuel.

If there were no loss of heat by radiation or conduction while combustion is taking place, the rise of temperature from 13 lb. of combustion products would be about 5,500 deg. F. In practice, however, heat is lost by radiation to and possible contact with relatively cold surfaces while combustion is proceeding, the amount lost depending upon the rapidity with which combustion takes place, and the actual rise in temperature may be very much less. Also if air in excess of that required to ensure complete combustion is supplied, the rise of temperature is less than the maximum possible. If the air supply is pre-heated, the actual temperature at the end of combustion may be very appreciably higher than with a cold air supply.

Rate of Transmission of Heat

The rate of transmission of heat (B.Th.U. per sec.) is proportional to the area of the radiating surface (e.g. a glowing fuel bed or a luminous flame) and is also proportional to the fourth power of its absolute temperature (Fah. deg. + 460). Thus a surface at 3,000 deg. F. (3,460 deg. abs.) will radiate 72 p.c. more heat per sec. if its temperature is raised to 3,500 deg. F. (3,960 deg. abs.). Luminous flames, which contain unconsumed hydro-carbon vapours at a high temperature, radiate considerably more heat than non-luminous flames, but must not be brought into contact with colder surfaces or cooled by an excess of cold air before combustion is completed, otherwise carbon is deposited, either alone or in combination with hydrogen, producing smoke and deposits of soot and tarry matter on the surfaces receiving heat.

The high temperature gaseous products of combustion, which consist mainly of carbon dioxide, steam, and nitrogen plus unconsumed oxygen, radiate comparatively little heat, even at high temperatures: they give up their heat only in actual contact with colder surfaces. With steady flow, only a small part of the gas

comes into contact with the surface to be heated, the heating of which is therefore correspondingly slow; for this reason, vigorous turbulence is desirable. There is also a tendency for a very thin layer of the gases, diminishing in thickness as turbulence increases, to adhere to the surfaces; this has a retarding effect on the transmission of heat by conduction. (A film of air 0.001 in. thick has a resistance equal to that of 4 ins. of steel plate.) A deposit of soot or ash has a similar effect.

Incomplete Combustion and Waste

Incomplete combustion, denoted by the presence of carbon monoxide (CO) in the products of combustion, may result in appreciable loss of heat. As little as 1 p.c. of CO by volume in the cooled products represents a loss of approximately 7 p.c. of the heat value of the fuel and counter-balances any saving effected by reduction of excess air and consequent reduction of loss in the escaping products. Absence of smoke is not necessarily an indication of complete combustion. Incomplete combustion may result (a) if the total air supply is insufficient, (b) if the mixing is inadequate, producing local deficiencies in oxygen. With solid fuels, apart from the effects of volatile constituents, only the air which is in actual contact with the surface of the fuel takes part in the primary combustion, and this must be sufficiently rapid to maintain the fuel surface at ignition temperature in spite of the cooling effect of the current of air. Thus, the fuel bed must be sufficiently compact to prevent large quantities of air passing through without contact, and sufficiently porous to allow the requisite quantity of air to pass through the bed with a high degree of turbulence. The amount of air passing, and consequently the rate of combustion, depend upon the pressure difference between the top and bottom of the bed, i.e. the draught, and upon the thickness of the bed.

Fuel may be solid (wood, coal, briquettes, coke, vegetable waste), liquid (petrol, alcohol, light and heavy fuel oils) or gaseous (coal gas, producer gas, blast furnace gas, hydrogen). Their suitability for a particular purpose depends upon cost of production, cost of transport and delivery to bunkers, space required for storage, convenience of handling to furnaces and adjustment of supply to requirements, maintenance of uniformity in combustion, formation

Fuegians. Indian and his squaw wearing blankets

of deposits on heating surfaces, facilities for removal and disposal of ash where this is formed.

Coal, the most important solid fuel, is also the most complex and variable in its constitution (see Coal). The percentage of incombustible matter (oxygen and ash) present in a particular grade of coal is important, since for each ton of coal burned containing 92 p.c. of combustible material, arrangements must be made for the removal of 8 p.c., or about 180 lb., of ash. If the ash is fusible (i.e. has a low fusing temperature) it may form clinker, which will tend to stick to the grate bars and obstruct the flow of air, necessitating frequent cleaning of the fire. Some of the combustible material may also be lost, enclosed in the fused ash. On the other hand, a friable ash disintegrates readily, and with high rates of draught dust may be deposited on the heating surfaces, checking the flow of heat. The calorific value, i.e. the heat obtainable, from the complete combustion of 1 lb. of coal will depend upon the ash percentage. If the calorific value of the combustible portion is 15,000 B.Th.U. per lb. then, with 10 p.c. of ash, the actual calorific value of 1 lb. of the coal is 13,500 B.Th.U. The design of the stoking appliance and the grade of coal must be suited to one another, and heating appliances should be readily adaptable to differences in the quality of the coal used.

Solid and Pulverised Fuel

The rate of burning of a solid fuel depends largely upon the amount of surface exposed to the air supply. A one in. cube has a total surface of 6 sq. ins., but if this cube is broken up into cubes of $\frac{1}{10}$ inch side, the total surface is increased to 600 sq. ins. For certain purposes where rapid burning is desirable, pulverised fuel is used, in particular for firing cement-burning kilns, metallurgical furnaces, and steam boilers. In America, it is largely used suspended in mineral oil (colloidal fuel), various methods of treatment ensuring that the particles do not separate.

Coal gas is produced from bituminous coal by heating in a retort in the absence of air (see Gas). The solid residue, coke, is a useful commercial fuel. So-called soft coke, the residue from low-temperature carbonisation, contains more volatile matter and hence is more suitable for domestic fuel than hard coke; the majority of the

special fuels marketed under trade names are products of low-temperature carbonisation.

Reckoned in cost per unit of calorific value, gas is considerably more expensive as a fuel than coal; but it can be burned more efficiently than coal, gas fires and furnaces require less attention, and need no bunkers or facilities for cleaning and ash removal.

Where large quantities of gas are required at comparatively cheap rates for metallurgical purposes or power production, producer gas, generated on the site, is frequently used. This is produced by passing air, usually accompanied by a certain amount of steam, through a thick bed of incandescent fuel (see under Gas). It has a lower calorific value than coal gas, but this is partly counter-balanced in use by the fact that for combustion it requires much less air.

Chief Liquid Fuel

Mineral oil is the chief liquid fuel, but though it occurs naturally it is rarely used in its natural state. (See Petroleum.) By gradually heating the natural oil, products are obtained varying from high grade petrol, through lower grade petrols and kerosene to a residue which is used as a fuel oil for compression ignition engines, for heating and for steam raising. Advantages of oil fuel compared with coal are described under Fuel Oil.

Coke and anthracite are relatively smokeless. Coke, though cheaper in cost per ton, has a lower calorific value, is bulkier than coal, and has a higher ash content. It is also more difficult to burn and needs well scrubbing with air. The ignitability of coke depends upon its source and largely on the size of the lumps. With large lumps the exposed surface is too small for rapid combustion, while with very small lumps the closer packing of the fuel retards the passage of air through the fuel bed.

During the mining, handling, and transport of coal, appreciable quantities of slack and dust are produced, which have a comparatively high calorific value (after separation of dirt by washing) and can be utilised if mixed with a bituminous binder and moulded into briquettes (usually egg-shaped). Their ash content is somewhat high, but they burn readily and uniformly, and are suitable for domestic fires.

For domestic heating and cooking, coal is by far the cheapest fuel, reckoned in cost per 100,000 B.Th.U. of calorific value, but a much larger percentage of the heat

is wasted than with gas or electricity, particularly with open fires, so that to achieve a given result, reckoned in physical comfort or convenience, the difference in cost is much less pronounced.

The world's coal and oil are being used up at a constantly increasing rate and, being irreplaceable, must eventually become exhausted. Alcohol produced from grain and potatoes, which was an important fuel in Germany during the Second Great War, may become a fuel of world importance; while the harnessing of atomic energy promises major developments in the provision of heat and power. See Coal; Fuel Oil; Gas; Heat; Internal Combustion Engine, etc.

A. T. J. Kersey, M.I.Mech.E.

Fuel and Power, MINISTRY OF. British Government department established on June 3, 1942, to coordinate the fuel supplies of the U.K. It replaced the ministry of Mines, absorbed the Mines and Petroleum department of the board of Trade, and took over responsibility for gas and electricity supplies. It assumed full control over the operation of all coal mines and the allocation of the coal raised. By an Act of April, 1945, the ministry continued in being after the Second Great War, the minister's first important post-war duty being to pilot through the house of commons the Coal Industry Nationalisation Act, 1946. Under nationalisation the ministry became responsible for the running of all coal mines from Jan. 1, 1947; for the generation and supply of electricity from April 1, 1948; and for the manufacture and supply of gas from May 1, 1949.

Fuel Oil. Term for oil used as a source of heat and power. Although this term properly refers to all oils which are used as a source of heat and power, it is commonly restricted to those oils burned in industrial furnaces or under boilers. Fuel oil varies in grade from exceptionally thick, black oil which has to be preheated before it can be handled, to pale oil of low viscosity comparable in general appearance with that used for lubricating light machinery. In terms of viscosity, this is a range from about 7,000 seconds to 40 seconds Redwood No. 1 at 100° F. Petroleum residues and distillates form the bulk of fuel oil, but some coal oils are also used. In general, it may be said that the heavy, viscous oils are residual products which remain

after distillation from crude petroleum is completed, and that the light oils are distillates; but many products, such as residues from the cracking plant and from lubricating oil manufacture, are frequently blended with normal residues and distillates.

The most important properties of a fuel oil are those affecting the ease with which it passes from tank to burner (viscosity and pour point) and the operation of the burner itself (carbon residue). Burners such as are fitted to small domestic appliances vaporise the oil by causing it to come in contact with a hot surface; the vapour then mixes with air drawn in by natural chimney draught. This system requires an oil of low viscosity and low pour point, so that the gravity feed from the tank will be maintained in all conditions, and also a low carbon residue, for otherwise appreciable carbon deposits will form on the vaporising surface and reduce its efficiency. These conditions are satisfied by relatively light distillate fuels.

Use of Residual Fuels

Atomising burners, by means of steam or air jets, centrifugal action, or high pressure oil jets, break the oil into a fine spray, which promotes complete combustion, and so can deal with residual fuels having a high carbon residue, provided that the mechanical design of the burner obviates the possibility of the oil being decomposed by heating before it is atomised. Burners of the type are used in all medium and large size furnaces.

Most petroleum fuel oils have a calorific value of between 18,000 and 20,000 B.Th.U. to the lb. Coal tar oils range between 16,000 and 18,000 B.Th.U. to the lb.

Though the cost of liquid fuel is higher than that of solid fuel, it has the following advantages: it has a higher calorific value, hence smaller storage space is required; it is cleaner and easier to use and to handle; its combustion is simpler to control; it has virtually no ash, which means that no steps have to be taken to remove and dispose of waste. For these reasons it is widely used for marine work, in the metallurgical and ceramic industries, in the preparation of foodstuffs, for portable driers and heaters in agriculture, and in jet and gas turbine engines. Storage in steel tanks is normally no problem because the high flash point—a statutory minimum of 150° F.—makes special precautions unnecessary. Flash point determinations should be made, how-

ever, to guard against possible admixture of gasoline or kerosene. Steam or hot water pipes must be installed in storage tanks for viscous oils, especially those with a high pour point, to render the oil sufficiently fluid for pumping.

Fuenteovejuna. Town of Spain, in the prov. of Córdoba. It stands on an eminence in a fertile district, 45 m. by rly. N.W. of Córdoba, and is encompassed by ramparts. It trades in honey, wine, fruit, grain, and cattle; and leather, bricks and tiles, preserved meat, and soap industries are carried on. A stock fair is held yearly. Near by are silver-lead mines, and stone quarries. Fuenteovejuna is reputed to be the ancient Mellaria, famed for its honey. Pop. 17,068.

Fuenterrabia. City of Spain, in the prov. of Guipuzcoa. It stands on a peninsula, near the mouth of

battle was fought because Wellington was blockading that fortress, and the French, under Masséna, were marching to relieve it. Although inferior in numbers, Wellington decided to fight, and he drew up his 32,000 men behind a stream flowing through a deep ravine. One French division attacked on the 3rd, and there was some savage fighting around the village, but at the end of the day practically no ground had been won or lost.

With about 40,000 infantry, and 5,000 cavalry, Masséna made his great attack on the 5th. His intention was to turn the British right, but, foreseeing this, Wellington extended his front until it was 7 m. long. There was some fighting, infantry and cavalry mingled in a confused encounter, the British in general being worsted.

Gradually, in spite of great gallantry, they were forced back, and, as desired, the right was turned, and the 7th and light divisions, which had borne the brunt of this attack, were separated.

To prevent, therefore, a more serious disaster, a new front was decided upon. The 7th division crossed the river Tur-

Fuenterrabia, Spain. The walled fortress which guarded the entrance to the old city

the river Bidassoa, on the opposite side to France, 10 m. E.N.E. of San Sebastian on the Paris-Madrid rly. It is a picturesque walled town, with a 10th century castle, narrow streets, and curious houses. The modern part, facing the estuary, is a popular summer resort, with fishing quarters and industrial suburbs. Ropes, fishing nets, and paper are made, and there are also flour and saw mills.

Fuenterrabia was taken several times by the French, but its most noted siege was in 1638, when the French under Condé were defeated here. To celebrate this event a festival is held every year on Sept. 8. It was opposite Fuenterrabia that Wellington crossed the Bidassoa, Oct. 8, 1813. Pop. 6,100.

Fuentes d'Onoro, BATTLE OF. Fought in the Peninsular War between the English and the French, May 3 and 5, 1811. Fuentes is a village in the prov. of Salamanca, Spain. It stands on a hill, near the Portuguese frontier, 15 m. by rly. W.S.W. of Ciudad Rodrigo. The

ones, while the light division resisted the oncoming foe, squares of infantry slowly retreating before surging masses of horsemen. At length the new line was formed and an artillery duel ensued. Meanwhile, there was a terrific battle in Fuentes itself, where the houses were used to good purpose. From part of this the few British troops were driven, but, strongly reinforced, they managed to keep to some of their positions until the evening, when the battle ended without a decision. The English and their Spanish auxiliaries lost about 1,500, including 300 prisoners; the French casualties were somewhat less.

Fuero (Lat. *forum*). Spanish word meaning a code of laws, or set of privileges, something like the English charter. The Spaniards had many of these fueros, the most important being the Fuero Juzo, the national code of Castile, taken from the Visigoths, but several times revised. It was not known at first as a fuero, for the word

only came into use in the 10th or 11th century, the first fuero being probably the one granted to Leon in 1020. There were various local and municipal fueros, by which towns and provinces enjoyed certain privileges, such as the right to choose their own overlord. The three Basque provinces had fueros which made them largely self-governing until 1876, when these privileges were taken away. Portuguese towns had also their *foraes*. See Charter.

Fuerteventura. One of the Canary Islands. It lies S.W. of Lanzarote and N.E. of the Grand Canary; area 664 sq. m. Mountainous and barren, it has only two fresh-water springs, and suffers from prolonged periods of drought. The inhabitants are mostly fisher-folk. The capital is Santa Maria de Betancuria, and Cabras is the chief port.

Fugger. Name of a German family of merchants. Johann Fugger, its founder, settled in Augsburg about 1370. A weaver from the neighbourhood, he soon became a merchant and a citizen. His son and grandsons carried on his business as merchant and money-lender and became very rich.

Jacob Fugger (1459-1525) was perhaps the most notable member of the family. With his brothers he had mining, banking, shipping, and other interests nearly all over Europe, became the banker of the Hapsburg family, and found the money which secured the imperial throne for Charles V in 1519. His nephew Anton took advantage of the discovery of America to add to his wealth, while the family, among other ventures, farmed the silver and the quicksilver mines in Spain that belonged to Charles V.

The succeeding members were less interested in business, but remained personages of wealth and importance. They were divided into various branches; some entered the Church, at least two becoming bishops; others were soldiers, others scholars and patrons of art. The Fuggers maintained correspondents in all parts of Europe, who kept them in touch with events. Some 36,000 pages of their so-called Fugger News-Letters are preserved in the Vienna state library, and give an illuminating picture of the period 1568-1605. Two selections were translated into English by von Klarwill, 1923 and 1928.

Three branches of the family continued, and before the changes of 1918 the head of each was a member of the Bavarian upper

house. One Fugger was made a prince in 1803; the others became counts.

Fugitation (Lat. *fugitare*, to flee). Term used in Scots law for the act of declaring a person a fugitive from justice. If a person charged with a crime fails to appear to answer the charge, he can be declared outside the law. His goods then become the property of the crown.

Fugitive Offenders Act, 1881 (Lat. *fugitivus*, runaway). Law operative throughout the British Commonwealth. By it a person accused of a crime in any part of the king's dominions may be arrested in any other part and sent to where he is wanted. The Act applies only to offences punishable by imprisonment with hard labour or the equivalent for 12 months or more. See Extradition.

Fugitive Slave Laws. Two laws of the U.S.A. providing for the recovery of runaway slaves. The first, passed in 1793, enabled the owner of a slave who had taken refuge in a non-slave state to recover his property on application to a magistrate for a warrant. As the anti-slavery feeling grew in intensity in the northern states the Act was evaded or nullified by the passing of state laws forbidding state officials to assist in enforcing this law of the federal government. After insistent demands from the slave-owning states, a new law was passed in 1850, by which the obligation was imposed on federal officials to enforce the law. See Slave Trade.

Fugleman (Ger. *Flügel*, a wing). Corruption of *Flügelmann*, i.e. a soldier on the wing of a body of troops. At drill he advanced in front of the line to give the time in the exercises with the musket.

Fugue (Fr. from Ital. *fuga*, flight). Important form of contrapuntal music akin to the round and canon (*q.v.*), but much more free. Here are only given definitions of the chief terms used in connexion with fugue-form, readers being referred to musical works for full elucidation. The subject is the chief theme, announced by all the voices or parts in turn, but it is called the answer when it has the

dominant as its key-centre instead of the tonic; the answer is called real when it is an exact transposition of the subject, or tonal when certain modifications take place in order to avoid a too great divergence from the original key. The countersubject is the counterpoint which accompanies later entries of subject and answer. The first complete set of entries of all the parts is the exposition. Subjects are sometimes inverted, augmented, or diminished.

A counter-exposition is a further set of entries in a different order from that of the exposition. An episode is a free section introduced as a relief from the stricter portions of a fugue. A stretto contains entries of subject and answer at shorter time-intervals than at first. A pedal, a long sustained note, usually the dominant or tonic, often accompanies the stretto, and is also used independently. J. S. Bach was the supreme exponent of fugue writing for organ or clavier. See Art of Fugue.

Führer (Ger. leader). Title taken by Adolf Hitler, and as applied to him almost a sacred word to Nazis in Germany; just as the familiar Prophet has become sacred to the Mahomedans when applied to Mahomet. Benito Mussolini, as Il Duce, and General Franco, as El Caudillo, Marshal Antonescu as Conducator, assumed similar titles in Italy, Spain and Rumania respectively.

Fujiyama, FUSUYAMA, OR FUJISAN. Loftiest peak in Japan, on the island of Honshu. Alt. 12,390 ft. A dormant volcano, with a beautiful snow-capped cone, it occupies a position of splendid isolation, 60 m. S.W. of Tokyo. According to tradition it was upheaved during one night in 285 B.C. and at the same time a depression was caused near Kyoto, which is now occupied by Lake Biwa (*q.v.*). Its crater, nearly 3 m. in circumference and 500 ft. deep, is now filled with water.

The last recorded eruption happened in 1707-08. The sacred mountain of Japan, it is annually visited by thousands of Buddhist pilgrims, who ascend to the summit to pray at the numerous

Fugue

The image displays musical notation for a fugue. It consists of two staves. The top staff is in G major (one sharp) and 4/4 time. It begins with the 'Subject' (a series of eighth notes: G4, A4, B4, C5, B4, A4, G4) and continues with the 'Real Answer' (a series of eighth notes: A4, B4, C5, D5, C5, B4, A4). The bottom staff is in G major and 4/4 time. It begins with the 'Subject' (a series of eighth notes: G4, A4, B4, C5, B4, A4, G4) and continues with the 'Tonal Answer' (a series of eighth notes: A4, B4, C5, D5, C5, B4, A4). The notation includes various musical symbols such as clefs, key signatures, and time signatures.

Fujiyama. The famous snow-capped mountain of Japan viewed from Omiya village

shrines. It is frequently portrayed on Japanese pottery, and is a favourite theme with poets and artists. See Cone.

Fukien. South-eastern coastal province of China. It contains 64 counties and two municipalities, with Foochow (Minhou) as its capital. Other important cities are Mamo, at the mouth of the Min, an important naval training base; the port of Amoy, Yungan, and Kienou. There is only one short rly. in the province, but five highways link it with other parts of the country. The principal products are rice, tea, tropical and candied fruits, fish, and superfine lacquerware. Area, 45,845 sq. m. Pop. 11,990,000.

Japanese forces invaded Fukien in April, 1941, during the China-Japan conflict, Foochow being occupied on April 21. By this Japanese success the Chungking government lost one of its last lines of communication by sea; but Chinese troops compelled the Japanese to evacuate the port on Sept. 3. The prov. was again invaded on June 18, 1942, from Kiangsi; and in Sept. the coast-line opposite Formosa was "scorched" as a precaution against invasion from that direction. On Oct. 8, 1944, Japanese units recaptured Foochow, this success giving them possession of all important harbours on the S. coast of China. The Chinese regained the port May 18, 1945.

Fukui. Town of Japan, on the island of Honshu. Seat of the prefecture of Fukui, it stands athwart the Ashiwa, 80 m. N.N.E. of Kyoto. It had silk and paper industries. Heavily damaged in U.S. air raids during the Second Great War, it was being rebuilt when an earthquake, June 28, 1948, destroyed almost every house and killed over 1,000 people.

Fukuoka. Town of Japan, on the island of Kyushu. It stands at the head of a small stream on

the N. coast, 86 m. by rly. N.N.E. of Nagasaki. Its suburb, Hakata, is on the opposite shore of the stream. There are several good streets, a citadel, and a public garden. It is noted for its silk industry. The town is the seat of the prefecture of Fukuoka. Pop. 323,217. This name is borne by several other towns in Japan.

Fukushima. Town of Japan, on the island of Honshu. It is 84 m. E. by S. of Niigata and 170 m. by rly. N.N.E. of Tokyo. Its principal trade is connected with silk and silkworm cocoons, which are exported in large quantities. Pop. 48,287.

Fukushima, BARON (1853-1919). Japanese soldier. Entering the army as a drummer-boy, he studied at Tokyo university, and joined the general staff in 1875. Attaché at Peking (Peiping), 1882-84, he was transferred to Berlin, 1887-92. In 1892-93 he accomplished a 9,000-mile horseback ride from Berlin to Vladivostok by way of Russia and Siberia. He was sent on missions to Egypt, Turkey, Persia, Caucasus, Arabia, India, Burma, and Siam. General staff officer in the Manchurian army during the Russo-Japanese war (1904-05), he became chief of staff, 1906. Made governor-general of Kwantung, Manchuria, he died Feb. 18, 1919.

Fukuyama. Seaport of Japan on the island of Hokkaido. It stands at the S.W. extremity of the island, 53 m. S.W. of Hakodate. Formerly it was the chief seaport of Hokkaido, but most of its commerce has been transferred to Hakodate. There are numerous temples and shrines, and the town was once the chief residence of the lords of Matsu-mai. Pop. 56,653. There is another town of the same name on the S. coast of Honshu.

Fula (Mandingan, reddish). Dominant African people in the W. Sudan, the plural being Fulbe and the Hausa name Fulani. Estimated at 8,000,000, and descended from

an early admixture of Libyan—if not pre-Libyan—and negro stocks, they are handsome, oval-faced, chestnut-hued, straight-nosed, thin-lipped, and curly-haired, with no negro odour. In the 7th century they were still in the uplands S. of Morocco; by the 13th they were cattle-owning nomads, partly Islamised, in Bornu; by the 16th they reached Lake Chad, and, after founding the Sokoto kingdom (1807-1903), with much Hausa intermingling, are now a virile stock, three-fourths Caucasian, dwelling from the Atlantic coast to the Nile valley.

They are compact in Futa Jallon, dominant in Sokoto and Gando, where many have adopted settled husbandry, and colonist in Bornu, Bagirmi, and Wadai. The ruling Mahomedan aristocracies are aggressive and intelligent, with many mosques and schools. The cow-Fulani or Bororoje are peaceable booth-dwelling nomads. The most easterly tribes are hostile to Islam. See Africa: Languages.

Fulcrum (Lat. *fulcrum*, a prop). Fixed point in the mechanical system of a lever about which the lever can rotate. See Lever.

Fulda. City of W. Germany, in the Land of Hesse. It stands on the Fulda, 69 m. N.E. of Frankfurt. The chief ecclesiastical building is the cathedral, an 18th-century edifice, modelled on S. Peter's at Rome, with the crypt of a church of 751 containing the tomb of S. Boniface. The church of S. Michael dates from c. 820, and that of S. Severus from the 15th century. Secular buildings include the chateau, the town hall, and the library, with a large and valuable collection of books and MSS. There are two squares and a public park. The industries included the manufacture of textiles, rly. shops, and a trade in cattle and agricultural produce. The U.S. 3rd army occupied it on April 4, 1945, in the Second Great War, and it was in the U.S. zone of occupation after the Allied conquest of Germany.

Fulda is noted for its abbey, round which the town grew. This was founded by S. Boniface in 744, and was endowed with authority over Benedictine houses in Germany and France. It was very rich; its abbot became one of the great prince-bishops ruling a territory of some size. This was secularised in 1803, and, after belonging to various princes, was divided between Hesse-Cassel and Bavaria. Most of it later became Prussian. From 1734 to 1803 there was a university here. Pop. 27,753.

The great majority of the many hundreds of species of fungi found in Great Britain are harmless, though even these should not be eaten without full examination and identification. Poisonous kinds are shown above between the red lines. These pictures, which show the examples about half actual size and in correct colouring, are reproduced by courtesy of H.M.S.O. from Bulletin No. 23 of the Ministry of Agriculture and Fisheries

FUNGUS: SOME BRITISH SPECIES, EDIBLE AND POISONOUS

Fulda, LUDWIG (1862-1939). German poet and dramatist, born at Frankfort-on-Main, July 15,

Ludwig Fulda,
German dramatist

1862. By winning a contest with his first comedy, *Die Aufrichtigen*, 1882, he became popular; his fairy play *Der Talisman*, 1892, was awarded the Schiller prize, but William II vetoed the grant. Among his comedies, *Jugendfreunde*, 1897, and *Die Zwillingschwester*, 1900, the fairy drama *Schlaraffenland*, 1901, and *Maskerade*, 1904, stand out. His gift of rhyme served Fulda for translations of Shakespeare's sonnets, Molière's and Beaumarchais's plays, Rostand's *Cyrano de Bergerac*, and Ibsen's *Peer Gynt*. He was a holder of the Goethe medal and from 1928 a president of the German academy of poetry.

Fulgurites (Lat. *fulgur*, lightning). Tubes formed in sandy soil, and less commonly in rocks, by

Fulgurite. Specimens obtained at Maldonado, Uruguay

passage of lightning. This often penetrates to a depth of many feet, fusing the particles it encounters. The glassy lining often produced in tubes varies in size to more than two ins. in circumference. Fulgurites are common on Mt. Ararat, in the Alps, Pyrenees, and in Mexico and La Plata.

Fulham. Metropolitan bor. and parish of the co. of London. On the Middlesex side of the Thames, S.E. of Hammersmith, it has been a parish since 1631 and a met. bor. since 1899. Its oldest building is Fulham Palace, the ancient manor house of the bishops of London, the courtyard of which belongs to the time of Henry VII. During the bishopric of Frederick Temple a part of the grounds now called Bishop's Park was opened to the public. The parish church of All Saints, a Perpendicular structure, rebuilt 1880-81, near Putney Bridge, has a 14th century tower, an organ by Jordan, 1700, a fine peal of bells

Well served by buses and underground rlys., Fulham has a town hall, free libraries, an old pottery, and contains the grounds of the Chelsea and Fulham football clubs, and those of the Hurlingham club and Queen's club. Eminent names associated with the district, which includes Parson's Green and Walham Green, are those of Addison, Bartolozzi, Burbage and Condell, Sir T. Bodley, John Florio, Burne-Jones, Lord Lytton, Samuel Richardson. Two M.P.s are elected. This was one of the most heavily bombed boroughs in the Second Great War, over 22,000 houses suffering damage. Pop. 150,928.

Fulham Ware. Fine stoneware first produced in 1671 by John Dwight (*q.v.*) at Fulham. It was an imitation of china, semi-transparent, with hard, close body of grey colour. Jugs, pots, bottles, butter dishes, and busts were produced. The enamel was brilliant, the colours being largely blue and purple. The decorations of flowers and leaves were raised. Marbled pieces were also produced. Dwight gave up in 1746, and was succeeded by White until 1762. The factory is still carried on, stoneware jugs and pots being produced. In 1888 William De Morgan began the manufacture of quaintly shaped pots and pans in lustre ware.

Full Age. A person reaches full age when he or she completes 21 years of age, which is deemed to happen at the first moment of the day preceding the 21st anniversary of birth. This is because the law does not regard fractions of a day. The sovereign attains full age at 18.

Fuller. Person whose occupation is to full cloth, or carry out a finishing process by which cloth is thickened and shrunk. The term is also applied to a tool used by

Fulham. Courtyard of Fulham Palace, built in the time of Henry VII

blacksmiths for shaping iron by forcing it into grooves.

Fuller, JOHN FREDERICK CHARLES (b. 1878). A British soldier and publicist. He was born Sept. 1, 1878, and commissioned in the Oxford and Bucks Light Infantry, serving in the South African and First Great Wars. As chief general staff officer of the tank corps in 1917 he took a prominent part in the attack at Cambrai. He was the inventor of the Fullerphone (*v.i.*). Fuller was chief instructor at the staff college in 1922 and military assistant to the C.I.G.S. in 1926. Promoted maj.-gen. in 1930, he was placed on retired pay in 1933. His published works include *Tanks in the Great War 1914-18*, 1920; *The Foundations of the Science of War*, 1926; *Grant and Lee*, 1933; *Decisive Battles*, vol. 1, 1939; vol. 2, 1940; *Machine Warfare*, 1942; *Armament and History*, 1945.

Fuller, THOMAS (1608-61). An English divine and historian. Born at Aldwinkle St. Peters, Northants, and educated at Cambridge, he shared the reverses of the Royalists during the Civil War. In addition to private chaplaincies and lectureships, he held at various times the curacy of S. Bene't's, Cambridge, the rectory of Broadwindsor, Dorset, the curacy of Waltham Abbey, and the rectory of Cranford, Middlesex; but from 1642 till his death depended largely upon his pen for subsistence, with such books as *Good Thoughts in Bad Times*. 1645.

Fuller was the first to follow Bede in attempting to write the ecclesiastical history of England, his *Church History of Britain* being published in

Thomas Fuller,
English divine

Fulham Ware. Figure of Jupiter by John Dwight
Liverpool Museums

1655. His *Hisotry* of the Worthies of England was issued in folio in 1662. Witty and learned, he was happily described by A. Jessopp, who in 1892 published a selection from his writings, as the Sydney Smith of the 17th century. He died Aug. 16, 1661.

Fullerphone. Telegraph system invented by Major-Gen. Fuller (*q.v.*) for use by the British army. The alternating components of the buzzer currents are used for hearing signals in a telephone receiver while the direct current impulses are filtered and used for the line. The system cannot be tapped and provides for compensating the effects of steady, stray earth currents. See Telephone.

Fuller's Earth. A natural clay used as an adsorbent of oil and grease during the fulling of cloth. It is a hydrated aluminium silicate with proportions of other bases. Many clays possess this property to a slight extent but it is shown to a marked degree only by those which are largely minerals of the montmorillonite-beidellite groups. Fuller's earth is worked on a large scale in England, the U.S.A., and Germany. In England it is now found only near Redhill, Nutfield (Sussex), Bedford, and Bath, the active mineral being calcium montmorillonite. Some of the world's best supply comes from Florida. It is used for refining animal, vegetable, and mineral oils; for the preparation of foundry sands; as a filler in many industries; for pharmaceutical purposes; for preparation of cosmetics; as a carrier for basic dyes; but very little is now used for fulling.

A subdivision of the Jurassic system of strata in England is named the Fuller's Earth formation. It outcrops from the Dorset coast to Gloucestershire. The only occurrence in this formation of fuller's earth, is that near Bath.

Fulling. A process of cloth finishing, characteristic of woollen cloth as distinct from worsted, also known as milling. The cloth is stitched end to end to form an endless belt, and passes upwards from a warm soap or dilute acid liquor through a funnel-like device which squeezes and rubs it, and then between squeeze-rolls back into the liquor. This cycle continues until the desired effect is obtained. In Meltons, uniform cloths, etc., the weave becomes entirely obliterated and the fabric shrinks to half its original width. Yorkshire practice is to full quickly, whereas West of England

flannels are fullled over several days. Fulling gives a smooth felt-like appearance and makes cloth more impervious to wind and weather. It is based on the propensity of wool fibres for interlocking under the action of rubbing while wet.

Full Score. Extended score of a musical composition showing the parts for various voices and instruments on separate staves, for a conductor's guidance or a student's information. Many different arrangements have been used, but the following is the plan of a typical modern score. The names in roman type show the instruments of the classic orchestra, those in italics are the modern additions or more rarely used instruments.

WOODWIND.—*Piccolo*, Flute, Hautboy (oboe), Clarinet, Bassoon, *Double Bassoon*.

BRASS.—Horn, Trumpet, Cornet, Trombone, *Bass Tuba*.

PERCUSSION.—Kettle Drum, *Side Drum*, Triangle, *Bass Drum*, *Cymbals*.

STRINGS.—Harp, Violin I, Violin II, Viola (Voices, if any, on separate staves) Violoncello, Double Bass, Organ.

Fulmar. Two-seater fighter reconnaissance aeroplane of the Royal Navy. It was powered by a single 1,145 h.p. Rolls-Royce Merlin engine, and had a maximum speed of 250 m.p.h. Wing span was 46 ft., length 40 ft. 5 ins. Introduced in 1940, it was later replaced by the Firefly and other more modern carrier-borne aircraft. See illus. pp. 130-131.

Fulmar Petrel (*Fulmarus glacialis*). Sea bird common in the Hebrides and St. Kilda. These pet-

Fulmar Petrel. A native of the Hebrides and north coast of Scotland

rels are usually grey on the back, and white below, and measure nearly 20 ins. in length. They commonly follow whaling ships to feed on the refuse blubber, and nest on grassy slopes among the cliffs.

Fulminate of Mercury (Lat. *fulminare*, to lighten, thunder) Sensitive and violently explosive compound used for the initiation of high explosives. Discovered by Howard in 1799, it has the composition $\text{HgC}_2\text{N}_2\text{O}_2$. Owing to its

sensitive nature little was done with it for some years, but by 1815 it was utilised for percussion caps.

It is manufactured by dissolving mercury in strong nitric acid and adding this whilst warm to a large quantity of ethyl alcohol in a glass flask, from which the fumes pass to condensers. Shortly after the ingredients have been mixed reaction commences, and if it should be too violent is modified by the addition of more alcohol. About half an hour after the start, fulminate is deposited from the solution as fine crystals, and when all reaction is over the liquid is decanted off and the product washed free from acid, and stored under water until required for use. Occasionally fulminate is stored in a moist condition, but never dry, as it is decidedly less sensitive when it contains at least 12 p.c. of water.

Fulminate of mercury is a fine crystalline powder, white to grey-brown in colour, and has a density of 4.42. It has a sweetish metallic taste and is highly poisonous. It is detonated by moderate friction or percussion, by heating to about 150°C . or by contact with strong sulphuric acid. If unconfined, small quantities burn violently when ignited, but two sheets of paper confine it sufficiently to cause violent detonation. Its most remarkable and useful property is its ability to cause the detonation of other explosives, and it is widely used in detonators and caps.

Fulminic Acid. Dibasic acid which has not been obtained in the free state. It was prepared combined with mercury, as fulminating mercury, by Howard in 1800, and Liebig, in 1822, showed that the mercury is combined with a peculiar acid which he named fulminic acid.

Fulnek. A town of Moravia, Czecho-Slovakia. It is 17 m. S. of Troppau. It has a cathedral church of considerable architectural merit and a Capuchin convent. It was for many years the centre of the Moravian Brotherhood (*q.v.*), and in this connexion gave its name to Fulneck, their settlement in the W. Riding of Yorkshire, England.

Fulton, ROBERT (1765-1815). American engineer. Born in Pennsylvania and poorly educated, he showed talent as a painter, and crossed to London, where he studied under Benjamin West. Abandoning art for engineering, in 1794 he invented improvements for the canal systems, and two years later went to Paris, where he turned his attention to the adaptation of the steam engine for marine purposes.

An experiment in 1803 answered all his hopes, and in 1807 he constructed a larger vessel, the *Clermont*, in New York, whither he had returned the previous year. This was followed by the steam frigate *Fulton* in 1814. Though not the

Robert Fulton,
American engineer
After Benjamin West

inventor of marine engines, *Fulton* was the first to apply steam successfully to navigation. He died Feb. 14, 1815.

Fulvia. Mistress of *Curius*, one of the ringleaders in the conspiracy of *Catiline* against the Roman republic in 63 B.C. It was she who divulged the plot to the consul *Cicero*. She is not to be confused with the *Fulvia* the wife, first of *Clodius*, and later of *Antony*.

Fumariaceae (Lat. *fumus*, smoke). Family of annual or perennial herbs. They are natives of temperate and warm regions of the N. hemisphere; also of S. Africa. They have tender divided leaves and small irregular flowers in sprays; the four petals forming two unequal pairs. The watery juice is acid. See *Fumitory*.

Fumaric Acid. Solid dibasic acid somewhat widely distributed throughout the vegetable kingdom, notably in *fumitory* (*Fumaria officinalis*), Iceland moss (*Lichen islandicus*), and various fungi. It is best prepared by heating malic acid (q.v.) at 150° C. in a current of air so long as water distils over. The residue is washed with a little water and dried at 100° C. It forms normal and acid fumarates with the alkali metals.

Fumarole (Lat. *fumariolum*, smoke-hole). Vapour-vent in volcanic districts, which acts as a funnel for the escape of gas. Many are formed during eruption of such volcanoes as *Vesuvius* and *Etna*. They were first studied by R. W. Bunsen in Iceland. See *Volcano*.

Fumed Oak. Oak furniture timber darkened by fumes of ammonia to give an appearance of age.

Fumigation (Lat. *fumigare*, to smoke). Term used for the disinfecting of rooms, clothing, etc., by means of certain vapours. Sulphur was the popular substance for fumigation through many generations which burnt it in a form of candle. Its action is by the generation of sulphuric acid, but this is ineffective against micro-organisms and kills only some 50 p.c. of beetles and bugs, driving the rest

away to neighbouring quarters. Thiophosgene vapour has superseded it, as have sprays of powdered D.D.T. Paraformaldehyde in 40 p.c. solution is now the method of choice of disinfection against contagious or infectious disease; it is sprayed over the contents of the room, which is sealed and left for some hours. Regulations have been made for prevention of accidents due to fumigation with hydrogen cyanide.

In gardening, fumigation is the process of destroying greenfly, red spider, and other greenhouse pests by means of smoke. The greenhouse is closed and a few leaves of tobacco are caused to smoulder for about an hour, when the plants must be removed and sprayed with rainwater before being replaced in the greenhouse, which has meantime been scrubbed down with carbolic soap. Various proprietary substances may replace tobacco.

Fuming. Property possessed by some liquids of emitting fumes on exposure to air. Fuming sulphuric acid, a solution of sulphur trioxide in sulphuric acid, gives off dense white fumes when air is admitted to the bottle containing the acid. *Libavius's* fuming liquor is solution of tin tetrachloride, whilst *Boyle's* fuming liquor contains ammonium polysulphides.

Fumitory (Lat. *fumus terrae*, earth-smoke). Small genus (*Fumaria*) of annual or perennial herbs of the family *Fumariaceae*. Natives of Europe and Asia, they hang on the borders of cultivation. The leaves are much divided into slen-

der segments, and the small flowers are in terminal sprays. Common *fumitory* (*F. officinalis*), the best known species, has delicate, much-divided, grey-green leaves and small rosy-purple flowers. The name is variously explained by its fancied resemblance to smoke curling upwards, its being engendered from a vapour rising from the earth, and the irritant effect of the plant's juice on the eyes.

Funchal. Capital of *Madeira*, an island in the Atlantic, belonging to Portugal. It stands on *Funchal* Bay, on the gentle ascent of some

Funchal. Quayside and stand in Funchal, Madeira. The town being on a steep hillside rising from the sea to a height of 4,000 feet, many of the streets are too steep for wheeled vehicles

hills in the form of an amphitheatre, and as seen from the sea is very beautiful, with its houses of dazzling whiteness, embosomed among tropical verdure. The principal residents have their country houses on the encircling hills. *Funchal* has a salubrious climate, is well provided with water, and is a popular winter health resort. It has a cathedral, Anglican and Presbyterian churches, hospitals, museum, theatre, casino, meteorological observatory, wireless telegraphy station, and cable communication with *Lisbon*, *Falmouth*, and *Pernambuco*. Pop. 48,493.

The streets, which are steep and narrow, are electrically lighted and have no wheeled traffic, ox-sleds being used. There is a large trade in wine and coal. In the roadstead is a steep black rock crowned by a castle. *Funchal* was bombarded by German submarines on Dec. 3, 1916, and Dec. 12, 1917.

Function (Lat. *functio*). Term used in mathematics. One quantity is said to be a function of another when, for any particular value of one, there is a corresponding value or set of values of the other. This may be made clear by a simple example. If a train

Fumitory. Flowers and foliage of *Fumaria officinalis*

travels at 50 miles an hour, then the distance travelled is a function of the time, i.e. in six hours the distance travelled is 6×50 miles, in 10 hours 10×50 miles, and generally in n hours $50n$ miles.

This is the simplest example of a function, but there occur many complicated functions in mathematics, and the expression relating one with another or the function with its argument, as it is called, is generally given in the form $y=f(x)$, or $w=f(x, y, z)$, and so on.

The term function is due to Leibniz, who in 1692 divided functions into algebraic and transcendental, the former being those functions which may be expressed by elementary algebraic operations, the latter the remainder. See Algebra; Mathematics.

Functional Disorders. Pathological conditions in which the functions of muscles, limbs, or organs are disturbed without any apparent organic basis, i.e. no change can be detected in the anatomical structure of the muscles or nerves affected. Some change of structure must exist, however, to alter activity. See Hysteria; Neurasthenia.

Functionalism. Term applied to utilitarian forms of contemporary architecture and design. The functionalist attitude implies returning to first principles, and in using materials such as reinforced concrete, glass, and steel to bring about a radical change in the popular attitude to architecture as established in the 19th century. After the First Great War architectural development was greatly influenced by engineering and machine design, the frame construction of buildings tending to eliminate all unnecessary detail and ornament. Functionalism accepts such elimination as an aesthetic principle, relying on beauty of line to express dynamic simplicity. Thus it stresses the utilitarian aspect of buildings, furniture, and other utilitarian objects. Le Corbusier (*q.v.*) drew attention to the beauty of machinery in *Towards a New Architecture*, and influenced a whole school of architects and designers, who aimed at coordination of construction with and the expression of a single purpose. See Aesthetics; Architecture, Modern.

Fundamentalism. Belief held by those who are convinced of the literal and complete accuracy of the Bible. Fundamentalists are strongly opposed both to the higher criticism and to Darwin's teaching that man is the product

of an age-long process of evolution. Fundamentalism remains particularly strong in the U.S.A. See Monkey Trial.

Funded Debt. Debt, particularly in national finances, which is of a permanent or semi-permanent nature, as distinct from short-term or floating debt. Of the various forms of government debt in Great Britain, $2\frac{1}{2}$ p.c. consols, $3\frac{1}{2}$ p.c. conversion loan, 4 p.c. consolidated loan, and $3\frac{1}{2}$ p.c. war loan constitute the principal items in the funded debt.

Funds (*Lat. fundus*, bottom). Word meaning a sum of money or supply of credit. A fund is a sum set apart for some special purpose, e.g. an endowment fund or a building fund. In the plural the word has the special meaning of government securities, consols, etc. A fundholder is one who possesses such, and to fund part of the national debt is to turn it from a temporary into a permanent security, i.e. to turn treasury bills into consols or war loan, which is then known as the funded debt. See National Debt.

Fundy, BAY OF. Extension of the N. Atlantic Ocean, dividing Nova Scotia from New Brunswick,

Bay of Fundy. Map of inlet of the Atlantic between New Brunswick and Nova Scotia

Canada. It terminates in two branches, the N. section being known as Chignecto Channel or Bay, and the S. as Minas Channel, which leads to Cobequid Bay. From Grand Manan Island, which stands at the entrance of the bay, to Cape Chignecto, its length is about 100 m., and its mean breadth 35 m. Several rivers drain into the bay, the chief are the St. John and the St. Croix.

Except for the fogs which drift into the bay in summer from the Gulf Stream, the bay is easily navigable, the coasts are rocky, and the ceaseless tidal scour prevents the accumulation of sandbanks; the tides themselves are

swift but regular. Spring tides are high; they range from 27 ft. at St. John to 50 ft. in Minas Channel; wherever a river estuary is narrow the tide makes a bore, usually from 4 ft. to 6 ft. high.

Fünen. Island forming part of Denmark, is also known as Fyen and so described in this work.

Funeral (low Lat. *funeralia*, things belonging to a funeral). Comprehensive term, at one time written in the plural, for the ceremonies, etc., attending the conveyance of a dead person to grave or tomb. The term obsequies, often used in the same connexion, has not quite the same meaning; funeral means a mournful ceremony, especially the processional part of it; obsequies, a respectful valediction. The National Association of Funeral Directors, 11 Soho Sq., London, W.1, exists to organize funeral carriage proprietors and improve the ordering of funerals, and to provide for the holding of examinations, and awarding of diplomas in the proper conduct of the business. See Burial Customs.

Funeral Rites. Ceremonial observances attending the actual disposal of the dead. The time intervening between death and the funeral rite may be a few hours, several months, or—as with eminent Burmese monks—more than a year. Interment often occurs at night, as in ancient Greece and Rome, to avoid polluting the sunlight, or at sunset, to prevent the ghost from capturing living shadows. Basuto graves, dug after dark, are filled in before dawn awakens the children. Salutation of the corpse occurs in E. Europe; in Hungary, kissing of the right hand accompanies appeals for forgiveness. In the U.K. the dead are sometimes touched to prevent future haunting.

The place of sepulture may be indicated by omen; the Laos carry the dead into the jungle, and halt when sensible of increased weight. Bodies may be carried through smoke-holes or apertures in the house walls. Carrying out feet foremost ranges from Torres Strait to modern Europe. Chams turn the bier about and bear it along zigzag paths to circumvent the ghost and impede its return. Borneo Iban obliterate the bearers' footprints; in the Congo basin thorns are strewn after the procession. Crossing water is symbolised among the Koryak by lines across the path, leaped over by returning mourners. Attendants in Arctic lands pace thrice

round the body, and in the Hebrides thrice round the church, to protect the living.

The last pilgrimage is facilitated by various observances. The face may be turned towards sunrise, sunset, Mecca, or the tribal cradleland. Coins are provided for the ferryman, honey-cakes for Cerberus, passports for the janitor. Immolation of relatives and slave-sacrifice, unknown in the earliest culture, formerly rife in some barbaric societies, and still extant, survives symbolically in the paper effigies of attendants burned at Chinese graves. Many tribes in S.E. Asia offer funeral honours to symbolic images, a practice observed also in Brittany and Italy.

Precautions Against Pollution

Measures are taken to avoid pollution, as when Yakut inter the mortuary shovels, or Warundi the earth baskets. Baganda mourners cleanse their hands with plantain leaves; some Australian aborigines fumigate themselves; Fanti mourners wash in the sea. The Semitic use of burned spices passed into early Christian ritual. Fear of the ghost's return, which dictates the Eskimo custom of waving torches behind the corpse, accounts in part for the medieval use of bells and candles. Corpses may be mutilated, or fires maintained on graves. In some instances ghosts are deemed to haunt their former homes until flesh decays. The bones are then disinterred for a final funeral rite.

Funeral feasts are traceable to Neolithic Europe. The Gilbert Islands feast during three days preceding the funeral is comparable with the Irish wake. Feasting continues for several months in Madagascar, and for a year in Patagonia. Primitive cannibalism is perpetuated in the Cocomma practice of mixing pulverised bones in ritual cups, and symbolically in corpse-cakes, arval bread, and other special viands provided at ritual meals. These, sometimes indicating communion, are largely displaced by food and money doles. Dances, designed as magical rites to placate or scare the ghost, or to stamp down the grave, are associated with public spectacles, as in ancient Greece and Rome, or with games, such as the blind-man's-buff formerly played in S. Ireland, or the Sioux dicing for the effects of the deceased. See Burial; Mourning Customs.

Fung-hwang. Fabled bird of Chinese mythology. Generally described as a kind of phoenix, a fantastic representation of it is

frequently found in the decorations of Chinese embroideries and porcelain. The word is sometimes rendered Fum, and is thus given in Thomas Moore's satiric verses, Fum and Hum.

Fungicide. Substance used to safeguard plants against attack by fungus. Fungi, belonging to the lowest group of the plant kingdom, do not contain the green colouring matter chlorophyll, which enables the green plant to assimilate the carbon dioxide of the air and build up the carbohydrates necessary for plant growth. They are parasitic organisms deriving their food directly from the host plants. As the fungal threads develop rapidly within the body of the plant, remedial measures cannot be applied at the seat of infection. Either the spores of the fungus must be killed with a direct or eradicant fungicide, or, more effectively, conditions must be created which are unfavourable for the germination of spores. This is done by applying a protective fungicide. Certain disease-spreading organisms (bunt in wheat, smut and stripe in barley and oats) are seed-borne, i.e. they infect the seed of the host plant before germination. Fungicides for the treatment of such diseases are called seed dressings or seed disinfectants.

Fungicides should be toxic to the fungus at relatively low concentrations and should retain their activity on the spray-coated surface for a considerable time. They are applied as dusts or sprays (see Insecticide) and should be renewed as rain removes the protective film or new growth occurs.

Copper Fungicides

The main groups are based on copper, sulphur, and mercury. Copper fungicides consist, in general, of water-insoluble copper compounds which, when applied, liberate traces of soluble copper. The most familiar is Bordeaux Mixture, a suspension of basic copper sulphate, prepared by the interaction of copper sulphate (4 oz.) and hydrated lime (5 oz.) in 2½ gallons of water. It is effective against potato blight, leaf spot of celery, leaf curl of peach, and downy mildew of vine. A related but less safe fungicide is Burgundy Mixture, prepared from copper sulphate and washing soda. Among the dusts are Bordeaux powders and copper-lime dusts. Copper oxychloride and cuprous oxide are also used. The chief sulphur fungicides are elementary sulphur (as dust or in wettable, dispersible, or colloidal form) and lime sulphur

(the deep red solution of calcium polysulphide, used for apple scab control). Seed dressings consist of organo-mercury derivatives.

Fungus. Enormous group of cellular cryptogams or flowerless plants. They are divided into four classes, *Phycomycetes*, *Ascomycetes*, *Basidiomycetes*, and *Fungi Imperfecti*. Some 37,000 species are all characterised by a total absence of chlorophyll, the green colouring matter contained in other plants. Thus they are unable to manufacture food from the carbon dioxide of the air and the mineral salts in the soil, and must obtain supplies from decaying or living vegetable or animal matter. Those that take it from living tissues are known as parasites and are responsible for many diseases; those obtaining it from the dead residues of plants and animals are called saprophytes: such is *Penicillium* (*q.v.*).

The vegetable body of a fungus is a *mycelium* of microscopic, thin-walled, branching threads or *hyphae*. Reproduction is by sexual or asexual spores. The forms of fungi are multitudinous, varying from the hard or corky brackets that advertise their attacks on trees, through the mushrooms, toadstools, and puff-balls of the woods and fields, to the minute and destructive leaf-moulds, rusts, and mildews that live on crops.

FUNGICID PESTS. Unless remedial measures are practised, the losses due to parasitic fungi may be enormous. In 1845 a hitherto unrecorded disease attacked the potato; it spread with alarming rapidity and next year destroyed practically the whole Irish potato crop, thousands of the peasantry dying of starvation. Potato blight is due to the minute fungus, *Phytophthora infestans*. In some countries the rust diseases of cereals cause great loss. Black rust of wheat, due to *Puccinia graminis*, decreased the Canadian wheat crop in 1916 by 100,000,000 bushels.

Of preventive measures, by far the most effective is good farming that aims at producing healthy, vigorous crops. The correct choice of variety, clean seed free from disease and weed, and a well-planned sequence of cropping will do much to prevent crop failures, but will be of no avail if the soil is sour or badly drained. Weeds often harbour destructive fungi and insect pests, and special attention should be given to headlands, hedges, and ditches. The danger of infection is much increased by growing a crop continuously on the same piece of land.

Fungi may be present on the seed, in the soil, or in the air, but are so minute that they can be seen only with a microscope. When spores are present on the surface of the seed, the diseases to which they give rise can usually be prevented by treatment with an appropriate fungicide (*q.v.*), examples of seed-borne diseases are covered smut or bunt of wheat (*Tilletia caries*), covered smut of barley (*Ustilago hordei*) and the oat smuts. As their spores are present on the grain they can be killed by disinfecting the seed before it is sown with powders known as organo-mercury seed dressings. With loose smut of wheat (*Ustilago tritici*) and loose smut of barley (*Ustilago nuda*) the agents of disease are deeply embedded within the grain and beyond the reach of the fungicide. These diseases are not of serious consequence in Great Britain.

Starve the Fungus in the Soil

Diseases caused by soil-inhabiting fungi are more difficult to control, but usually they can be avoided by a sound sequence of cropping. The remedy is to starve the fungus from the soil by avoiding susceptible crops. If red clover and related crops are grown too frequently, the land may breed clover rot (*Sclerotinia trifoliorum*). *Helicobasidium purpureum* causes the violet root rot disease of man-golds, sugar beet, carrots, etc.; this likewise must be starved from the soil. Many diseases are brought about by airborne spores and, to protect the foliage, crops are sometimes sprayed with fungicides. It is sometimes possible to avoid disease by growing resistant varieties, e.g. wheat resistant to yellow rust (*Puccinia glumarum*) and to black rust (*Puccinia graminis*).

POISONING BY FUNGI. The rarity of fungus poisoning renders it all the more dangerous when it does occur because of lack of knowledge on the part of those in attendance. Of the 2,000 larger fungi growing in England and in similar climates, 200 are edible, about 10 are poisonous, the rest are merely indigestible. Many brilliantly coloured fungi are edible, but because they do not resemble the ordinary mushroom they are not generally eaten. The extremely poisonous death-cap (*Amanita phalloides*) is easily mistaken for the edible mushroom (*Psalliota campestris*). Allied species are the fool's mushroom (*Amanita verna*) and the destroying angel (*Amanita virosa*), with white caps, fortunately rare in England.

The edible mushroom has a white cap with brownish-purple gills. The base of the stem is clubbed with no volva (height 3½ ins., width of cap 5 ins., width of stem 1 in.). The death-cap has a yellowish-green cap, white gills and volva at base of stem (height 4½ ins., width of cap 3½ ins., width of stem ½ in.). Fly agaric (*Amanita muscaria*) has a red cap with white patches (height 10 ins., width of cap 7 ins., width of stem 1 in.). Owing to its striking appearance it is not eaten in error, nor does it cause death.

Most current statements regarding edibility are valueless. The edible mushroom peels easily, but so does the death-cap. Rabbits can eat the latter with impunity, but man cannot. Change of colour on cutting has no implication; failure to blacken a silver spoon during cooking does not mean that the fungus is wholesome. Cases of poisoning by fungi may be considered as those with early symptoms or those with late. The early symptoms are diarrhoea and vomiting, while nervous symptoms may be present. Delayed symptoms come on eight hours or more after eating the fungus—vomiting and diarrhoea with intense abdominal pain—and this delay is characteristic of death-cap poisoning. Death often occurs from failure of liver function. If symptoms appear quickly, then, death-cap poisoning is unlikely; if 8 hours later, highly likely. The stomach

should be washed out, the bowel emptied by an enema, and atropine 1/50 grain (the adult dose) given intravenously. Insulin, glucose, and vitamin B all tend to support the liver. The administration of anti-phallic serum is a method of treatment, as is the diet of rabbit stomachs and brains.

FUNK, WALTHER (b. 1890). German journalist and economist. Born Aug. 18, 1890, in East Prussia, he was educated at Berlin and Leipzig universities, and became city editor of a Berlin financial paper. An early member of the Nazi party, he was economic adviser to Hitler from 1931, and chief of the Reich press bureau in 1933. Minister of trade and industry in 1938, he was appointed president of the Reichsbank the following year. Funk continued Schacht's policy of chaining Balkan countries by barter treaties to Hitler's war machine. Captured by Allied troops on May 14, 1945, he was indicted as a major war criminal, appeared before the international court of justice at Nuremberg, was found guilty, and on Oct. 1, 1946, sentenced to imprisonment for life.

Funny Bone. Popular term for the groove between the olecranon process of the ulna and the internal condyle of the humerus on the inner side of the elbow. The ulnar nerve passes along this groove, and a blow on the nerve at this point produces the familiar sensation of "pins and needles." See Elbow; Humerus.

FUR: ITS SOURCES AND TREATMENT

John C. Sachs, Fur Trade Expert

This is a sketch of the history of the wearing of furs, and the way they are prepared for the market. See the articles on the various fur-bearing animals: Fox; Marten, etc.; also Costume

Fur (old Fr. *forre*, sheath) may be defined as the skin of certain mammals which, after preparation, is worn by men and women for warmth. The Tabernacle of the Israelites had an outer covering of badgers' skins (Ex. 26, v. 14) and an inner one of rams' skins dyed red (Ex. 35, v. 7). The Chinese claim to have employed furs for 3,000 years, but their methods of preparing the skins have stood still for centuries, and the same remark applies to other Asiatic countries. The Assyrians, Greeks, and Romans all made lavish use of furs. The practice is mentioned by Herodotus, and Hercules, we are told, wore the skin of the Nemean lion.

The Romans learnt the ornamental use of furs from the Greeks, who owed their knowledge of them to campaigns against the Medes

and Persians. The legend of Jason and the Golden Fleece was probably the allegorical description of the voyage of a Greek fur trader who sailed into the Black Sea and collected large stocks of valuable furs from what are now southern Russia and Armenia. Skins were worn by the ancient Britons, Saxons, Danes, and Norsemen, but women made comparatively little use of furs until the Middle Ages.

Mark of Riches and Nobility

Many edicts have been promulgated forbidding the use of various fine furs by the commoners. The wearing of ermine early became a badge of nobility, and miniver, or ermine powdered with black spots, was regal wear, and to this day figures in the coronation robes of kings. Men wore heavily furred garments during the York and Lan-

caster period, and both sexes displayed furs freely in the time of the Tudor sovereigns. Henry VIII is portrayed almost swathed in furs.

Furs fell into disuse in England during the Stuart period, but a most important event with regard to the trade happened after the Restoration, when Prince Rupert founded a company to trade for furs in Hudson Bay, 1670. From this really dates the commencement of the British fur trade. It did not start under the happiest auspices; the first company was a failure: the wearing of furs was objected to by the Puritans as savouring of vanity, and the elegant dress of the cavalier, although eminently suitable for the display of ribbon, velvet, and lace, was not adaptable to the employment of the furriers' art. The chief fur markets of the world continued to be at Constantinople, as for over 1,000 years, at Nijni Novgorod, Venice, and Genoa, while smaller markets were held at Nuremberg and Leipzig.

The two great fur-producing countries of the world are Canada and Siberia. The colder the country the better the fur, hence the covering of the animals produced in the high latitudes of Canada and Russia is particularly thick and warm. From Canada or Siberia come the sable and American marten, mink, ermine, fisher, red and silver fox, lynx, wolf, beaver, musquash, otter, bear, squirrel, wolverine, elk, and musk ox; while within the Arctic circle are found the polar bear, white fox, seal, and hair seal. Skunk, raccoon, and opossum come largely from the U.S.A. Australia produces opossum, wallaby, and vast quantities of rabbit; the beautiful chinchilla comes from Peru and Argentina; and Armenia gives its name to the ermine, though its habitat is farther north. Astrakans, slinks, caracul, tigers, sheep, goats, and bears come from Central Asia.

Transport from Hudson Bay

The transfer of these skins from the wilds to the ultimate wearers necessitates an immense organization. The great fur companies have their main depots around Hudson Bay, which is closed to navigation by ice for over nine months every year; hence a vast amount of work has to be done during the short time that the bay is open. The *modus operandi* is briefly as follows. As soon as the ice breaks up the steamers make for the depots, and on arrival discharge their cargoes, food, clothing, rifles, ammunition, axes, etc. The empty holds are at once refilled with furs which have

been brought from the base posts to the depots to await the arrival of the ships or aircraft.

Smaller steamers convey the stores to the base posts, which in their turn make use of sailing barges or scows as a means of communication with the ordinary posts. These get in touch with the flying posts by canoe or sledge, and the flying posts are open at agreed times during the year, to receive visits from the trappers, obtain their catches, and furnish them with necessities.

European agents are located at base posts—where are collected provisions for the ordinary posts, as well as their accounts and their collections of skin—and these officials have under their orders rangers (practically extinct), half-breeds, Indians, and Eskimos. Indians obtain skins up to about 55° N. latitude—the far northern regions are worked by Eskimos.

The London Fur Market

London was, before 1939, the premier raw fur market of the world, but, owing to the Second Great War, this market was transferred to New York. The Hudson's Bay Co. auctions were resumed in 1946, with a view to re-establishing London as the centre of the world fur trade. The raw skins are consigned to London and sold at Garlick Hill sale rooms to a cosmopolitan crowd of buyers.

The following quantities, among many others, of skins were offered at the reopening of the London fur sales in 1946:

Beaver	10,378
Ermine	88,125
Fox: red	24,886
Fox: white	13,957
Lamb, Indian	70,988
Mink	24,441
Musquash	173,942
Opossum	414,559
Pony	6,926
Skunk	140,226
Squirrel	219,005
Wolf	8,660

To combat the gradual disappearance of many fur-bearing animals, amongst which may be mentioned the sable, seal, chinchilla, beaver, and silver fox, numerous animal farms have been established, this branch of the fur trade coming more and more into the picture. Now 90 p.c. of the silver foxes are "farmed" skins; and Persian lambs, imported into S.W. Africa from Bokhara, some 20 years ago, are now produced on the African farms.

Raw skins go through many processes before they are ready for human wear. Experts sort and value the skins, which are then fleshed, i.e. cleaned of fat, etc., by

round revolving knives. Next they are placed in a bed of grease, oil, yolk of egg, butter, or some greasy substance, and subsequently pounded in a treading vat, which causes the grease to enter the pores of the leather. Hot sawdust of beech or mahogany is rubbed in with the effect of drying the grease. Machines then unhair certain skins, i.e. take away the long coarse hairs, leaving only the soft and silky down. Thereafter such as are intended for dyeing are immersed in dyeing vats. Finally, skilled craftsmen deal with the skins, which, when manufactured into garments, become furs.

Of these craftsmen, the first and most important is the assorter, a highly trained specialist. His task is to select such skins as will work up together. Colour, length of hair, quality, texture, grounding, leather, and cost—all must be considered; and to get a perfect match he frequently rejects hundreds of skins. The selected skins are sent to the cutter, with whom work one or more nailers, men who with knives and nails skilfully work the skins to the pattern accompanying the order. Sewers, using a variety of machines, and subsequently liners and finishers are employed, and designing goes on incessantly. Moth, the great enemy, is kept under by beating the furs or by cold storage, which is more effective.

Furetière, ANTOINE (1619–88). French writer. Born at Paris, Dec. 28, 1619, he entered the Church, becoming abbé of Chalivoy and prior of Chuines. He wrote satirical poems, a book of fables, 1673, and is chiefly remembered for his humorous story, *Le Roman Bourgeois*, 1666, written to cast ridicule on the romances of aristocratic gallantry then in vogue. He was elected a member of the French Academy in 1662, but was expelled in 1685 for preparing a dictionary, a work which the academy regarded as its exclusive privilege. He died May 14, 1688, his dictionary being published in 1690.

Furfurane or **FURANE**. Compound produced by distilling barium pyromucate with a soda lime or by heating pyromucic acid at its boiling point. It is also known as tetrol, tetraphenol, and tetrane. It is contained among the distillation products of pinewood tar.

Furies (Lat. *Furiae*). In classical mythology, the name under which the Romans knew the Eumenides (*q.v.*).

Furka. Mt. road of Switzerland, in the Valaisian Alps. It runs between the upper Rhône valley

and that of the Reussau, leading past the Rhône glacier to Andermatt, in canton Uri. Its maximum height is 7,991 ft.

Furlong (A.S. *furlang*, furrow-long). British measure of length, one-eighth of a mile, or 220 yds. The name is derived from the old English furrow length. A square, each side of which was a furrow 220 yds. long, contained 10 acres. See Acre.

Furlo Pass (anc. *Intercisa* or *Petra Pertusa*). Tunnel through the Apennines in Perugia, Italy. It is on the road from Rome to Ariminum, the ancient Via Flaminia. It is about 40 yds. long, 14 ft. high, and 17 ft. wide, and, according to an inscription cut in the rock, was made by order of the emperor Vespasian in A.D. 77.

Furlough (Dutch *ver lof*, for leave, or *oorlof*, permission, sanction). Term formerly used to designate the permitted absence from duty of military personnel, now referred to as leave (*q.v.*).

Furnace (Lat. *fornus*, oven). In the general sense, term applied to any device which is used for raising heat, whether for steam, for chemical processes such as roasting of ores or lime, or for the manufacture of metal. The metallurgical usage is by far the most common. Furnaces have been designed and used for metal smelting for many centuries, references being made to them in the O.T. and in the literature of the ancient Greeks. Archaeologists have found ancient bronze and copper weapons which were made by casting molten metals. Since the industrial revolution, design of furnaces has grown and broadened until it is impossible to name the hundreds of types used.

Furnaces fall into three main classes. The first and often the cheapest to construct is the type in which the heat is transferred directly from the burning fuel, flame, or hot gases, to the material to be heated. This differs from the second type, in which the charge is separated from the heating medium by some form of container, such as a crucible or muffle. The third class is the electric furnace (*q.v.*), distinct in that it uses no fuel as such. In reality it may be classed with the others, for the arc-type of electric furnace forces the heat directly into the charge, and so fuel and charge may be said to be mixed, while induction or resistance furnaces employ a crucible, tube, or muffle. Even so, in many induction furnaces the material to be heated supplies the

necessary resistance, so that these fall into the first rather than second group.

The first class of furnaces is the commonest found in industry. Design depends on the type of fuel used—solid, liquid, powdered solid, or gaseous—on the form of the material to be heated, temperatures to be attained, products desired, and numerous other factors. In blast furnaces and cupolas (*q.v.*) the charge is mixed with the solid fuel itself. Their chief disadvantage is that the products of combustion, ashes, and flue dust are carried down with the metal and must be slagged off. All pig iron used in steel making comes from blast furnaces, which may run for several years without interruption. Some roasting furnaces employ similar principles, but most of the fuel for combustion is supplied by the ore itself in the form of sulphur.

Reverberatory Furnaces

Contamination from the ash is reduced in the reverberatory furnace (*q.v.*), in which the hearth containing the metal to be heated is separated from the fuel bed, the products of combustion being led over the charge. The hot gases impinge on the roof and sides of the furnace, which then reverberates heat down on to the mass of material to be heated. Reverberatory furnaces may also be fired by liquid fuels or frequently by pulverised anthracite or coal, which is forced through special burners at one end of the furnace. These are used not only for the roasting of ores to remove sulphur, arsenic, antimony, etc., to provide a material amenable to smelting, but also for the smelting itself of copper, lead, tin, nickel, and other metals. Open hearth furnaces (*q.v.*), most widely used in modern steel production, work on a similar principle, but the gases and air for combustion must be preheated in regenerators or recuperators; these use the heat left in the gases after they have passed over the melt, which would otherwise be wasted.

Typical of the second class are muffle furnaces, used for heat treatment of metals; kilns (*q.v.*), for calcination and roasting; and the many forms of crucible furnace, for melting ferrous and non-ferrous alloys for casting in the foundry. They are usually fired by gas, oil, or pulverised coal in injection; heating is rapid, while they have the advantages of easy manipulation and control and complete separation of the molten

metal from the furnace gases. Thick crucibles or muffles mean heavy heat losses through the walls, but with modern refractory materials this is cut to a minimum. Another example of this type is the retort or still, used in the production of mercury, zinc, cadmium, arsenic, etc. As these metals volatilise at fairly low temperatures, they or their compounds may be distilled from the ore and condensed to produce metal, which may be redistilled for higher purity. Small gas-fired or electric furnaces are used in laboratories for testing, where accurate control of temperature is needed. See Boiler.

Furneaux. Group of islands between Tasmania and Australia in Bass Strait. They were discovered in 1773, by the English navigator Tobias Furneaux. Flinders Island, the largest, is 35 m. long and 10 m. broad.

Furness. District in the N.W. of Lancashire, England. It is detached from the main portion of the county by Morecambe Bay. Its area is 250 sq. m. The hematite iron ore in the S. of the district was worked by the Romans. Lake Coniston and much of Windermere are in Furness, which claims the finest scenery in the co. The rly. serving the mineral district round Barrow was called the Furness Railway until merged in the L.M.S.

Furness, CHRISTOPHER FURNESS 1ST BARON (1852–1912). British shipowner. Born April 23, 1852, at West Hartlepool, he became a shipbroker in 1876, establishing soon afterwards the Furness line of steamers. In 1885 he went into partnership with Edward Withy,

1st Baron Furness,
British shipowner
Russell

of Hartlepool, the firm being known as Furness, Withy & Co., and developing a huge business as shipbuilders and engineers. He was Liberal M.P. for Hartlepool, 1891–95 and 1900–10. Knighted in 1895, he was raised to the peerage in 1910, after losing his seat as an M.P. through a minor technical offence against the laws of election procedure. In religion a Methodist, Lord Furness was responsible for several philanthropic schemes and started a co-partnership scheme among his employees. He owned over 30,000 acres in Yorkshire. He died Nov. 10, 1912.

His son Marquess (1883-1940) was head of Furness, Withy & Co. from 1914 to 1919, when he started the Furness

Shipbuilding Co. Made a viscount in 1918, he died Oct. 5, 1940 and was succeeded in the title by his son William (b. 1929).

Furness Abbey. Picturesque ruins, 1 m. S. of Dalton, Lancashire, England. Situated on the banks of a small stream, in a wooded valley, close to a railway station, the ruins include part of the Transitional Norman nave, Early English chapter house, decorated transepts, and Perpendicular belfry and presbytery. In the abbot's chapel are two 12th century effigies of knights in armour. The abbey, dedicated to S. Mary, was founded in 1127 by Benedictines from Normandy, under the patronage of the earl of Morton, afterwards King Stephen, and became Cistercian in 1148. The abbot had feudal powers over the whole surrounding district, and the foundation was richly endowed. In 1920 Furness Abbey was presented to the nation by Lord R. Cavendish.

Furness Line. British steamship company. It was founded by Sir C. Furness, afterwards Lord Furness, in 1877, the present company of Furness, Withy & Co. being registered in 1891. Associates and subsidiaries include the Prince Line; Cairn Line; Johnston Warren Lines; Shaw, Savill & Albion; Furness Houlder Argentine Lines. These operate passenger and cargo lines to S. America, Newfoundland, Bermuda, W. Indies and Trinidad, Mediterranean, Black Sea, and Palestine ports, South Africa, Australia and New Zealand.

Furness Abbey. Ruins of the 12th century building of a former wealthy and powerful Cistercian abbey

Valentine

Furniss. One of his famous caricatures of Gladstone

The head office is at 56, Leadenhall Street, London, E.C.3.

Furniss, HARRY (1854-1925). British caricaturist. Born at Wexford, of Anglo-Scottish parents, he

came to London in 1878. He contributed sketches to *The Illustrated London News* and joined the staff of *Punch* in 1880, at Burnand's invitation, as illustrator of the *Essence of Parliament*. In this capacity he created the legendary Gladstone collar. His connexion with *Punch* lasted until 1894, when he started his own weekly, *Lika Joko*. This was not a success, nor was the short-lived periodical *Cartoon*, which he launched in 1915. He illustrated Lewis Carroll's *Sylvie and Bruno*; the works of Dickens, 1910, and Thackeray, 1911; and wrote *Confessions of a Caricaturist*, 1901; *Harry Furniss at Home*, 1903; *Poverty Bay*, a novel, 1905; *How to Draw in Pen and Ink*, 1905. He died Jan. 14, 1925.

Harry Furniss. Russell

In the same year appeared his reminiscences, a volume entitled *The Two Pins Club*. See *Caricature*.

FURNITURE: AN HISTORICAL SURVEY

Hamilton Temple Smith

A brief description of the origins and development of the movable contents of domestic buildings, with particular reference to English forms, but with notes also on the Continental modes and their influence on English furniture makers. See also separate articles Bed; Chair; Table, etc.

The earliest known records of domestic furniture are Egyptian bas-reliefs dating from about 4000 B.C., in which beds, tables, chairs, and stools are depicted. At a very remote period the craft of cabinet making was brought to a high state of development by the Egyptians. Dovetails and mortise-and-tenon joints were in common use. Glue was used, not only for strengthening the construction but also for decoration by veneering and inlay, sometimes with rare and lovely woods, sometimes with ivory (often dyed) and other semi-precious materials. Painting and gilding were favourite methods of decoration: very rich examples of these were found in the tomb of Tutankhamen (q.v.). A common wood was sometimes painted and "grained" to resemble a more costly one. The usual type of receptacle was the coffer or chest, the lid sometimes

sliding in a groove and often of a domed or roof-like shape.

The design of much Egyptian furniture was of the most sumptuous kind, especially that of chairs and thrones. Besides being elaborately carved, painted and gilded, or inlaid, these had large feather cushions covered with rich stuffs of gold and silver tissue, or embroidered with silk and threads of gold, and supported upon a web of interwoven thongs or cords. Rameses III (c. 1230 B.C.) is portrayed sitting upon a throne with X-shaped supports, evidently constructed upon the same principle as a deck chair of today, but of the greatest elegance. Legs were often shaped to represent the legs of animals—far-off ancestors of the cabriole leg of 18th century Europe. Bronze was frequently used as an alternative to wood for many pieces.

The influence of Egyptian culture spread to Greece through the Phoenicians, and it seems, from the evidence of their sculptures and vase paintings, that, though their furniture remained simple

and sparse (*cf.* Homer's *Odyssey*), the Greeks achieved in the design of their furniture (as in architecture and the other arts) an unequalled refinement and purity of line and form.

The Romans who, in their turn, borrowed from the Greeks, soon exceeded them in domestic luxury, though not in artistic merit, and after the sack of Corinth in 146 B.C. Greek craftsmen flocked to Rome for employment. Two hundred years later the bronze chairs, stools, and couches buried in the ruins of Pompeii still showed clear evidence of their derivation from Greek designs.

Early Civilizations

During all these centuries, the range of furniture remained substantially as it had been during the early Egyptian dynasties: namely, chairs, stools, beds and couches, tables, and coffers. Moreover, while details of style varied widely between one civilization and another, the forms remained fundamentally the same. Indeed, the forms of many of them so closely resemble those of corresponding pieces today as to give the impression that modern furniture can claim unbroken descent from that of the early civilizations; but this is only partly true.

The Romans, colonizing most of the known world from Britain to the Persian Gulf, took with them everywhere the culture which had been developing since the dawn of history in Mediterranean lands. With the fall of Rome in the 5th century A.D., what remained of Roman civilization found refuge in Byzantium, whence its influence (in a modified form) spread slowly westward again through many troubled centuries. Meanwhile, in the west, civilization was swept away by successive waves of barbarian invasion, and the making of furniture, with the other domestic crafts, had to start all over again from primitive beginnings.

Such furniture as the Anglo-Saxons had was to be found in the chieftain's hall, the centre of their communal life. The 8th century poem *Beowulf* gives a glimpse of it: "Countless nobles guarded the hall . . . They cleared away the bench boards; it was strewn throughout with beds and bolsters . . ." About the time of the Norman conquest, the furniture of the hall still consisted of benches, trestle tables, and strong iron-bound chests which served for seats as well as safes. Chairs are shown in the Bayeux tapestry,

but at this period, and long after, the chair was a rarity whose use denoted rank or eminence, as the throne denoted royalty, and ordinary folk had to be content with stools.

As conditions became less primitive, and life more settled, comfort began to be studied. A back was added to the bench or the chest, and it became a settle. The cup-board appeared—a kind of dresser upon which plate and other treasures could be displayed; doors were added, and by degrees the "cupboard" changed its form, so that it has now come to be a place for hiding things rather than displaying them. The medieval craftsman found means of enriching and beautifying all that he made. Thus the trestles of tables blossomed out into the cusps and trefoils characteristic of Gothic buildings; cupboards for storing food, which needed ventilation holes, were presently pierced with tracery like miniature church windows. Little if any domestic furniture of early medieval times has survived, but illustrations in illuminated manuscripts, paintings, and carvings give a clear picture of it. Woodwork of the period still existing in churches and cathedrals reflects the same idiom and makes it possible to visualise the setting of domestic life in the Middle Ages.

Carved and Gilded Oak

During the 14th and 15th centuries commerce and wealth increased, and in the houses of the nobles, the great churchmen, and the rich merchants, furnishings reached a high degree of luxury and splendour. Oak was the timber commonly used and carving its main enrichment, sometimes enhanced by gilding, but more generally by painting in the bright heraldic colours that are still to be seen (much dimmed by age) in the roof work of some medieval buildings. Iron hinges and locks were elaborately wrought. Bedsteads had testers of panelled wood and were resplendent with embroidered hangings and coverlets. The actual joinery, however, judged by later standards, was crude, and still only the rich had more than the barest minimum of furniture.

There was constant intercourse between England and the neighbouring Low Countries and France, where Gothic art developed along parallel lines. In Italy, and the south, the Gothic spirit had never taken root; there the older Byzantine culture had remained the chief influence in the arts, till the 14th century saw the dawn of the

Renaissance and the revival of the purer classical forms of ancient Greece and Rome. In the 15th century the Renaissance reached its zenith in Italy; its impulse was soon to permeate France, fostered by the cultural kinship of these two Latin countries, and by the numerous Italian artists and craftsmen employed by Francis I. He died in 1547, by which time the three great furniture schools of Lyons, Touraine, and the Île-de-France had reached the summit of accomplishment in the new manner.

Early Tudor Period

In England there was no such easy transition. Henry VII, Henry VIII, and Wolsey all employed Italian and other foreign artists and artificers, whose work fired the native craftsmen to experiment in the new fashion, though more than a century was to pass before this became fully naturalised. Gradually the "linenfold" panel, typical of early Tudor woodwork, gave place to panels carved with arabesques. But the Elizabethan cabinet-maker's balusters, Florentine scrolls, dolphins, and acanthus leaves would have seemed mere caricatures to the authors of their French or Italian originals. The structural form of Elizabethan furniture, at its best, remained Gothic; at its worst it threw composition to the winds, bulging out into monstrous shapes and gross ornamentation. Oak was still the favourite wood, often inlaid with geometric or floral patterns: in this work the English excelled.

Two innovations appeared at the beginning of the Tudor period: the drawer, which in course of time was to have a profound effect upon furniture design; and the "shovel-board" or draw-leaf extending table—a simple and ingenious device which has come back into favour after three centuries of disuse. During this time, too, with the increasing diffusion of wealth, the demand for furniture spread through all classes of people.

Jacobean furniture repeated the forms of Elizabethan, with a marked falling-off in vigour and inventiveness, but James I's reign was notable for one new development: that of upholstery as a fixed part of the chair.

The few pieces that have survived from the troubled time of Charles I show an increasing purity of classical detail, perhaps due to the influence of Inigo Jones, the royal architect. The Baroque style, then reaching its height on the Continent, is reflected in the

introduction of the spiral—or "barley sugar"—turning.

Commonwealth furniture, made for use rather than display, had a sober comeliness, both in proportion and detail, which is thoroughly English. The demand for smaller and more portable types produced the gate-leg table; turning was of simple baluster or columnar form, and there was little carving.

Charles II brought home with him the classical traditions of the French court, and at long last the full tide of the Renaissance reached England. Walnut—which can be worked with much finer detail than oak—became the favourite timber. Except in chairs, table legs, and mouldings, where it was used solid, walnut was generally veneered upon deal. *Marqueterie*, of French and Italian origin, was already highly developed before Dutch influence, under William III, superseded French for a while. Through the Netherlands came the cabriole leg, most characteristic feature in furniture design throughout the first half of the 18th century: the Dutch had borrowed it from the French, who, in their turn, had received from the Italians this adaptation of an ancient Roman convention inherited from Egypt and Assyria.

The Tendency Towards Curves

In the reigns of Anne and George I the cabriole leg went through many experimental phases before reaching its graceful maturity and, in harmony with it, there was a general tendency to introduce curves in place of the straight constructional lines which had hitherto prevailed in English furniture. This tendency, and with it the trend towards lighter and more delicate forms, was encouraged by the introduction of mahogany, which, with its strength and fineness of grain, was exactly suited to the new vogue; great quantities of this wood were imported from the West Indies until it largely superseded the native walnut.

The later 18th century, the "golden age" of English furniture, is dominated by the figure of Thomas Chippendale (*q.v.*), a practical cabinet-maker who became the most successful furnisher of his day. In 1754 he published *The Gentleman and Cabinet-maker's Director*, containing 160 plates of his designs for a great variety of pieces. This had a wide circulation and was used as a pattern book by cabinet-makers in all parts of the country. Thus the elaborate (and

often fantastic) designs, invented by Chippendale for his aristocratic patrons, were adapted, simplified and produced by other hands for numberless middle class customers up and down the land. These productions varied considerably in quality of workmanship, but works of even unknown makers of this period are prized (and quite often justly) as outstanding examples of design.

Hepplewhite and Sheraton
Hepplewhite published *The Cabinet-maker and Upholsterer's Guide* in 1788, while Thomas Sheraton produced more than one similar volume, the first in 1791. There is no direct evidence that Hepplewhite had any workshop of his own; Sheraton almost certainly had not: they were free lance designers, and their designs were carried out in great numbers by competent master cabinet-makers, of whom some 2,000 have been identified in London alone during the 18th century.

Chippendale had borrowed many rococo details from the France of Louis XV, translating them into more domesticated forms to suit the English taste. His later work, produced in association with the fashionable architect, Robert Adam, reflected the current swing back towards straight lines and classical ornament.

The tides of foreign influence had ebbed and flowed continually around English design, which selected what details it needed, absorbing them into the strong native tradition evolved throughout the centuries. In furniture this English tradition came to full maturity in the work of Hepplewhite and his younger contemporaries, and continued at its prime for rather more than twenty years.

Regency furniture, elegant and sophisticated, marks a decline: never had taste been more eclectic, nor workmanship more competent, but the end of the golden age was near: well before the Great Exhibition of 1851, tradition had disappeared in a welter of styles and fashions, and only the habit of fine workmanship remained to show that a famous golden age had ever existed.

Half a century later William Morris began the search for a way back to tradition in the crafts. Among his followers were some young architects—among them Voysey and Mackintosh—who experimented in designing furniture suited to the kind of houses they were building. The most outstanding was Ernest Gimson, who set

himself to master the craft of woodwork, and at his renowned Cotswold workshop, during the first two decades of the 20th century, produced furniture unsurpassed for beauty of design and perfection of workmanship.

This English "arts and crafts" movement had a profound and immediate effect upon Continental designers and manufacturers, who (unlike the English furniture trade which ignored it) saw in it the beginning of a new and vital adventure. In England a few craftsmen, in small workshops up and down the country, were developing a contemporary style of design based upon fine craftsmanship. Meanwhile, the furniture trade in general cut itself off from all contemporary impulses, turning out endless copies of designs disintegrated from its own past. For many years there was only one man in it—Ambrose Heal—who took the new development seriously; then, between the two Great Wars, his example was followed by fresh entrants to the trade and, by degrees, established manufacturers began to be influenced by contemporary design. By 1939 a definite style could be recognized here and there, and at least the beginnings of a revived tradition, of which good proportion, straightforward construction, fitness for purpose, and the right use of materials were guiding principles.

Veneered Wood

Veneered laminated wood largely replaced solid wood in furniture construction. Plywood bonded with synthetic resin is exceedingly strong, durable and impervious alike to moisture and to insect attack. It can be readily moulded into curved shapes, and was so used in aeroplane construction during the Second Great War—experience tending to influence and modify considerably the traditional forms of mass-produced furniture, already improved and simplified in the designs used for utility (*q.v.*) furniture. Metal, both in pressed sheet and in tubular form, enamelled or chromium-plated, used for office, kitchen, and bathroom furniture, gave little indication of superseding wood as the accepted material for bedroom and living-room furniture.

Bibliography. Popular Account of the Ancient Egyptians, Sir J. G. Wilkinson, 2 vols., 1854; *Dictionnaire du Mobilier*, Viollet-le-Duc, 1855-75. *Ancient and Modern Furniture and Woodwork*, J. H. Pollen, 1875. *History of English Furniture*, Percy Macquoid, 4 vols., 1904-06. *English Furniture of the*

18th Century, H. Cescoinsky, 3 vols., 1911; Encyclopaedia of Furniture, H. Schmitz, 1930; Furniture and Furnishing, J. L. Rogers, 1932; A Key to English Furniture, H. P. Shapland, 1938; publications of Design and Industries Association.

Furniture Beetle. Small insect destructive to furniture and worked wood in general. The worm-holes on the surface of affected furniture are mostly caused by the beetles making their exit, whereas the actual destruction results from the boring activities of their larvae. The common furniture beetle (*Anobium punctatum*) attacks mature or old timber; its worm-holes are less than $\frac{1}{16}$ in. in diameter. The death-watch beetle *Xestobium rufovillosum* mostly attacks beams and other structural timbers. Its worm-holes are $\frac{1}{16}$ in. to $\frac{1}{8}$ in. across. Its larvae have caused great damage to the rafters, etc., of Westminster Hall and other ancient buildings. The powder-post beetles (*Lyctus*) attack most hard woods. *Consult* Furniture Beetles, C. J. Gahan, 4th ed., 1946.

Furnivall, FREDERICK JAMES (1825-1910). A British philologist and editor. Born at Egham, Surrey,

Feb. 4, 1825, he was educated at University College, London, and Trinity Hall, Cambridge, and was called to the bar in 1849. The

publications of the Early English Text Society, founded by himself, like the New Shakespeare, Chaucer, Wyclif, Browning, and Shelley societies, have been of great service to students of English. His own most important work was an edition of Chaucer, and he was an originator of the Oxford English Dictionary. He took much interest in the welfare of the working classes and in the Working Men's College. Died July 2, 1910.

Furnival's Inn. Old London Inn of Chancery. It was on the N. of Holborn, between Brooke Street and Leather Lane. It dated from the reign of Henry IV, was rebuilt in the 16th century, and ceased its career as an inn in 1818, when it was again rebuilt. Dickens wrote the greater part of *The Pickwick Papers* when resident here. Its site is approximately that of the premises of the Prudential Assurance Co., built in 1879.

Furring. Deposition of mineral scale in vessels in which lime and

magnesium-bearing waters are heated. In the absence of evaporation the fur is composed of the carbonates of lime and magnesium which are precipitated at temperatures above 140° F. The scale in steam boilers and similar evaporators contains also the salts—sulphates, chlorides, and nitrates—which remain in solution even in boiling water. Fur may vary between the extremes of a firmly adhering, flint-hard, crystalline scale, and a soft, sand-like precipitate. It is highly undesirable because, being a poor conductor of heat, it serves as an insulator and impedes the transmission of heat from the fire to the water. A thickness of $\frac{3}{8}$ in. is estimated to cause a 40 p.c. reduction in thermal efficiency. In pressure vessels, incrustation may bring about serious overheating and eventual failure. Furring may be prevented by water softening and other treatment; most processes remove the scale-forming matter from the water before it is heated, but others only ensure a soft precipitate by preventing crystallisation of minerals. *See* Water Softening.

Furrow. Trench or hollow made by the plough. It comes from an Anglo-Saxon word, and has been extended to describe hollows of other kinds, such as furrows on the face. *See* Plough.

Furry Dance. Correct local name of the celebration, May 8, at Helston, Cornwall. *See* Flora Day.

Furse, CHARLES WELLINGTON (1868-1904). British painter. Born at Staines, Jan. 13, 1868, and educated at Haileybury, he studied art at the Slade School under Legros, and in Paris under Julien. In open-air portraiture he achieved rapid success, notably in *The Return from the Ride*, 1903, and *Diana of the Uplands*, 1904, a portrait of his wife (*v.i.*),

both in the Tate Gallery. A sportsman himself, he easily caught the atmosphere of country life, composing on a robust scale in bold, luminous masses of colour. He was elected A.R.A. in 1904, but died Oct. 17.

Furse, DAME KATHARINE (b. 1875). British organizer. She was born at Bristol, Nov. 23, 1875, the daughter of John Addington Symonds, and married C. W. Furse, the painter, in 1900. Going to France in Sept. 1914, she developed the activities of the Voluntary Aid Detachments, becoming their commandant-in-chief in 1915. She was director of the Women's Royal Naval Service, 1917-19; assistant chief commissioner of girl guides in 1922; director of the world bureau for girl guides and girl scouts, 1928-38. She was created G.B.E. in 1917. Her published works include *Ski-running*, 1924; *Hearts and Pomegranates*, 1940.

Furse, ROGER (b. 1903). British designer. Son of Sir W. T. Furse, he was born at Ightham, Kent, and educated at Eton. His settings and costumes for stage productions were outstandingly brilliant, *Victoria Regina*, 1936; *Oscar Wilde*, 1937; *Design for Living*, 1939; *The Skin of Our Teeth*, 1945. For the Old Vic he designed Shakespearean costumes and settings. His most notable work in the cinema was in *Henry V.* Furse was art director at Perranporth summer theatre, 1936-39, and then served in the Royal Navy.

Fürstenberg. Name of two families of the German nobility, unconnected with each other. The Swabian princely house is the more important, though the Westphalian counts and barons have numbered several prince-bishops of Paderborn and statesmen of repute among their members. The later grand duchy of Baden was, 1136-1457, largely under the rule of the southern Fürstenbergs

Dame Katharine Furse, British organizer

Elliot & Fry

Furnival's Inn, London. View of the interior of the inn before its demolition
From Wilkinson's *Londina Illustrata* 1819

who thence until 1806 ruled a principality of their own, which is now mostly a part of Württemberg, with the capital at Donaueschingen. Large territories in Bohemia and Austria were held by younger branches of the family. Notable among the Fürstenbergs were Egon VIII, a general of the Catholic League during the Thirty Years' War, and his sons who backed Louis XIV against the emperor, both successively bishops and the younger, Wilhelm Egon, in 1686, made a cardinal. Maximilian Egon (1863-1941), personal friend of the Kaiser William II, was famous for his sumptuous hospitality and hunting parties at Donaueschingen.

Fürstenbund (Ger., league of princes). Term specially applied to the league formed by Frederick the Great in July, 1785, to maintain the existing constitution of the Empire as established by the treaty of Westphalia. The emperor Joseph II was pressing a scheme for securing Bavaria for himself and in exchange giving the Netherlands to the Bavarian ruler. Frederick persuaded the rulers of Saxony and Hanover—George III of Great Britain—to combine with him against this policy, and the league was joined by the elector of Mainz, the rulers of Brunswick, Baden, Hesse-Cassel, Mecklenburg, and others. It succeeded in stopping Joseph's project, but did not long survive the death of its mainstay, Frederick, in 1786.

Fürstenwalde. Town of E. Germany in the *Land* of Brandenburg. It is on the Spree, 32 m. E.S.E. of Berlin. A bishop's seat until 1571, its chief building is the cathedral. One of the oldest and richest towns in the prov., it owned a forest of about 12,000 acres. Metals, textiles, beer, and iron-founding provided its chief industries. Pop. 25,490.

Fürth. Town of Germany, in Bavaria. A rly. junction, 5 m. N.W. of Nuremberg, and linked with it by Germany's first railway, 1835, it stands at the confluence of the rivers Pegnitz and Rednitz. Its chief buildings are S. Michael's church and the town hall, as well as the ruins of a castle; other churches and several schools are nearly all modern. Its trade and population grew considerable between 1885 and 1914, its chief industries being printing and attendant trades, the making of mirrors, furniture, machinery, toys, and fancy goods. There was also a trade in agricultural produce, and an annual fair. Fürth had a large

Jewish population. At one time under the burgesses of Nuremberg and later the bishops of Bamberg, Fürth became part of Bavaria in 1806. Pop., pre-war, 81,135. *Pron.* Few-ert.

Further Education. Term used for instruction, higher, technical, or commercial, pursued after the end of primary and secondary schooling. The Education Act, 1944, defined further education as "(a) a full-time and part-time education for persons over the compulsory school age; and (b) leisure time occupation in . . . cultural training and recreative activities . . . for any person over compulsory school age." Further education includes dressmaking classes for housewives, shorthand evening classes for office workers, lectures on bee-keeping or gardening, as well as full-time courses in preparation for university degrees. Under section 42 of the Education Act, every local education authority must prepare and submit to the minister of Education schemes of further education for its area, to be carried out after consultation, and possibly in cooperation, with universities and other educational bodies providing facilities for further education in the area.

School Attendance Compulsory. The same Act required local education authorities to establish and maintain county colleges (*see* County College). Conditions when the Act was passed, and for some time afterwards, made it impossible to construct and staff county colleges immediately; but as soon as they were functioning attendance of young persons became compulsory, and employers were compelled to release them for such attendance.

Long before the passing of that Act, however, many employers, in conformity with the aims of the Education Act of 1918, allowed their juniors to attend, on one or more days a week, day continuation schools, the number so released for further general education amounting in 1946 to more than 100,000. Thousands of apprentices were also released for one or more days a week to continue their technical training. Employers paid wages for days spent in this way. Experience proved the value of this further education both to the juvenile and to the employer.

Institutions which have long offered opportunities for further education include the universities and university colleges, colleges of art, science, commerce, or tech-

nology, trade schools, polytechnics, technical colleges maintained by local education authorities, evening schools. The London and other county councils maintain technical, commercial, literary, art, and general institutes for further education, most of the classes being held in the evening.

Many students in evening schools concern themselves with a particular subject, and sometimes with a series of subjects in succession; but an increasing number take full courses with the object of securing a university degree, a professional diploma, or passing some other qualifying examination. The award of certain national certificates, *e.g.* in engineering, depends on satisfactory class attendance and homework during three sessions, and success in the terminal as well as the final examinations.

Besides technical and vocational subjects, literature, art, music, drama, crafts, civics and sociology are studied in leisure hours; and communal activities, such as discussion groups, amateur dramatic societies, etc., are encouraged by most local authorities. An institute of adult education was formed in 1946 to cooperate with such bodies as the Workers' Educational Association and the extramural departments of the universities to encourage the provision of university extension lectures and courses, and extend opportunities for the aesthetic, intellectual, and social development and expression of all beyond compulsory school age. *See* Education Acts.

Furtwängler, WILHELM (b. 1886). German conductor. Born in Berlin, Jan. 25, 1886, he was educated at Munich, and conducted operas and concerts at Breslau, Zürich, Munich, and Strasbourg, Lübeck (1911-15), Mannheim (1915-20). He made

Wilhelm Furtwängler
German conductor

his reputation as a musician of supreme knowledge and profound understanding during successive seasons with the Berlin state opera, 1920-22, the Tonkünstler orchestra of Vienna, and the New York Philharmonic orchestra, 1925-27. He made his first London appearance in 1924, with a British orchestra. He had a great success on several subsequent visits with the Berlin Philharmonic orchestra. Furtwängler acted as director of

concerts at Vienna, 1927-30, and Baireuth, 1931, and 1936-37. Accused of collaboration with the Nazis in the Second Great War, he was cleared by a German "denazification" court, Dec., 1946, and allowed to resume his career.

Furunculosis. Acute localised inflammation of hair follicles in the skin with *Staphylococcus aureus*. See Boil.

Fury and Hecla Strait. Narrow channel of the Arctic regions, separating Baffin Island from Melville Peninsula on the S. It contains numerous islands and communicates with the Gulf of Boothia on the W., and with Fox Channel on the E. Parry, the Arctic explorer, discovered the strait in 1822.

Furze or Gorse (*Ulex europaeus*). Shrub of the family Leguminosae. It is a native of Europe, the Canaries, and Azores.

Furze. Left, seedling of *Ulex europaeus*; right dwarf furze, *U. minor*

It varies in height from 2 ft. to 8 ft., according to situation, and is densely covered with sharp evergreen spines, which are mainly transformed leaves. Young seedlings have trefoil leaves, and a single leaflet is sometimes attached to the long spines of older plants. The bright yellow, scented flowers are borne on the larger spines, which are twigs. The two-lobed calyx is yellow, like the petals, but covered with short black hairs. The black pods are about $\frac{3}{4}$ in. long, and hairy. The seeds bear an oily attachment, known as an elaiosome, which is relished by ants, who convey the seeds to their runs to feed upon this part. By this agency the distribution of the plant is effected. The dwarf furze (*U. minor*), smaller in all its parts, is native only to Belgium, France, and Great Britain.

Fusagasugá. Town of Colombia, in the dept. of Cundinamarca. It stands at an elevation of 5,627 ft., 28 m. S.W. of Bogotá, and is locally known as the Cordilleran Paradise. A summer resort, it is

one of the chief coffee-growing centres of the country.

Fusan. Seaport of Korea. It stands at the S.E. extremity of the Korean peninsula, in S. Keisho division, on Broughton Strait, 7 m. from the mouth of the Naktong river, and is the S. terminus of the rly. from Seoul (Keijo). Old Fusan is the native town and New Fusan was mostly inhabited by Japanese before the defeat of Japan in 1945.

Fusan, one of the treaty ports, opened to foreign commerce in 1883. The harbour is sheltered and deep, and the largest vessels afloat can approach the quay. Steamers normally ply to and from Nagasaki, Port Arthur, Vladivostok, Shanghai, Chemulpo (Jinsen), and other ports. The trade is connected with cotton fabrics, raw silk, Japanese wares, hides, rice, dried fish, petroleum, and beans. Of the fisheries the principal catch is herring and cod. After the annexation of Korea by Japan in 1910, the Japanese improved the harbour, making roads, and building water and electricity works. Pop., pre-war, 249,734.

Fusaro. Lagoon of Italy. The ancient Acherusia Palus, it is in the prov. of Naples, 11 m. W. of Naples, and is separated from the sea by alluvial sand-hills. The Romans made an outlet for it in the 1st century A.D. During the Empire its banks were studded with villas, of which there are many remains, besides tombs. Then, as now, the lake was famed for its oysters.

Fuse. A device for bringing about the ignition or detonation of an explosive charge which allows a fixed interval of time before the charge explodes. The safety fuse used in mining operations consists of a train of black powder contained in a waterproof, woven textile tube and provides a means of communicating a flame from a distance to the charge to be fired. A crude form of safety fuse is the so-called "miner's squib," a tapered tube 7 ins. long, filled with fine gunpowder. Quickmatch fuse, now used mainly in fireworks, is made by soaking cotton wick in a solution of gunpowder and gum arabic, dusting with fine

gunpowder when in the tacky state and finally wrapping in waterproof tape. Instantaneous fuse, several strands of quickmatch in the same wrapping, burns at a speed of 200-300 ft. per sec. For a more rapid fuse the core

Fusan, the Korean port in the south-eastern extremity of the peninsula

consists of an explosive filling (Pentaerythritol tetranitrate or T.N.T.) which can be readily detonated.

Modern artillery employs over 100 different types of fuses, the principal being impact or direct action; graze action or percussion; time; and radio proximity. With military ammunition, such as shell or bomb, the charge is usually fired on impact with the target. The most usual direct action fuse is operated by a small pin held by a spring, which impinges violently on a detonator when impact occurs. Armour-piercing shells have a fuse set in

Fuse. Diagrammatic sketch of radio-proximity fuse for A.A. shells

the base, so that the shell does not explode till it has penetrated the target. The fuse holds the firing pin back by a balance system and is set off by the sudden retardation of the projectile on impact.

A.A. shells and bombs have time fuses, actuated either by a train of powder or by a clockwork mechanism. A major development of the Second Great War was the variable time fuse operated by radar. This was a tiny broadcasting and receiving set which exploded by radio reflection over the heads of troops or near an enemy aircraft or vehicle. The L. delay fuse depended on the time for a piece of lead alloy to break when stretched by a spring; it could be arranged for one hour or one month. Magnetic fuses in mines are set off by the movement of a sensitive needle under the influence of a ship's magnetic field. The fuse of the acoustic mine is actuated by the noise of the ship's engines.

Bombs dropped from aircraft and intended to explode upon striking the ground have a fuse in the tail fin which is set off by the sudden retardation of the projectile on impact. The fuses are armed by the unscrewing of fins by the air-stream while the bomb is dropping. Delayed-action bombs have either chemical or clockwork fuses. (*See Ammunition; Detonating Fuse; Explosives; Shell; Shrapnel.*)

ELECTRIC FUSE. This is an important element in the transmission and distribution of electric current. In all practical systems for the distribution of power it is necessary to provide something in the nature of a relief which will operate when excessive local stress or pressure threatens danger to the system. In a steam, water, or air system this relief is provided by safety-valves, supplemented frequently for steam by fusible plugs.

In an electrical system the relief is mostly provided by fuses

which are designed to carry the ordinary amount of current in a particular circuit, and to melt and break the circuit automatically should the current become so great as to heat the other parts of the circuit beyond the limit of safety. Hence the fuse is made of such materials and dimensions that its resistance is greater than that of an equal length of any other part of the circuit, and in consequence it is always, when current is passing, at a higher temperature than the rest of the circuit, while, its melting point being low as compared with that of the other materials of the circuit, it is also ready to give way first.

The material used for fuses is generally tinned copper wire, but an alloy of tin and lead is sometimes used. The fuse should be so long that when it goes there will be no risk of the formation of an arc across the space formerly occupied by the fuse—the current must be completely broken. The material should be such that it melts quietly without throwing splashes of molten metal where they may ignite anything and thus give rise to a fire. Hence the fuse is usually fixed between two hard brass clamps secured on a small slab of porcelain. Frequently the fuse is enclosed bodily in a porce-

lain tube or case, while the space about it is packed with some non-conducting material which will effectually prevent the passage of a spark or the formation of an arc between the interrupted terminals when the fuse "blows."

Fuselage (Fr. *fuseau*, shuttle). Body of an aero-

plane, to which the mainplanes, tail-unit, undercarriage, etc., are attached. The body of a flying-boat is correctly called the hull.

Fuseli, HENRY (1741–1825). Anglo-Swiss painter. Born at Zürich, Feb. 7, 1741, and educated

Henry Fuseli, Anglo-Swiss painter

for the Church, he had to leave Zürich owing to the enmity of a public official whom he had exposed. He came to England in 1765, and secured the good offices of Sir Joshua Reynolds. On his advice Fuseli studied in Italy from 1770, and later returned to England. In 1782 he produced his gruesome and notorious picture, *The Nightmare*. Nine pictures for Boydell's Shakespeare gallery, and 47 for a Milton gallery of his own, were his other principal achievements. He became R.A. in 1790, lecturer on painting in 1799, and keeper in 1804. He died at Putney, April 16, 1825.

Fusel Oil or **AMYLIC ALCOHOL**. Volatile liquid present in the products of the alcoholic fermentation of saccharine liquids, especially those derived from potato starch. It is a complex liquid and varies according to the source of the alcohol, and the proportion obtained is influenced by the activity of the particular bacteria which form amylic alcohol. *See Alcohol.*

Fusibility. Name given to that physical property by virtue of which matter may be melted or rendered fluid if heated to a sufficiently high temperature under suitable conditions. It is solely due to this that objects can be cast in metal. While all the metals are fusible they melt at a range of temperatures, all the way from -39°C . (-38°F .), the melting point of solid mercury, to $1,773^{\circ}\text{C}$. ($3,223^{\circ}\text{F}$.), the approximate temperature at which platinum melts. At whatever temperature the melting takes place it is always accompanied by the absorption of heat which becomes "latent" and a change of volume. Usually this change is one of expansion, but bismuth, for example, contracts in volume on fusion. *See Liquation; Metal.*

Fusible Metals. Metal alloys which melt at comparatively low temperatures. Newton devised such an alloy. One composed of 15 parts bismuth, 8 lead, 4 tin, and 3 cadmium, known as Wood's

Fuse. 500-ampere fuse handle with adaptor plates and cartridge fuse. (Top right). 800-ampere fuse handle and base

metal, will melt at 155° F., and another (Rose's metal) composed of 8 parts bismuth, 8 lead, and 3 tin will melt at 203° F. Both these metals, therefore, will melt in boiling water. The "magic spoon" of the conjurer which melts in a cup of tea is made of such a metal. By varying the proportions of the constituents, alloys of tin and lead, or tin, lead, and bismuth, can be made which will melt at from 202° F. to 380° F. Some are used to make fusible plugs for steam boilers and electric kettles. These plugs, being inserted in the furnace plates of a boiler, will melt if the plate becomes dangerously overheated, and, by permitting the steam to escape, may prevent a serious accident. They are also of use in electrotyping on account of their property of expanding on cooling, and so giving clean-cut impressions of moulds. See Alloy.

Fusil (late Lat. *foecile*, steel for kindling fire). French term for the infantry magazine rifle, e.g. the *fusil Lebel*; also a light form of flint lock musket formerly used in the British army. In 1857 a sergeant's fusil was issued weighing 8 lb. 10½ oz. to fire the Enfield rifle ammunition, and in 1858 a smooth-bore fusil weighing 7 lb. 12½ oz. was issued to sergeants of native Indian regiments. The original was the *fusil mousquet* of Vauban. The *fusil mitrailleur* was a Belgian and Czechoslovak machine-gun. It was air-cooled and charger-fed. See Firearms; Flint Lock; Matchlock.

Fusil. In heraldry, an elongated lozenge. A fusil may be pierced. A shield divided by diagonal lines crossing each other so as to form acute pointed lozenges is said to be "fusily." See Lozenge.

Fusilier. Formerly the designation of special bodies of troops equipped with a fusil or light flint lock musket at a time when the matchlock was the standard military firearm. It is now only the distinctive regimental name of certain corps of infantry who are armed exactly the same as infantry of the line, though some battalions in the Second Great War provided machine-gun support companies, which were divisional troops.

The first mention of fusiliers occurs about 1643, when they were organized as companies during the Thirty Years' War. They were mounted, and differed only from the carabiniers in that they were armed with the flint lock musket. Following the lead set by France, various European armies introduced these troops of fusiliers between 1670 and 1680 to act as an

escort for the artillerymen, who were hired by contract for the campaign, an escort being considered desirable not only to protect them from hostile attack, but also to keep a close watch on them in case of treachery. As the cannon were served with loose powder from open barrels, it was not safe for the escort to be armed with muskets requiring the use of burning match; consequently the fusiliers were detailed for this duty.

General adoption of the flint lock musket made unnecessary the use of special troops as artillery escort, and, owing to the fusiliers having become accustomed to act as independent units, the regiments were largely employed as light infantry and not as line troops. The fusiliers were regarded as *corps d'élite* and the lowest commissioned rank was second lieutenant, the junior of whom took precedence of all ensigns; but at present they enjoy no privileges other than those of the infantry.

The senior fusilier regiment of the British army is the Royal Fusiliers (City of London Regiment), formed in 1685. The Scots Fusilier Guards relinquished the title fusiliers in 1877 and became the Scots Guards. Other famous British regiments of fusiliers are the Northumberland, Lancashire, Royal Scots, Royal Welsh, Royal Inniskilling, and Royal Irish. Distinctive of the full dress uniform of British fusilier regiments was the busby or fur cap.

Fusion (Lat. *fusio*). Term referring to the change of state from solid to liquid, i.e. liquefaction or melting of a substance. The temperature T_m , at which the transformation takes place is known as the melting point; this is well defined for a crystalline material, but less definite for glass or pitch. The melting point, in contrast to the boiling point, shows a slight variation with pressure.

The amount of heat required to be imparted to unit mass of the solid to transform it into the liquid phase at the melting point is known as the latent heat of fusion, L_m . A knowledge of this latent heat gives directly the difference in the internal energy of the substance in the liquid and solid phases, and the ratio $\frac{L_m}{T_m}$ gives the entropy of fusion. In metals the value of L_m is only 3 or 4 p.c. of the latent heat of vaporisation, whereas in molecular substances it may exceed 20 p.c. See Freezing Point; Melting Point.

Füssen. Town and health resort of Germany, in Bavaria. It is on the left bank of the Lech, 56 m. S. of Augsburg. It dates from an early period, the Benedictine abbey of S. Magnus, it is said, having been founded here in 629, and was a town by 1300. Its principal centre of interest is the 15th century castle of the bishops of Augsburg, which stands on an eminence overlooking the town. A treaty during the War of the Austrian Succession was signed here in 1745. The church of S. Magnus, dating from 1701, was constructed on an older foundation, a Romanesque crypt. Near by is the Calvarienberg (3,130 ft.). Pop. 6,315.

Fust or **FAUST**, JOHANN (d. 1466). German printer. With Johann Gutenberg, and Gutenberg's

Johann Fust,
German printer
From a print

son-in-law, Peter Schoeffer, Fust, who is not to be confounded with the Faust of German legend, was prominent in the introduction of typographical printing in Germany.

He was a wealthy goldsmith of Mainz, and financed Gutenberg's printing office there. He foreclosed on a mortgage and carried on the business with Schoeffer, one of the masterpieces of this partnership being a Latin Psalter, 1457, whose initial letters were printed in red and blue. Fust died in Paris of the plague.

Fustel de Coulanges, NUMA DENTIS (1830–89). French historian. Born March 18, 1830, and educated in Paris, he studied for a time in Greece and then returned to France to teach and study history. During 1860–70 he was professor at Strasbourg; after 1870 he lectured in Paris, in 1878 he was made professor of medieval history at the Sorbonne, and from 1880 until his death, Sept. 12, 1889, was director of the École Normale. Fustel was probably the most able and certainly the most uncompromising of historians who combated the theory that the early institutions of France were mainly of Teutonic origin. In six volumes he showed how the influence of Rome survived there, and how the Teutonic invaders did little more than fall under it. Fustel's best-known work, however, is *La Cité Antique*, 1864, which claims that religion

was the chief force in the development of the ancient states of Greece and Italy.

Fustian. Thick short-piled cotton fabric, mostly used for workmen's clothes. The term is applied to clothes of the nature of velvet, e.g. velveteen, moleskin, and corduroy. The early fustians seem to have been made of cotton or of cotton weft and linen warp. The manufacture of fustian was apparently introduced into England in the 14th century by the Flemings, the first English-made fustians being woollen. Spain and Italy were noted for their fustians those made at Naples becoming so popular as to be specially described as fustian of Naples, a term which became corrupted into such strange forms as fustian anapes, fustian and apes, fustianapes, and fustianapes. The name fustian is said to come from Postat, near Cairo, where the stuff was made. Rum fustian is an old Oxford university "night-cap," a kind of egg flip. The use of the word for pompous or unseasonably lofty language is due to the idea of stuffing or padding.

Fustic. Name given to two yellow dye materials known respectively as old fustic, obtained from the wood of *Maclura tinctoria*, and young fustic from *Rhus cotinus*. Both plants are grown in the West Indies, but young fustic is also found in S. Europe. The colouring matters from young fustic are called fustin and fisetin, whilst those from *Maclura tinctoria* are morin and maclurin. In wool dyeing fustic is a natural yellow dye.

Fusulina Beds. In geology, great thicknesses of limestone, made up to a great extent of fossil remains of chambered shells of Foraminifera, including species of *Fusulina*. They are well developed in carboniferous rocks of Russia and the Ural Mts., and in Japan, China, and N. America.

Futa Jallon or FOUTA DJALLON. Region of French W. Africa, forming the N.W. portion of French Guinea. Area, 42,000 sq. m. It is a mountainous country, rising in parts to over 5,000 ft., with fertile valleys, containing the head-streams of the Gambia, Senegal, and Niger rivers. Cattle, sheep, and horses are raised in large numbers, and cereals, coffee, and cotton are produced. The rly. from Kankan, on the Milo tributary of the Niger, and Karussa on the Niger, to the port of Konakry, touches Timbo, the capital, in the S. part of the territory. The inhabitants are Muslim Fulas,

Futurism. *La Modiste (the dressmaker)*, a Futurist painting by Gino Severini, exhibited at Paris in 1912

who settled here in the 16th century. See Guinea, French.

Futures. Business term for goods to be shipped at some future time. Merchants and others speculated in futures, especially of corn, cotton, hops, etc., variations in freight rates and in market conditions generally providing an ample gambling element. The word was confined in practice to foreign produce.

Futurism. Name given to an art movement which originated at Turin in 1910. It owed its inception mainly to F. T. Marinetti, the Italian poet. It preached the renovation of Italian art, declaring that art could live only by its emancipation from the past. It repudiated tradition, academic training, museums, picture galleries, the art of previous ages, and other similar "fetters" on art progress. In literature, experiments were made by Marinetti and others to convey emotions directly to the reader's eye by the use of varying types, suggestive arrangements of spacing and lines, and other devices. An account of scenes in the Balkan Wars, 1912-13, was written by Marinetti and read to an accompaniment of drums, crashing metal instruments, etc. Futurism tried to introduce into the art of painting a "poetry of motion," whereby, for example, the painted gesture should cease to be a fixed momentary thing

and become actually "a dynamic condition." The weakness of the proposition lies in the fact that kinetics cannot be realized by static qualities. Successive scenes witnessed, for instance, from a train in motion were depicted on a canvas as though they had been simultaneous, the result being confusion. This aim was further complicated by a sort of psychological bias which was expressed in the Futurists' effort to indicate, in the painting of a scene, not only the state of mind of the painter but also that of the person or persons

depicted in the picture.

A picture, according to the Futurist manifesto, "must be a synthesis of what one remembers and what one sees." Thus a Futurist would paint not only what he saw before him, but would combine with it the recollection of previous scenes which lingered in his mind, and also attempt to give, in the same picture, some idea of the sitter's sensations. These sensations were to be represented by "force lines and rhythms." Objects and personages were to be studied from all sides so that all aspects of things, visible and invisible, front and back, should be painted in a picture. The results were frequently ludicrous.

Original Futurists included Marinetti and the Italian painters Boccioni, Carra, Russolo, Balla, and Severini. Their first exhibition was held in 1911 in Paris, whence it was transferred to London. In the light of subsequent events it was clear that Futurism possessed to a considerable degree some of the prophetic marks of fascism. In Italy the movement emerged with a political as well as an aesthetic creed, and was the manifestation of a bombastic worship of the machine and brute force. See Cubism.

Fuyong. Chinese dish of egg served in the form of an omelette and suitably garnished with various mixed vegetables.

Fyen or **FÜNEN**. Island of the Baltic Sea, forming part of Denmark. It lies between Jutland and Zealand, ranking next to the latter in size, and is separated from Slesvig by the Little Belt, and bounded E. by the Great Belt. Length, 52 m. by 42 wide; area, 1,133 sq. m. Mostly flat, and much indented, it rises in the S.W. to some 400 ft. Well watered by the Odense and other streams, it is very fertile, producing fruits, cereals, flax, hemp, timber, cattle, and horses. The chief towns are Odense (*q.v.*), the capital, Svendborg, and Nyborg. Fyen was occupied by German troops on April 9, 1940, when Denmark was invaded during the Second Great War. It was a centre of resistance until the liberation on May 8, 1945. The Gestapo headquarters at Odense was destroyed by the R.A.F. on April 17, 1945.

Fyfe, Sir David Patrick Maxwell (b. 1900). British lawyer and politician. He was educated at George Watson's College, Edinburgh, and Balliol College, Oxford, and was called to the bar in 1922. Having practised on the northern circuit, he took silk in 1936 and was recorder of Oldham, 1936-42. From 1935 he was Conservative M.P. for the W. Derby division of Liverpool. Solicitor-general 1942-45, and, attorney-general May-July, 1945. Fyfe was British acting chief prosecutor of the international military tribunal that tried the major war criminals at Nuremberg, presenting the case against Ribbentrop. Knighted in 1942, he was made a privy councillor in 1945.

Fyfe, Henry Hamilton (b. 1869). A British journalist and author. Son of a barrister, he was born in London Sept. 28, 1869, and educated at Fettes. After varied work with *The Times*, he edited the *Morning Advertiser*, 1902-03 and the *Daily Mirror*, 1903-05. He was special correspondent of the *Daily Mail* all over the world from 1907 to 1918, and also wrote the Amiens dispatch in *The Times* which gave first news of the reverse at Mons, Aug., 1914. In July, 1918, he took charge of British propaganda in Germany. Under his editorship, 1922-26, the *Daily Herald* substantially increased its circulation. His first book, *A Player's Tragedy*, appeared in 1894; later came biographies of Northcliffe, 1930, and T. P. O'Connor, 1934; *Revolt of Women*, 1933; *My Seven Selves*, 1936; *Britain's Wartime Revolution*, 1944; *60 Years of Fleet Street*, 1949. His best-

known play was *The Kingdom, the Power, and the Glory*, 1920.

Fyfe, Sir William (Hamilton) (b. 1878). British educationist. Born July 9, 1878, he was the younger brother of H. Hamilton Fyfe (*v.s.*). Educated at Fettes and Merton College, Oxford, he was headmaster of Christ's Hospital, 1919-1930; principal and vice-chancellor of Queen's university, Kingston, Ont., 1930-36, becoming principal and vice-chancellor of the university of Aberdeen in 1936. He was chairman of the Scottish advisory council on education, 1942-46, and a member of the Scottish advisory council on the rehabilitation of offenders. His publications included translations of the histories and minor works of Tacitus, and Aristotle's *Art of Poetry*. He was knighted in 1942.

Fyfe, Will (1887-1947). Scots variety artist. He first appeared on the stage at the age of six in a company managed by his father. His reputation grew as a comedian in the Harry Lauder tradition, and his impersonations of a ship's engineer and a Scottish centenarian were popular music hall sketches. Entering films, usually as a character actor, in the 1930s, he was in *Annie Laurie*, 1936; *Owd Bob*, 1938; *Rulers of the Sea*, 1940; *The Brothers*, 1947. He died Dec. 14, 1947.

Fylde. Name given to the district in Lancashire between the estuaries of the rivers Wyre and Ribble. It is a flat area devoted mainly to agriculture, but Fleetwood, Blackpool, and Lytham St. Annes stand on it.

Fylfot. In heraldry, the cross gammadion, or crampooned cross. It is celebrated in occult science,

and is a modification of the extremely ancient Oriental Swastika (*q.v.*). Each limb is terminated by a crutch-like protrusion to the right. This

is the lucky or beneficent fylfot; if the projections are reversed it is a "black" or evil sign. The word is probably a corruption of fill-foot, as a row of "fylfots" was used to fill a space at the bottom of a painted window.

Fyne. Sea loch of Argyllshire, Scotland. It extends S.W. and S. for 40 m. from above Inveraray to its mouth at the Sound of Bute, with a breadth of from 1 m. to 5 m. Its arms are E. Loch Tarbert (with Tarbert village), Loch Gilp (with

Lochgilthead, Ardrishaig, and the Crinan Canal), Loch Gair, and Loch Shira.

Fyrd (A.S., army). Name given to the army, or rather militia, of England in Anglo-Saxon times. It is first mentioned in the Anglo-Saxon Chronicle as existing about 600, and consisted apparently of all able-bodied men. They were called out in times of danger by the shireman or sheriff, each shire having its own fyrd. In the 7th century laws laid down penalties for neglecting this duty. Called fyrdwite, the fines varied, according to the rank of the offender, from forfeiture of his land to a moderate fine.

The fyrd was reorganized by Alfred the Great and was used to fight the Danish invaders. It survived the Norman Conquest, but was not used abroad, the idea that it was a defensive force only being very strong. It did good work at the battle of the Standard and in other fights against the Scots and Welsh, but from about the time of Edward I its place was taken by commissions of array and the militia. See *Militia*.

Fyt, Jan (1609-61). Flemish painter. Born March 7, 1609, at Antwerp, where he also died, he studied under Jan van Berch. He achieved renown as an animal painter and was employed by Rubens, Jordaens, and De Crayer to introduce animals, especially dogs, into their pictures. Most European galleries contain examples of his art.

Fytton, Mary (c. 1578-1647). English maid of honour. Except that she was grand-daughter of Sir Edward Fytton, and one of an English family long associated with Gawsorth, Cheshire, little is known of her life. She became maid of honour to Queen Elizabeth about 1595, but, after a liaison with the earl of Pembroke, was dismissed the court. She has been identified, without much historical justification, with Shakespeare's "dark lady" of the sonnets.

Fyvie. Village of Aberdeenshire, Scotland. It is on the Ythan, 31 m. by railway N.N.W. of Aberdeen. The castle, once a royal mansion and then a home of the Gordons, was restored by Lord Leith of Fyvie (1847-1925) and has five towers. Traces exist of earthworks constructed by Montrose in his winter campaign of 1644. Consult *Fyvie Castle*, A. M. W. Stirling, 1928.

Fyzabad. This is another spelling of Faizabad (*q.v.*), city of the United Provinces, India.

Fylfot in heraldry

THE hard guttural sound associated with the letter G was represented in the ancient Semitic and Greek alphabets by the third letter, gimel or gamma, which evolved into the Latin C. But Latin practice began to extend the pronunciation of C by softening the guttural to the sound of K; and to avoid confusion a new letter was invented to represent the hard guttural, a modification of C—in its earliest recognizable form G (700-600 B.C.).

Of more interest is the unusual elaboration of the Latin minuscule. Uncial scripts of the 6th and 7th centuries gave *G* or *G*, and these soon developed into a cursive *G* form in which the upper loop became a complete circle

thus: *G*. This form became standardised in Carolingian writing as *G*. Other cursive minuscules had developed meanwhile, including various flat-headed, rather than round-headed, forms, not unlike the numerals 5 or 3, these being the only minuscule forms in use in England before the Norman conquest. The round-headed minuscule, *G*, introduced from the Continent in the 12th century, was used through the Middle English period, representing the sound of the modern hard *g*, while the flat-headed *3* represented the soft *j* sound introduced by the Normans, and (occasionally) the sound of a *y*. The modern printer's *g* is a recognizable derivation from both forms.

G Seventh letter of the English and Latin alphabets.

It is a soft guttural or throat sound, the corresponding hard letter being *k* (c). It was a later addition to the Latin alphabet, being a modified form of *C*, which had hitherto done duty for the sounds of both *C* and *G*. In English it has two sounds, the one hard, as in *gate*, the other soft, mostly before *e*, *i*, and *y*, as in *gender*, *ginger*, *Egypt*. In the word *gaol* also it is pronounced as *j*. Before *n* it is mute, as in *gnat*, *reign*; and may lengthen the preceding vowel as in *resign*. The combination *gh*, when initial, corresponds to the first value of *g*, as in *ghost*; when medial, it is mute, as in *brought*, and sometimes when final, as in *bough*, though it often has the sound of *f* as in *rough*, *enough*. See Alphabet; C; Phonetics.

G. Fifth note of the major scale of *C*. It is a perfect fifth above *C*, and is known as the dominant of the key of *C*.

The treble clef sign was originally a form of the letter *G* and gives the name *G* to the line of the musical staff round which its central curl passes. See Clef; Stave.

Gabbro. Basic igneous rock, somewhat similar in texture to granite, with a speckled or mottled appearance. Gabbro consists usually of plagioclase feldspar, augite (*q.v.*), and often olivine (*q.v.*), while many common varieties have varying proportions of iron- and magnesium-rich minerals. In the Inner Hebrides, Sweden, Norway, and Canada these rocks are common.

Gabelle. French word for an indirect tax, in ordinary use confined to the tax on salt. Salt was a state monopoly, and almost from its imposition before 1300 to the Revolution the tax on it was most oppressive, every family being compelled to purchase a weekly

minimum of salt. Its incidence varied from province to province; one or two were exempt from the burden. In the others the price of salt was fixed by royal officials. At one period the prisons of Normandy were filled with persons unable to pay this imposition. One of the grievances which contributed to the Revolution, it was abolished in 1790.

Gaberdine OR GABARDINE (Span. *gabardina*, smock, coarse frock). Loose garment, usually of

Gaberdine, as worn by Jews

rough, dark material, reaching to the ankles and girt with a cord. It was worn in the Middle Ages by pilgrims and mendicants, in which connexion the Scots word *gaberlunzie*, a beggar, is noteworthy, and came to be identified chiefly with the Jews, who wore flowing robes of this type. The gaberdine was probably never a compulsory dress for the Jews. The name is now applied to fine cotton fabrics in close twill weave, used for raincoats.

Gabès. Port and military station of Tunisia. On the Gulf of Gabès, it is the ancient Tacape. It is 205 m. by rly. S. of Tunis and 90 m. by rly. S.S.W. of Sfax. The surrounding country is semi-desert. W. of Gabès are salt lakes or *shats*, extending for nearly 250 m. to within 50 m. of Biskra. There is trade in dates, oil, hides, and henna. Gabès was occupied by N.Z. troops of the British 8th army, March 29, 1943, the Germans and Italians retreating towards Sfax. Pop. 18,611.

Gable (old Fr., *fork*). Pointed or nearly pointed termination of a

roof in the Gothic style. In classical architecture the gable is known as a pediment. The simplest form of gable is the triangular. This came into vogue in the Middle Ages, as a result of the high-pitched roof, and, indirectly, of the vault which required such a roof. As Gothic tended towards luxuriance in detail, the severe triangular gable was enriched with ornaments such as the crocket (*q.v.*) and the finial (*q.v.*), and in the 16th century, the transitional period of British architecture, the sides were formed in a succession of short curves. The latter form was adopted in the Netherlands, and is popularly known as the Dutch gable. The main façade of Holland House, Kensington, built early in the 17th century, was surmounted by a succession of these gables, consisting of two curves divided by a rectangular step on each side.

In another variety the sides are formed by a sequence of rectangular steps, known as corbie-steps (*q.v.*). When, as in the timber, or half timber, buildings of the 16th century, the gable projected some distance over the wall, the edge or verge was ornamented with a barge-board. When the "hipped" roof, i.e. the roof made to slope back from all sides, was introduced in the latter part of the 17th century, the gable ceased to exist except in farmhouses and buildings in which the older architecture still persisted. See Architecture; House; Barge-board illus.

Gable. Example from an old house in Salisbury, c. 1360

Gable, CLARK (b. 1901). American film actor. Born at Cadiz, Ohio, Feb. 1, 1901, he was educated at Akron university, and later joined a repertory company. He began his screen career at the end of the 1920s, being placed under contract with M.G.M. studios.

Clark Gable,
American film actor

His assertive personality, rugged appearance, and emotional range of acting made him a Hollywood star. Films in which he played leading parts included *The Painted Desert*, 1931; *A Free Soul*, 1932; *It Happened One Night*, 1934; *Mutiny on the Bounty*, 1936; *Parnell*, 1937; *Test Pilot*, 1938; *Idiot's Delight*, 1939; *Gone With the Wind*, 1941; *Adventure*, 1946; *Any Number Can Play*, 1949. During the Second Great War he joined the U.S.A.A.F.

Gablouz (Czech Jablonec). A town of Czechoslovakia, in Bohemia. Situated on the Neisse, 7 m. E.S.E. of Reichenberg, it is a manufacturing centre. Under the Austrian regime before 1914, Gablouz was the headquarters of an administrative division of the same name. Part of the Sudetenland region, it was annexed by Hitler in 1938. Pop. 33,855.

Gaboriau, ÉMILE (1833-73). French novelist. He was born at Saujon, Charente-Inférieure, Nov. 9, 1833. An acknowledged master of detective fiction, his clever story *L'Affaire Lerouge*, 1866, brought him instant fame. This was followed in rapid succession by *Le Dossier No. 113*, 1867; *Le Crime d'Orcival*, 1867; and other novels of the same type, which, though or slight literary value, hold the attention by their skilfully woven plots and abundance of sensational incident. He attained a European reputation as the originator of this type of detective fiction. Much of his work has been translated into English. He died Sept. 28, 1873. See *Detective Fiction*.

Gabriel (Heb. man of God). Name in Biblical and post-Biblical literature of one of the seven archangels. He was sent to Daniel to explain the vision of the ram and the he-goat (Dan. 8), and again to instruct him as to the "seventy weeks" (chap. 9). In the N.T. he is the divine messenger who predicts to Zacharias the birth of a

son to Elizabeth (Luke 1, vv. 8-20), and to the Virgin Mary the birth of the Saviour (vv. 26-38).

Gabun, GABON, OR GABOON. Colony in French Equatorial Africa. It lies to the S. of Cameroons, and is bounded W. by the Atlantic Ocean, E. by the French Middle Congo colony, and S. by the Belgian Congo and the Portuguese enclave of Cabinda. French occupation commenced in the estuary of the Gabun river in 1841, and in 1849 the settlement of Libreville was formed as a place of refuge for escaped slaves.

French influence gradually extended along the coast and into the interior, largely through the efforts of de Brazza and of French missions. In 1884 France took possession of the entire coastal region between Libreville and Brazzaville. In 1894 the boundaries between Cameroons colony and the French Congo regions were determined, but in 1911 Germany demanded, and received, as compensation for her recognition of the position of France in Morocco, a block of territory, the greater portion of which was taken from the Middle Congo and Ubangi-Shari-Chad colonies.

The present area of the Gabun colony is 93,219 sq. m. It is administered by a governor, aided by administrative council, subject to the governor-general of French Equatorial Africa, and contains vast forests and a large variety of tropical products, including rubber, palm kernels, and cocoa. There are rlys. from Brazzaville, the chief town of the Middle Congo to the W. coast and from Libreville, inland to Njole. Despite the lack of rly. communication there is a considerable trade along the rivers and through the ports of Libreville, the capital, Cape Lopez, Sette Gama, Mayumba, and Loango. The climate of the colony is unhealthy in the coastal regions, sleeping sickness prevailing, but comparatively healthy in the elevated interior. Pop. 384,000 (1,715 of whom are Europeans).

Following the Franco-German armistice of June, 1940, Gabun adhered to the Vichy government. On Oct. 27 Free French troops, under Gen. de Larminat, advanced on Lambarène which fell on Nov. 6. Libreville surrendered five days later; and Port Gentil, the last Vichy stronghold, on Nov. 12.

Gad. Seventh son of Jacob, by Zilpah the handmaid of his wife Leah (Gen. 30, vv. 10, 11). He had seven sons at the time he went down to Egypt with his father and brothers. Gad is also

the name of a prophet who acted as a counsellor to David (2 Sam. 24 v. 11; 2 Chron. 29, v. 25), and wrote a history of his reign (1 Chron. 29, v. 29); and of an Oriental divinity, regarded as the bringer of good fortune.

Gadag. Town and subdivision of Bombay, India, in the dist. of Dharwar. The area of the subdivision is 699 sq. m. Gadag (or Bettigiri) town trades in cotton and silk, and contains remains of temples. Pop. 56,283.

Gadara. An ancient town of Palestine, included in the Decapolis. It stands among the hills on the E. side of the Jordan, 6 m. S.E. of the Sea of Galilee. Founded by Greeks, it was captured by Antiochus III, 218 B.C., and by Alexander Jannaeus, 100 B.C.; when it was nearly destroyed. Pompey rebuilt it about 65-63 B.C. and it became friendly to Rome. It suffered from Jewish aggression in A.D. 66-70, but flourished thereafter until the Mahomedan conquest. It is mentioned in Mark 5, in connexion with the Gadarene swine. Extensive ruins include remains of two theatres, and a colonnade; the tombs in the neighbouring cemetery are remarkable.

Gaddi, TADDEO (c. 1300-66). Italian painter. Born in Florence, he studied first under his father, Gaddo Gaddi, and under his godfather, Giotto. Few of his works survive. An altarpiece, *The Virgin and Child*, was in Berlin, and his fresco, *The Last Supper*, in the church of Santa Croce in Florence. The *Triumph of S. Thomas Aquinas* in Santa Maria Novella, Florence, attributed to him, has been ascribed to a Siennese painter. Deeply imbued with the spirit of Giotto, Gaddi maintained that master's tradition in painting.

Agnolo Gaddi (b. c. 1330), son and pupil of Taddeo, painted frescoes, e.g. at Holy Cross church, Florence: also altarpieces.

Gade, NIELS WILHELM (1817-90). Danish composer. Born at Copenhagen, Feb. 22, 1817, he became a violinist in the royal orchestra. In 1840 his overture *Nachklänge aus Ossian* brought him into notice as a composer. He assisted Mendelssohn in conducting the Gewandhaus concerts at Leipzig, but in 1848 returned to Copenhagen and devoted himself to composition and conducting, being *Kapellmeister* (director of the court orchestra), and professor and director of the musical union. He died Dec. 21, 1890. Gade's compositions include orchestral and chamber music, and cantatas.

Gad Fly. Name given to members of two groups of flies that harass cattle in summer, causing them to run wildly about the pastures. It is most often applied to the horse fly (*q.v.*) which pricks the animals with its piercing proboscis in order to suck blood. Sometimes it is used for the warble fly (*q.v.*), which is not blood-sucking, but alarms the cattle by its buzz when on the wing.

Gadolinite. A silicate of beryllium, iron, and yttrium ($\text{Be}_2\text{FeY}_2\text{Si}_2\text{O}_{10}$), which may contain appreciable cerium. It is a greenish black mineral principally found in massive or prismatic crystal form in pegmatite veins, often associated with other minerals containing rare elements, such as allanite, yttrialite, etc. It was investigated by J. Gadolin, Swedish chemist, in 1794. See Rare Earths; Yttrium.

Gadolinium. A chemical element (Gd), one of the terbium family of rare earths, moderately soluble in a saturated solution of potassium sulphate. J. C. G. de Marignac in 1859 announced that he had isolated a new earth from the mineral samarskite by fractional precipitation with potassium sulphate. Since then workers have prepared its salts by fractional crystallisation of double nitrates. The element is also found in gadolinite and orthite. It has the atomic number 64, and atomic weight 157.3. The oxide gadolinia, Gd_2O_3 , is white and hygroscopic. Gadolinium forms a hydroxide, halides, oxyhalides, a sulphate, carbonate, and nitrate. As with cerium and neodymium, the metal can be prepared from the alloy with magnesium by the action of excess molten magnesium on molten gadolinium chloride, or by distillation from the electrolytically prepared alloy with cadmium.

Gadow, HANS FRIEDRICH (1855-1928). Anglo-German zoologist. Born in Pomerania, March 8, 1855, he was educated at Frankfurt-on-Oder and at the universities of Berlin, Jena, and Heidelberg. He settled in England, became naturalised, and in 1880 secured an appointment in the natural history department of the British Museum. He left that in 1882 and in 1884 was made Strickland curator and lecturer on zoology at Cambridge. Gadow's works include a Classification of Vertebrata, 1898; Amphibia and Reptiles, in The Cambridge Natural History, 1901; and, together with A. Newton, A Dictionary of Birds, 1893-96. He died May 16, 1928.

Gadsden. A city of Alabama, U.S.A., the co. seat of Etowah co. It stands on the Coosa river, 65 m. N.E. of Birmingham, and is served by the Southern and other rlys. Gadsden is situated in a coal and iron region and in the centre of farming land, producing cotton, maize, grain, and poultry. Lumber, red clay, and limestone are found in the vicinity. The city makes iron and steel products, stoves, pipes, furniture, bricks, and textiles. Pop. 36,975.

Gadsden Purchase. THE. Name given to territory which the U.S.A. obtained from Mexico in 1854. The sale was negotiated by James Gadsden, U.S. minister to Mexico, and amounted to 45,535 sq. m. This is now part of New Mexico and part of Arizona, being the region bounded by the Gila, Rio Grande, and the Colorado river. The price paid was £2,500,000.

Gad's Hill. Village of Kent, England, famous as the residence of Charles Dickens. It is 2 m. from Rochester, on the road to Gravesend. The home of the novelist was Gad's Hill Place (see Dickens illus.), a red brick house almost opposite the Sir John Falstaff inn. Shakespeare (I Henry IV) places the episode in which Falstaff robs the travellers and is then robbed by Prince Hal and Poins at Gadshill, which is also used as the name of a character in the same play.

Gadwall (*Anas strepera*). Species of duck found in many parts of Europe, Asia, Africa, and North America. It is rare in Great Britain, except in Norfolk, where it is protected, and breeds in fair numbers. It resembles the common mallard. See Duck; Mallard.

Gaea or **Ge.** In Greek mythology, the earth goddess. The daughter of Chaos, she was the mother of Uranus (Heaven), and Pontus (Sea), and by the former of the Titans. She represented the productive power of earth, bringing forth from her bosom and nourishing all living things. Her Roman counterpart, Tellus, was associated with a male divinity, Tellumo.

Gaekwar. Title borne by former rulers of Baroda, India. In reality it is the family name of the house that governed this state from the early part of the 18th century. The word is derived from a native word meaning a cow. The gaekwar Pratap Singh (b. 1908) succeeded his grandfather, Feb. 6, 1939. See Baroda.

Gael. Name applied to the members of the Gaelic branch of the Celtic race, and especially to the Celtic people of the Scottish Highlands. The word in Gaelic itself is *Gaidheal*, pron. approximately gale, and in an earlier form was *Goidel*; contrary to old belief, it is unconnected with Gaul, or Lat. *Galli*, Gauls. See Celt.

GAELIC LANGUAGE & LITERATURE

Magnus MacLean, Author of The Literature of the Celts

There are articles on the various languages akin to Gaelic, e.g. Breton; Erse. See also Celt; Philology; Wales

Gaelic, the language of the Gael, belongs to the European branch of the Indo-European family. Philology classifies the languages of the European branch into: (1) Greek, Latin, and Celtic in the middle and S. of Europe; (2) English, German, and Norse in the N.; and (3) Russian and Old Prussian in the E. In Greek and Roman times the Celts occupied the middle of Europe and their language has closer affinities with Greek and Latin than with English, German, or Norse.

Celtic itself now stands as the name for two groups of dialects distinct from each other, but closely related—the Gadhelic and Brythonic, the former comprising Irish, Manx, and Scottish Gaelic; and the latter, Welsh, Cornish, and Breton. They are also known as the Q and P groups in accordance with a well-marked linguistic dis-

tinction which differentiates them. Though Irish, Manx, and Scottish-Gaelic are all derived from the ancient Gaelic, the original name is now almost exclusively restricted to the Gaelic spoken in the Scottish Highlands.

For three centuries, from the 5th onwards, the language and literature of Gaelic Ireland and Gaelic Scotland were virtually the same. The Gaels had come from Ireland into Scotland. But after the Norsemen began their raids, intercourse between the two countries was interrupted, and this in time, under Pictish and Norse influences, led to a divergence in the speech—a process which the Reformation accentuated, so that Irish and Gaelic are now separate dialects.

The beginnings of Gaelic literature date back to the 5th century A.D. But even before then, in pagan times, there existed the materials

for its most characteristic productions. There were the rich and abundant Sagas, or prose romances transmitted by oral tradition. What is known as the Heroic cycle, about the opening of the Christian era, was really the golden age of Gaelic romance. Before this there had been a mythological cycle, and after, the Ossianic cycle (3rd century A.D.), the hero of which has continued to inspire the classic poetry of the Gael down to the modern days.

The first cycle deals with ancient myths; the second with the famous Cuchullin romances, greatest of which is the *Tain Bo Chualgne*; the third with the tales of Fionn, his son Ossian, and the Fianna. The earliest records of them are to be found in the great Middle Age MSS., *Leabhar na h'Uidhre*, and the Books of Leinster, Ballymote, Lecain, and Lismore. The most valuable document in Gaelic literature is this

Gaelic. Facsimile of a passage from the Book of Leinster, a 12th century manuscript in Trinity College, Dublin. These lines tell of the hunting of a dangerous boar at Lough Con, in co. Mayo, by the dogs of Manannan mac Lir, and the hounds from Moa, now Clew Bay islands

Leabhar na h'Uidhre. Like its famous contemporary, the *Liber Hymnorum*, a book of ancient Latin and Gaelic hymns, it belongs to the 11th century, and is a compilation from earlier books now lost. It is the oldest exclusively Gaelic MS. in existence.

At the dawn of letters among the Gael, S. Patrick figures as the author of two letters in Latin, the *Epistola ad Coroticum*; and a *lorica*, or hymn, in Gaelic, still extant, popularly known as S. Patrick's Breastplate. After him S. Columba and his followers inaugurated a period of great literary activity, which continued for two centuries. They wrote in Latin and Gaelic, using the Roman script and the Roman alphabet. With great assiduity they made Latin copies of books of the Bible, some of them beautifully decorated and illuminated. They also wrote hymns and lyrical poems having nature for their theme. Many of these, including S. Patrick's and S. Columba's, are in the *Liber Hymnorum*.

During this early period the Gaels gave to the Continent evangelists and professors, who founded monasteries and wrote books. In later times others fled thither from the Norse, carrying their MS. treasures. As a result, most of the early documents are in France, Italy, Switzerland, Holland, Belgium, and Germany. In all, excluding scores of Latin ones, there are 56 Gaelic MSS. abroad, of dates ranging from the 8th to the 19th century—the oldest at Milan and Cambrai. These also are Latin books, but they contain Gaelic glosses, poems, or other jottings of great interest. M. H. d'Arbois de Jubainville, in 1881, catalogued the MSS. in England, Ireland, and on the Continent, and Prof. MacKinnon did the same for those in Scotland. The latter are deposited in the Advocates' Library, the universities of Edinburgh and Glasgow, and the library of the Society of Antiquaries.

The two oldest books of Gaelic Scotland now extant are Adamnan's *Vita Columbae* in Schaffhausen, and the Book of Deer, 9th century, with Scottish Gaelic entries of 10th to 12th, in Cambridge. After the latter comes the Book of the Dean of Lismore, containing a collection of pre-Reformation Gaelic poetry taken down from 1512 to 1526 in Argyllshire. It has pieces from 56 authors, 11,000 lines, 800 Ossianic. Similarly the *Fernaig MS.* (Ross-shire, c. 1688-93, and the Books of Clanranald (Inverness-shire) represent the literary output of the 17th century.

From 1600 Scottish Gaels led the way in a great change which transformed the poetry of both Ireland and Scotland. Hitherto most of it had been Ossianic and in the ancient style. Mary Macleod was the first of the modern Highland bards to break away from the older order. She invented rhythms of her own, and from her time a great variety of new and melodious metres appear. John Macdonald and some others followed, and then came the golden age of Gaelic poetry around the Forty-five—a quick and splendid succession of bards. In the fifty years after Culloden are grouped nearly all the greater names of Highland poetry; among the many, Alexander Macdonald, John Mac-

Codrum, Duncan Ban Macintyre, Dugald Buchanan, Robb Donn, James Macpherson, and William Ross. Greatest of all were Macdonald and Macintyre, their descriptive powers being unique. The *Birlinn Chlann Raonuill* of the one, and the *Coire Cheathaich* and *Ben Dorain* of the other, rank as the masterpieces of Gaelic poetry.

The 19th century produced a succession of new bards, gifted, and of a high order, from MacLachlan, Livingston, and Maccoll on to Neil Macleod. It also furnished books of the choicest selections of Highland literature: John MacKenzie's *Beauties of Gaelic Poetry*, 1841; J. F. Campbell's *Popular Tales of the West Highlands*, 1860-62; and *Leabhar na Feinne*, 1872; Archibald Sinclair's *The Gaelic Songster*, 1879; Alex Cameron's *Reliquiae Celticae*, 1892-94; and Alexander Carmichael's *Carmina Gadelica*, 1900.

Gaelic poetry is mainly lyrical. There are no epic poems except Macpherson's Ossian. Songs of love, nature, chiefs and Prince Charlie, descriptive poems, hymns, eulogies, satires, epitaphs and laments were more in the line of the bards. The best prose is represented in the Gaelic Bible, *Caraidnan Gaidheal*, and Nicolson's *Proverbs*.

The great modern interest in the language and literature dates from the publication of J. C. Zeuss's *Grammatica Celtica* in 1853, a work which revolutionised Celtic studies. Among Gaelic grammars those of Alexander Stewart, James Munro, H. C. Gillies, and Duncan Reid are chiefly used. There are large dictionaries by R. A. Armstrong, *The Highland Society of Scotland*, Alexander Macbain (etymological), and Ewen Macdonald; and a smaller one by Neil MacAlpine.

John Reid's *Bibliotheca Scoto-Celtica* contains a list of all books printed in Gaelic before 1832, the first being Carewell's Translation of Knox's Liturgy, 1567. Since then Donald Maclean has brought the list down to 1914. Beautiful English renderings of Gaelic poetry are published in *Selections from the Gaelic Bards*, T. P. Pattison, 1866, and in *Language and Literature of the Highlands*, J. S. Blackie, 1876. See Erse.

Gaeta (anc. *Portus Carata*). Seaport and city of Italy, in the prov. of Naples. It stands amid beautiful surroundings 30 m. N.W. of Capua, and 74 m. by rly. N.W. of Naples. A strongly fortified naval station, it has an Angevin castle, a 12th century cathedral with belfry, remains of an amphitheatre and theatre. The town is

the centre of considerable trade, coasting, and fishing. Near it was the Formian villa of Cicero, and tradition points to the spot where he was murdered.

On the fall of the Roman Empire Gaeta became an independent centre of culture and commerce. It held out against the Austrians in 1815 and 1821, and afforded an asylum to Pope Pius IX in 1848-49. The last Bourbon king of Naples was besieged in the town and forced to surrender to Victor Emmanuel, 1861. Pop. 6,000.

Gafencu, GRÉGOIRE (b. 1892). Rumanian journalist and politician. After study in Geneva and Paris, he joined the Peasants' party in his own country and founded a weekly paper which became the economic daily, *Argus*; a news agency; and a broadcasting station. His first post was as secretary to the foreign office, 1928. English on his mother's side and multilingual, Gafencu was chosen foreign minister in the crisis of 1938 and made a tour of the European capitals hoping to secure peace—the subject of his book *Les Derniers Jours de l'Europe*, 1946. He resigned in May, 1940, when Rumania was forced into the Nazi alliance; served as ambassador to Moscow; and in 1941 went into exile in Switzerland.

Gaff (Fr. *gaffe*). A spar which stretches out the upper end of a sail. The forked part of the gaff which fits upon the mast is called the jaws. At the back of the mast these jaws are joined by a parrel, a cord or rope with balls of wood upon it, so that the jaws slide up and down the mast easily. The other end of the gaff is termed the peak, and the sail is attached to it by halyards. Sails with which a gaff is used are gaff sails.

Gaff. Stick armed with an iron hook for landing large fish, especially salmon. The use of the gaff is prohibited for catching salmon unless it is auxiliary to angling with rod and line. See Bone Implements illus.

Gage, VISCOUNT. Irish title borne since 1720 by an English family, earlier members of which included Sir John Gage (c. 1479-1556), victorious against the Scots at Solway Moss, 1542; and Joseph (c. 1678-1754), who became a Spanish general and offered large sums in the hope of becoming king of Poland and (later) Sardinia. Joseph's elder brother Thomas became 1st viscount.

Gage, THOMAS (1721-87). British soldier and administrator, younger son of the first Viscount

Thomas Gage,
British soldier

in 1774 of Massachusetts. Here he lacked tact in dealing with the admittedly difficult situation which led to the collision between his troops and the colonists at Lexington on April 18, 1775. This was followed by the battle of Bunker's Hill on June 17, and though Gage was appointed commander of the forces in America in Aug., he shortly afterwards resigned and returned to England. He died April 2, 1787. His *Correspondence with the Secretaries of State, 1763-75*, was ed. by C. E. Carter, 1931.

Gahn, JOHAN GOTTLIEB (1745-1818). Swedish mineralogist and chemist. As a boy he worked in the mines of Helsingland, but having educated himself he was eventually appointed assessor at the Swedish college of mines. He then became analyst and mineralogist at the Gripsholm mines where, in 1774, he discovered a new metal, manganese. The rare mineral gahnite (*v.i.*) was named in his honour.

Gahnite. A member of the spinel group of minerals, composed of zinc and aluminium oxides ($ZnAl_2O_4$). It may be associated with other zinc materials in ore deposits, also as a contact mineral or in certain crystalline schists. See Spinel.

Gaff: angling implement. 1. With handle. 2. For trout. 3. Folding gaff
By courtesy of S. Allcock & Co

Gage. Entering the army in 1741, he distinguished himself in Braddock's expedition against Fort Duquesne, 1755. In 1760 he became governor of

Montreal, and in 1774 of Massachusetts. Here he lacked tact in dealing with the admittedly difficult situation which led to the collision between his troops and the colonists at Lexington on April 18, 1775. This was followed by the battle of Bunker's Hill on June 17, and though Gage was appointed commander of the forces in America in Aug., he shortly afterwards resigned and returned to England. He died April 2, 1787. His *Correspondence with the Secretaries of State, 1763-75*, was ed. by C. E. Carter, 1931.

Gahn, JOHAN GOTTLIEB (1745-1818). Swedish mineralogist and chemist. As a boy he worked in

Gaillardia. Brilliant flowers of this garden plant

Gaiety Theatre. London theatre at the corner of the Strand and W. Aldwych. The original building was an enlargement of the Strand Music Hall, opened Dec. 21, 1868, under the management of John Hollingshead with *On the Cards*, by Burnand, and Robert the Devil, a burlesque by Gilbert. In the 'eighties and 'nineties the old Gaiety was famous as the home of burlesque, with Nellie Farren, Edward Terry, and Fred Leslie as brilliant stars, and chorus girls of legendary charm. It was demolished to make room for the Strand improvements.

Rebuilt from designs by Norman Shaw, the Gaiety reopened with *The Orchid*, Oct. 26, 1903. Under George Edwardes's control it was devoted almost exclusively to musical comedy, e.g. *The Girls of Gottenburg*, *Our Miss Gibbs*, *The Sunshine Girl*. The theatre was acquired in 1920 by Grossmith and Laurillard. In the 1930s it housed musical comedies starring Stanley Lupino and Leslie Henson. Closed from Feb., 1939, a licence being refused until overhauling was carried out, it was purchased for £200,000 in 1946 by Lupino Lane who, after spending £10,000 on repairs, planned to reopen it in 1950. The Gaiety, Manchester, was run as a repertory theatre by Miss Horniman, 1908-20.

Gaillardia. Genus of annual and perennial herbs of the family Compositae. They are natives of America. The leaves are lance-shaped and rough, the flower-heads yellow or red, and the ray florets broad, but cut at the end into three or five teeth. Several species are favourite garden flowers.

Gainex. A component of high-explosive filling, also commonly known as the booster or exploder. It is introduced between the detonator and the high explosive charge to ensure satisfactory detonation of the main charge. In British service ammunition, bombs, and mines, a small pressed pellet or block of tetryl is normally used as the gainex. See Ammunition: Explosives; Shell.

Gainesville. City of Florida, U.S.A., the co. seat of Alachua co. A winter resort and busy rly. junction, it is 80 m. S.W. of Jackson-

ville. Gainesville ships citrus fruits, farm and garden produce, lumber, naval stores, and tung oil, of which industry it is the centre. It is the site of the university of Florida, Florida agricultural college, and a state agricultural experimental station. Established as a trading post in 1830, Gainesville was incorporated in 1869, and received a city charter in 1907. Pop. 13,757.

Gainford, JOSEPH ALBERT PEASE, 1st BARON (1860-1943). English politician. He was born at Darlington, Jan. 17, 1860, younger son of Sir Joseph Pease, and educated at Tottenham and Trinity College, Cambridge. Pease entered parliament as Liberal M.P. for Tyneside in 1892, later representing Saffron Walden, 1901-10, and Rotherham, 1910-16. He was chancellor of the duchy of Lancaster, 1910-11; president of the Board of Education, 1911-15; postmaster-general, 1916; first chairman of the B.B.C., 1922-26. Interested in colliery and public utility companies, he was chairman of the F.B.I., 1927-28. He was created a baron in 1916 and died Feb. 15, 1943, his son Joseph (b. 1889) succeeding to the title.

Gainsborough. Urban dist., market town, and river port of Lincolnshire, England. It stands on the Trent, 18 m. N.W. of Lincoln, and has a railway station. The parish church of All Saints has a 12th century tower, and the Old Hall or manor-house is a picturesque 15th century building, restored in 1884.

Gainsborough is the St. Ogg's of George Eliot's Mill on the Floss. The industries include ironfounding and the manufacture of linseed oil, and a considerable inland trade is carried on by means of the canals connecting with the Trent. The council owns the gas and water supplies, and

maintains baths, library, recreation grounds, markets, and corn exchange. Gainsborough gives its name to a co. div. returning one M.P. Market days, Tues. and Sat. Pop. 18,684.

Gainsborough, THOMAS (1727-88). An English painter. Born at Sudbury, Suffolk, son of a wool merchant, and baptized May 14, 1727, he was sent to London at the age of 13 and studied under Gravelot and Hayman, but failed to make

a living by his brush. In 1746 he married Margaret Burr, who possessed an annuity which enabled the young couple to settle in Ipswich.

Here he found patrons and pupils and made the acquaintance of Thicknesse, the governor of Landguard Fort, who advised him to go to Bath to try his fortune. Gainsborough set up there in 1760, and his portraits attracted attention. On the foundation of the Royal Academy he became one of its original members, and in 1774 left Bath for London to reside at Schomberg House in Pall Mall. There his reputation reached its height. His studio was crowded with sitters, and, although he raised his prices several times, he was unable to keep pace with the demands made upon him. He exhibited yearly at the R.A. until 1783, when he quarrelled with the council concerning the position allotted to his portrait group of the princess royal with the princesses Augusta and Elizabeth. He died of cancer of the neck at Schomberg House, Aug. 2, 1788, and was buried in Kew churchyard.

Sir Joshua Reynolds's 14th discourse, delivered to the students of the R.A. on Dec. 10, 1788, was almost entirely concerned with Gainsborough's genius, although the two had quarrelled seriously.

Of his wonderful paintings, more than 200 were portraits—eight of George III, seven of Pitt, five of Garrick.

He also practised etching with some success, and produced a few plates in aquatint. Some of his finest pictures are in the National Gallery, Dulwich Gallery, Windsor Castle, Grosvenor House, Buckingham Palace, National Gallery at Edinburgh, and the Wallace Collection, and many are in private American collections. A man who in spite of his irritability was much beloved, and an accomplished musician, Gainsborough stands in the front rank of English portrait and landscape painters, though he preferred to think of himself first as a landscapist. For exquisite beauty and vibrant quality, his portraits have never been surpassed. Gainsborough's Blue Boy was purchased in 1921 by Henry Huntington of New York for, it was stated, £150,000. In 1928 The Harvest

Thomas Gainsborough. His portrait of Master Butall (c. 1770) commonly called The Blue Boy

Waggon was bought for £72,000 by Sir Joseph Duveen at a sale in America.

Bibliography. Sketch of Life and Paintings, P. Thicknesse, 1788; Lives, G. W. Fulcher, ed. E. S. Fulcher, 1856; N. D'Anvers, 1897; Lord R. Gower, 1903; Thomas Gainsborough, Sir W. Armstrong, rev. ed., 1905; Thomas Gainsborough, W. T. Whitley, 1915; Lives, E. R. Dibden, 1923; H. Stokes, 1925.

Gairdner. Salt-water lake of S. Australia. It lies 360 ft. above sea level, 90 m. S.W. of Lake Torrens. Its length from N. to S. is 160 m., and its maximum breadth 40 m.

Gairdner, JAMES (1828-1912). British historian. Born in Edinburgh, March 22, 1828, he entered the Public Record Office in London in 1846, and spent nearly

Gainsborough, Lincolnshire. The Old Hall, manor house built in the 15th century and restored in 1884

his whole life there. He was made a C.B. in 1900, and died Nov. 4, 1912. Gairdner's researches were mainly concerned with the early Tudor period. He edited the Letters and Papers of the Reign of Henry VIII, vols. 5-21, 1880-1910; and The Paston Letters, 3 vols., 1872-75; while

James Gairdner,
British historian
Russell

among his writings are Henry VIII, 1889; History of Richard III, 1898; Lollardy and the Reformation in England, 1908-11.

Gairloch. Sea loch of Scotland. On the W. coast of Ross and Cromarty, it is 6 m. long and 3½ m. broad at the entrance. The name is also borne by a village at the head of the loch, which has a pier at which steamers call, and golf links. Pop. 2,781.

Gaiseric or **GENSERIC** (c. 395-477). Vandal king. The son of a king, he succeeded on the death of his brother in 428, being doubtless chosen on account of his reputation as a fighter. His people were then in Spain, but he led many of them across to Africa and made his first conquests at the expense of the Romans there. The emperor Valentinian III recognized the new Vandal kingdom, of which Carthage was the capital. Gaiseric then began a career of conquest at sea, capturing Sicily, Sardinia, and Corsica, making his hordes feared by the dwellers along the Mediterranean coasts. His greatest exploit was the sack of Rome, 455. His power remained unshaken until his death, Jan. 25, 477.

Gaisford, THOMAS (1779-1855). British scholar. Born Dec. 22, 1779, at Iford, Wilts, he was educated at a school near Winchester. In 1797 he entered Christ Church, Oxford, becoming tutor. He was then ordained. In 1812 he was chosen regius professor of Greek, and in 1831 became dean of Christ Church, a post he retained until his death, June 2, 1855. Gaisford made a great reputation as a Greek scholar, and the Gaisford prizes for Greek composition were founded in his honour. He did useful work in connexion with the Oxford University Press.

Gait. Term for the manner of walking. The stride and the way in which the foot is brought to the ground are indicative of the personality of the walker. Compare

the mincing, hesitating movements of the nervous with the rhythmic swing of the confident man. Many diseases have a characteristic gait. In cases of neuritis such as are associated with advanced alcoholism, or with acute shortage of Vitamin B, as in pellagra and beri-beri, there is over-high step-page. In paralysis agitans the patient walks bent forward and with rapid steps, as though pursuing his centre of gravity. A dragging gait is associated with chorea. The sufferer from locomotor ataxia walks on a wide base to maintain his unsteady balance.

Gaiters (Fr. *guêtre*). Covering of cloth for the leg, buttoning from knee to ankle, and usually extending to the instep. Spatter-dashes, or "spats," both forms of gaiters, used to form part of a military costume, and still exist in that of Highland regiments. Gaiters,

Gaiters. 1. Military, 2nd half of 18th century. 2. Bishop's. 3. As worn in Highland regiments

officially known as anklets, form part of British army battledress. The U.S. army in 1944 abandoned gaiters for boots reaching to the calf.

Gaius (fl. 2nd century A.D.). Roman jurist. Except that he lived during the period from Hadrian to Marcus Aurelius nothing is known of him, not even his full name. Fragments of his Institutions were preserved in Justinian's Digest and other works, and in 1816 the historian Niebuhr discovered, in the library of the chapter house at Verona, a MS. of Jerome, written over an almost complete copy of the work.

Gala Beds. In geology, a group of sedimentary rocks, shales, flagstones, grits, etc., of Silurian age. Between 3,000 and 5,000 ft. in thickness, they are developed in the S. of Scotland.

Galactic Coordinates. System of specifying the position of heavenly bodies by reference to the Galaxy or Milky Way. Galactic latitude in measured N. or S. from the galactic equator (practically the central line of the Milky Way); galactic longitude along the galactic equator.

Galactose (C₆H₁₂O₆). Hexose derived from lactose by hydrolysis or by oxidising dulcitol. It may be made by boiling milk-sugar with dilute sulphuric acid, neutralising the solution with baryta, and concentrating by evaporation.

Galago. Group of small, longtailed, lemuroid animals, found in most parts of tropical Africa. The largest of them is about the size of a domestic cat, while the smallest is only five inches long.

They are nocturnal in habit, and feed mainly on fruit, insects, and small birds. They are readily distinguished from the true lemurs by their very large ears.

Galahad. Knight of Arthur's Round Table, who achieved the vision of the Holy Grail. Son of Lancelot and Elaine, daughter of King Pelles, he was brought up by nuns, came to Camelot on the eve of Pentecost, and received knighthood at Arthur's hand. After riding on many strange adventures, he started, with Sir Perceval and Sir Bors, on the quest of the Sangreal, and was granted the sight of the mystic cup from which Christ drank at the Last Supper. Thereupon Galahad asked for death, and when his hour came, the Sangreal was borne up to heaven and never seen of man again. It was of Galahad that Tennyson wrote: "My strength is as the strength of ten, Because my heart is pure." See Grail; Morte d'Arthur.

Galápagos or **TORREJO ISLANDS.** Group of volcanic islands in the Pacific Ocean, 695 m. W. of Ecuador, to which they belong. Officially renamed the Colon Archipelago in 1892, the 16 islands include Albemarle, Indefatigable, Chatham, James, Hood, Narborough, Barrington, Charles, and Abingdon. Albemarle, by far the largest, is 60 m. long. The archipelago constitutes a territory and its est. area is 2,868 sq. m.

Most of the surface, which rises from 3,000 ft. to 3,600 ft., is arid. Mt. Wilson and Mt. Whiton were active volcanoes in 1925. Yet there is a richly endemic flora, and an interesting fauna; turtles of huge

Galago. Specimen of the Maholi galago

size and giant tortoises are found. Domestic animals run free; cotton, figs, oranges, and tobacco plants, introduced by early colonists, are widely distributed. Sulphur exists in large quantities. Salt, hides, and lizard skins are exported. On Charles Island there is a penal settlement. With the consent of the government of Ecuador, U.S. forces used bases on the islands, 1942-46. Pop. est. 1,000.

Galashiels. Mun. burgh and parish of Selkirkshire, Scotland. It stands greyly on Gala Water,

near its confluence with the Tweed, 33½ m. by railway S. by E. of Edinburgh. The chief seat of the Scottish woollen industry, introduced Galashiels arms towards the end of the 16th century, Galashiels has important tweed manufactories and dyeworks. Near by are Abbotsford and Ashestiel, residences of Sir Walter Scott. Market day, Wed. Pop. 13,102.

Galatea. In Greek mythology, a sea nymph, one of the daughters of Nereus. She loved the beautiful Sicilian youth Acis (*q.v.*), who was slain by the jealous Cyclops Polyphemus. Galatea herself is the personification of the bright, calm sea. The name has also been given, in modern times, to a statue endowed with life by the goddess Venus at the prayer of the sculptor Pygmalion (*q.v.*).

Galati OR GALATZ. Town of Rumania, in Moldavia. It is situated on an amphitheatre of hills rising on the N. side of the Danube about 10 m. above its junction with the Prut, and nearly 80 m. N.E. of Bukarest. Before the First Great War it was made prosperous by improved navigation of the river by the Danube Commission. One of the best ports on the Danube, it is well served by rlys., manufactures iron and copper, and exports grain and timber. Galati is the seat of an Orthodox bishop. It was the scene of a defeat of the Russians by the Turks in 1789; was bombarded in 1916 by the Germans and Bulgarians; and was captured from the Germans by the Russians on Aug. 27, 1944. Pop. 93,229.

Galatia. Territory in Asia Minor, comprising part of Phrygia and part of Cappadocia. It was so called from the name of its inhabitants, Galatae, who were Gauls belonging to the expedition which, under Brennus, penetrated into Greece in the 3rd century B.C. These Galatian Gauls were an off-

shoot from the main host who crossed the Hellespont and overran Asia Minor, until checked by Attalus I, king of Pergamum (241-197 B.C.), who compelled them to settle within the limits of the country subsequently known as Galatia. The Galatians became Graecised in culture, but retained their Gallic speech. Under Augustus, Galatia became a Roman province.

Galatians, EPISTLE TO THE. One of the four principal Epistles written by S. Paul. Like the Epistle to the Romans, it contains the main points of the Apostle's teaching, together with autobiographical matter, which supplements the biographical statements in the Acts. The Epistle raises some difficult problems. The most difficult is the question of its destination. Galatia was used in ancient times to denote both a N. district of Asia Minor and also a S. district, the latter being the Roman province.

The N.T. does not mention any missionary work undertaken in the N. district. Hence some scholars adopt what is called the North Galatian theory, others what is known as the South Galatian theory. The latter has the support of Sir W. Ramsay, and it is more natural to suppose that the Epistle was addressed to the Church in S. Galatia. If this theory is adopted, the Epistle may have been written from the Syrian Antioch about A.D. 53. See Paul, Saint.

Galatina. Town of Italy, in the prov. of Lecce. It is 15 m. by rly. S. of Lecce. It has a fine 14th century church, with sculptures and tombs, besides frescoes by Francesco d'Arezzo. There is trade in oil, wine, leather, and cotton.

Gala Water. River of Scotland. It rises among the Moorfoot Hills in Midlothian, and flows through Selkirkshire and Roxburghshire, joining the Tweed, 1 m. below Galashiels. Length, 21 m. The valley was once known as Wedale.

Galaxy (Gr. *galaxias*, milky). The Milky Way, an irregular luminous belt, composed of faint stars, which crosses the heavens almost in a great circle several degrees wide inclined at 63° to the equator. Its luminosity comes from innumerable stars so far away as to be indistinguishable except by telescope. The word is also now applied to the whole disk-shaped collection of stars in which the solar system is embedded. When the disk is seen edgewise from within, the impression of a luminous band is created. By a

further extension of meaning the word is used for other such systems of stars outside our own Galaxy. See Nebula.

Galba, SERVIVS SULPICIUS (3 B.C.-A.D. 69). Roman emperor. He was born Dec. 24, 3 B.C. He

Servius Galba,
Roman emperor
From a bust

had held several provincial governorships with credit, when, in June, 68, he was proclaimed emperor by the legions in Gaul, who had risen against Nero. He proceeded to Rome, but his reign lasted only some seven months. Harshness and parsimony making him exceedingly unpopular, as a result of a conspiracy he was murdered by the soldiery.

Galbanum. Gum resin obtained from *Ferula galbaniflua* and probably other large umbelliferous plants growing in Persia. It occurs in tears, in small masses, and in lump form, and is regularly imported into the London market. It possesses a characteristic, aromatic odour and bitter taste. Galbanum has been an article of commerce from early times, and was regarded by the ancients as a stimulant, expectorant, and antispasmodic drug. It is now used occasionally as a stimulant in plasters for external use.

Galcha (Persian, boor). Name denoting several mountain tribes in the Pamir and Hindu Kush region in Afghanistan and Tadzhik S.S.R. The best known are the Shighni and Wakhi near Badakshan. They represent the easternmost extension of the round-headed, long-bearded race occupying the alpine axis westward to the Pyrenees. Early Aryan admixture often reappears in tall, blond, red-haired, grey-eyed descendants. Living in patriarchal communities, with no intertribal cohesion, they speak non-Sanskrit dialects. See Iskasmī.

Galdhøppigen. Highest mountain of Norway. In Oppland co., having a height of 8,400 ft., the mt. is part of the Langfjeld plateau, which virtually comprises the S. part of the country.

Galdós, BENITO PÉREZ. This Spanish novelist and dramatist is more correctly known as Pérez-Galdós (*q.v.*).

Gale. To the layman a gale signifies merely a high wind, but the meteorologist requires a more rigid definition. It is the practice

to limit the term to those occasions when the wind velocity exceeds a specified force on a numerical scale—Beaufort scale (*q.v.*). By international agreement ranges of wind velocity, measured by well exposed anemometers, have been adopted as equivalent to Beaufort numbers estimated by experienced observers.

In the lower layers of the atmosphere, however, a reduction in wind speed is brought about by friction with objects on the ground, and for comparisons it is necessary to measure the wind under standard conditions of exposure. The standard adopted in the British Meteorological Office is that the anemometer head should be exposed in an open situation at a height of 10 metres (33 ft.). If anemometers have to be erected at higher levels, corrections will be applied.

Gales are deemed to begin at Force 8 on the Beaufort scale.

the sheltering effect afforded by headlands. In general, Dec. and Jan. are the windiest months in the British Isles. An analysis of gales logged chiefly by lighthouse keepers, coastguards, and crews of lightships during 1876–1935 revealed that on the N. and W. seaboard a gale could be expected every five or six days in these months. Throughout the year as a whole, the N.W. coast of Ireland is the stormiest region with gales on nearly 40 days on the average. The Bristol Channel, S.W. Ireland, S.W. England, and N.W. Scotland record gales on more than 30 days. Excluding the interior, gales are fewer on the E. coasts of England and Scotland, where the number of days each year drops to 20.

Statistics of gales are based on the mean speed of the wind, *i.e.* the average of the gusts and the lulls. Surface irregularities, buildings, trees, etc., set up eddies in the air flow and a gusty wind results.

former. Gusts of at least 100 m.p.h. have been registered on about a dozen occasions in the U.K. since 1909. On Dec. 6, 1929, at Scilly, a gust of 111 m.p.h. was experienced; on Jan. 18, 1945, the speed in a gust at St. Ann's Head, Pembrokeshire, was 113 m.p.h., the highest recorded in the British Isles. It is rare that gusts exceeding 70 m.p.h. are recorded in the London area. Outside the British Isles gust levels reaching 200 m.p.h. may be encountered in revolving storms. In April, 1892, a gust of 130 m.p.h. was registered in a cyclone at Mauritius before the anemometer was blown away. See Cyclone; Hurricane; Tornado; Typhoon; Wind.

GALE WARNING. Prediction of strong winds as a danger to shipping is one of the most important duties of the forecaster. When an atmospheric disturbance is moving or developing in such a way that it is probable a gale will occur, the Meteorological Office issues warnings which are broadcast or telegraphed to responsible authorities at ports and fishing stations. On receipt of a gale warning a black-painted cone is hoisted by day; at certain places at night the warning takes the form of three red lanterns suspended in a triangle. Storm signals are hoisted when a gale is expected within 50–100 m. of the point where the signal is displayed. This service was introduced c. 1860 by the Board of Trade, at the suggestion of Admiral Fitzroy.

Gale, NORMAN ROWLAND (1862–1942). British poet, born at Kew. He was noted for dainty lyrics on birds and flowers, spirited cricketing songs, and charming verses addressed to children. His volumes include *A Country Muse*, 1892; *Orchard Songs*, 1893; *Songs for Little People*, 1896; *Verse in Bloom*, 1925; *Messrs. Bat and Ball*, 1930. He died Oct. 7, 1942.

Galen OR CLAUDIUS GALENUS (c. A.D. 130–200). Greek physician and writer on medical philosophy.

Born at Pergamum, Asia Minor, he studied at the chief seminaries of Greece and Egypt, and about 164 went to Rome, where he became famous, many eminent Romans attending his lectures. His reputation was still further increased through his wonderful cures, many

Claudius Galen, Greek physician. From a bust in the Coll. of Physicians, London.

Beaufort Number	NOTICEABLE EFFECT OF WIND		VELOCITY AT 33 FT.	
	At Sea	On Land	Knots	M.P.H.
8	Moderately high waves; foam blown in well-marked streaks.	Twigs break off; progress impeded generally.	34–40	39–46
9	High waves; sea begins to "roll"; dense streaks of foam.	Slight damage to structures; chimney pots and slates removed.	41–47	47–54
10	Very high waves with long, overhanging crests; foam patches; heavy rolling.	Considerable damage to structures; trees uprooted.	48–55	55–63
11	Exceptionally high waves; sea covered with foam; visibility considerably affected.	Widespread damage; rarely experienced in British Isles.	56–63	64–73
12	Large ships hidden in the troughs of waves; air filled with spray; visibility seriously affected.	Countryside devastated; experienced only in tropical revolving storms.	64–71	74–82

Force 12 is regarded as a hurricane. The wind speed and characteristics of gales of each force from 8 to 12 are shown in the accompanying table. Since 1944 an extension of the table for use in the British empire has carried the numbers up to 17.

The highest wind velocities are experienced over the sea and at the coasts, since a wind blowing from sea to land suffers a decrease in force owing to the friction which occurs, particularly in passing over wooded and built-up areas. Comparison is also rendered difficult by

Thus, despite the mean speeds being greater at the coast than inland, the latter stations are more subject to gusty winds than the

17	109–118	126–136

attributed to magic by the superstition of the times. He was intimate with Marcus Aurelius, and body physician to his son Commodus during the emperor's absence on the Danubian campaign.

Galen was the author of some 500 treatises on medical and philosophical subjects. Most of these were burnt in the Temple of Peace in Rome, where they had been deposited, but 83 authentic works are extant. The date and place of his death are uncertain, some authorities saying it took place in Sicily about 200, others at Pergamum some years later. As a physician Galen ranks second only to Hippocrates; he was great as a practical anatomist, but as a physiologist erred on the side of theory. He coordinated all known medical knowledge, and did more than any other single man to render possible the development of modern medicine. *Consult* Harvey and Galen, J. Payne, 1897.

Galenia OR **LEAD GLANCE**. The most important ore mineral of lead and frequently silver (argentiferous galena). Theoretically, lead sulphide (PbS) containing 86.5 p.c. of lead; often with silver, sometimes selenium, zinc, cadmium, antimony, bismuth, and copper as sulphides, and occasionally a little gold. Galena crystallises in isometric lead-grey metallic crystals associated with zinc and copper sulpho-salts, silver ores, quartz, carbonates, barytes, fluorite, etc. Cerussite and anglesite are common secondary minerals. It is found in crystalline and non-crystalline rocks. Important ore deposits occur as veins associated with eruptive rocks and as replacements in limestones, in Australia, America, Europe, and elsewhere. The mineral has been worked in Northern England, Cornwall, and Devon. *See* Lead Ores.

Galenicals. Preparations of natural drugs. The term is derived from Galen and is now employed to distinguish such preparations as tinctures, extracts, infusions, etc., from drugs obtained by more elaborate chemical procedures.

Galeopithecus. Generic name for the flying lemurs (*q.v.*). Natives of Malaya and the Philippines, they eat leaves and fruit. *See* Colugo.

Galerites (Lat. *galērus*, a cap). Sea urchins of the Cretaceous system, with conical shaped shells, which give them the popular name of sugar-loaves. The under surface is flat, with a central mouth.

Galerius VALERIUS MAXIMIANUS (d. 311). Roman emperor A.D. 305-311, also known as Maxi-

mianus II. At the quadripartite division of the empire by Diocletian in 293, Galerius became one of the Caesars or junior rulers, with control of the Danube provinces and the Balkans from Sirmium, and on the abdication of Diocletian in 305 he became senior emperor. He relinquished power to Licinius in 307.

Galesburg. A city of Illinois, U.S.A., the co. seat of Knox co. It is 43 m. E.N.E. of Burlington, and is served by the Chicago, Burlington, and Quincy, and the Atchison, Topeka, and Santa Fé rlys., and has an airport. It is a rly. and manufacturing centre and shipping point, and produces refrigerators and air-conditioning units, fabricated steel, building and paving brick. The water supply comes from two artificial lakes. One of the Lincoln-Douglas debates of 1858 was held in Knox College here. Galesburg was settled in 1836, and chartered as a city in 1857. Pop. 28,876.

Galgacus OR **CALGACUS**. Caledonian chief. He commanded the northern native tribes when Caledonia was invaded by Agricola (*q.v.*), and after a determined resistance was defeated about A.D. 85 at the battle of Mons Graupius, the modern Grampians (*q.v.*). The site of the battle is variously placed. Tacitus put into the mouth of Galgacus the well-known words "they make a wilderness and call it peace."

Galicia. Former kingdom and prov. of N.W. Spain, now divided into the provs. of Corunna, Lugo, Pontevedra, and Orense. It lies between the Bay of Biscay, the Atlantic, and Portugal, with deeply indented coast-line, and is traversed by mts. and watered by the Minho and many smaller streams. The Galician people (Gallegos), a rude, industrious race, retain their individuality. The coastal climate is mild and equable, the rainfall abundant, and the soil is productive. A Roman colony, a Suevian kingdom, a Moorish possession, a part of Castile or Leon, Galicia has shared fully in the history of the peninsula. Area, 11,255 sq. m. Pop. 2,585,965.

Galicia. A district of Central Europe. Galicia extends for rather more than 300 m. along the N. side of the Carpathian Mts., from the common frontier of Poland and Czecho-Slovakia in the neighbourhood of Teschen to the frontier of Rumania between the Dniester and the Carpathians. The N. boundary of the district begins in the W. on the N. side of the

Vistula, then follows the river itself for over 100 m., passes up the valley of the San to the E. of that stream, crosses the Bug to Brody, and finally follows the Zbrucz affluent to the Dniester.

The S. half of Galicia comprises the foothills of the Carpathians, mainly composed of flysch sandstones. The heights stretch in long, monotonous ridges from E. to W., except where the granitic Tatra Mts. present rugged Alpine peaks. The whole area is a natural forest region, coniferous trees being common on the higher ground. The deeply cut valleys contain fertile alluvium. The Jablunkov (1,810 ft.), Lupkov (1,916 ft.), Dukla (1,650 ft.), and Uzsok (2,916 ft.) are the chief passes from Poland to Czecho-Slovakia. The Magyar or Tatar Gate (3,300 ft.), also known as the Delatyn or Jablonitz pass in the Forest Carpathians, is strategically the gateway from Russia to the Hungarian plain.

The foothills contain deposits of salt and petroleum. The great salt mines of Wieliczka, near Cracow, have been worked for centuries, and the galleries extend for 3 m., 1,000 ft. below ground. Rich deposits of salt are also worked at Bochnia, Sambor, Drohobycz, and Dolina. Drohobycz is the chief centre of the oil district.

The Lowland Areas
The N. portion of Galicia comprises three lowland areas: in the W. the narrow valley of the Vistula; in the middle the Galician plain between the Vistula and its affluent the San; in the E. the lowland between Podolia and the Carpathians. The Galician plain is trenched by broad alluvium-filled valleys made during the Ice Age in which the modern rivers, all too small for the valleys, flow unconformably. Between the valleys the plateaux rise from 50 ft. to 150 ft. above valley level; they are covered with glacial deposits of sand and clay, with many erratic boulders. The forest covering has been cut down; sand has encroached over the area and destroyed its former fertility. In the N. there are sand dunes. The rivers flood regularly, and prevent the fertile valley alluvium from being well tilled.

The E. lowland is divided into two parts by the water parting, which passes from W. to E. close to Lwow, between the Baltic and the Black Sea drainage. Northwards drains the Bug, one of the chief tributaries of the Vistula; southwards the Dniester and its

main affluent, the Sereth. and the Prut drain to the Black Sea. The N. portion is level and monotonous, with pinewoods, peat bogs, and sand dunes. In the S. portion the rivers have cut deep trenches filled with alluvium; the spring floods frequently turn the valleys into temporary lakes.

Population and Political Boundaries

Galicia is more densely peopled than the rest of Poland to the N., or the former Hungarian area to the S. The inhabitants in the W. are Roman Catholic Poles, and in the E. Greek Orthodox Ruthenes or Little Russians. Historically, this boundary zone has marked the E. limit of the influence of the Roman Church since A.D. 1000. All Galicia was included within the kingdom of Poland during the 14th, 15th, and 16th centuries. In 1740 it was divided, the W. belonging to the district of Little Poland and the E. to Red Russia. Galicia became Austrian in 1772. That part W. of the San went to Poland after the First Great War, as did East Galicia in 1923. Following the Second Great War, a Russo-Polish treaty of Aug., 1945, gave Galicia E. of Przemyśl to the U.S.S.R.

BATTLES IN GALICIA. Early in the First Great War the Russians attempted to break through to Germany via Bohemia, which necessitated an advance through Galicia. They took Lwow and Tarnopol, but were halted at the Carpathians by an Austro-Hungarian force. In spring, 1915, the Germans, under von Mackensen, broke through the Gorlice Pass and forced the Russians to retreat. Przemyśl was relieved at the beginning of June, and Lwow towards the end. The Russian forces, reorganized, undertook an offensive in Sept., defeating the Austrians S.E. of Lwow. Trench warfare supervened until the autumn of 1916, when the Russians made another attack that was brought to a standstill by their revolution of 1917.

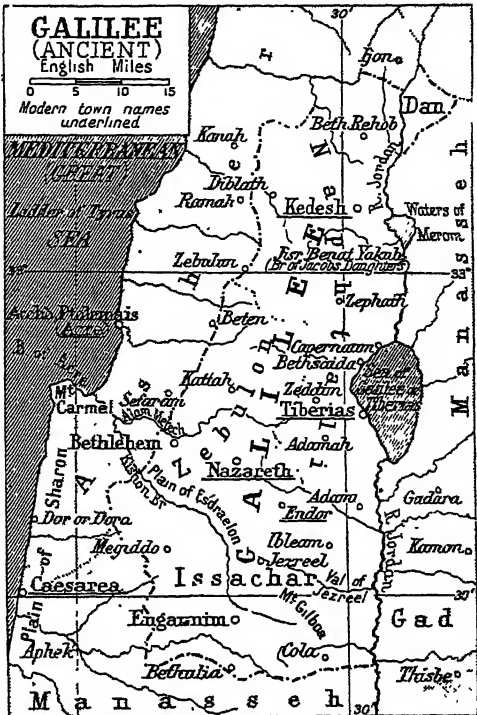

When German armies invaded Poland on Sept. 1, 1939, resistance was stubborn in the S., where to meet three German armies there were only two Polish. Coordinated withdrawal was impossible, because the Polish left was continually outflanked by German forces which had crossed the Carpathians from Slovakia. It was hoped to establish

defensive fronts on the Vistula and other rivers, but a German thrust towards Lwow, in conjunction with another from E. Prussia, rendered this impracticable. On Sept. 17, Russian troops advancing into Galicia occupied Lwow, Tarnopol, and Przemyśl. The line of demarcation between the Russian and German zones of occupation in Galicia was the San.

When Germany attacked Russia on June 22, 1941, Russian forces in Galicia were forced to withdraw, evacuating the district by the first week in July. For the campaign of 1944-45, see Russo-German campaigns.

By Jan. 19, 1945, Russian armies had cleared Galicia and liberated Cracow. Under the terms of the treaty signed Aug. 17, delimiting the Russo-Polish frontier, Galicia E. of the San passed to Russia, who gained possession of valuable oilfields.

Galignani, GIOVANNI ANTONIO (1752-1821). Founder of a celebrated family of European publishers. Born in Brescia, he settled in Paris and established an English library there in 1800. In 1814 he began the publication of Galignani's Messenger, carried on by his descendants until 1884, when they disposed of the paper,

Galilee. Map of the province in New Testament times

which, until it ceased in 1904, was called *The Daily Messenger*.

Galilee. Dist. of N. Palestine. Little is recorded of it in O.T. days, but after the Captivity it was ceded by the Assyrians to the Israelites and soon became virtually a separate nation, the inhabitants being chiefly Arabs, Syrians, and Greeks. They were despised by the Jews of the S., and the fact that Christ's home was in that country was made a reproach to Him. Tiberias was its chief city, and it was a fertile and populous district, but is now little better than a wilderness in many parts.

Galilee, SEA OF. Lake in Palestine, also called the lake of Tiberias and the lake of Genesareth. It is formed by an expansion of the Jordan, about 13 m. long by 8 m. broad. Owing to its situation among steep hills it is subject to sudden and violent storms, to which allusion is made in the Gospels. On its shores stood various cities, including Tiberias and Capernaum, the latter the scene of so much of Christ's ministry that it was known as His own city. Of these cities only Tiberias remains, the sites of the others having been covered up.

Galilee. Term in ecclesiastical architecture. Its origin is obscure,

Galilee, looking across the sea towards Tiberias

It is applied to a chapel at the west end of Durham Cathedral, and also to large porches such as those to be seen at Ely Cathedral and Lincoln Cathedral. *See* Ely.

Galilei, GALILEO (1564-1642). Italian astronomer. Born at Pisa, Feb. 15, 1564, he was the son of a

Galileo Galilei
From a picture in
Trim. Coll., Camb.

Florentine nobleman, who intended him to adopt medicine as a profession. He entered Pisa university in 1581, but there he soon followed his natural inclinations, and while still only 25 he became professor of

mathematics, working on dynamics from 1589-91.

Early distinguished by clarity and originality of thought, his free expressions of opinion won him such unpopularity that he had to resign. In 1592 he went as professor of mathematics to Padua, where he made a series of scientific discoveries. A report from Flanders in 1609 of the invention, by Hans Lippershey, of a glass which made remote objects appear near, led to his constructing a telescope, and its first application to astronomical observation.

This marked a revolution in astronomy, and Galileo's first observations were published in *Sidereus Nuncius*, 1610. Specially notable was his discovery of the satellites of Jupiter, confirming the planetary theory of Copernicus (*q.v.*). In that year Galileo moved to Florence, as mathematician to the duke of Tuscany, and observed sun-spots and the formation of Saturn. During 1613-15 he was engaged in controversy on the theological implications of his discoveries, and of the Copernican theory, which resulted in his being warned by the Holy Office, in Feb., 1616, not to preach the latter doctrine.

In 1632 appeared his great work, *The Dialogue of Two Systems of the World*, and the controversy reopened, for scientists hailed the conclusions as loudly as churchmen condemned them. Summoned to Rome, Galileo was obliged under the threat of torture, June 22, 1633, to recant the doctrine that the earth moved round the sun. He returned to Florence, where he spent his remaining years. One of his last notions was that a pendulum might be applied to regulate a clock. Probably for his

contributions to mechanics Galileo deserves chief fame. Becoming blind in 1637, he died Jan. 8, 1642.

Bibliography. Works, ed. E. Alberi, 16 vols., 1842-56; ed. A. Favaro, 20 vols., 1890-1909, etc.; Galileo and his Judges, F. R. W. Prosser, 1889; Life and Work, J. J. Fahie, 1903; Galileo (in *Pioneers of Progress Series*), W. W. Bryant, 1918; Aristotle, Galileo, and the Tower of Pisa, L. Cooper, 1935.

Galitzin. Name of a Russian noble family. Vasili Galitzin (*q.v.*) was its first prominent member, and after him came two brothers, Mikhail and Dmitri. Mikhail (1674-1730) was a soldier who assisted Peter the Great in his wars with Sweden; Dmitri (d. 1738) was one of those who helped Anne to secure the throne in 1730; in 1731, however, he was banished, and he died in prison. Later members included Dmitri Alexievitch (1738-1803), ambassador to France and to the Netherlands, also a writer on scientific subjects, the husband of Princess Galitzin (*v.i.*) and the correspondent of Voltaire.

Galitzin, ADELHEID AMALIE, PRINCESS (1748-1806). German pietist. The daughter of a Prussian general, she was born at Berlin, Aug. 28, 1748, and married Dmitri Galitzin, Russian ambassador to Holland and France. Of literary tastes and an extraordinary amiable disposition, she became noted for her piety. She established a circle of pietists in Münster. She died Aug. 24, 1806.

Galitzin, VASILII VASILIEVITCH (1643-1713). Russian statesman. In 1676 he was successful in a campaign against the Dnieper Cossacks and in 1682 became minister of foreign affairs. Regent during the minority of Peter the Great, he wielded great influence and ruled Russia with a firm but just hand. He led two expeditions into the Crimea. In 1689 the regency ended, and Galitzin was sent into exile, dying in Siberia, March 13, 1713.

Galium. Genus of hardy annual and perennial plants belonging to the family Rubiaceae. Its common name is bedstraw (*q.v.*).

Gall. Word used in different senses according to its etymology.

(1) The fluid secreted from the liver, more generally known as bile (*Gr. cholē, Lat. fel*). The phrase gall and wormwood is used to express anything specially painful or unpleasant. (2) The gall-nut or oak-apple (*Lat. galla*), a swelling on the oak-tree resulting from the attacks of certain parasitic insects. From this probably comes the meaning of

a soft tumour or sore on a horse's back, the result of rubbing, the verb to gall being used in the sense of to chafe.

The galls on trees and herbs are varied in their nature and origin. Most are abnormal growths which develop around the larvae of insects as these feed and grow within the plant tissues, the eggs having been introduced by the female insects through punctures made for that purpose. Of this class are the familiar oak-apples, bullet-galls, and leaf-spangles of the oak, the nail-galls of the beech and lime, and the cone-like galls on the shoots of spruce. Other galls, such as the "witches' broom" which appears on pine, birch, cherry trees and others, are caused by fungi. *See* Gall Wasp; Witches' Broom.

Gall (c. 550-645). Irish saint. Born in Ireland, he was educated at Bangor under S. Columban. In 585 he went to France, and later to the neighbourhood of Lake Constance, where his preaching converted large numbers to Christianity. In 614 he founded the Benedictine monastery of St. Gall, on the river Steinach, Switzerland, which became a great centre of learning. Offered the bishopric of Constance, 616, he declined. He died at Arbon, Oct. 16, 645.

Gall, FRANZ JOSEF (1758-1828). German anatomist and founder of phrenology. Born at Tiefenbrunn,

Franz Josef Gall,
German anatomist

near Baden, March 9, 1758, he studied medicine at Strasbourg and Vienna. Interested by the possibility of a connexion between the form of the skull and men-

tal growth and characteristics, he gave lectures on this subject in Vienna in 1796. In 1800 Joseph Caspar Spurzheim (1776-1832) became his pupil, and in 1804 his partner in research. They toured Germany and Switzerland lecturing, and came to Paris in 1807. After Spurzheim left France in 1813, Gall continued to work in Paris till his death at Montrouge, Aug. 22, 1828. Among his works are *Introduction au Cours de Physiologie du Cerveau*, 1808; *Anatomie et Physiologie du Système Nerveux*, 1810-19.

Galla. People of Hamitic stock W. of Somaliland, in S. Abyssinia and Kenya (barbarians). First of the Hamites to occupy the eastern

horn of Africa, they were driven inland by the allied Somali, and their original nomadism is now tempered by settled agriculture. Numbering 3,500,000, they breed horses in the Christianised north, cattle in the Muslimised south. Mingled with Nilotic negroes, they gave rise to the Masai: E. of the great lakes they became the Bahima herdsmen of Uganda and the Unyoro aristocracy. A negroid strain is perceptible in skin-colour and hair, in culture and belief. *See Abyssinia.*

Gallabat. Town of the Anglo-Egyptian Sudan. It stands on a tributary of the Atbara, near the Abyssinian frontier. There is considerable trade with Abyssinia, Gallabat forming one of the frontier customs posts. On July 6, 1940, Italians advancing from Abyssinia captured Gallabat, but the British retook it four months later.

Gallacher, WILLIAM (b. 1881). Scottish politician. Born at Paisley, Dec. 25, 1881, he started work as a brass turner at the age of 16. He was chairman of the Clyde workers' committee during the First Great War. A member of the executive committee of the Communist party from 1921, he was made chairman in 1940. As Communist M.P. for West Fife 1935-50 he won a reputation for fiery intervention in debate. His books include *Revolt on the Clyde*, 1936; *The Chosen Few*, 1940; *Marxism and the Working Class*, 1943; *What Is Democracy?* 1946.

Galla Ox OR SANGA. Domesticated breed of humped cattle, found only in Abyssinia and the surrounding country, and kept by the local tribes or Gallas. It is remarkable for massive horns, and it may be a descendant of the Indian buffalo.

Gallarate. Town of Italy, in the prov. of Varese. It is 25 m. by rly. N.W. of Milan, and a junction for Arona and Varese. It has an 11th century Romanesque church, a technical school, cotton mills, and many textile factories. Machinery, buttons, and cabinet goods are made. Electric works at Vizzola, 6 m. W., were once reputed to be the largest in the world.

Gallas, MATTHIAS (1584-1647). Austrian soldier. Born Sept. 16, 1584, he began his military career in the Spanish service; when the Thirty Years' War began he entered the service of the Catholic League, and his courage and talent soon carried him to the front. He took command of Wallenstein's

army when its leader was murdered, a crime in which he was concerned, and won a great victory at Nördlingen over the Swedes in Aug., 1634. He was dismissed, but was recalled, only to have his army destroyed.

Gallas, who became very rich by his plunderings, founded the Austrian family of Clam-Gallas. His titles included those of count of the empire and duke of Lucera. His corpulence made him much ridiculed by his enemies. *See Caricature illus.*

Gallatin OR GALLANTIN, ALBERT (1817-1849). Swiss-American statesman. Born at Geneva,

Albert Gallatin
After Chappell

Jan. 29, 1761, he emigrated to America in 1780. In 1789 he entered political life in Pennsylvania, being a leader of the so-called Whisky insurrection, and a member of the state assembly. In 1793 Gallatin was elected to the senate of the U.S.A., but was declared ineligible on a question of citizenship, and did not take his seat until 1795. Prominent among the opponents of the Federalists, he won fame as an authority on financial matters. This led in 1801 to his appointment as secretary to the treasury, in which capacity he reduced the national debt, and did much to improve the country's financial position. Leaving the treasury in 1813, he was made commissioner for the treaty of Ghent, 1814. He was minister to France 1816-23, and to Great Britain 1826-27, retiring from public life in 1828. Died at Astoria, Long Island, Aug. 12, 1849.

Gall-bladder. Receptacle on the under surface of the liver. In it bile is stored to be discharged at very low pressure into the duodenum, first part of the small intestine, during the process of digestion. *See Gall-stones.*

Matthias Gallas,
Austrian soldier
From a print

Galle OR POINT DE GALLE. Seaport of Ceylon, on the S.W. coast of the island. Until the development of the harbour at Colombo, Galle was a port of note; its harbour has the advantage of deep water close to the land, but it lacks adequate shelter to make it safe in rough weather. It was founded as Ponto Gallo by the Portuguese in 1518. There is rly. communication with Colombo. Pop. 38,424.

Galle, JOHANN GOTTFRIED (1812-1910). German astronomer. He was born near Wittenberg, June 9, 1812, became professor of astronomy and director of the observatory at Breslau in 1851, retired 1897, and died July 10, 1910. Galle discovered three comets and at Berlin in 1846, with d'Arrest, was the first to detect the planet Neptune from Leverrier's directions.

Gallegos. Town of Argentina; capital of the Patagonian prov. of Santa Cruz. At the estuary of the river Gallegos, it is 1,600 m. S.S.W. of Buenos Aires. It trades in refrigerated mutton, sheepskin, wool, and tallow. It is served by airline. Pop. 7,000.

Galleon (Span. *galeón*). Spanish ship of the 15th, 16th, and 17th centuries. Of large size, sometimes with three or four gun decks, it was used both for war and in the Indies trade. Owing to their cumbersome build, galleons were awkward to handle, and the lighter, quicker craft of the British seamen were able to defeat them by their better manoeuvring powers, as was shown by the episode of the Great Armada in 1588. The name is sometimes used loosely of any large ship. A galleass was a ship of the galleon type but smaller, and partly propelled by oars. It had high castles at stem and stern and was low in the waist, where, chained to crossbenches, sat the 300 galley slaves who rowed the vessel.

Galleon such as formed part of the Spanish Armada

Gallery (Fr. *galerie*). Upper floor extending over a part only of the room below it. In secular architecture, the use of a gallery may be traced, in Great Britain, to the Norman keep (*q.v.*), the hall of which was often surrounded by a gallery built into the thickness of the wall. Such galleries were lighted by an upper tier of windows. As a domestic feature the gallery did not attain importance till the latter part of the 16th century, when the Elizabethan long gallery was introduced. The earliest example is believed to have been at Hampton Court, built about 1540. From this time designers appear to have aimed at elongating this apartment as much as possible.

When it became the fashion to collect family portraits and other works of art, the gallery was the most suitable place for their accommodation; hence the application of the term to a museum of art treasures. The Elizabethan gallery extended the whole length of the longest wing of the house, and being on the first floor was approached from the hall by the main staircase. It was lighted from both sides and ends, the walls were usually panelled, and the plaster ceiling richly decorated.

The minstrels' gallery (*q.v.*), a well-known feature of the hall of the fortified manor house, arose out of the custom of cutting off the entrance end of the hall from the rest by a screen, the roof of which formed a platform where music could be performed. Church interiors, in the Middle Ages, were often fitted with galleries, the top of the rood screen being frequently used for that purpose. Galleries at the west end and along the aisles of early 17th century churches were common until Archbishop Laud was charged with the duty of abolishing them. Many survived, and the feature was also copied in chapels. The word is also used for a level or drive in a mine, and for the highest tier of seats in a theatre or concert hall.

Galley (late Lat. *galea*). Six-oared boat in a warship, used by the captain only. It is the largest single-banked (*i.e.* not having two oars abreast) boat

in the ship. An admiral's boat is called a barge. Large galleys were the earliest form of fighting ship and were so used in the Mediterranean until late in the 16th century. The last great battle between galleys was that of Lepanto, 1571. In modern vessels the place where cooking is done is called the galley.

Galley. In printing, a flat tray made of metal or wood used for holding type after it has been set. It is oblong or quarto in size with flanges on each side and at one end. On the quarto galley the type is made up into page form and secured before it is slid off on to the stone. Impressions of the type secured on the oblong galley by means of side-stick and quoins are called galley proofs, and the form of press on which the proofs are pulled is known as a galley press. *See* Printing; Type-setting.

Gall Fly. This is a common but inaccurate name for the gall wasp (*q.v.*).

Galliard. Old dance, of a lively character, in triple time. Some writers have quoted it as being of

Galliard. Opening of melody by John Bull, supposed by some to be the original form of the tune used later for God Save the King

an immodest character, but there is nothing in the music to suggest this. One of the supposed original forms of God Save the King is a galliard by John Bull (1562-1628), of which the melody begins as shown above.

The galliard was usually associated with the pavan, a stately dance in duple time, which it followed in the suites of the 17th century. After about 1640 the galliard, in name, disappeared, and its place was filled by the minuet and saraband, as representatives of

triple time. *See* Minuet; Pavane; Sarabande; Suite.

Gallic Acid ($\text{H}_3\text{C}_7\text{H}_5\text{O}_5 \cdot \text{H}_2\text{O}$). Substance with an astringent taste. It occurs naturally in small quantities in galls, sumach, and divi divi. It is best prepared by Scheele's method; finely powdered gall-nuts are extracted with cold water and the separated solution is allowed to become mouldy. The fermentation thus set up converts, or hydrolyses, the tannin into gallic acid. It is also prepared by boiling tannin with dilute sulphuric acid. Gallic acid is used in medicine as an astringent, and in photography on account of its power of reducing gold and silver salts.

Gallican Church (Lat. *Gallia*, Gaul). National church of France. It arose under Irenaeus towards the close of the 3rd century, took definite shape as a state organization under Charlemagne, and was consolidated by decrees of Louis IX in 1226-70, the controversies between Philip IV and Pope Boniface VIII, and Louis XIV and Pope Innocent XI, the councils of Pisa, Constance, and Basel, and

the Pragmatic Sanction of 1438. At the instance of Louis XIV its principles were drawn up by Bossuet in a document which maintained that S. Peter's successors had power alone in spiritual things and that papal decisions were valid only with the consent of the whole Church.

This attitude of independence of Rome became known as Gallicanism and had its advocates in other countries. It was opposed by Ultramontaniam, or defence of Roman centralisation; but the Vatican has always regarded it as representing a contest between despotic rulers and corrupt ecclesiastics for church property, patronage, and influence, and by the definition of papal infallibility in 1870 it became a formal heresy.

The Gallican church was abolished at the Revolution of 1789, re-established under Napoleon, who maintained that the pope could not relieve French subjects from loyalty to their secular ruler, and finally severed from the state during the Third Republic. Its specific Gallicanism had become obsolescent before it ceased to be a national church. *See* Bossuet; Concordat; Fénelon; France; Jansenism; Jesuits; Lamennais;

Galley. Medieval Venetian trireme; the rowers sat in groups of three, the oars of each group passing through the same rowlock-port as seen in this model
From Vincenzi, "Le Triremi"

Ultramontane; consult also Church and State in France, A. H. Galton, 1907.

Galli-Curci, AMELITA (b. 1889). Italian-born American singer. Born at Milan, Nov. 18, 1889, she became a pianist, graduating at Milan conservatoire in 1903. In 1909 she made her debut as a soprano singer, and soon scored a great success in Italy, Spain, and S. America. By 1916

A. Galli-Curci,
Italian-born
American singer

her reputation as a coloratura was established and she took leading parts with the Chicago Opera Company, joining the Metropolitan Opera company in New York, 1919. She toured England in 1924 and 1930. Her popularity, based upon the extreme flexibility and brilliance of her voice, surmounted what critics termed musical inaccuracies and unequal dramatic interpretation.

Galliéni, JOSEPH SIMON (1849-1916). French soldier. Born at St. Béat, Haute-Garonne, April 24, 1849, he entered the army in 1870 as lieutenant of marines, taking part in the Franco-Prussian War, and later seeing active service in the Sudan and Indo-China. He was governor of Madagascar, 1896-1905, organized the island as a French colony, and published an account of this work in 1908. That year he became a member of the Conseil Supérieur de Guerre. During the First Great War he was appointed military governor of Paris, Aug. 26, 1914, saw to its fortifications, and rendered assistance to the French 6th army under Gen. Maunoury. He was named the Saviour of Paris, as his plan of sending troops to the front in Paris taxicabs helped to decide the victory of the Marne in Sept. In Oct., 1915, he was minister of war in the cabinet of Briand, but was compelled to resign by ill-health in March, 1916, and died May 27. He was posthumously created a marshal of France in 1921.

Gallienus, PUBLIUS LICINIUS EGNATIUS. Roman emperor A.D. 260-268. He was associated with his father, Valerian, in the government from 253, and succeeded him on his disappearance in the disastrous Persian campaign. Vain and frivolous, Gallienus was quite unfitted to rule. A separate "Empire of the Gauls" was created under Postumus, and the prince of

Palmyra, followed by his more famous wife Zenobia, carved what was, in effect, an independent kingdom out of the eastern portion of the empire. Hordes of Goths penetrated the N.E. frontier, while plague materially reduced the population of the empire. Usurpers arose in all parts, and while dealing with one of these, named Aureolus, Gallienus was murdered by his own soldiery.

Gallinaceous Birds (Lat. *gallus*, a cock). Name applied to game birds generally. It includes such groups as the pheasants, partridges, quails, and domestic fowls. They are found in practically all parts of the world, and are valued for the table. See Fowl; Grouse; Pheasant; Poultry.

Gallio. Roman Proconsul of Achaia in the 1st century A.D. He was a brother of the Stoic philosopher, Seneca. Paul was brought before him at Corinth. Amiable, accomplished, and of mild disposition, Gallio typified Roman impartiality towards the controversies of sects and parties. The phrase "he cared for none of these things" (Acts 18, v. 17) seems to imply this impartiality rather than to indicate hostility or indifference to Paul.

Galliot (late Lat. *galeota*, small galley). Type of Dutch trader somewhat akin to the British barge, and now almost obsolete. The galliot was a long, narrow, two-masted craft of about 100 tons burden. She carried a main mast and a mizzen, but the sail on the latter was of small area and used principally to assist in steering the vessel. The mainsail was short at the head and very long at the bottom.

Gallipoli. Seaport of European Turkey, in the vilayet of Adrianople (Edirne). Situated at the N.E. end of the Dardanelles, on the peninsula of the same name, it is 130 m. S.W. of Istanbul. It was the ancient Kallipolis, of which some ruins remain. Before the First Great War, it had a considerable trade in wheat, barley, maize, and linseed, produced in the neighborhood. Its capture by the Turks in 1354 gave them their first foothold in Europe. There are two good harbours, of which the Allies made full use during the Crimean War. The Russians improved the defences in 1878.

Gallipoli (Gr. *Kallipolis*, beautiful city). Seaport and city of Italy, in the prov. of Lecce. It stands on the Gulf of Taranto, on an island, protected by a fort and connected by a bridge with the

mainland, 25 m. W. of Otranto. It possesses an Angevin castle, and a cathedral dating from 1629. Formerly famed for its olive oil, stored and clarified in rock-cut cisterns, it exports wine and fruit, but the output of oil has declined. In the vicinity there are stone quarries. Tunny fishing is engaged in. As the "beautiful city" it was founded by Greeks, and in Roman imperial times was known as Anxa.

Gallipoli. Peninsula of Europe, now a part of western Turkey. Anciently known as the Thracian Chersonesus, this tongue of land is 52 m. in length from the isthmus of Bulair in the N. to Cape Helles (Helles Burnu), its S. extremity, and varies in width from 2 m. to 12 m., its broadest part, from Kilid Bahr, on the W. side of the Narrows of the Dardanelles, to Cape Suvla (Suvla Burnu), being measured from S. to N. The isthmus of Bulair is 3 m. across,

Gallipoli. General map of the district

with the Gulf of Saros on the W., and the S.W. end of the Sea of Marmara, above Gallipoli Strait, on the E. The isthmus is strongly fortified by the Bulair Lines.

The E. shore of the peninsula forms the W. side of the Dardanelles, and is of enormous strategic importance. Its W. shore fronts the Gulf of Saros on the N., and the Aegean on the S., opposite the island of Imbros, about 20 m. W. The peninsula is covered with rocky ridges and hills, some of which rise to a height of nearly 1,000 ft. The population is sparse.

The most important place in the peninsula is Kilid Bahr, from its military significance, at the foot of the Pasha Dag, 700 ft. high. Mohammed II, the Conqueror, who took Constantinople in 1453, founded it, and it came to be termed the castle of Europe, just as Chanak opposite it was called the castle of Asia. In the 17th century the Turks constructed fortifications at Sedd-el-Bahr, at the S. end of Gallipoli, and at Kum Kale, on the Asiatic side, at the entrance to the Dardanelles from the Aegean. See Achi Baba illus.

GALLIPOLI: THE CAMPAIGN OF 1915

H. W. Wilson, Joint Editor of The Great War

The Gallipoli expedition was an Allied venture of the First Great War which ended in failure and gave rise to considerable public controversy. The facts about the origin, conduct, and results of the military campaign are given here. For the preliminary naval operations see Dardanelles. See also Dardanelles Commission

On Jan. 2, 1915, the Russian government appealed to Great Britain for action against Turkey, in order to relieve the pressure on the Russian army in the Caucasus. A promise was given by the British government that a demonstration would be made, and after much discussion, the point at which it was to take place was fixed by the cabinet as the Dardanelles. This project gradually widened into a campaign for reaching Constantinople and opening the Black Sea, though in January, 1915, the Turkish forces in the Caucasus were beaten and forced back upon the defensive, so that the immediate danger to Russia passed. But the risk remained that she might collapse before the German attack in Poland, owing to the want of munitions, which she could neither manufacture nor import; and if the Black Sea could have been opened her forces could have been increased by some millions, and her artillery could have been provided with shells.

Plans of Attack

The first intention of the British was to deliver a purely naval attack, but, even before this had opened, it was decided on Feb. 16 that land forces must be available in the area "to be used as occasion might require." This decision committed the British government to some form of military enterprise. Withdrawal was impossible without loss of prestige, Lord Kitchener, then secretary for war, having originally declared no further troops could be spared for the East, now agreed to send the 29th division, still in the U.K., to Gallipoli instead of to France. Later, however, he hesitated again, and for a time allowed himself to be persuaded that the division was needed more urgently in the West. Winston Churchill, first lord of the Admiralty, who had been throughout the prime supporter of the Gallipoli project, pressed for immediate action, but Kitchener did not finally agree to release the 29th division until March 10.

On Feb. 19 the naval attack on the Turkish forts commanding the Dardanelles began and was prosecuted as weather permitted till March 18, with no result to the

Allies but heavy loss in men and ships. The Turks had been given such ample warning that they were ready, and, under the direction of Liman von Sanders, had thoroughly organized their defences. At the outset Venizelos, the Greek prime minister, was willing to join in the campaign, and offered the aid of the Greek fleet and Greek troops. But there was already a secret Allied understanding about Russia's claim to Constantinople, and Russia protested against any suggestion that Greek troops, and particularly the Greek king, should forestall her by entering that city as conquerors. The Greek king, Constantine, sympathetic to Germany through ties of blood, was quick to repudiate the Greek offer and to dismiss Venizelos. A Russian corps was held at Sevastopol ready to strike at Constantinople, but at the end of April it was withdrawn to meet the Austrians in Poland.

On March 12 Sir Ian Hamilton was appointed to command the Allied landing force which was to be held ready. He was promised by Lord Kitchener 80,000 men, of whom about 15,000 would be French. The instructions given by Lord Kitchener were of a casual character. He placed the Turkish force at only 40,000 men; he thought that the southern part of the Gallipoli peninsula, which was reported by those on the spot to be very strongly entrenched and

wired, was "open to a landing on very easy terms"; and he appears at that date to have expected the navy to clear the passage, leaving the expeditionary force only the duty of occupying Constantinople. His instructions forbade operations on the Asiatic coast, which, according to the French ex-military attaché at Constantinople, was the most vulnerable point, and he seems to have been responsible for the plan eventually adopted, of landing at the tip of the mountainous, roadless, and desolate Gallipoli peninsula, and fighting a way over its series of rocky heights, which were covered with thorny scrub, and almost waterless in summer.

The landing of the expeditionary force could not be carried out promptly, after the failure of the naval attack, as the transports had not been loaded in such a manner as to permit a rapid disembarkation on a hostile coast. Sir Ian Hamilton had no appliances, and his picked regular division, the 29th, had not arrived. He decided to withdraw the transports to Egypt, there to reload them.

The First Landing

Not till April 23 were they back at the Dardanelles, and on April 25 the landing took place, with a total force of about 90,000 British and French. No attempt was made to seize the Bulair isthmus, the most vital point if Gallipoli was to be secured. Feints were made by the French on the Asiatic coast, and by the British at several other points, but the main landings took place at open beaches on the Gallipoli peninsula. The arbitrarily chosen names of the landing beaches, e.g. V beach (Lancashire landing), X beach (Implacable landing), and Z beach (Anzac Cove), live in military history. The chief landings were in the region of Cape Helles, the extreme southern tip of the peninsula, but Z beach was isolated to the north of Gaba Tepe (see map). By great heroism, and in spite of very heavy losses, under cover of the fire of the fleet, the Allies established themselves ashore.

They found themselves short of artillery and ammunition, and still shorter of water, confronted by a superior Turkish force who were well entrenched, amply supplied with machine guns and artillery, and protected by barbed wire, holding a succession of six parallel ridges.

At the southern tip of the peninsula by May 5 the Allies were less than a mile S. of Krithia, but the

Gallipoli. Map showing the scene of the campaign

British loss to that date had been 13,979, and ammunition was running very low. On May 6 a second French division began to arrive, and the second battle of Krithia opened, but it brought only a trifling advance, purchased with heavy loss. The Australians at Gaba Tepe, lacking land communication with the rest of the Allied force, were violently counter-attacked by the Turks on May 10, and again on May 18-19. These attacks were repulsed, though not without difficulty. The Allies, in fact, were everywhere held in a siege war for which they lacked the necessary ammunition and equipment. The appearance of German submarines at the Dardanelles on May 25 endangered the whole expedition, but, fortunately, the German boats were very timidly used. On June 4 a general attack was delivered on the Turkish defences at Krithia, and was repulsed with severe loss, though on June 21 the French made a small advance. A week later, on June 28, the Australians improved their position, carrying five lines of trenches.

Attack on Achi Baba

On July 12 the Allies, who had now been reinforced by a fresh British division, delivered a frontal attack on the Turkish defences at Achi Baba, which was continued on the following day with no result but a small gain of ground and heavy losses. The British government had now, however, reluctantly decided to send out strong reinforcements which would raise the total strength of Sir Ian Hamilton's army to 100,000 effective infantry. These reinforcements were to be employed mainly in a new landing at, and an advance from, Suvla Bay, to turn the Turkish defences in the southern part of the peninsula, and in a vigorous attack from the Australian positions on the Turkish entrenchments about Sari Bair.

On Aug. 6 the Allies attacked in the S. of the peninsula to hold the Turks, and fighting there continued for six days with little result; simultaneously, the advance was begun from the Australian front on Sari Bair; and a landing was successfully effected at Suvla Bay, the Turks there being completely surprised. But at every point the operations miscarried. By Aug. 10 the Suvla attack had completely failed; it was renewed on Aug. 21 without a gleam of success. Before this last attack Sir Ian Hamilton telegraphed a request for 45,000 drafts and 50,000 new formation troops

in addition, which the British government was unable to grant. Lord Kitchener's hope that the Turks would run when British submarines passed up the Dardanelles had proved quite chimerical.

On Oct. 11 the government asked for an estimate of the losses likely to be involved in the evacuation of the peninsula, and when Sir Ian Hamilton replied that "we might have a veritable catastrophe," he was recalled, and replaced by Sir C. C. Monro. Kitchener himself visited the peninsula. The Allied force had fallen to 50,000 fit men; sickness was growing; the daily wastage was nearly 1,000; the enemy was being strongly reinforced, and with the German advance through Serbia there was every probability that at an early date heavy guns would reach the Turks and blow the Allies out of their positions. After great hesitation, on Dec. 8 the British cabinet ordered the evacuation of the Suvla and Anzac positions. This was carried out without any loss on Dec. 20, by a most brilliant operation. The plan, worked out by Gen. Birdwood, was to remove guns and other material by night while apparently holding positions as usual by day. The bombardment of the Turkish lines was maintained to as great an extent as was possible, and the enemy was deceived still further by bogus guns being emplaced in the positions of the real guns which had been taken away. The final embarkation was fixed for Dec. 18 and 19. On the latter day a covering attack was made by the forces in the Krithia area, at a cost of 283 casualties. By 5.30 a.m. on Dec. 20 the last man quitted the British trenches in the Suvla-Anzac area, the transports stole out of the bay, and the warships followed later. The evacuation was absolutely successful. The Turks were completely unaware of what had taken place, and went on bombarding the empty British positions.

Final Evacuation

On Dec. 27 the evacuation of the position at Cape Helles was sanctioned and was carried out on Jan. 8-9, 1916.

The very success of the first evacuation militated against the chances of a like success in the Cape Helles area. It was not to be expected that the enemy would be deceived a second time in the same way. Yet actually that was what happened, perhaps because the Turks never imagined that the same thing could be worked twice.

In the last days of 1915 the evacuation began—men, guns, and stores being taken down to the beaches of Helles, in the same way as at Suvla and Anzac, while the firing lines of the British appeared to be maintained precisely as if nothing of the sort was proceeding. The French made use of beach S, the British of the other beaches. On Dec. 29-31 the 52nd Division made a demonstration to throw dust in the enemy's eyes, and for some days afterwards a fairly constant and heavy fire was kept up all along the Allied front. Two nights were allotted to the final embarkation—Jan. 7 and 8.

Bad weather made the final steps of the evacuation very difficult, the landing-stages and connecting piers being washed away. But the storm had at least the effect of covering the final withdrawal from the enemy, who, as at Suvla-Anzac, had no notion that the Allies had evacuated Gallipoli. The first intimation that reached him was conveyed by the blazing on the beaches of the stores which had been left behind, and which had been fired simultaneously by time-fuses. Then he heavily shelled the abandoned beaches and trenches, nor did he cease firing until the sun rose and revealed that the Allies had got clear away. The total casualties incurred in the operation amounted to one man wounded. The one unequivocal and perfect success of the Gallipoli Expedition was the evacuation of the peninsula.

Causes of the Failure

From first to last 468,987 men were employed by the British, with losses of 33,522 killed, 7,636 missing, and 78,420 wounded, in addition to an enormous total invalided. The French force employed was probably over 80,000, with proportionate casualties. The causes of the failure include inadequate strength—for the Allied forces were thrown in piecemeal, and there were never more than 100,000 infantry available; defective ammunition supply; and the defiance of principles of naval and military strategy. There were some who declared that these operations diverted men and munitions from France at a critical time, but this was a controversial statement. Certainly the failure encouraged Bulgaria to throw in her lot with the Germans. At the same time it is true that the Gallipoli campaign prevented the Turks from concentrating against Russia, and inflicted upon them very heavy losses, totalling, according to

Liman von Sanders, 66,000 killed and 152,000 wounded.

On Nov. 8, 1918, under the conditions of the armistice with Turkey, the Gallipoli forts and peninsula were occupied by British troops, and on the following day the first British ships since the outbreak of war passed up the straits for Constantinople.

Bibliography. Reports of the Dardanelles Commission, 1917-18; Gallipoli Diary, Sir Ian Hamilton, 1920; Gallipoli, John Masefield, 1923; Official History of the Great War—Military Ops.: Gallipoli, Brig.-Gen. C. F. Aspinall-Oglander, 2 vols., 1929-31; The World Crisis, Winston S. Churchill, 1923-29 (vol. ii).

Gallium. Metallic element of the aluminium group. It was discovered in 1875 by Lecoq de Boisbaudran, who found it in some zinc blende from the Pyrenees. Extremely rare, it may be found in traces in blendes, some magnetites, iron, aluminium ores, etc. It can be isolated chemically or electrolytically. The metal is crystalline, similar to steel in colour, but like tin when melted. It melts at the low temperature of 30° C. and will remain liquid down to room temperature.

Gallium, symbol Ga., has the atomic number 31; atomic weight 69.72; and the crystal structure is orthorhombic with 8 atoms in the unit cell. The metal does not readily oxidise, but reacts with chlorine, bromine, and iodine; is dissolved rapidly by hydrochloric acid and more slowly by nitric acid; and forms numerous salts. It is frequently found in amounts between 0.01 and 0.03 p.c. in aluminium prepared from bauxite. Gallium has been added to low melting alloys with indium, and these alloys may have applications in surgery.

Gall Midge. Group of true flies (family Cecidomyiidae) which cause gall-formation on plants. They are minute, delicate insects with antennae bearing whorls of long hairs and almost veinless wings. Their larvae or grubs cause the terminal rosette galls common on hawthorn and willow and the pinkish pustules on the leaves of meadowsweet.

Gallon. British standard measure of liquid and dry capacity. The exact volume of the gallon has varied from time to time, that of Henry VII being 274½ cu. ins., and the wine gallon of Queen Anne, 1707, being 231 cu. ins., but it became standardised by the Act, 5 Geo. IV, c. 74, in 1824, as containing 277.274 cu. ins. This figure

was fixed by taking the volume of 10 lb. of distilled water measured at barometric pressure 30 ins. and temperature 62° F.

The gallon is divided into four quarts or eight pints, and equals 4.54346 litres. Two gallons make one peck. The gallon in the U.S.A. and Canada is that of Queen Anne, 231 cu. ins. The word itself is of doubtful origin, possibly connected with the French *jale*, bowl, the -on being augmentative, and thus meaning a large bowl.

Galloon (Fr. *galon*, Span. *galón*). Worstid lace or trimming of cotton or silk, or woven with a metallic thread. It is used on uniforms.

Galloway. District of S.W. Scotland. Comprising the counties of Kirkcudbright and Wigtown, it is now divided into three portions—East, West, and the Rhinns of Galloway, a double peninsula of Wigtownshire. It is noted for a celebrated breed of horses and hornless cattle. It gives its name to a div. returning one M.P. S. R. Crockett put the scenic background into his novels. A scheme to supply electric power by harnessing the river Dee was completed in 1934, the river being dammed at Clatteringshaw.

Galloway, MULL OF. Promontory, the extreme S. point of Scotland. It has a lighthouse (86 ft. high), and there are remains of Scandinavian defences and the chapel of S. Medan, which was erected around a natural cave.

Gallowglass OR **GALLOGLASS.** Name given to the members of the armed retinues of ancient Irish and Scottish chiefs. They were heavy-armed foot soldiers, in contrast with the kerns or caterans, who carried only light weapons. The word is an adaptation of the Gaelic *gall-oghlach*, meaning a foreign servitor.

Gallows. Apparatus used for the execution of criminals. It consists usually of two posts with a horizontal beam, to which is fastened the execution rope. In some forms of gallows there is only one upright post, with a projecting beam. These are more generally called gibbets, and from them were hung malefactors in chains as a warning to others. Until the passing of the Act of 1868 gallows were erected in public, the most notorious being

those at Tyburn, and in front of Newgate. The criminal was slowly strangled, the trap-door and drop being modern. See Execution.

Gall-stones OR **BILIARY CALCULI.** Masses consisting chiefly of cholesterol and bile-pigments which are formed in the gall-bladder, and much less frequently in the substance of the liver. In the gall-bladder the number of calculi may vary from a single stone, perhaps measuring as much as four inches across, to many hundreds of small stones; those formed in the liver are usually small grains.

The cause of gall-stones is catarrhal inflammation of the mucous membrane of the gall-bladder. This inflammation is set up by micro-organisms in the presence of an overplus of cholesterol or bile pigment with sluggish bile flow. Often the condition follows an attack of typhoid fever. "Every gall-stone is a tomb-stone." The formation of gall-stones is rare in those below 25 years of age and most frequently occurs after 40. Women are more liable to the condition than men. Lack of exercise, over-eating, and constipation are predisposing factors, but in addition there is some biochemical reason which determines an error in the chemistry of cholesterol.

Gall-stones may exist in the gall bladder for years without causing any symptoms. The presence of small stones and "biliary sand" may give rise to spasmodic pain, generally attributed to dyspepsia but in reality caused by cholecystitis. The passage of a stone may set up violent biliary colic, agonising pain, vomiting, sweating, and collapse. If the stone passes into the intestine

the symptoms abate suddenly, but if the calculus becomes impacted in the common bile duct (the channel leading from the gall-bladder to the intestine) distress continues and intense jaundice ensues. This impacting of a stone demands surgical intervention. The medical treatment of biliary colic consists in relieving the pain by hypodermic injections of morphia (possibly in the form of pethidine) and by giving belladonna and sodium salicylate by mouth. In a convalescent patient, magnesium sulphate (Epsom salts) prevents the stagnation of bile.

Gallows. Wayside gibbet once used for malefactors

Gallup Poll. A referendum to measure public opinion, named after the American Dr. George Gallup, who developed the technique. The method was to sound the opinions of a relatively small number of persons carefully chosen to be representative of larger groups. Those to whom the questions were addressed included people of all ages, political and religious opinions, income groups, and occupations, in the same proportion as these groups were found to exist among the whole population. Gallup founded the American institute of public opinion in 1935, and similar institutes came into being in many other countries. In 1945 and 1950 Gallup polls forecast the voting in British general elections within 2 per cent.; but all such polls showed a marked failure to estimate voting in the 1948 U.S. presidential election.

Gallus, GAIUS CORNELIUS (d. 26 B.C.). Roman poet, born at Forum Julii (Fréjus) in Gaul. His distinguished public career, under Augustus, culminating with the governorship of Egypt, was brought to an abrupt conclusion by his disgrace, leading to loss of his estates and suicide at the age of 43. His works, four books of love poems, are lost, but there is no doubt of his eminence in Latin literature. In technique Gallus was ranked with Horace and Virgil.

Gallus, TREBONIANUS. Roman emperor, A.D. 251-253. Governor of Lower Moesia during the campaign of his predecessor Decius against the Goths, he is blamed for deliberate failure to effect a junction with Decius, which led to the defeat and death of the latter in

Trebonianus Gallus,
Roman emperor

the marshes of the Dobruja. Proclaimed emperor, Gallus concluded a humiliating peace with the Goths, and proceeded to Rome, but in 253 he was defeated and slain at the battle of Interamna (Terni) by the usurper Aemilianus.

Gall Wasp. Group of hymenopterous (membrane-winged) insects, nearly related to the wasps, and often incorrectly called gall flies. They are all very small, either black or brown; usually the insect in its larval stage is parasitic on plants. The galls found on the

stems and leaves of many trees are often caused by the attacks of these insects; though certain beetles, flies, and aphides also cause them.

The female gall wasp pierces the outer skin of the leaf or stem with her ovipositor, and leaves an egg in the wound. The presence of this egg, or of some fluid accompanying it, causes the plant to develop an abnormal growth of tissue around it, which soon assumes the appearance of the familiar gall. In this the larva lives and feeds, only emerging as it reaches maturity. Each species of gall wasp affects one particular plant and keeps to it, and the resulting galls are characteristic of both plant and insect. One of the most familiar is the oak marble gall, which is hard and spherical; but there are many other and diverse forms found on the oak, including the oak apple. In the wild rose, the gall takes the form of a mossy outgrowth, known as a bedeguar, usually containing larvae. Many gall-wasps exhibit the phenomenon of alternating generation: sexual propagation and parthenogenesis taking place in turn.

Galop (Fr.). Dance popular in England at the end of the 19th century. It is danced to two-four time, the movements being a quick sliding step down the room and then one of rapid revolution.

Galston. Police burgh and parish of Ayrshire, Scotland. It stands on the Irvine, 5 m. E. by S. of Kilmarnock on the railway. The centre of a colliery and agricultural district. Galston has muslin, lace, and blanket factories. Market day, Wed. Pop. 4,825.

Galsworthy, JOHN (1867-1933). English novelist and dramatist. Born at Coombe, Surrey, Aug. 14, 1867, he was educated at Harrow, and at New College, Oxford. Called to the bar in 1890, he did not pursue law, but travelled extensively and devoted himself to writing, at

John Galsworthy,
English novelist
and dramatist

first under the pseudonym of John Sinjohn. His early stories attracted only little attention, as did his novel *The Island Pharisees*, pub-

Gall Wasp. Galls formed
on oak by *Cynips Kollari*

lished under his own name in 1904. Two years later the first novel in what was to become the Forsyte Saga (q.v.) launched him on his career as a social chronicler, with every accomplishment that observation and feeling could bestow; while his play, *The Silver Box*, produced the same year, placed him at once among the first dramatists of his time as one who could direct an almost flawless technique to serve an original and arresting theme.

The Forsyte Saga and its sequels remain his greatest contribution as a novelist. Other novels were *The Country House*, 1907; *Fraternity*, 1909; *The Patrician*, 1911; *The Dark Flower*, 1913. He also published volumes of collected short stories, some of which, notably *The Apple Tree*, take their place among the most accomplished of their kind.

His plays were perhaps more immediately expressive than his novels of the workings of his finely balanced mind, one that was unusually sensitive in its perception of both sides of a question, moral or social, and by holding the scales with scrupulous fairness could make an indictment seem the more damning. *The Silver Box* raised problems of social injustice as between rich and poor; *Strife* (1909) poised the relations of capital and labour. *Justice* (1910) so forcefully presented the tragedy of the wrongdoer, crushed by the penal system rather than by human persecution, that it resulted in some immediate reform of the evils he displayed, notably in the matter of solitary confinement. Other plays include *The Pigeon* (1912); *The Mob* (1914), a study of altruism pitted against mass passion; *The Skin Game* (1920), ostensibly dealing with the clash of the older and newer ruling classes but actually revealing in subtle allegory all the standards England had lost in the recent war; *Loyalties* (1922), another characteristic presentation of conflicting passions not confined to the central theme of Jew versus Gentile; and *Escape* (1920), showing specimens of the normal world in reaction to the abnormal in the form of a hunted convict. All Galsworthy's plays were collected in a single vol., 1929.

Galsworthy refused the offer of a knighthood in 1918, but was

awarded the O.M. in 1929, and received the Nobel prize for literature in 1932. He played a considerable part in the campaign for the humane slaughtering of animals, and his great desire for better international understanding led to his very practical interest in the P.E.N. club. Consult John Galsworthy, H. Ould, 1934; *Life and Letters of J. G., H. V. Marrot, 1935*; *Memories of J. G. by his sister, M. E. Reynolds, 1936*.

Galt. City of Ontario, Canada. In Waterloo co., it lies 25 m. W. of Hamilton and 60 m. S.W. of Toronto, being served by C.P.R. and C.N.R. It makes edged tools and farm implements for the surrounding agricultural district. It was named after John Galt (c.i.). Pop. 15,346.

Galt, Sir ALEXANDER TILLOCH (1817-93). Canadian statesman. Son of John Galt (v.i.), he was born Sept. 16, 1817, emigrated to Canada in 1835, and took part in the development of Quebec. In 1849 he entered the Canadian legislature, and during 1858-62 and 1864-67 was finance minister.

Sir A. T. Galt,
Canadian statesman

He made the financial arrangements of the dominion when established in 1867, and was its first finance minister. During 1880-83 Galt was high commissioner for Canada in London. He died at Montreal, Sept. 19, 1893.

Galt, JOHN (1779-1839). Scottish novelist. Born May 2, 1779, at Irvine, Ayrshire, he was a clerk at Greenock, first in the customs and then in a mercantile house. Having travelled abroad, in 1813 he issued his *Letters from the Levant*, and in 1821 *Annals of the Parish*, his best known book. There followed *The Entail, 1823*; *The Omen, 1825*; and *The Last*

of the *Lairds, 1826*. Galt was in Canada, 1826-29, as agent of the Canada Company. Later he brought out *Lawrie Todd, 1830*, and *Boyle Corbet, 1831*, novels of settler life. He died April 11, 1839. Consult John Galt, J. W. Aberdein, 1936; *Novels of John Galt, F. H. Lyell, 1943*.

Galton, Sir FRANCIS (1822-1911). British anthropologist and meteorologist. Born near Birmingham, Feb. 16, 1822,

Sir Francis Galton,
British scientist

a cousin of Charles Darwin, he studied medicine, travelled in the Sudan, 1846, and explored Damaland, 1850. He formulated a theory of anticyclones and introduced new methods of weather-charting, embodied in *Meteorographica, 1861*, from which arose his long association with the Meteorological Council. His works, *Hereditary Genius, 1869*, and *Inquiries into Human Faculty, 1883*, established the principles of what he termed eugenics, in furtherance of which he founded a laboratory, 1904, bequeathing £45,000 for a chair in London. He devised composite portraiture and systematised finger-print methods. He was knighted in 1909, and died Jan. 17, 1911. (See *Finger Print*.) An autobiography, *Memories of My Life*, appeared in 1908; *Life and Letters*, ed. K. Pearson, 1931.

Galtonia. Small genus of bulbous herbs of the family Liliaceae. Natives of S. Africa. they have more or less erect strap-shaped leaves, about 30 ins. long. They have also a tall scape (4 ft.) bearing at its summit a loose truss of drooping bells which, in *G. candidans*, the better known of the two species, are pure white and fragrant.

Galty OR **GALTEE.** Range of mts. in Eire. It extends for 15 m. in an E. to W. direction through the counties of Tipperary and Limerick. Galtymore, the highest peak, attains 3,015 ft.

Galuppi, BALDASSARE (1706-85). Italian composer, born on the island of Burano, near Venice, Oct. 18, 1706. He became famous as a composer of light operas, frequently in collaboration with Goldoni. His works enjoyed popularity in England, particularly *Alexander in Persia*, performed 1741, and *Il Filosofo di Campagna*, performed as *The*

Guardian Trick'd, 1761. Master of music in S. Mark's, Venice, from 1762, he died Jan. 3, 1785. R. Browning's poem, *A Toccata of Galuppi's*, has helped to keep his name alive.

Galvani, LUIGI (1737-98). Italian physiologist. Born at Bologna, Sept. 9, 1737, he became in

Galvani

1762 professor of anatomy at Bologna university, resigning for political reasons in 1797. By experiment, largely on frogs, he discovered animal electricity, and his investigations are commemorated in certain electrical manifestations and terms, e.g. galvanism and galvanometer. His work *On the Force of Electricity in Muscular Movement* was published in 1791. He died Dec. 4, 1798. His collected works were pub. at Bologna, 1841-42.

Galvanic Battery. Name given to a cell for producing electricity by chemical action. The name voltaic cell is now generally used in place of galvanic battery. Both names are derived from those of the electrical pioneers, Galvani and Volta. See *Cell*.

Galvanising.

Method of coating iron with zinc. It was devised by Malouin, French chemist, in 1742. In galvanising, the zinc coating does not merely lie on the surface of the iron as a sheet of paper might, but actually combines or alloys with the iron, penetrating the latter to an appreciable extent. The modern process is in all essentials as proposed

Galtonia leaf and truss of bell-shaped flowers

by Malouin, the principal departure being the use of sal-ammoniac as a covering to the molten zinc and as a flux, a modification patented by Crawford in 1837.

Today the process is chiefly applied to the coating of thin sheets of iron or steel intended to be used for roofing and other building purposes, and to wire. Sheets are usually delivered black with the scale on them to the galvanising works, where the scale is removed, then dipped in a "pickle" of

hydrochloric acid or hot sulphuric acid, withdrawn, washed with water, often rubbed with sand, and then passed through a bath of molten zinc covered with sal-ammoniac. As the sheets emerge they are scrubbed with revolving wire brushes. When desired, the sheets are subsequently corrugated. Wire for galvanising is reeled continuously through both the pickle trough and the zinc bath. Wire netting is woven white black and then galvanised. For the best sheets 2 to 3 p.c. of tin is added to the zinc. The proportion of zinc taken up by the metal may range from 25 p.c. in fine wire to 6 p.c. in anchors, chains, and other large objects.

Galvanised sheets cannot be employed in contact with acids or caustic alkalis or for the preparation of containers for food products where organic acids may be present. (See Zinc.)

A modification of this "hot-dip" process is electro-galvanising, in which the protective coating of zinc is produced by electroplating (*q.v.*). The electrolyte is usually an acid solution of zinc sulphate; for complicated parts, an alkaline zinc cyanide bath may be used. The anode is pure zinc.

Galvanism. Use for medical purposes of the galvanic current, *i.e.* electricity produced by chemical action. The subject is treated under Electrotherapeutics.

Galvanometer. Instrument used for the detection or measurement of small electric currents. The force deflecting the pointer (or other indicator) may be due to either the electro-magnetic or the thermal properties of a current; while the controlling force which limits the deflection is a spring or gravity control in ammeters and voltmeters and the torsion of the suspension in suspended or moving coil galvanometers. In moving needle galvanometers the restraining force is provided by the earth's (or other permanent) magnetic field.

Fig. 1 (a) gives a diagrammatic representation of the features of a suspended coil galvanometer. The coil C is suspended at its upper end by a thin phosphor bronze strip P (which has a smaller torsional control than a wire of equal mechanical strength), and attached at its lower extremity to a loosely coiled spiral L. The current to be measured or detected is led to and from the instrument via the terminals T₁ and T₂ which are electrically connected to P and L respectively. The coil moves be-

Galvanometer. 1. Diagrams showing principle of a suspended coil galvanometer. 2. Moving needle instrument. For lettering, see text

tween the curved poles N and S of a permanent magnet (Fig. 1 b) and is provided with a central soft iron core I so that a radial magnetic field is produced, as indicated by the dotted lines.

This device results in the deflecting couple remaining constant over quite large rotations of the coil and so the angle of deflection is strictly proportional to the current flowing. The mirror M reflects a spot of light from a lamp on a distant scale.

In the moving needle instrument (Fig. 2) an astatic arrangement of magnets is employed and two fixed coils C₁ and C₂ are arranged so that the deflecting forces of the currents are in the same sense but the controlling forces on the two suspended magnet systems are in opposite directions because of the field of the permanent magnet AA.

In order that the deflections of a galvanometer should be observed in the minimum time, some form of damping device is provided in the moving needle instrument by the use of a light vane V (Fig. 2) at the lower end of the suspension. V moves in the small air space between the two plates B₁ and B₂ and suffers viscous damping.

These instruments are unsuitable for measuring alternating currents, but a moving coil instru-

ment known as the Einthoven string galvanometer is employed for this purpose. Here the coil is replaced by a conductive fibre or a fine wire (0.01 mm. diameter) which is maintained taut in a narrow gap between the poles of an electro-magnet. The deflection of the fibre (or wire) is observed by a microscope or by projection on to a screen or photographic film. The period of such an instrument is necessarily small, 0.01 sec. or less.

Alternating currents may also be measured indirectly by their heating effect in a subsidiary coil, which raises the temperature of a thermo-junction forming part of the loop of a galvanometer moving coil. The resulting direct current in the latter coil will react with the magnetic field in which it is suspended and will suffer deflection.

Galveston. City and port of entry of Texas, U.S.A. The co. seat of Galveston co. lies across the E. end of Galveston Island at the entrance to Galveston Bay. It is 49 m. S.E. of Houston and is on five main rlys., a canal, two causeways, and the Canada-to-Gulf highway; it also has an airport. The "oleander city" faces the Gulf of Mexico to the S. and has a harbour in the bay to the N. It is the second port in the U.S.A. by volume of foreign commerce and one of the principal ports in the world for cotton and sulphur. It exports wheat, cotton seed oil, copper and iron ore, lumber and timber, crude and refined oil, etc.

Galveston has unequalled facilities for storing cotton. Grain ships can be loaded in a single day. There are large dry dock and ship repair services. Other industries are tin smelting, wire making, oil refining, flour milling, iron and cement working. Here are the schools of medicine and nursing of Texas university, also an R.C. university and schools. A seaside resort with an annual mean

perature of nearly 70° F., Galveston welcomes a million visitors a year to its beaches.

First visited by Spaniards about 1781 and named probably in honour of Bernardo de Galvez, governor of Louisiana, Galveston was settled for the U.S.A. in 1837 and incorporated in Texas two years later. During the Civil War it was blockaded by the Federal navy, which occupied it Oct. 8, 1862, but it capitulated to the Confederates Jan. 1, 1863. In 1885 the city was badly damaged by fire, but a greater catastrophe was the hurricane of Sept. 8, 1900, which flooded the city to a depth of 16 ft., killed 8,000 people, and did damage estimated at £4,000,000. A wall higher than the high-water mark of that storm was built, and justified itself in 1915 when a storm of greater velocity caused no loss of life. In 1901 Galveston instituted the commission form of local government. Pop. 60,862.

Galveston Bay. Inlet of the Gulf of Mexico. Protected by the island of Galveston and by a narrow promontory stretching W.S.W., it extends inland for about 35 m.

Galway. County of Eire, in the province of Connacht. Its area is 2,293 sq. m., the second largest (after Cork) of the Irish counties. It has a coast-line of about 400 m. on the Atlantic, where are several bays with excellent harbours, and off which are a number of islands; the former include Killary, Kilkieran, and Galway; the latter include the Aran Islands, Inishbofin, Gorumna, and Lettermore.

The county is one of the wildest and most beautiful parts of Ireland, especially its western portion. The E. part is flat and boggy; the W., known as Connemara, contains the mountain group of the Twelve Pins. Joyce's Country is an adjacent mountainous district, while a third is called Iar Connacht. In the S. are the Slieve Aughty mts. and a stretch of the Golden Vale; on the N. there is another fertile area.

The Shannon flows along the borders of the county, which has few other rivers. Lough Corrib is the most notable lake; it is 4 m. from Galway and is about 50 sq. m. in area. On it are a number of inhabited islands. The chief industries are the rearing of cattle, sheep, and poultry, while there are many fishermen here. Oats and potatoes are grown, limestone and black and red marble are worked, and there are some manufactures of linens and woollens. The chief

places are Galway, Ballinasloe, Loughrea, Tuam, Oughterard, Clifden, Athenry, Portumna, and Gort. There are cathedrals at Tuam and Clonfert. A number of small places are visited by tourists and sportsmen. There are prehistoric remains on the Aran Islands. Nine members are elected to the Dáil. Pop. 166,231.

Galway. Seaport, market town, and county town of Galway, Eire. It stands on the N. side of Galway Bay, at the mouth of the Corrib, and is 133 m. W. of Dublin on the Eire state rlys. It has a good harbour. There are some interesting old buildings, several, including Lynch Castle, in the Spanish style. The town is divided into old and new portions.

The chief church is S. Nicholas, founded 1320, which for long had a college attached to it. S. Augustine's is modern. As the chief town of Connacht, Galway has a university college. This was founded as Queen's College in 1845. The town has fisheries and a considerable shipping trade; its other industries include flour mills, distilling, marble polishing, and recently making women's hats. Owing to its situation on the most W. harbour of the British Isles, it has often been proposed as a great Atlantic packet station. For purposes of local government Galway is an urban district. Market days, Wed. and Sat. Pop. 18,294.

Galway Bay. Inlet on the W. coast of Eire, between cos. Clare and Galway. It is protected at the entrance by the Aran Islands, which form a natural breakwater against the storms of the Atlantic Ocean. Its length is 30 m., and its breadth at entrance 22 m.

Galway, GEORGE VERE ARUNDELL MONCKTON-ARUNDELL, 8TH Viscount (1882-1943). British administrator. He was descended from a family holding an Irish peerage since 1727, and his father, 7th viscount, was created a peer of the U.K. as Baron Monckton in 1887. George was born March 24, 1882, educated at Eton and Christ Church, Oxford, had a distinguished military career from which he retired in 1929, and succeeded to the title in 1931. He was governor-general of New Zealand 1935-41. He died March 27, 1943, and was succeeded in the peerage by his son Simon (b. 1929).

Gama, VASCO DA (c. 1460-1524). Portuguese navigator. Born at Sines of an ancient noble family, he took to the sea as a lad. He commanded the expedition sent by Emanuel I to find a sea

route to India round S. Africa; four ships sailed from the Tagus, July 9, 1497, rounded the Cape, touching at Natal on Christmas day, 1497, and crept up the E. shores of Africa to Malindi, whence going E., they sighted the Malabar coast at Calicut, May 20, 1498.

In 1502 he sailed again to the E. with ten vessels, to take vengeance for the murder of crews left at Calicut by Cabral. Da Gama sacked the town, explored the coast as far as Cochin, and returned home with merchandise. In 1524 he was appointed viceroy of India, but died of fever at Cochin on Dec. 24. More than anyone he was responsible for the age of Portuguese prosperity, and he is the hero of the Lusians of Camoens. Consult *Three Voyages of Da Gama and his Viceroyalty*, C. Correa, 1869; V. da G. and his Successors, K. G. Jayne, 1910.

Gamaliel (d. c. 52). Jewish rabbi. The grandson of Hillel, he was an important member of the Sanhedrin. S. Paul attended his school at Jerusalem, as a youth. Famed for his learning, piety, and tolerance, he urged that the early preachers of Christianity should not be interfered with. The legend of his conversion to Christianity has no foundation.

Gamba (Ital., leg.). (1) Abbrev. of viola da gamba, one of the large viols, played between the knees of the performer. (2) Organ stop, usually of 8 ft. pitch, with a reedy tone like that of the stringed instrument. See *Organ*; *Viol*.

Gambella. Town of Abyssinia, 160 m. E. of the Sudan frontier. It is situated on the Baro, a tributary of the Sobat, which is navigable during the summer floods; steamship services connect it with Nasir and Khartum. By a treaty of May 15, 1902, it was leased to the Sudan government as a trading station, with the proviso that it should not be militarily occupied. During the Second Great War Gambella was the centre of an operation in March, 1941, falling to British troops on the 23rd.

Gambetta, LÉON (1838-82). French statesman. Born at Cahors, Lot, April 2, 1838, his father being a grocer of Genoese origin, he became a law student in Paris, and was early prominent for his republican enthusiasm. Called to the bar in 1859, in 1868 he made a deep impression by his defence of the journalist Delescluze, who had been prosecuted for proposing a monument to Charles Baudin, killed in the *coup d'état* of 1851.

Elected to the chamber in 1869, Gambetta became a leader of the uncompromising anti-imperialist party. A speech attacking the Ollivier ministry in 1870 helped to bring about the May plébiscite on the proposed constitutional changes.

When the news of Sedan arrived, Gambetta proclaimed the Third Republic, and became minister of the interior, Sept. 4, 1870. On Oct. 7 he escaped from the besieged capital in a balloon, and joined the government at Tours as minister of war as well as of the interior.

At Tours, and later at Bordeaux, aided principally by de Freycinet, he showed astounding energy, in most adverse circumstances, in levying and equipping fresh armies and organizing plans of national defence. Elected to the national assembly for Strasbourg, he resigned office when the surrender of Alsace was acquiesced in, and retired to Spain.

In the summer he returned to politics, founding the newspaper *La République Française* in Nov., 1871. Henceforth his energies, popularity, and oratorical gifts were directed towards consolidating the new republic against monarchist influences, and he was a determined opponent of MacMahon and the clerical reactionary party during his presidency. Gambetta was elected president of the chamber of deputies in Jan., 1879, and under Grévy's presidency was premier from Nov., 1881, to Jan., 1882, resigning on the defeat of his proposals for electoral reform. An accidental wound from a pistol brought about his death at his villa, near Sèvres, Dec. 31, 1882. The Gambetta monument in the Place du Carrousel, Paris, by Boileau and Aubé, was erected in 1886. On Nov. 11, 1920, to mark the jubilee of the republic, Gambetta's heart was buried in the Panthéon. *Consult* Life, P. Deschanel, 1920; Gambetta and the National Defence, J. P. T. Bury, 1936.

Gambia. River of W. Africa. It rises in Futa Jallon in French Guinea, flows generally westward for over 500 m., and falls into the Atlantic at Bathurst. At its estuary it is 12 m. broad, and it is navigable for 300 m.

Gambia. British colony in W. Africa. It is situated on both sides of the lower portion of the river Gambia, below the Falls of Barra Kunda, and includes the colony of St. Mary's Island and the five provinces, North Bank, South Bank, etc., which form a protectorate. The area of the colony proper is 69 sq. m., and that of the protectorate, which extends 250 m. inland is 3,999 sq. m. In 1618 James I granted a charter to a trading company which built Fort James, and in 1631, 1662, and 1783 other companies were founded. Formerly part of the W. African Settlements, Gambia was made a separate colony in 1888. The capital is Bathurst (*q.v.*), on the island of St. Mary. Exports are chiefly ground-nuts, rubber, rice, hides, wax, and palm kernels. During the Second Great War there was troop movement in autumn, 1942, when the bluff of an impending attack on Dakar (*q.v.*) was staged. Troops from Gambia served with distinction in Burma against the Japanese. Pop. 185,150, Mandingos, Jolas, Varahulis, and Fulas; mostly Mahomedans.

Gambier, GAMBIR, OR PALE CATECHU. Extract prepared from the leaves and young shoots of *Uncaria gambier*, a climbing shrub which grows in the Malay Archipelago. The leaves are boiled with water, the decoction being evaporated to a thick syrup and allowed to set. Gambier is used chiefly for tanning, the purer qualities being employed in medicine as an astringent. The Malays use gambier, in combination with areca and betel, for chewing.

Gambier. Group of seven small islands in the Pacific Ocean, belonging to France. They lie in lat. 23° 12' S., and long. 135° W. Total land area 6 sq. m. The

largest island is Mangareva, and all are of coral formation. The inhabitants are mostly Roman Catholic converts, with some immigrants from Easter Island. Pop. 1,504.

Gambier, JAMES GAMBIER, BARON (1756-1833). British sailor. Born at New Providence, Bahamas, Oct. 13, 1756, he went to sea at 11 years of age. In 1778 he was captured by the French admiral d'Estaing, but was released after a few months, and was present at the relief of Jersey, 1779, and at the capture of Charleston, 1780. In 1794 he commanded the *Defence*, which, in the battle of June 1, was the first to break through the enemy's line. In 1795 he was promoted rear-admiral and a lord of the admiralty, becoming vice-admiral 1799. In 1800 he was commander-in-chief at Newfoundland, and in 1804 returned to the admiralty. Here he ordered the discontinuance of the rule enjoining officers to enforce the salute from all foreign vessels within the king's seas, an order in force since the reign of John.

In 1805 he became admiral, and in 1807 sailed to the Baltic, bombarding Copenhagen and capturing the Danish fleet. For this he was raised to the peerage. In 1809 he commanded the Channel fleet when Lord Cochrane attempted to destroy the French fleet by fire-ships, an operation of which Gambier disapproved so strongly that he refused to help Cochrane, and himself demanded a court-martial for his failure of duty. He was acquitted, and retained his command until 1811, being promoted admiral of the fleet in 1830. He died April 19, 1833.

Gambit. Method of opening a game of chess in which by the sacrifice of a pawn or piece in one of the early moves a player seeks to obtain some advantage over his opponent. There are the king's gambit, queen's gambit, king's knight's gambit, etc. If the opponent declines to take the piece offered, this is a "gambit

Gambia. Map of the British colony and protectorate in West Africa

declined." The term comes from the Italian phrase *dare il gambetto* to trip up (*gamba*, leg).

Gambling. Staking money or other valuable commodity upon the as yet undecided issue of an event, particularly of a sporting event or of a game. The practice is of undiscoverable antiquity, but has always been discountenanced by the statute law of civilized communities.

Greeks and Romans had two principal games of chance, both played with dice. *Tesserae* were cubes, the faces marked I to VI as in modern dice, the points on the opposite faces totalling 7; the game was played with 3 *tesserae*, shaken and thrown from a turret-shaped box upon the board; the highest throw, called *Venus*, was of 3 sixes, the lowest, or dog's throw, of 3 aces. *Tali*, or knucklebones, were oblongs, with two of the long sides broader than the others, and numbered 3 and 4, the narrower pair marked 1 and 6, and rounded ends unmarked. Four *tali* were used, the highest throw being when all showed different numbers, the lowest when all came out the same. Odd and even, head and tails, and mora, and an early form of backgammon were other games of chance in classical times. Games of chance were prohibited by law except during the *Saturnalia*, but gambling was rife in Rome.

According to Tacitus, the ancient Germans were bewitched with the spirit of play to an exorbitant degree. Their modern descendants were not innocent of the same vice, Wiesbaden, Homburg, and Baden-Baden being notorious gaming centres until their gambling-houses, with all the others in Germany, were abolished in 1872.

Cards were used for gambling there as they had been in England; in Belgium, at Spa, and Ostend, upon the suppression of the German houses, until suppressed there too in 1902; and as they still are in France at such resorts as Aix-les-Bains, Trouville, Biarritz, and especially in the principality of Monaco, the Mediterranean paradise in which roulette, trente-et-quarante, and rouge-et-noir are the triple-headed serpent. Systems innumerable have been devised by gamblers to render winning certain at all the games of chance, but never one of which the fallibility cannot be proved mathematically, or which cannot be defeated by the advantages reserved by the bank as in fixing the maximum which it will pay on

any chance and in retaining the *refait* of 31 at trente-et-quarante, and in the zero in roulette.

In England statute law against gambling originated in desire to protect the manlier sports of archery and the like from being abandoned in favour of idle games, but even Henry VIII, who was responsible for one of the earliest of these moral enactments, was not proof against the seduction of the dice. That reformed gambler, Theophilus Lucas, who wrote *Memoirs of Gamblers* as a warning to future generations, records that Sir Miles Partridge once played at dice with King Henry for the four largest bells in London, and won them. In the reign of Charles II the fashionable vice became a scandal. One statute of this period enacted that if any person by playing or betting lost more than £100 at one time he was not compelled to pay the sum, and the winner forfeited treble the amount.

The respect shown to the statute may be gauged by the fact that the duchess of Mazarin won 1,400 guineas in one night from Nell Gwynn at basset, and more than £8,000 from the duchess of Portsmouth, and derived no little financial advantage from doubtful play with the merry monarch. Even the more austere William III is said to have lost £2,500 to the professional gambler Richard Bourchier, who next proceeded to win £15,000 from the elector of Bavaria, a sum immediately doubled by tossing double or quits.

As Blackstone insists, gambling "taken in any light is an offence of the most alarming nature; tending by necessary consequence to promote public idleness, theft, and debauchery among those of the lower class; and, among persons of a superior rank, it has frequently been attended with the sudden ruin and desolation of ancient and opulent families, an abandoned prostitution of every principle of honour and virtue, and too often has ended in self-murder."

The gaming laws governing the practice in Great Britain, and the legally prohibited games, ace of hearts, basset, dice (except backgammon), faro, hazard, lotteries (with a few exceptions), and roulette, are dealt with under separate headings.

The economic nature of gambling is that as the result of a bet property is transferred from one to another upon the occurrence of an event which, to the two parties to the bet, was a matter of

complete chance, or as nearly so as their adjustment of condition could make it. Chance is the principle upon which the transaction is founded, in the mind at least of one of the parties. Chance enters into every human transaction, but the reason is always exercised to reduce its possible effect to the minimum. Into gambling, on the contrary, reason is introduced only so to adjust the element of chance as to make it the determining principle of the transfer, and the wrongfulness of the practice lies not in the indulgence in an intrinsically innocent act, but in the surrender to chance of acts which ought to be controlled by reason alone. See Betting.

Bibliography. *Memoirs of the Lives, Intrigues, and Comical Adventures of the Most Famous Gamblers . . .*, T. Lucas, 1714; *The History of Gambling in England*, J. Ashton, 1898; *The Ethics of Gambling*, W. D. Mackenzie, new ed., 1911; *The Law of Gaming*, H. A. Street, 1937.

Gamboge. A gum resin of a rich brownish yellow tint, obtained from *Garcinia morella*, a tree which grows in Siam, near the S.W. coast of Cambodia, whence the drug takes its name. It is imported in the form of sticks or cylinders, 1 in. to 2½ ins. in diameter and 4 ins. to 8 ins. in length, the shape being caused by the liquid juice of the tree being collected in lengths of bamboo cane. Gamboge was formerly used in medicine as a drastic purgative. Because of its brilliant colour, gamboge is sometimes used in water-colour painting, but it does not mix well and tends to dry with a shiny surface.

Gambrinus. Legendary king of Flanders, to whom is ascribed the invention of beer. In Germanic countries his name is sometimes used as a sign for beer halls and cellars, and the king is represented sitting across a barrel, holding in his hand a tankard of foaming beer.

Game. Name given to certain undomesticated animals taken in field-sports by coursing or shooting, and to their flesh when used for food. Game, as defined by the Night Poaching Act, includes hares, pheasants, partridges, black game, red grouse, and bustard. Some of these are high in flavour, and it is the custom to hang them in a cool place for several days before eating, that the flesh may become tender or short. Gamekeepers are servants employed by landowners to rear and preserve game, prevent poaching, and check the depredations of vermin

and birds of prey. A gamekeeper may call on any person to produce a licence if he finds him doing an act illegal without a game licence. See Close Time; Game Laws.

Game. SIR PHILIP WOOLCOTT (b. 1876). A British administrator. Game was born March 30, 1876, and educated at Charterhouse. He entered the Royal Artillery in 1895 and served in the S. African War and First Great War. Director of training and organization at the Air

Sir Philip Game,
British administrator

ministry, 1919-22, he was a member of the Air Council, 1923-28, and was placed on the retired list in 1929. He served as governor of N.S.W. 1930-35. He was then appointed commissioner of the metropolitan police, retiring in 1945. Created K.C.B. in 1924, he received the G.C.B. on retirement.

Game Fowl. Breed of domestic fowls descended from those used in the cockpits for betting purposes. The birds had as their ancestors the wild jungle-fowl (*Gallus bankiva*) of India. Up to the beginning of the 19th century the English game-fowl appears to have been little altered by domestication from the wild birds, having the strong beak, single upright comb, and the very long, sharply pointed spur at the back of the leg. It was sparsely built, and the feathers pressed closely to the body. The pugnacious disposition of the cock was shared by the hen, who could kill a rat in protecting her young, and the chickens, the young cocks crowing and fighting among themselves even before they had left their mother's care. See Cockfighting.

Game Laws. In England, the Acts which deal in a special manner with poaching and trespassing in pursuit of game; and those which impose restrictions on the killing of game, two very different matters. Game includes hares, pheasants, partridges, grouse, heath or moor game, black game, and bustards, and for some legal purposes, woodcock, snipe, quails, landrails, and rabbits.

Under the Larceny Act, 1861, it is a misdemeanour to kill or take any hare or rabbit in a warren by night, and a fineable offence (£5) to do so by day. By the Night Poaching Acts of 1828 and other years, it is punishable unlawfully

to take or destroy any game or rabbits by night in any open or enclosed land or road, highway, etc.; or to enter any land, enclosed or not, with gun, net, engine, or other instrument for taking or destroying game. A gamekeeper has power of arrest at night. Any policeman or constable may stop and search anyone whom he reasonably suspects of having been in unlawful pursuit of game. A licence is required to shoot or deal in game.

Gamelin, MAURICE GUSTAVE (b. 1872). French soldier. Born in Paris, Sept. 20, 1872, son of a general, Gamelin was educated at St. Cyr, and was chief of staff to Joffre in 1911. He commanded French forces in the Levant in 1925, becoming chief of the general staff in 1931. Supreme commander of all French forces from 1938, in Sept., 1939, he was made generalissimo of Allied armies on

Gen. Gamelin,
French soldier

the Western Front. Replaced by Gen. Weygand on May 19, 1940, and on Sept. 9 arrested by the Vichy government, he was among the former military and political leaders of France whose indictments were heard at the trial by the supreme court at Riom (q.v.). On Oct. 6, 1941, Marshal Pétain sentenced Gamelin to detention at Bourrassol, whence he was transferred to Germany on April 4, 1943, by the Nazis. He was liberated by Allied troops from a secret prison camp on May 6, 1945. See France, Battle of.

Games. Word of Teutonic origin, meaning sports or amusements. The Latin word is *ludi*, hence the phrase used in the public schools of *victor ludorum*. Both Greece and Rome had their public games, the forerunners of the athletic meetings of today. Among the Greeks the chief games were the Isthmian, Nemean, Olympian, and Pythian. The idea has been revived in the modern Olympic Games (q.v.). See Athletics; also under separate games.

Gamete. Biological term which may be applied to any cell that unites during sexual reproduction with another, similar or dissimilar, to form the first cell of the new organism.

Gametogenesis. The process of gamete formation. Whatever the

nuclear constitution of the parent (animal or vegetable), the gametes are haploid (q.v.), a process of meiosis at some stage previous to gametogenesis reducing the diploid condition, where it exists, to a haploid condition. The vegetative cells of most gamete-producing plants contain a nucleus with one bundle of chromosomes (haploid), and in many lowly plants (e.g. *Spirogyra*) gametogenesis is simple, the protoplasts of previously vegetative cells becoming gametes. In others (e.g. *Oedogonium*) which form gametes of two kinds, protoplasts about to become oospheres become denser, and may also enlarge. In a few lowly plants (e.g. *Fucus*) whose vegetative body is diploid (i.e. has nuclei containing two bundles of chromosomes) the cells of oogonia and antheridia divide, meiosis (q.v.) occurs, and the oospheres and antherozoids, when formed, are haploid.

Typically the cells of animals are diploid, but meiosis induces a haploid condition in the spermatids, which later become either spermatozoa or ova.

Gaming. Term used mainly in law, and meaning practically the same as gambling. By the common law of England, a wagering contract or bet was as legal as any other. But by the Gaming Act, 1845, "All contracts or agreements . . . by way of gaming or wagering shall be null and void"; and no suit is to be maintainable for recovering any money or other stake alleged to be won on a wager. This does not apply to a prize to be awarded to the winner of any lawful game, sport, pastime, or exercise. A transaction in stocks and shares or any article of commerce is a wager, if the contract between the parties is not really to be a sale and purchase, but only a payment of differences depending on the rise or fall of the market.

The Betting Act, 1853, makes it illegal to keep or use any house, office, or other place for the purpose of betting or receiving money for bets. Until the Gaming Act, 1892, a commission agent who was employed by P to bet for him, and made himself personally liable for the losses, could pay the losses, although P ordered him not to do so, and recover the amount from P. By the Act of 1892 the agent loses this right. By Acts of Anne and William IV, bills and other securities given wholly or partly in paying of gaming debts, or in payment of money lent to pay gaming debts, are given upon an illegal consideration. See Betting.

Gamma Rays. Rays produced during the disintegration of radio-active elements. Their origin is nuclear. They are actually photons of great energy and very short wavelength, which gives them penetrating power usually stronger than that of the characteristic X-rays of heavy elements. Gamma rays can pass through several centimetres of lead before being reduced to half intensity. A beam of such rays is not usually monochromatic unless the softer components have been removed by filtration through large thicknesses of metal. The absorption law for monochromatic gamma rays is the same as for X-rays; in passing through a thickness x the intensity is reduced from I_0 to I_x , where $I_x = I_0 e^{-\mu x}$, μ being the absorption coefficient. Gamma rays are not suitable for diagnostic work, as insufficient contrast is obtained between bones and flesh.

Their wavelength may be measured by a crystal method as for X-ray spectra, and these nuclear spectra can be analysed in the same way as optical spectra. When a gamma ray of frequency ν is emitted by a nucleus, the energy released is $h\nu$ where h is Planck's constant. Gamma rays exhibit similar properties to X-rays and ultra-violet radiation in that they can ionise gases, blacken photographic plates, and produce fluorescence. When allowed to collide with atomic nuclei, they can give rise to "pair-production," which consists in the actual creation of a positron and electron, the gamma-ray photon being absorbed in the process. In effect this means that electromagnetic energy is directly converted into energy of matter.

Gammarus. Genus of amphipod crustaceans. The fresh-water shrimp, *Gammarus pulex*, common in brooks, is about half an inch in length, and feeds on dead fishes. *G. chevreuxi* is used in genetical experiments. See Amphipoda.

Gamp, MRS. SAIRY. Character in Dickens's novel *Martin Chuzzlewit*. A monthly nurse, all too true to her contemporary type, drink-sodden, ignorant, incompetent, and in every other way reprehensible, she is nevertheless transmuted by her creator's genius into one of his richest comic characters. Her bulky umbrella gave us the colloquial term.

Gamtoos OR CAMTOOS. River of the Cape Province. It rises in the Nieuwveld mts. and falls into St. Francis Bay, about 50 m. W. of Port Elizabeth, after a course of about 200 m.

Gamut. Musical scale of the Middle Ages based upon hexachords or series of six-note scales. The name comes from *gamma-ut*, the lowest note, so called from the Greek letter γ or gamma, and *ut*, the first note of the Sol-fa scale, later called *do* or *doh*. This note is still called by organ builders Gamut G. The complete gamut was:

The *ut-re-mi-fa-sol-la* series was started from each of the notes marked with an asterisk.

Gandak, GREAT. River of N.E. India. It rises in the Nepal Himalayas, and for some 30 m. forms the boundary between the United Provinces and Bihar. It flows generally S.E., and joins the Ganges opposite Patna, after a course of about 400 m.

Gandak, LITTLE. River of N.E. India. It rises in the Nepal hills, flows parallel with the Great Gandak, and empties into the Gogra at Sunaria.

Gandamak. Village of Afghanistan. It was the scene of the massacre of the last survivors of General Elphinstone's army in 1842 in the retreat from Kabul. It is about 35 m. W. of Jellalabad on the road to Kabul. In 1879 an agreement made by Great Britain and Yakub Khan was known as the treaty of Gandamak.

Gander. Lake, river, and bay of N.E. Newfoundland. In the Second Great War a huge airport was developed for the Atlantic ferry service near the settlement of Hattie's Camp, at an alt. of 400 ft. above Gander Lake and about 150 m. N.W. of St. John's. This later became a staging point on the commercial trans-Atlantic airways.

Gandersheim. Tn. in the *Land* of Lower Saxony, Germany, famous for its medieval buildings and tradition. Standing on the river Gande, 36 m. S.W. of Brunswick, it has a former abbey, once Germany's most distinguished Benedictine nunnery, whose abbesses were members of ruling houses between 856 and 1589; this was later turned into a Protestant institution. The abbey, an imperial banqueting hall, and a palace of 1530, now serve as government buildings. A cathedral of 1172, a town hall of 1580, and old patrician houses are other attractions. The 10th century nun,

Roswitha von Gandersheim, has international fame as the author of the first medieval Christian drama and of epic poems in Latin. Pop. 3,120.

Gandharva. Deity in Hindu mythology. The name is also given to a class of divine beings sometimes vaguely described as beautiful spirits of singing stars.

Gandhi, MOHANDAS KARAMCHAND (1869-1948). Indian lawyer and national leader. Born at Porbandar, Kathiawar, Oct. 2, 1869, he was the son of Kaba Gandhi, of the bania caste of vaishnava Hindus, prime minister (like his father and grandfather before him and his eldest son after him) of the little state of Porbandar. Mohandas was educated first at Rajkot and later in London, where he matriculated, and was admitted to the bar at the Inner Temple. While in England Gandhi came under the influence of Ruskin, Tolstoy, and Thoreau, from whose writings he derived his ideas of passive resistance.

On his return to India in 1891, Gandhi started to practise in the Bombay high court, but in 1893, accepting an engagement to represent an Indian firm in litigation then proceeding in Durban, he decided to set up practice there. In 1899, during the S. African War, he raised and was second in command, with the rank of sergt.-major, of an ambulance unit whose services were commended by the military authorities. In 1909 he renounced his practice to become hon. sec. of the Transvaal British Indian association, founding an Indian colony on Tolstoyan lines near Durban. In 1914, after some of the major restrictions against which Indians in S. Africa had protested were removed, he returned to India, on the way visiting England where he helped to organize an ambulance unit for service with the Indian troops in the First Great War.

On arrival in India he conducted a recruiting campaign for the Indian Army. From 1918, however, passive resistance, which he defined as *satagrahya* (soul force), played an ever-increasing part in the movement he led in favour of the Swaraj (self-government) in India. In 1919 the

passing of the Rowlett Act, which gave the government permanent emergency powers for dealing with revolutionary activities, inspired Gandhi to develop resistance through non-cooperation. Gandhi's insistence on non-violence (ahimsa) was genuine but, as he himself had to admit on many occasions, his movement invariably led to violence, and much against their will the authorities condemned him to six years' imprisonment in March, 1922. He was released in 1924, when he became president of the Indian National Congress party.

Gandhi, who also preached the use of the handloom in revolt against the mechanisation of industry, became the idol of the Indian masses because of their conviction that his asceticism, earnestness, and eloquence marked the saint in him. Even his critics admitted that he had for the first time aroused in Indian minds a sense of self-respect and nationhood.

In 1930 he inaugurated a campaign of civil disobedience, which led to 8 months' internment. On March 6, 1931, he signed with the viceroy (Lord Irwin) a pact to end the disturbances produced by his 1930 campaign. He thereupon temporarily ceased non-cooperation and went to London to participate in the round table conference of 1931. In Jan. 1932, again involved in civil disobedience, he was arrested. During this term of imprisonment he underwent a three weeks' fast to secure acceptance of what was known as the Poona pact whereby the untouchables were given larger representation in the legislatures at the price of remaining within the caste Hindu constituencies—an apparent gain which was in fact vitiated by denying to the untouchables separate electorates.

In 1940, Gandhi instituted a campaign of individual civil disobedience which, after Japan's entry into the war, so nearly suggested a readiness to come to terms with the enemy that in 1942 he was interned again, being released in 1944 on health grounds. Though he resigned from the Congress party in Oct., 1941, he continued its virtual leader—a paradox possible only because of his unique standing in India's affection, long illustrated by popular bestowal on him of the title "mahatma" (great soul).

Gandhi, with other Congress party leaders, conferred with the British cabinet mission of 1946 and helped to secure acceptance by

their party of the terms which led to the election of a constituent assembly and the formation of an interim government. He continued to take a leading part in discussions until power was finally transferred to Indian hands, 1947; then announced his intention to settle in E. Bengal, i.e. in Pakistan. But the continuance of communal strife prompted him to announce

M. K. Gandhi, Indian lawyer and national leader

another fast until "sanity returned" to Calcutta. A calmer period followed in that city and the fast was abandoned. But early in 1948, in a desperate attempt to bring about Hindu-Muslim agreement, he began his 15th fast in 35 years, styled a "fast unto death." It ended on the sixth day, after Gandhi had been assured that Hindu discrimination against Muslims in Delhi would stop. On Jan. 30, 1948, while on his way to evening prayer at New Delhi, Gandhi was shot dead by a Hindu fanatic. His body was cremated on the banks of the Jumna, the ashes being later cast into the river at its confluence with the Ganges. His assassin, Nathuram Vinayak Godse, was, with an accomplice, hanged for the crime, Nov. 15, 1949.

Gandhi's published works include: *Indian Home Rule*, 1909; *Young India*, 1922; *Autobiography*, 1927-29; *The Story of My Experiments with Truth*, 1949.

Edwin Haward

B. Sharga, 1933; Mahatma Gandhi, S. Radakrishnan, 1939; Gandhi, Carl Heath, 1944.

Gandia. Seaport of Spain, in the prov. of Valencia. It stands on the river Alcoy, 2½ m. from its small harbour, Grao, at the mouth, and 35 m. by rly. S.S.E. of Valencia. Enclosed by ancient ramparts it possesses a Gothic church, an old college, palaces of the dukes of Borgia and of Osuna, and a Jesuit convent. Fruit, wine, and tomatoes are exported. Pop. 12,676.

Ganesha or HANA-PATI. In Hindu mythology, the god of wisdom, represented as a stout human figure with the head of an elephant.

Ganges. Most important river of India. It rises in two head-streams—the Bhagirathi and the Alaknanda—on the southern slopes of the Himalayas in lat. 30° 53' N. and long. 79° 8' E. The Bhagirathi issues from a glacial cavern at an alt. of over 14,000 ft. near the pilgrim town of Gangotri, takes in the Jahnvi and the Alaknanda, and from the junction of the latter stream at Devprayag in the Uttar union, the river is known as the Ganges. Penetrating the mountains and flowing in a S.W. direction, it emerges from the mountainous tract and enters the plains close to the sacred city of Hardwar. Thenceforth it pursues a S.E. course to Allahabad.

From its source to this point the river is only a series of pools and shoals, with occasional rapids, but during the rainy season it becomes a raging torrent. At Allahabad, 670 m. from its source, it receives the waters of its largest tributary, the Jumna, and becomes a noble stream. The course of the river now trends E. and S.E., through the Uttar union and Bengal, receiving the Gumti, Gogra, Son, Gandak, and the main stream of the Brahmaputra—to fall into the Bay of Bengal by a deltaic system of the most intricate character. The length of its course is 1,557 m. The delta begins about 280 m. from the sea.

The Ganges is navigable as far as Garhmuktesar, 850 m. from the sea. In the upper reaches the rly. has led to a diminution of waterborne traffic, but within Bengal the river remains a teeming waterway. It is the most sacred river in India, and its junction with the Jumna at Allahabad is called the Tribenium, for tradition has it that there is a third underground stream, Saraswati, which effects its junction at the same spot. An underground temple in the fort at

Ganges. Map of the great river basin, from the rise of its headstreams to the delta in the Bay of Bengal

Allahabad contains the everlasting tree, the roots of which are supposed by legend to stretch down to the Saraswati.

At Sonpur another junction is formed with the Gandak, and that, too, has sacred significance for the Hindus, as also has the famous place of pilgrimage at Saugor Island at the mouth of the Hooghli. At these places annual bathing festivals are attended by thousands of pilgrims.

Among the chief towns on the river's banks are Cawnpore, Murshidabad, Farrukhabad, Allahabad, Mirzapur, Benares, Ghazipur, Patna, and Monghyr, besides Calcutta on the Hooghli mouth. The principal mouths of the Ganges are the Hooghli, the most westerly, Meghna, the most easterly, Matla, Raimangal, Malancha, and Haringhata. The vast region embraced by the deltaic system is a flat alluvial tract of from 80 m. to 220 m. in breadth. The frontal region, or that part which fringes the ocean, is known as the Sunderbans, a mass of continually shifting mud banks intersected by navigable channels, and notoriously unhealthy. An immense amount of silt is carried in the water and deposited at the mouths, discoloring the sea for a distance of 50 m.

The Ganges forms, with its tributaries and the Gangetic system of canals, the greatest waterway communication and the largest irrigation system in India, the water-borne traffic to and from the numerous cities on its banks being prodigious. The valley is one of the most productive on the earth; it is everywhere cultivated, yielding rice, sugar, cotton, indigo, fruit, and opium.

At Benares, 740 m. upstream, the river has a width of 1,450 ft. in the dry months, nearly doubled in the wet season. At 500 m. from its mouth it is a mile wide. The period of flood begins in May and lasts until the end of July, the waters subsiding in Aug.-Sept. The river rises on the average 31 ft. and the country overflowed is about 100 m. in width. A tidal bore, most noticeable on the Hooghli, rushes up the river at nearly 18 m. an hour, sometimes causing an instantaneous rise of 5 ft. at Calcutta. The drainage area is estimated at 391,100 sq. m. See Allahabad; Benares.

Gangi. Town of Sicily, in the prov. of Palermo. It stands on a mt. slope, at an alt. of 3,000 ft., 19 m. S.E. of Cefalu. It has been identified with the ancient Enguium (Gr. Engyon), famed for its temple of the Great Mother of the Gods, despoiled by Verres.

Gangjam or **GANJAM.** District and town of India, in Orissa, formerly in Madras. The district (including the agency), which lies on the coastline of the Bay of Bengal, has an area of 7,688 sq. m. It is traversed by the E. Ghats, which here reach an alt. of nearly 5,000 ft. The chief products are rice, millet, and gram. Turmeric is grown for export. Among the industries are weaving and tanning, and there is trade in sugar and salt. Pop. 1,855,264. Gangjam town, at one time the headquarters of the district, has declined in importance since it was superseded in 1815 by Berrampur.

Ganglion (Gr., tumour under the skin). Anatomically, a collection of nerve cells. Instances are the spinal ganglia on the posterior

roots of the spinal nerves, and the gasserian ganglion lying deep in the temporal region of the skull.

The term may describe a cyst-like swelling which forms in connexion with a tendon sheath or joint, most frequently involving the tendons at the back of the wrist or the fingers. It used to be treated by being struck a sharp blow which ruptured the cyst internally and led to absorption of the contents. Injection of sclerosing substances into the cyst is now preferred. See Brain; Nervous System.

Gangpur. Former state of India, in Orissa. The area of the state was 2,477 sq. m. The region is a long undulating tableland about 700 ft. above sea level, interspersed with hill ranges and isolated peaks. It is watered by the Ib, the Sankh, and the S. Koel, the last two uniting and forming the Brahmani. Gangpur was transferred from Chota Nagpur to Orissa in 1905, but in 1933 came into the Eastern States Agency, which became a residency in 1944. It was merged in the state of Orissa in 1948. The principal crops are rice, sugar-cane, and oilseeds, while coal, limestone, and iron are worked. Pop. 398,171.

Gangrene (Gr. *gangraina*) or **MORTIFICATION.** Death of a mass of tissue. The condition may be due to blocking of an artery which cuts off the supply of blood to a part (embolic gangrene); imperfect nutrition of a part in elderly people (senile gangrene); abnormal condition of the blood, as in diabetes, combined with a slight injury; chronic poisoning by ergot; Raynaud's disease (*q.v.*); injury to a limb (traumatic gangrene); infection by certain organisms (wound phagedena, hospital gangrene, gas gangrene, cancerum oris, etc.); frost-bite; and burning. Clinically, gangrene is divided into two forms: dry gangrene, in which there is little fluid in the tissues and the part becomes dry, hard, shrunken, and black; and moist gangrene, in which the part is swollen with fluid and is putrescent. The chances of arrest of the progress, and recovery to health, as well as the treatment, depend upon the cause of the condition and the recuperative powers of the patient.

Gangue (Fr.). Term used in mining and geology to signify the useless minerals in an ore deposit. The term is not inflexible; e.g. barytes (barium sulphate) may be a useless mineral in a lead deposit but in certain circumstances

may be utilised as an ore of barium. Moreover values change, and what was once considered a gangue mineral may become an important ore mineral.

Ganister. Local name of a siliceous stone found in the lower coal measures of Yorkshire, particularly in the neighbourhood of Sheffield. It is a close-grained, dark-coloured, argillaceous sandstone rock, the clay being present in just about the necessary proportions to permit the stone, when ground and mixed with a little water, to be moulded into bricks. It is highly refractory and largely used for the lining of metallurgical furnaces of all kinds. See Blast Furnace; Dinas Rock; Furnace.

Ganja OR **GANJAH.** Name applied to the tops of cultivated female plants of *Cannabis sativa* or Indian hemp. The tops are cut directly after flowering and made into bundles from 2 ft. to 4 ft. long. The two varieties are Bengal and Bombay ganja, the superiority of the former being due to the care taken to eradicate the male plants from the fields where the tops are collected. Ganja is a narcotic and anodyne. See Hemp.

Gannet OR **SOLAN GOOSE** (*Sula*). Group of large sea fowl, rather goose-like in form, from which they derive their popular name. About 17 species are usually recognized, and they are widely distributed throughout the world. The European gannet (*S. bassana*) is common around the British coasts, and nests in vast numbers on the Bass Rock and the cliffs in many wild districts. It is almost 3 ft. in length, and has pure white plumage with the exception of some black feathers on the wings and a slight yellowish buff tinge on the head and neck.

Gannet. Unusual study of this large sea-bird alighting on its nest on a cliff

The birds assemble in great multitudes in the early spring at their nesting sites, and construct a small heap of seaweed and grass on the bare rock. Only one egg is laid, and the female sits so closely that she will often allow herself to be touched rather than leave the nest. She generally sits with her face turned towards the cliff. Gannets work havoc in the herring and pilchard fisheries, and their flesh is rank. See Grassholm.

Ganoid. Name applied to one kind of scale in fishes. Ganoids are bright bony structures. Many of the earlier fossil fishes had scales of this type, and the few still existing genera which have them in something like primitive form, include the sturgeon, American gar pike, bowfin, and polypterus. The majority are fresh-water fish; some, like the sturgeon, attain a large size. The ganoids were formerly regarded by zoologists as forming a separate group from the Teleostei or bony fishes, but a more complete study of the fossil forms has shown so many intermediate types that the two groups are now classed as Actinopterygii, or pointed-finned ones. See Sturgeon.

Gantang. Mt. pass of East Punjab, India, in Bashahr state. It leads over the Indian boundary into Tibet in lat. $31^{\circ} 40' N.$, long. $78^{\circ} 46' E.$, reaching an alt. of 18,295 ft. amid perpetual snow.

Gantok. Chief town of the Himalayan state of Sikkim. It stands among the mts. 40 m. N.E. of Darjeeling. The inhabitants are allied to the Tibetans.

Gantry (Lat. *cantherius*, trelis, framework). In engineering, a structure used for a variety of purposes, and generally of rolled steel sections. Gentries elevate grabbing locomotive cranes at coal yards. In the gantry crane in use on quays for unloading ships, giving high level operation for the crane with minimum obstruction at ground level, the gantry is so constructed as to allow rly. rolling stock and traffic to pass underneath the crane. It generally

Gantry. Shipyard hydraulic gantry in the process of being moved across the head of the slips
Courtesy of "Mechanical Handling"

forms an integral part of the crane construction, the whole unit being usually mobile on rail tracks and often self-propelling.

Another gantry crane comprises two fixed and parallel frameworks on top of which travels a beam or girder, which in turn carries a mobile crane winch capable of travelling the length of the beam. This type is used in steel stock yards, engineering works, timber yards, and power stations, where the need for full load operation over the whole area enclosed by the gentries and the reduced obstruction at ground level is of special importance. An adaptation, with travelling instead of fixed gentries, is the heavy "Goliath," capable of lifting 30 tons, and used for building breakwaters and harbours. Light gentries spanning trenches, travelling on crane rails and carrying chain blocks or tackle, are commonly used for laying large diameter pipes. In building work gentries of platforms supported by columns elevated above the pavements are adopted in restricted areas.

Ganymedes OR **GANYMEDE.** In Greek mythology, a Phrygian youth. He was carried off to heaven by an eagle, or by Zeus in the form of an eagle, to be the cup-bearer of Zeus at the celestial banquets. Later he was identified with the spirit of the sources of the Nile, and as such was placed by astronomers among the constellations as Aquarius or the water-carrier. He is usually represented with an eagle.

Ganz, WILHELM (1833-1914). German musician. Born at Mainz, Nov. 6. 1833 he belonged to a

musical family. In 1850 he settled in London, where he became accompanist to Jenny Lind, and during 1874-82 conducted the New Philharmonic and Ganz's orchestral concerts. He acted as accompanist to other great singers, and was professor of singing at the Guildhall School of Music. Ganz died Sept. 12, 1914.

Gap. Town of France, capital of the dept. of Hautes-Alpes. It stands on the Luye, 48 m. S.S.E. of Grenoble. It has a modern cathedral and in the prefecture is a valuable collection of manuscripts, as well as a museum. Another building is the bishop's palace. Gap has some small manufactures. It was a Roman settlement, and in the Middle Ages was chiefly famous as the seat of a powerful bishop. Pop. 16,371.

Gapes. Common disease in poultry affecting young chickens, in which it produces a heavy mortality. It is due to the presence of a worm, which is found sometimes in great numbers in the windpipe of the chicken, causing great irritation and weakness consequent upon efforts to expectorate the parasite. Actual suffocation may occur. The ground becomes infected by the eggs of the worm being scattered in all directions. The poultry are noticed to be gaping, sneezing, running backwards, and, finally, to be greatly exhausted. Attention should be paid to the food and water, and then to the affected ground. The chickens should be put upon a fresh run dressed with lime. See Poultry.

Gaping Ghyll. Largest pothole in England. The entrances to the two shafts are on the S. slopes of Ingleborough, in the W. Riding of Yorkshire. The main chamber, called the Hall of the Winds, is 500 ft. long, 82 ft. broad, and 20 ft. high, and lies 360 ft. below the level of the moor. Fell Beck falls into the chamber in twin cascades twice as high as Niagara, flowing thence by an uncharted underground course to Beck Head. Gaping Ghyll was first entered by

the main shaft in 1895, but not until 1935 was an entry made by the entrance known as the Rat Hole.

Garabit. Town of France in the dept. of Cantal. It is 81 m. by rly. S. of Clermont-Ferrand, and is known on account of the remarkable viaduct by which, near here, the railway crosses the Truyère. Built in 1881-84, this is 620 yds. long and 400 ft. high, with a central span of 540 ft.

Garay, JUAN DE (1541-84). Spanish soldier. Having settled in Paraguay, Garay attained a leading position there, and in 1573 founded the city of Santa Fé de Vera Cruz. As governor of Paraguay he conducted wars against the natives and in 1580 founded Buenos Aires, on the site of the older settlement called Mendoza. He was killed by Indians.

Garbett, CYRIL FORSTER (b. 1875). English archbishop. He was born Feb. 6, 1875, and educated at Ports-

Dr. Cyril Garbett, English archbishop

mouth grammar school, Keble College, Oxford, and Cuddesdon College. Ordained 1899, he was vicar of Portsea, 1909-19, and gained the reputation of being an excellent administrator and trainer of junior clergy. He was appointed bishop of Southwark in 1919 and translated to Winchester in 1932. Here he began pastoral tours on foot, which took him throughout his diocese and

made him one of the best-loved bishops in England. On his translation to York as archbishop in 1942 he continued this practice of visiting the people. Garbett was clerk of the closet to the king, 1937-42. He wrote *A Call to Christians*, 1935; *The Church and Social Problems*, 1939; *We Would See Jesus*, 1941; *Physician, Heal Thyself*, 1945.

Garbo, GRETA (b. 1906). Swedish-born American film actress. Greta Gustafson was born in Stockholm, Sept. 18, 1906, and made her debut in a picture which advertised hats sold by the store in which she worked. Her performance attracted the attention of

Greta Garbo Swedish-born American film actress

Mauritz Stiller, who directed her in *The Atonement* of Gosta Berling, 1925. Her emotional and dramatic range, wistful melancholy, and beauty of unusual type ensured success, and she was put under contract to M.-G.-M. After such slight pictures as *The Temptress*, *The Mysterious Lady*, and *The Kiss*, she gave a memorable performance in *Anna Christie*, 1931, and her reputation was enhanced by her deep, slow utterance in talking films. These included *Mata Hari*, 1932; *Grand Hotel*, 1933; *Queen Christina*, 1934; *The Painted Veil*, 1935; *Anna Karenina*, 1936; *Camille*, 1937; *Marie Walewska*, 1938. Films in a lighter vein and perhaps less successful were *Ninotchka*, 1940; *The Two-Faced Woman*, 1942. Garbo became a citizen of the United States of America in 1940.

Garborg, ARNE (1851-1924). Norwegian author. Born Jan. 25, 1851, he was trained as a teacher, and in 1873 went to Christiania (Oslo) university. He became known as a critic, his essays, mostly on religious or ethical questions, being published in *Aftenbladet* and other papers. In 1877 he founded *Fedraheimen*, a periodical published in dialect, which he edited until 1882. His first book, *A Year of Free-thought*, 1881, aroused great interest; it had previously appeared anonymously in *Fedraheimen*. His dialect stories, *Peasant Students*, 1883. *Tales and Legends*, 1884. *Menfolk*, 1886; *At Home with Mother*, 1890; and *Weary Folk*, 1891, placed him in the front rank of Norwegian

Gaping Ghyll, Yorkshire. A descent on this great pothole being made in a bo'sun's chair

authors. Garborg, who also trans. the *Odyssey*, died Jan. 14, 1924.

Garcia, CALIXTO (1836-98). Cuban patriot. Born at Holguin, Oct. 14, 1836, he early took part in insurrections against Spanish rule. In 1880 he was captured, and imprisoned in Spain. In 1895 he escaped to Paris and thence to Cuba, where he at once joined in the rebellion then going on, and won several notable victories. In 1898 he commanded a body of his compatriots in the Spanish-American war, but died in Washington while on a mission to President McKinley, Dec. 11.

Garcia, MANUEL DEL PÓPOLO VICENTE (1775-1832). Spanish singer and composer. Born at

Manuel Garcia,
Spanish singer

Seville, Jan. 22, 1775, he was a chorister in the cathedral there, and soon made himself known as composer, conductor, singer, and actor. In 1808 he became the

leading tenor in the Italian opera in Paris, and in 1812 in the royal chapel at Naples. After singing in London and Paris he went to New York and Mexico. He opened a school of singing in London, and also taught in Paris. Garcia composed many operas, including *The Caliph of Bagdad*, 1812; and *The Death of Tasso*, 1821. He died June 2, 1832. His daughters, Mmes. Malibran and Viardot, became famous singers.

His son Manuel (1805-1906) was born March 17, 1805. A noted teacher of singing, for many years professor at the Royal Academy of Music, he made a scientific study of the vocal organs, one result being his invention of the laryngoscope. Jenny Lind was his pupil. He died July 1, 1906.

Manuel's son, Gustave (1837-1925), was born Feb. 1, 1837, and had a noted operatic career, making his debut in Donizetti's *Don Sebastiano* at La Scala, in 1862. In 1880 he settled in England as a teacher, and was for some years professor at the R.A.M., and afterwards at the Royal College of Music and the Guildhall School of Music simultaneously. He retired in 1911 and died June 12, 1925.

Albert, his son (1875-1946), born Jan. 5, 1875, in London, also became professor at the R.C.M. and the Guildhall School, and had himself a fine baritone voice. He died Aug. 10, 1946.

Garcilaso de la Vega (1503-36). Spanish poet. A native of Toledo, he fought in the army of Charles V in Austria and Tunisia, and died at Nice from wounds received in action, Oct. 14, 1536. His poems, chiefly sonnets or elegies written on Italian models, were highly esteemed, and strongly influenced his generation. Cervantes called him the prince of poets. His works were translated into English by J. W. Wiffen, 1823; and J. Clough, 1930.

Gard. Dept. of France. In the S.E., it formed part of Languedoc. Its eastern boundary is the Rhône, and in the S. it borders the Mediterranean. Area, 2,270 sq. m. It consists of three districts, one covered by the Cévennes in the N., with beautiful mountain scenery and fruitful valleys; another called the Garrigues in the centre, where wheat, oats, vines, and olives are grown; and a marshy region in the S. Other industries are the rearing of cattle, horses, and sheep, and the culture of silkworms. Minerals include salt obtained from the marshes. Quarrying and fishing are also carried on. Nîmes is the capital; other places are Alais and Aigues-Mortes, while Le Vigan, although small, is worthy of mention. The Pont du Gard is a Roman aqueduct crossing the Gard, near Remoulins. The dept. takes its name from the Gard, or

Gardon, a tributary of the Rhône; other rivers are the Cèze and the Hérault. Pop. 393,279.

Gard, ROGER MARTIN DU (b. 1881). French author, born March 23, 1881, in Paris. One of the outstanding representatives of 20th century French literature, he won the Nobel prize for literature in 1937. He first attracted attention by a novel, *Jean Barois*, 1913, inspired by the Dreyfus case; his masterpiece is *Les Thibault*, 1921. Numerous essays and a few comedies were interspersed among du Gard's carefully written novels, on each of which he spent three to five years, living in seclusion in a castle in Normandy.

Garda, LAGO DI (Lat. *Lacus Benacus*). Lake of Italy. It is the easternmost and largest of the Italian lakes, and lies between Lombardy and Venetia, running a few miles into Trentino. Some 34 m. long and from 3 m. to 10 m. broad, with a maximum depth of 1,900 ft., it has an area of about 180 sq. m. It is fed by the Sarca and drained by the Mincio. Mountains on the N. and E., the shores slope gently to the S., and on the W. figs and grapes flourish. This part, called *La Riviera*, is lined with charming villas. The beautiful promontory of Sermione, between Peschiera and Desenzano, has many remains of Roman and later buildings.

GARDEN AND GARDENING

H. H. Thomas, Editor of Popular Gardening, 1907 47

The information given herein is supplemented by the articles on the various flowers and plants grown in gardens, e.g. Dahlia; Gardenia; Flower; Lobelia; Rose. The growing of vegetables is discussed under Allotment; Kitchen Garden. See also Annuals; Greenhouse; Market Gardening

Garden comes from a Teutonic word meaning an enclosure, and is akin to the less familiar garth. Its present meaning is that of a piece of enclosed ground, wherein flowers shrubs, fruit, and vegetables are grown. There are two main divisions of gardens, ornamental and useful, many of the latter being known as market gardens. Ornamental or flower gardens are classified according to the way in which they are laid out, e.g. in the Dutch or Italian style, or according to what flowers and shrubs they contain, e.g. a rose garden. Public places of amusement, ornamented with flowers and shrubs, are sometimes called gardens, e.g. the old Cremorne Gardens in London, and there are zoological gardens and botanical gardens.

Gardening is the practice and development of plant cultivation

which results in the production of the best and choicest forms of flowers, fruit, and vegetables. According to Strabo, the first systematic attempts at horticulture in Britain were due to the Romans. Probably, however, the so-called gardens were merely patches of ground cleared and cultivated with fruits and vegetables, in which little attempt at floriculture, or colour effect, was made.

The first park in England was made by Henry I, at Woodstock, but progress was slow, despite the fact that there was no lack of material. A writer of the 12th century thus describes the desirable contents of a garden. "It should be adorned on this side with roses, lilies, and the marigold; on that side with parsley, cost, fennel, southernwood, coriander, sage, savary, hyssop, mint, vine,

dettany, pellitory, lettuce, cresses, and the peony. Let there be beds enriched with onions, leeks, garlic, mellons, and scallions. The garden is also enriched by the cucumber, the saporiferous poppy, and the daffodil, and the acanthus. Nor let pothebs be wanting, as beetroot, sorrel, and mallow. It is useful also to the gardener to have anise, mustard, and wormwood. A noble garden will give you medlars, quinces, the pearmain, peaches, pears of St. Regle, pomegranates, citrons, oranges, almonds, dates, and figs." Many of the subjects are unidentifiable with the familiar flowers and fruits known by their name today.

Until the 16th century, most of the practical horticulture of Britain was in the hands of the monks, who were chiefly concerned with the culture of fruit and vegetables for the table, and of medicinal herbs, rather than of flowers. In 1510 the earl of Northumberland, in an establishment of over 150 persons, boasted only one gardener, who was paid by the hour. Gardening made rapid strides in the latter half of the 16th century, and the Tudor gardens of that period, blended with the Dutch introduction of a century later, form, perhaps, the basis of modern horticulture. The Dutch, or formal, style of garden was much in evidence until the mid-Victorian era, when William Robinson and other practical gardeners started a vigorous campaign in favour of a less restrained and more natural arrangement of trees, shrubs, and flowers. The ultimate result has been a modification in the art of garden planning.

Considerations of Expense

The change has quickened since the Second Great War, as shortage and high cost of labour have made it necessary to reduce the charges of maintenance. Gardeners' wages have doubled, and plants are much more costly. Therefore the informal garden, less expensive to maintain than the formal, is more popular, particularly in large places where labour has been reduced. Economy in maintenance is a controlling factor in present-day garden design.

A plan that suits the average plot of ground, from one acre upwards in extent, is to have a fairly large lawn unbroken by flower beds, extending from the house for some distance, and merging into a grassy glade between plantations of ornamental trees and flowering shrubs. The use of a motor mower saves much time and

labour. Trees and shrubs need little attention beyond an annual pruning. Part of the garden might be planted as a woodland which can be made attractive with rhododendrons, lilies, and spring-flowering bulbs in the spaces among the trees. If room elsewhere be found for an herbaceous border, and plots are devoted to roses, rock and water plants, fruits, and vegetables, the garden will be representative of all that is best in modern practice.

During the 20th century numbers of trees, shrubs, and plants, new to gardens in Great Britain, have been introduced from China, Tibet, Burma, and other parts; their cultivation has brought about great changes. The tendency is to rely chiefly on those plants and shrubs which need the minimum of care once planted. Hence the popularity of the woodland garden in large country places; it might well be made a feature of smaller gardens. Within its shelter numerous exotic shrubs and plants can be grown to perfection with small expenditure of labour.

Woodland Plants

Rhododendrons and azaleas are ideal for planting where the shade is not dense. Of those introduced from the Far East, many are spring-flowering, and, together with the familiar large-flowered hybrids or varieties, will keep the woodland bright with blossom for months. The early flowering kinds must have shelter from spring frosts. Bulbous plants flourish in woodland—anemone, lily, hardy cyclamen, meadow saffron, bluebell, star of Bethlehem, snowdrop, winter aconite, and, if they are planted in open spaces, daffodil and narcissus. In the moister places, hardy primulas and those spiraea-like plants, the astilbes, will thrive. Other good woodland plants are Christmas and Lenten roses or hellebores, the tall bell-flowers or campanulas, mullein or Verbascum, golden rod, Solomon's seal, hardy geraniums, the tree heaths, broom or cytisus, columbine, primrose, and polyanthus. Most of these flourish in an acid soil, *i.e.* one that contains little or no lime; the woodland soil consists largely of leaf mould.

Specialisation in the cultivation of one or more plants is common practice. This cult has been fostered by special societies which, by exhibitions, discussions, lectures, and printed matter, further the interests of the flowers with which they are concerned. Thus there are the Rhododendron Associa-

tion, Iris Society, Alpine Garden Society, Royal Horticultural Society's lily group, etc. New varieties are often lost to cultivation because of some defect which makes them unsuitable for the average garden; the best remain and are listed in the catalogues of the nurserymen. It is only by choosing the finest varieties that the owner of a garden can cultivate his plot to full advantage; they are not more difficult to manage than the older and inferior sorts and they are superior in size of bloom, brilliance or charm of colouring, length of flowering season, and vigour of growth.

New and Improved Varieties

There are now greatly improved varieties of delphinium, lupin, iris, sweet pea, poppy, rock garden flowers, phlox, rose, dahlia, and chrysanthemum. Most have been raised by cross-breeding and selection in home gardens and nurseries, but new plants have also been discovered by botanical explorers and introduced to gardens. New fruits and vegetables have been made available, their cultivation being more profitable than that of the old-fashioned sorts.

THE HERBACEOUS BORDER.

This is one of the principal features of the modern garden, furnishing a brilliant display throughout the summer. It is successful only if, before the plants are put in, the ground is trenched 2 ft. deep and enriched with stable manure, hop manure, or material from the compost heap. The plants used chiefly are herbaceous perennials, so called because the root-stocks are perennial and live on from year to year while the top growth dies down annually. The finest show is obtained by setting the plants in groups of irregular shape, one group being arranged so that it merges naturally into the adjoining one; that cannot be done if the plants are set in squares, circles, or lines. In a long border each group should consist of at least a dozen plants; about seven to a group suffice in a shorter border. They should be arranged according to the height they will reach and the colour of the flowers. The tallest plants are set at the back of the border. If the groups are of irregular shape, the border will have a natural appearance, for different plants of the same height vary greatly.

Gertrude Jekyll, the famous artist-gardener, pointed out the need for grouping according to colours, and the method she described is often practised. The

1. Herbaceous border in the kitchen garden, Balls Park, Hertford. 2. Formal variegated flower-beds at Althorp Park, Northamptonshire 3. Sunk garden with paved walk and fountain, Hanover Lodge, Regent's Park, London. 4. Rock garden with water pools, Friar Park, Henley 5. Flower garden with clipped hedge enclosure, Aldenham House, Herts

GARDEN: DOMESTIC AND LANDSCAPE STYLES OF BRITISH GARDENS

white and pale flowers, those of light blue, light yellow, and pink are used at one end of the border; these are followed by those of rose, salmon, blue, carmine, and mauve, which again lead on to the most brilliant of all—scarlet, crimson, orange, and yellow. In this way the colour scheme is worked up from the palest flowers at one end to the most richly coloured at the other.

Although the herbaceous border is filled chiefly with perennials, a few other plants can fill blank spaces and add to the brilliance of the display. Among them are gladiolus, antirrhinum, aster, dahlia, anchusa, Canterbury bell, sweet william, and hardy annuals, e.g. larkspur, godetia, cornflower, clarkia. The soil must be kept weed-free by hoeing frequently. Those plants needing support must be staked in good time to keep the flowering stems erect. The herbaceous border will be in full splendour in July, but some flowers open in June and others delay until early Sept.

Plants for Mixed Borders

A variant of the herbaceous border, called the mixed border, entails less maintenance. Besides some favourite herbaceous perennials, e.g. delphinium, lupin, peony, helenium, purple sage, scarlet lychnis, bellflower, coreopsis, galea, and phlox, it is planted also with suitable shrubs. Such a border needs less tending than one devoted wholly to flowering plants, but does not provide such a brilliant show of bloom. Only shrubs of moderate vigour will serve; it is impossible to grow herbaceous plants near large shrubs whose roots impoverish the soil. Suitable are cythus or broom, *Daphne mezereum*, the smaller kinds of *berberis*, and especially the purple-leaved one named *Thunbergii atropurpurea*, shrubby *spiraea*, *deutzia*, *genista aetnensis*, *potentilla Farreri*, *potentilla Vilmoriniana*, *ceanothus Ceres*, and *Gloire de Versailles*, and the smaller shrub roses. If the soil contains little lime, *rhododendron*, *azalea*, *pernettya*, and heather can also be planted. Room can be found for some of the taller bulbous plants, e.g. lilies, *galtonia*, *gladiolus*, and for such ornamental plants as plume poppy (*bocconia*), *yucca*, *spiraea aruncus*, *pampas grass*, and red-hot poker. Rose bushes may be used, particularly those of the cluster or hybrid *polyantha* type.

THE ROCK AND WALL GARDEN.

The cultivation of alpine plants in

a rock garden is a fascinating recreation. A number of low-growing plants which are not true alpine are included in most collections. Although a few kinds spread quickly and take up a great deal of room, most rock plants are miniatures. They are not difficult to manage providing they are set in soil which is thoroughly drained; most thrive better on sloping ground than on the flat. Those native to the high alpine districts are the most difficult to grow successfully in lowland gardens; they probably flourish naturally in a moraine which consists chiefly of stones and gritty material.

Making a Rock Garden

It is not easy to grow a rock garden which looks natural. Successful results are most likely with stone or rock-limestone or sandstone in large blocks. Miniature cliffs of long narrow rocks placed against mounds of soil give variety of contour and the spaces between them provide ideal positions for the silvery saxifrages and other rock-loving plants, which should be set with their leaves flat against the cliff. Between the cliff-like formations there will be rock-strewn slopes which make a fitting home for numerous rock plants. At least half of each stone should be covered with soil. So many rock gardens look ridiculous because they consist of mounds of soil in which large stones are slightly embedded. The dry wall, i.e. a wall in which soil instead of cement mortar is used, makes an admirable adjunct to the rock garden. Flat, or walling, stones are used; each layer should be set slightly farther back than the previous one. Between one layer of stone and the next there should be 2 ins. or so of soil for the sustenance of the plants. If possible the plants should be put in as the building is done, which is a more convenient practice than scooping out soil from between the stones and inserting plants after the building is finished.

THE FORMAL GARDEN. This now usually consists of flower beds of simple design intersected by paved paths set on cement. York stone is the best material for the paths, as it weathers beautifully, but cement, in pre-cast slabs or mixed and shaped on the site, is used to reduce the expense. It is an advantage to have the paths slightly higher than the flower beds. Such a garden, surrounded by a yew hedge and containing a sundial or bird bath, might well be filled

with sweet williams, lilies, tulips, daffodils, poppies, anemones, Iceland poppies, fragrant stocks, catmint, old-fashioned roses, carnations, pinks, pansies, violas, marigolds, irises, bellflowers, the low growing Michaelmas daisies, and the Japanese stonecrop which attracts butterflies and bees. Such a garden is far more economical of labour than one filled with bulbs for spring and with geraniums, fuchsias, and other tender bedding plants for summer. Bedding out is not often practised except in large places where flower beds of formal shape near the house have to be filled, in public parks and gardens, and in small gardens containing only a few beds.

The Water Garden

This easily established feature affords a great deal of interest and pleasure. There are miniature water-lilies suitable for planting in the smallest pools and in water only 12–18 ins. deep; those which spread quickly and eventually cover wide spaces are used only in large ponds. Other water plants in great variety are available, among them those oxygenating plants which are necessary to keep the water clean for ornamental fishes. Moist soil by the side of the pool provides a suitable home for iris, *astilbe*, *spiraea*, musk, bog primula, the royal and other ferns, *loosestrife*, etc. This is an ideal place for the brilliantly coloured Japanese irises which like their roots in damp soil and their flowering stems in sunshine. The water garden must be in a sunny place.

GARDENING AS A PROFESSION. During the past generation the gardens attached to country mansions have been no longer maintained in their former splendour. Yet gardening as a recreation of the people has increased enormously. There are no finer small gardens in the world than the British. The village flower show holds its own, and almost every rural and provincial district has its horticultural society. Great flower shows, at Chelsea, Shrewsbury, Southport, and Edinburgh, attract large crowds who see all the modern forms of gardening as well as the popular plants and flowers.

Market gardening both under glass and out of doors has become an industry employing thousands, for, as the towns increase in size, so the demand grows for fresh vegetables, fruit, and flowers. Gardeners' wages have risen, since horticultural tools and implements

cost more than they used to. Though the number of professional gardeners on large estates has decreased, there are more plant nurserymen, growers of market produce, and jobbing gardeners. Those who wish to take up gardening to earn a living should specialise; they should grow vegetables, fruit, or flowers for market, undertake the management of private gardens, start nursery gardens, or set up as jobbing gardeners working by the day. But none of these jobs should be undertaken without several years' training. There are openings for teachers of horticulture, park superintendents, and other posts in municipal gardening, and as instructors to the county councils. To qualify for these posts it is necessary to obtain the national diploma in horticulture of the Royal Horticultural Society. Training facilities are afforded by Kew, the Wisley Gardens of the R.H.S., and Reading university. Women may fill posts as head gardeners, and are employed in nurseries, florists' shops, and experimental stations.

Garden City. Industrial or residential town in which overcrowding is avoided by the planned lay-out and spacing of buildings so that residents enjoy the amenities and conveniences of a city with the benefits of country life. The garden city was the first serious attempt in England to restore space and health to the worker's living conditions after the Industrial Revolution.

In 1898 Sir Ebenezer Howard advocated that manufacturers by acquiring tracts of suitable land might establish themselves and their employees under more healthy and economical conditions. Although not well received by most industrialists, Howard's theories were accepted by sociologists, and in 1899 the Garden Cities and Town Planning Association was formed. In 1903 the first English garden city was registered as a limited company with a capital of £300,000. Land was acquired at Letchworth, Herts, where a town was built, designed for healthy living and industry, and surrounded by a rural belt, the land being held in trust for the community.

Today there are some 50 factories at Letchworth, all within easy reach of the workers, who

have good houses with adequate sunlight, gardens and allotments; shops, schools, factories, and cinemas are built on modern hygienic principles.

Letchworth was followed by Welwyn garden city (1920), Hampstead garden suburb, and others throughout England and Scotland. Similar to the garden city are the settlements at Bournville and Earswick, promoted respectively by the firms of Cadbury and Rowntree and now administered by trusts having the status of public utility societies. Port Sunlight differs in being reserved for employees of Lever Brothers and lacking gardens.

The success of the garden city led to the Town Planning Act of 1909, the legislation against "ribbon" development, and the clearing of existing slum areas and the transfer of their populations to satellite "garden city" areas. France, Belgium, Germany, Austria, Spain, Poland, and the British dominions followed the British lead, and the International Garden Cities and Town Planning Association, which was formed in 1914, has members in every country. See Satellite Town; Town Planning; Zoning; consult also The Garden City, C. B. Purdom, 1913; Country Towns in the Future England, S. Baron, 1945.

Gardeners' Company. London city company, incorporated by letters patent in 1605 and by charter in 1616. Its motto is In the Sweat of Thy Brows Shalt Thou Eat Thy Bread (Gen. 3, v. 19). The temporary offices are at 52, Bishopsgate, London, E.C.2. Consult History of the Gardeners, C. Welch, 1900.

Gardenia. Genus of evergreen trees and shrubs. Of the family Rubiaceae, they are natives of tropical Asia and S. Africa. They have opposite leaves, and sweet-scented, white, funnel-shaped or salver-shaped flowers. The so-called Cape Jessamine (*G. florida*) is really a native of China.

Garde Républicaine. Force organized by decrees of July 5, 1848, and Feb. 1, 1849, as an integral portion of the national gendarmerie for police duty in Paris. Officially styled the Légion de la Garde Républicaine, it is a military organization of approximately 3,000 men, in 12 companies of infantry and 4 squadrons of cavalry, under the control of a colonel or commandant, and placed as a supplementary guard at the disposal of the prefect of police. The members of the force, all ex-soldiers,

wear a striking uniform and are armed with long swords. Under the direct control of the prefect, the legion guards the public buildings and offices, controls the traffic at certain points, and handles the crowds on holiday occasions, while always acting as a reserve force which can be brought to the relief of the regular police in emergency.

Gardiner, ALFRED GEORGE (1865-1946). A British journalist and essayist. He was born at Chelmsford, June 2, 1865, became a journalist on The Essex County Chronicle, and was editor of The Daily News, 1902-19, giving a Radical direction to its policy. He wrote several books of character sketches, including Prophets, Priests and Kings, 1908; Pillars of Society, 1913; and Lives of Sir William Harcourt, and George Cadbury, both 1923. Under the pen-name Alpha of the Plough, he wrote in The Star discursive essays, collected as Pebbles on the Shore, 1917; Leaves in the Wind, 1918. He died at Princes Risborough, March 3, 1946.

Gardiner, JOHN STANLEY (1872-1946). A British zoologist. Born at Belfast, Jan. 24, 1872, he was educated at Marlborough and Caius College, Cambridge. As a zoologist he took part in numerous expeditions to various parts of the world between 1896 and 1908. Chiefly concerning himself with marine biology, he was professor of zoology and comparative anatomy at Cambridge, 1909-37, and was trustee of the British Museum from 1931. He published Coral Reefs and Atolls, 1931. He died Feb. 28, 1946.

Gardiner, SAMUEL RAWSON (1829-1902). A British historian. Born at Ropley, Hants, March 4,

Samuel R. Gardiner,
British historian
Elliott & Fry

1829, he was educated at Winchester and Christ Church, Oxford. Beyond a professorship at King's College, London, he held no tutorial positions, and gave his life to historical studies. The period to which he devoted himself was that of the Civil War, and the Commonwealth, on which he was the supreme authority.

In ten volumes Gardiner wrote the History of England from the Accession of James I to the outbreak of Civil War, 1883-84; in three others he narrated the History of the Great Civil War, 1886-

91; and wrote three volumes on the History of the Commonwealth and Protectorate, 1894-1903; but did not live to complete the fourth. He collected and edited Constitutional Documents of the Puritan Revolution, 1889; wrote What Gunpowder Plot Was, 1897; Oliver Cromwell, 1899; A Student's History of England, 1890-91, new ed. taking the work down to 1910. In 1894 he declined an appointment as professor of history at Oxford. He died at Sevenoaks, Feb. 14, 1902.

Gardiner, STEPHEN (c. 1493-1555). English prelate and statesman. Son of a Bury St. Edmunds

Stephen Gardiner,
English prelate

cloth worker, he was educated at Trinity Hall, Cambridge, of which he was elected master in 1525. In 1528 he was sent by Henry VIII to Rome to conduct negotiations for his divorce from Catherine of Aragon, in 1529 became secretary of state, in 1531 was appointed bishop of Winchester, and in 1540 was elected chancellor of Cambridge University. His vindication of Henry's title as supreme head of the church was undertaken in 1535. Under Edward VI he spent over five years in prison for his opposition to doctrinal changes and was deprived of his see, but on Mary's accession he was restored and made lord chancellor. His actual responsibility in the persecution of Protestants is uncertain, but no one was burnt for heresy in Winchester diocese while Gardiner lived. He died in London, Nov. 12, 1555, and was buried in Winchester cathedral. J. A. Muller wrote his Life, 1926, and edited his Letters, 1933.

Gardner, ERNEST ARTHUR (1862-1939). British archaeologist. Born in London, younger brother of Percy Gardner, he was educated at the City of London school and Caius College, Cambridge. After excavating at Naucratis, Egypt, 1885-86, he was director of the British school at Athens, 1887-95, conducting excavations at Paphos and Megalopolis. Appointed Yates professor of archaeology, University College, London, in 1896, he remained until 1929, being also public orator to the university, 1910-32, and vice-chancellor, 1924-26. He served at Salonica, 1915-17. Among many

publications are his Ancient Athens, 1902; Six Greek Sculptors, 1910; Religion and Art in Ancient Greece, 1910; A Handbook of Greek Sculpture, rev. ed. 1915; The Art of Greece, 1925; Greece and the Aegean, 1933. He died Nov. 27, 1939.

Gardner, PERCY (1846-1937). A British archaeologist. Born at Hackney, Nov. 24, 1846, he was educated at the City of London school and Christ's College, Cambridge. Entering the British Museum in 1871, he produced several coin catalogues. In 1880 he became Disney professor of archaeology at Cambridge, and during 1887-1925 was professor of classical archaeology at Oxford. He edited the Journal of Hellenic Studies, 1880-96. His many works include Types of Greek Coins, 1883; Manual of Greek Antiquities, 2nd ed., 1898; Grammar of Greek Art, 1905; Greek Art, 1926. Another of his interests is exemplified by his Jowett lectures, Historic View of the New Testament, 1901; and Religious Experience of St. Paul, 1911. He died July 17, 1937.

Gardone Riviera. Name of a series of eight villages of N. Italy. On the W. shore of Lago di Garda, they form a winter resort for consumptives and a spring and autumn one for invalids.

Gare Fowl. Common alternative name for the great auk. It is the anglicised form of the Icelandic geirfugl. See Great Auk.

Gareloch. Arm of the Firth of Clyde, Dumbartonshire, Scotland. It extends about 7 m. N.W. from Helensburgh. After the collapse of France in the Second Great War had virtually closed the ports of southern England, work was begun on the Gareloch at the end of 1940, and the first ship was berthed there in July, 1942. The new port covered 1½ m. of waterfront and had six rail-served berths 500 ft. long. A large tonnage of U.S. military stores and vehicles was received here and dispatched to the Continent.

Gareth, Sir. Character in the Arthurian legends. Youngest son of King Lot and brother of Gawaine and Mordred, he entered the court of his uncle, Arthur, concealing his identity at his mother's request. He received a knighthood and, at the request of Linet helped her sister Liones (whom he afterwards married) to escape from castle Perilous.

Garfield. City of New Jersey, U.S.A., in Bergen Co. On the Passaic and Saddle rivers, 10 m.

N.W. of New York, it is served by the Erie rly. The manufactures are textiles, clothing, chemicals, paper and rubber products, printing presses, and hardware. A borough since 1898, Garfield was made a city in 1920. Pop. 28,044.

Garfield, JAMES ABRAM (1831-81). American statesman. Born at Orange, Ohio, Nov. 19, 1831, in

James Garfield

humble circumstances, and soon left fatherless, he worked as a labourer as soon as he was old enough. A desire for education seized him, and about 1849 he managed to enter a college at Chester, Ohio. He studied there and elsewhere for about six years, and in 1856 was made lecturer at Hiram College. In 1857 he was chosen its president and in 1861 he became a barrister. During the Civil War he commanded an infantry brigade at Shiloh and elsewhere, and, as chief of the staff to Rosecrans, distinguished himself at the battle of Chickamauga.

As a Republican he began his active political career in 1856. State senator of Ohio, 1859, he was elected to the house of representatives at Washington in 1863. He assisted Lincoln in the last difficult days of the Civil War, and was prominent during the next 18 years, being chairman of the military committee, and a frequent speaker on financial and other matters. He was three times candidate for the office of speaker, and in 1880 was nominated by the Republicans for president, being elected against W. S. Hancock.

During his brief term of office Garfield showed want of tact in dealing with political opponents, and by selecting his cabinet almost entirely from his own section of the Republican party, incurred the hostility of the "stalwarts," or supporters of Grant, led by Roscoe Conkling, who resigned their places in the senate. He was shot at Washington railway station, July 2, 1881, but survived until Sept. 19, when he died at Elberon, N.J. His assassin, who was hanged, was Charles J. Guiteau, a Chicago lawyer who had asked for, but failed to obtain, the American consulship at Marseilles. Garfield's monument is at Cleveland.

Bibliography. Life, Speeches, and Public Services, R. H. Conwell, 1881; Works, ed. B. A. Hinsdale,

2 vols., 1882-83; Garfield's Place in History, H. C. Pedder, 1882; Reminiscences of J. A. Garfield, C. E. Fuller, 1887; From Log-Cabin to White House, W. M. Thayer, repr. 1914; Life and Letters, T. C. Smith, 2 vols., 1926.

Gar-fish (*Rhampistoma belone*). Group of fishes of long and slender form. They have the jaws produced to form a sword-like beak, with rough edge and widely set teeth, and bones of a green colour. They are marine in habit,

the head back, and gently breathing air through it. They are employed chiefly in conditions of catarrh and inflammation of the throat. If the inflammation is acute, the action of gargling should be gentle. Gargle is from Fr. *gargouiller*, to gargle; *gargarisma* is a Latin word meaning a gargle, Fr. *gargarisme*.

Gargoyle (Fr. *gargouille*, throat). Projecting spout attached to the gutter of a roof for shooting rain-

Gargoyle. Examples in church architecture: left, at Stony Stratford, Buckinghamshire; right, at Horsley, Derbyshire

and include about fifty species, of which one is quite common around the British coasts.

Gar-fish. Slender fish with prolonged sword-like jaws

Garganey (*Anas querquedula*). Species of wild duck similar to the teal (*q.v.*). It is found in most parts of Europe and Asia during the summer, and in winter around the Mediterranean and in Southern Asia. An extremely rapid flyer, it visits Great Britain in the spring, and nests in dense clumps of rushes.

Gargano (anc. *Garganus Mons*). Mountainous peninsula of S.E. Italy, in the prov. of Foggia. Jutting out some 30 m. into the Adriatic, it rises, in Monte Calvo, to an alt. of 3,464 ft.

Gargantua. Central figure of Rabelais's *Les Horribles Faictz et Prouesses Espouventables de Pantagruel*, published under the pseudonym Alcofrabas in 1535. Gargantua, father of Pantagruel, is a huge giant with a vast capacity for eating and drinking. From his name is derived the adjective gargantuan to denote anything prodigiously large. See Rabelais.

Gargles or **GARGARISMA**. Fluid preparations used in medicine for medicating the throat by taking a mouthful of the liquid, throwing

water clear of the walls. In Gothic architecture it was made of stone fashioned into a grotesque animal or human face. The term can be used of an ordinary lead trough or rain-water head.

Garhmuktesar. Town of the United Provinces, India, in the Hapur subdivision of Meerut dist. It contains the great temple of Mukteswra Mahadeo, from which its name is derived, and is one of the chief resorts of pilgrims, being on the Ganges. There are also a mosque, built in 1283, and an ancient fort. Pop. 5,950.

Garhwal. District of the United Provinces, India, in the Kumaun div. Its area is 5,629 sq. m. It extends across the Himalayas, and is chiefly a mountainous region. The cultivated area is small, and is principally devoted to rice, wheat, and other grain crops. The chief trade is with Tibet. Exports consist of grain, cloth, ghi, and chillies, and imports salt, wool, sheep, and goats. The district contains a number of shrines held sacred by the Hindus, among them the temples of Badrinath, Kedar-nath, and Pandukeshwar, and is the centre of a great pilgrim traffic. Pop. 602,115.

Garhwal, **TEHRI**, or **TEHRI-GARHWAL**. Former Punjab state of India, merged in 1949 in the United Provinces. Its area was 4,500 sq. m. The area lies in the Himalayas, and the cultivated part is very small. Narendranagar, the former capital, is the chief commercial centre. Pop. 397,369.

Garibaldi, GIUSEPPE (1807-82) Italian patriot. A fisherman's son, he was born at Nice, July 4, 1807. In 1834 he flung himself ardently into the Young Italy movement, initiated by Mazzini, joined in an insurrection, and barely escaped from the country with his life. During 1836-84 he was in S. America,

Giuseppe Garibaldi, Italian patriot
From a photo c. 1860

where he won high reputation as a leader both on land and on sea, fighting for the Montevideans against Rosas, dictator of Buenos Aires. In 1848, when oppressed peoples were everywhere rising against their rulers, he returned to Italy, raised troops of volunteers, whom he inspired with his own heroic courage and passionate love of liberty, and performed brilliant feats of arms in the defence of the Roman republic. But the insurrection collapsed, and in 1849 he took refuge in New York. His Creole wife Anita had died during the campaign. In 1854 he again returned, settling in Caprera under the Sardinian government.

On the outbreak of the war in 1859 between Austria and Sardinia (*i.e.* Victor Emmanuel), supported by Napoleon III, Garibaldi rendered brilliant service to the Italian cause. But when Napoleon, after the victory of Solferino (June 24), imposed the peace of Villafranca, and Nice, to Garibaldi's deep chagrin, had been handed over to France, he lent his unique genius as a partisan leader to the Sicilian insurgents against the Bourbon monarchy of Naples. Openly discountenanced but secretly encouraged by Cavour, he gathered an army of 1,070 volunteers, his "red shirts," known as Garibaldi's Thousand, sailed from Genoa on May 5, 1860, threw himself into Sicily, and cleared it of the 20,000 Bourbon regular troops. Passing over into Italy, Aug. 8, he conducted what was in effect a triumphal march to Naples, whence Francis II took flight. When Victor Emmanuel entered Neapolitan territory, Garibaldi hailed him as king of united Italy, Nov. 7.

This conclusion to his epic showed that Garibaldi could rise to statesmanship. Later he was carried away by impetuosity, though his adventures in the cause of liberty were not ended. Believing

his project to be favoured by the king, he attempted, in 1862, to wrest Rome from the pope; but the Italian government turned against him, and he was hopelessly defeated at Aspromonte, Aug. 29. He again commanded the irregular troops he loved in the war with Austria, 1866; and in 1867, in defiance of his government, again tried to capture Rome, but was disastrously defeated by its French defenders at Mentana, Nov. 3. He was again permitted to go into retirement, but the Franco-Prussian War roused him once more, and, when France had discarded the emperor, he gave his services to the French army in the Vosges, 1870. The remaining years of his life he passed as an invalid in his home at Caprera, where he died June 2, 1882.

In 1864 Garibaldi paid his one visit to England, where he was welcomed with immense enthusiasm. His autobiography appeared in Eng. trans., 1889; his *Memoirs*, ed. A. Dumas, Eng. trans. R. S. Garnett, in 1931. G. M. Trevelyan's trilogy, repr. as Garibaldi, 1933, has superseded all earlier works in English for the period 1848-60.

Gariep. Variant name for the river of S. Africa better known as the Orange (*q.v.*).

Garigliano (anc. *Liris*). River of S. Italy. Rising in the Apennines, W. of Lake Fucino, it flows, as the Liri, S. past Sora, and thence to the Gulf of Gaeta. Its length is 104 m. Navigable below Pontecorvo, it abounds in fish. During the Second Great War it was crossed by the 5th army at the end of Dec., 1943. Its tributary the Rapido, flowing below Cassino, was one of the obstacles the Allies had to overcome in their attack on that stronghold.

Garlic. Pungent flavoured bulbs of the onion family, of the family Liliaceae, genus *Allium*. A native of the East, probably S.W. Siberia, garlic grows to a height of 2 ft., bearing at the top an umbel of a few whitish flowers mixed with a number of small bulbs. The plant is cultivated in similar way to the shallot, and only the bulb part is eaten. It has a powerful onion-like smell and taste, and is used as a condiment chiefly in S. Europe. The allyl

Garlic. Flowers and foliage of *Allium oleraceum*

sulphide found in garlic is reputed to be a cure for consumption.

Wild garlic, *Allium oleraceum*, is occasionally used in England as a pot-herb. Another species, *Allium vineale*, the field garlic or wild onion of America, grows extensively in the pasture lands of U.S.A., and gives a disagreeable flavour to milk, butter, and cheese when eaten by cattle. This species

also grows in English meadows.

Garmisch - Partenkirchen.

Twin towns in Upper Bavaria, at the foot of Germany's highest mountain, the Zugspitze. Situated at a height of 2,140 ft., they are a centre for winter sports, and a health resort reputed for a sunny, sheltered situation in the Partnach valley. Here were held the Olympic winter sports contests of 1935-36. Neighbouring Kainzenbad is a spa for rheumatic and feminine diseases. Excursions by cable rly. to the summit of the Wank and the Zugspitze (9,715 ft.) permit views of a beautiful Alpine panorama. Pop. 10,107.

Garnet. Group of common rock-forming minerals, occasionally used as an abrasive or valued as semi-precious stones. All members are composed of a monoxide, sesquioxide, and silica, in the ratio of 3:1:3 (general formula $3R''O.R'''O_2 \cdot 3SiO_2$; where R'' may be bivalent-calcium, magnesium, ferrous iron or manganese; and R''' may be trivalent-aluminium, ferric iron, chromium, or manganese). Winchell proposed two species, each composed of three members:

Pyrope	Pyrope	$3MgO \cdot Al_2O_3 \cdot 3SiO_2$
	Almandite	$3FeO \cdot Al_2O_3 \cdot 3SiO_2$
Ugrandite	Spessartite	$3MnO \cdot Al_2O_3 \cdot 3SiO_2$
	Uvarovite	$3CaO \cdot Cr_2O_3 \cdot 3SiO_2$
Grossularite	Grossularite	$3CaO \cdot Al_2O_3 \cdot 3SiO_2$
	Andradite	$3CaO \cdot Fe_2O_3 \cdot 3SiO_2$

Natural garnets generally contain two or more of the above molecules in mutually crystal solution. Minor varieties are hessonite, "South African Jade" (var. grossularite); "Adelaide Ruby" (var. almandite); "Bohemian" garnet, "Cape ruby," "Elie ruby," "Arizona" and "Colorado" ruby, rhodolite (var. pyrope); demantoid, "Uralian emerald," "topazolite" (var. andradite). Some of these are colloquial names for garnets of gem quality.

The garnets crystallise in the cubic system; they are hard, have no cleavage, and a specific gravity of 3.4-4.3. Colour is variable, often bright; they are commonly isotropic and possess a high refractive index. These properties make garnets of good quality valuable as gem stones and for watchmaking, and powdered iron-garnet (commonly almandite) has a technical application as an abrasive. Garnet is widespread in schists, gneisses, and contact-altered limestones, also in many plutonic rocks, but is rare in volcanic rocks. Deposits are rare of stones of gem quality or in sufficient quantity for mining as an abrasive. The principal varieties are described in this work under individual entries.

Garnett, CONSTANCE (1861-1946). British translator. Her maiden name was Black. After a brilliant career at Cambridge, she visited Russia to perfect her knowledge of the language. She began by translating the works of Gogol, and over some 20 years rendered into English the works of Dostoevsky, Turgenev, the plays and tales of Chekhov, and Tolstoy's War and Peace, and Anna Karenina. Into this achievement she put a sensitive literary conscience and scientific respect for both languages. She died Dec. 17, 1946.

Her husband, Edward Garnett (1868-1937), was a son of Richard Garnett, and was associated with the publishing firms of J. M. Dent and Sons, and Jonathan Cape. His plays included The Breaking Point; The Feud; The Trial of Jeanne d'Arc. He edited Letters from Conrad, and from Galsworthy. He died Feb. 19, 1937.

Garnett, DAVID (b. 1892). British novelist. Son of Edward and Constance Garnett, he was trained as a biologist at the Royal College of Science. His first novel, Lady Into Fox, 1923, was awarded the Hawthornden and Tait Black prizes, and quickly established his reputation as a writer of originality and whimsical imagination. His later books included Man in the Zoo, 1924; Go She Must, 1926; The Sailor's Return, 1928; No Love, 1929; The Grasshoppers Come, 1931; A Rabbit in the Air, 1932; Pocahontas, 1933; Beany-Eye, 1935; War in the Air, 1941. After the Second Great War he was associated with the publishing firm of Hart-Davies. He edited Letters of T. E. Lawrence, 1938. Lady Into Fox and The Sailor's Return were produced as ballets.

Garnett, OR GARNET, HENRY (1555-1606). English Jesuit. Educated at Winchester, he joined the

Henry Garnett,
English Jesuit

Jesuits in 1575, and in 1587 was made superior of the English province. He became involved in the Gunpowder Plot (*q.v.*) and after hiding in Hindlip Hall, near Droitwich, gave himself up, maintaining to the end that he did not approve of the plot, though admitting his knowledge of it. He was executed in S. Paul's churchyard, May 3, 1606. On an empty husk of a blood-stained straw picked up near the gallows a perfect image of the dead Jesuit's face is said miraculously to have appeared "as if it had been painted," and "Father Garnett's straw" created a great stir.

Garnett, RICHARD (1835-1906). British librarian and author. Born at Lichfield, Feb. 27, 1835, he joined the

staff of the British Museum in 1851. Becoming superintendent of the Reading Room in 1875, he was Keeper of Printed Books from 1890-99.

Awarded the C.B. in 1895, he died on April 13, 1906. Among his many works are *Lives of Carlyle*, 1887; *Emerson*, 1888; *Milton*, 1890; *Twilight of the Gods*, 1888; various poems and translations, and contributions to the *Dictionary of National Biography*, the *Encyclopaedia Britannica*, etc.

Garnier, ROBERT (c. 1545-c. 1599). French dramatist. Born at Ferté-Bernard, Garnier studied law at Toulouse, and after practising at the Paris bar, became one of the royal councillors for Le Maine. He wrote a number of poems, mostly lost, and was important in the history of the development of French classical tragedy as a fore-runner of Corneille. Garnier's tragedies of *Porcie*, 1573, *Cornélie*, 1573, and *Antigone*, 1580, are eloquent but dull; but his masterpieces, widely acclaimed in their day, were *Bradamante*, 1582, and *Les Juives*, 1583. These, though their inherent interest is slight, show considerable poetic power and good dramatic technique. Garnier died at Le Mans c. 1599.

Garnier-Pagès, LOUIS ANTOINE (1803-78). French statesman.

Born at Marseilles, Feb. 16, 1803, he took part in the revolution of 1830, became an advanced republican deputy for Verneuil, 1842, and joined the ministry of Dupont de l'Eure after the revolution in 1848. He was appointed mayor of Paris, Feb. 1848, and minister of finance in March. In the constituent assembly he sat for the Seine dept. He retired from public life in 1871, and died in Paris, Oct. 31, 1878.

Louis was the half-brother of Étienne Joseph Garnier-Pagès (1801-41), a prominent radical and republican orator, who sat as deputy for Isère, 1831-34, and for Le Mans, 1835-41. *Pron.* Garneyay-Pazh-ays.

Garnishee (Old Fr. *garnir*, to warn). Term used in English law. It is the procedure whereby a judgement creditor can obtain an order from the court directing a person who owes money to the judgement debtor to pay it over to the judgement creditor. For example, A has a judgement for £100 against B. B has £1,000 in Coutts's bank. A can obtain an order from a master ordering Coutts's to pay him £100 of B's money.

Garó. Primitive tribe in the Garo hills, S.W. Assam. Numbering about 150,000, they show kinship with the plains Kacharis. Short, dark, animistic, they practise fowl-sacrifice, matriarchy, and teknonymy—naming parents after their children. Headhunting has disappeared since British rule was established, after expeditions from 1790 to 1873. American Baptist missions work successfully among them. See Bodo.

Garó Hills. District of S.W. Assam. The district mainly consists of hills, and is principally inhabited by the Garos (*q.v.*), who form about three-quarters of the population. The area is 3,140 sq. m.; that under cultivation is uncertain. The principal articles of imports are rice, dried fish, pigs, fowls, goats, cattle, cloth and ornaments, while the exports consist of cotton, forest products, etc.

Garonne. River of France. It rises in the Pyrenees near Maladetta, and is for a few miles a Spanish stream. It enters France in the dept. of Haute Garonne, and, flowing mainly N.W., reaches the sea just below Bordeaux.

There it receives the Dordogne, and the two unite to form the estuary of the Gironde. Its chief tributaries are the Tarn and the Lot, both on the right; others are the Ariège, Save, Baise, Gers, and Salat. Toulouse and Agen stand on it, and it drains an area of over 30,000 sq. m.

Gar Pike. Name sometimes applied to the gar-fish (*q.v.*), but properly to *Lepidosteus osseus* and the alligator gar of American lakes.

Garrauli. Former petty state of India, merged in 1948 in the Vindhya union. Area 39 sq. m. Gopal Singh, who opposed the British occupation of Bundelkhand in 1803, causing trouble to the British authorities, received a pardon and a grant of this territory in 1812. Pop. 4,965.

Garrick, DAVID (1717-79). English actor. Born at Hereford, of Huguenot descent, on Feb. 19, 1717, he was educated at Lichfield grammar school, and later at Samuel Johnson's academy there. Becoming close friends, Johnson and Garrick set off for London to seek fame and fortune in March, 1737, arriving, according to the former, with only fourpence between them. Until 1741 Garrick engaged, with scant success, in a wine business, but his main interests were in the stage. His play *Lethe* was produced in 1740, and in March, 1741, he made his first appearance on the stage as Harlequin, appearing at Goodman's Fields Theatre in Oct. as Richard III. His great success in this part led him to become definitely an actor, under his own name.

During 1742-45 he played at Drury Lane, and after a season in

After R. B. Pine, Nat. Port. Gal.

After R. B. Pine, Nat. Port. Gal.

Dublin with Sheridan, appeared at Covent Garden during 1746-47. After this Garrick became the chief proprietor of Drury Lane. Specially noteworthy were his Shakespearian productions, which marked a great revival in the popularity of Shakespeare's plays and an attempt to secure accuracy in costume and mounting; but he took remarkable liberties with the text. Hamlet, Lear, Macbeth, and Richard III were among his most distinguished performances. After 1766 Garrick appeared only occasionally, except for his farewell season in 1776. His death on Jan. 20, 1779, called forth Johnson's famous remark that the event had "eclipsed the gaiety of nations, and impoverished the public stock of harmless pleasure." He was buried at the foot of Shakespeare's statue in Westminster Abbey.

A man of wit and versatility, Garrick enjoyed the friendship of many of the most distinguished figures of his day, to whom his house at Hampton was well known, and his services to the English stage were inestimable. His long association with the beautiful "Peg" Woffington ended in 1749, when he married Eva Maria Veigel, a German lady, who survived him until 1822.

Bibliography. Lives, James Smyth, 1887; P. H. Fitzgerald, rev. ed. 1899; David Garrick, J. Knight, 1894; Garrick and His Circle, F. M. Parsons, 1906; Some Unpublished Correspondence, ed. G. P. Baker, 1907; David Garrick, Dramatist, E. P. Stein, 1938.

Garrick Club. London club, founded in 1831 by Francis Mills and others for the general patronage of the drama and the formation of a theatrical library, and to combine the use of a club with the advantages of a literary society. Housed at first in 35, King St., Covent Garden, it moved to 15, Garrick St. in 1862. The 650 members include leading actors, literary men, and members of the legal profession.

Garrick Theatre. Playhouse in Charing Cross Road, London. It was opened April 24, 1889, by Sir John Hare with *The Profligate*, and continued under his management many years. Pinero's *The Gay Lord Quex* was put on here in 1899; and other successes were *Kismet*, 1911; *The Man in Dress Clothes*, 1922. Later came mostly light comedies and farces, except for the psychological thriller *Uncle Harry*, which ran through most of 1944. The theatre seats 1,250.

Garrison (Fr. *garnison*, from *garnir*, to supply). Body of troops manning a defensive position. The term is also applied to a military force stationed overseas; thus there are garrisons in Singapore, the West Indies, etc. Towns such as Aldershot, which are the headquarters of army commands, are known as garrison towns, as are York, Canterbury, and other territorial headquarters of regiments.

Garrison, WILLIAM LLOYD (1805-79). American abolitionist. Born at Newburyport, Mass., Dec.

W. Lloyd Garrison, American abolitionist

12, 1805, he was apprenticed to a printer. Before he was 20 he was writing articles, under the pseudonym of Aristides, attacking the institution of slavery. In 1827 he became editor of *The National Philanthropist*, the first paper founded in America to advocate temperance. In 1829 he joined the Quaker, Benjamin Lundy, in his work on *The Genius of Universal Emancipation*. Garrison now expressed such violent views on slavery that a libel action against him ended in his imprisonment. On his release he started, 1831, to publish at Boston a weekly journal, *The Liberator*.

He continued to produce his paper until 1865, having witnessed the triumph of his cause in 1863. He wrote *Thoughts on African Colonization*, 1832, and founded the Anti-Slavery Society, 1843. He visited Great Britain in 1833, 1846, 1848, and 1867. He died in New York May 24, 1879.

Garrod, DOROTHY ANNIE ELIZABETH. British archaeologist. Daughter of Sir Archibald Garrod, physician, she was educated at Newnham College, Cambridge, and St. Anne's Society, Oxford. Having directed archaeological expeditions to S. Kurdistan, 1928, and to Mount Carmel, 1929-34, she was appointed Disney professor of archaeology at Cambridge in 1939. In 1942-45 she was an officer in the W.A.A.F. In 1949, in company with Mlle. de Saint-Mathurin, she excavated a rock-shelter near Angles-sur-l'Anglin, Vienne, France, bringing to light painted limestone carvings of the Magdalenian period. From 1950 she was head of the dept. of archaeology and anthropology at Cambridge. She wrote *The Upper Paleolithic Age in Britain*, 1926.

Garros, ROLAND (1888-1918). French airman. Born at St. Denis, in the island of Réunion, he studied music at Nice and Paris. Aviation, then in its infancy, attracted him, and he made altitude records in 1911-12, and came to the front as a daring and expert flyer. He became the idol of France by a successful flight of 500 m. across the Mediterranean from San Raphael to Bizerta. He also won in 1912 the Grand Prix of the Aero Club of France in a violent storm. In the First Great War Garros, a pilot feared by enemy airmen, advocated the synchronisation of propeller and machine-gun. Captured in 1915, he escaped in 1918, but was shot down and killed on Oct. 5. The Stade Roland Garros in Paris, scene of national sporting events, perpetuates his name.

Garrote (Span. *garrote*, cudgel). Spanish method of execution by strangulation. Originally the condemned person was seated in a chair fixed at the back to an upright post. A cord was placed round his neck and also round the post. Strangulation was produced by twisting the cord with a stick after the manner of a tourniquet, for which a former alternative term was garrot. Later on the chair was provided with a hinged iron collar, in the back of which was a sharp-pointed screw, or a lever. Death was caused by dislocation of the spinal column, or by a blade which on being forced forward severed the spinal cord.

During the Inquisition prisoners who recanted were occasionally offered death by the garrote as a mark of favour, instead of death by actual burning. But the former, in the hands of a careless or unskilful executioner, was capable of inflicting severe torture before the end came. Possibly the garrote came into use in Spain as a result of the Moorish rule in the country, for, in its original form, it closely resembled the use of the bowstring in the East.

The winter of 1862-63 was marked in Great Britain by a serious outbreak of highway robbery with violence, many victims being attacked from behind and half-strangled by a cord or handkerchief thrown over their heads. The evil became so serious that in 1863 the Garrotters Act was passed authorising the punishment of offenders by flogging.

Garry. Loch and river in the Atholl district of Perthshire, Scotland. The river has its source in the Loch, and flows 20 m. E.S.E. until it joins the Tummel about

5 m. S.E. of Blair Atholl. In 1937 work was completed on a tunnel through the mountains to convey the waters of Loch Garry to Loch Eriicht, 5 m. W., to augment the output of the Rannoch hydro-electric power station.

Garry. Lake of Canada, in the North-West territories. It is in lat. 66°, and on the borders of the Arctic circle. The Back, or Great Fish, river passes through it, carrying its waters to the Arctic Sea. Its area is 980 sq. m. There is also a Garry Island, this being on the Arctic Ocean, off the mouth of the Mackenzie river.

Garrya. Small genus of evergreen shrubs. They belong to the family Garryaceae and are natives

Garrya. Spray of foliage and flower and sectional diagram of a berry

of the warmer parts of America. They have opposite, oval or elliptic leaves, and greenish-white or yellowish flowers in long pendulous sprays; the males being on one plant, the females on another. *Garrya elliptica*, a native of California, is frequently grown in the warmer parts of Europe.

Garshin, VSEVOLOD MICHAÏLOVITCH (1855-85). Russian novelist. He was known as an infant prodigy, and his essay on Death, written when he was 17, is a piece of surprising realism. His short stories, among which the Red Flower and The Signal are perhaps his best works, show him at once imbued with the spirit of the romantics and greatly influenced by Tolstoi. Loathing war, he served as a soldier against the Turks in 1877, that he might not shirk what others were compelled to endure. The execution of a friend drove Garshin mad, and though he recovered his mind remained somewhat unbalanced. On March 24, 1885, he committed suicide.

Garstang. Town of Lancashire, England. On the river Wyre and the main road from industrial Lancashire to the Lake District, it is 11 m. N.N.W. of Preston, and

has a railway station called Garstang and Catterall. The main street is narrow, with old and picturesque properties. It has bridges over the river and a canal. S. Thomas's church dates back to 1497, and Bonds R.C. church is a Gothic structure of 1858. On an eminence to the E. are the ruins of Greenhalgh Castle, built 1490, and dismantled 1650. Garstang was formerly a borough, having had charters granted in 1314 and 1680. Market day, Thurs. Pop., of parish, 1,200.

Garstang, JOHN (b. 1876). A British archaeologist. Educated at Blackburn grammar school and Jesus College, Oxford, he devoted himself to archaeology, and excavated Roman sites at Ribchester, Richborough, etc., and Egyptian sites, including Abydos, Beni-Hassan, and Negada. In 1907 he became John Rankin professor of archaeology in Liverpool university, remaining until 1941, when he became emeritus professor. He excavated the Hittite site of Sakjegeuzi, in 1908 and in 1911. He was director of antiquities, Palestine, 1920-26; supervised work at Jericho, 1930-36; and then directed the Neilson expedition to the Near East. He wrote much on the Hittites, Ancient Egyptians, and Biblical history, e.g. *The Heritage of Solomon*, 1934.

Garston. Port and parish of Lancashire, England, now included in Liverpool, of which city it is a parl. div. It stands on the Mersey, 6 m. S.E. of Liverpool. Here are rly. docks from which coal is shipped. There are iron, copper, match, and bobbin works. There is a parish of the same name near Watford, Herts. East Garston is a village situated on the Berkshire Downs, with a rly. station; pop. 386.

Garter, ORDER OF THE. British order of knighthood. It was originally instituted as a purely military order by King Edward III in 1344, as a means of rewarding comrades-in-arms, but in modern times is more generally bestowed on royal personages and on leading representatives of the British peerage. The first statutes limited its number to the sovereign, the prince of Wales, and 24 other knights companions. The order was enlarged during the reigns of George III and William IV, and now includes the above 26 knights as a constituent part of the original foundation, together with such descendants of George I as have been elected, or may be eligible to be elected, with the addi-

tion of those foreign rulers and princes who may be admitted.

Each knight is allotted a stall in S. George's chapel, Windsor Castle, on which is set up a plate engraved with his titles and coat of arms. The earlier plates are some of the most interesting and remarkable examples of heraldic design. Above each knight's stall are also placed, during his lifetime, his banner, sword, helmet, and crest. There was formerly a special ceremony in the chapel, when the new knight was invested with the habits and insignia of the order and conducted to his stall, but for ordinary knights companions this ceremony has been dispensed with; they are usually invested by the king personally.

The habits and insignia of the order are the garter, mantle, surcoat, hood, star, collar, George, and lesser George. The garter, of dark blue velvet inscribed in gold with the motto of the order *Honi Soit Qui Mal Y Pense* (Evil be to him who evil thinks), is worn below the left knee. The star has a buckled circular garter, with the motto, enclosing the cross of S. George, the whole enamelled in the proper colours, and surrounded by an eight-pointed star of silver rays; it is worn on the left breast. The collar is of gold and consists of 26 Tudor roses (alternately red and white), each within a circular garter, and joined together by chains and interlaced knots of cords. The George, in enamelled gold, representing S. George and the dragon, is suspended from the collar. The lesser George has the same device on an enamelled ground surrounded by an oval garter. It is worn suspended

Garter. Insignia of the Order. Top, star; centre, the garter; below, collar and George

from a broad ribbon of garter blue, which passes over the left shoulder and under the right arm. On the death of a knight companion his insignia go back to the sovereign.

An embroidered garter with the motto of the order was formerly worn on the left arm by the wife of a K.G. Nowadays the only women admitted to the Order are the Queen of England and foreign sovereigns.

The original statutes provided that on or about the feast of S. George (April 23) the knights companions should meet at Windsor and attend a special service in S. George's chapel. This was carried out for many years at irregular intervals, but finally discontinued.

The order has the following officers: prelate, the bishop of Winchester; chancellor, the bishop of Oxford; registrar, the dean of Windsor; herald, garter king of arms; gentleman usher of the black rod; and secretary. Included in the order of the garter under the statutes are the canons and the military (formerly called poor) knights of Windsor, and the lay clerks and choristers of S. George's chapel. See Heraldry; Knighthood; Military Knights of Windsor.

Bibliography. The Institution, Laws and Ceremonies of the Most Noble Order of the Garter, E. Ashmole, 1672, ed. T. Walker, 1715; The History of Antiquities of Windsor Castle . . . and Ceremonies of the Order of the Garter, J. Pote, 1749; Memorials of the Order of the Garter, G. F. Beltz, 1841.

Garter King of Arms. Principal officer of the English Herald's College. His office was instituted in 1417. He is herald of the order of the garter.

Garth (Icel. *garthr*, enclosure). Enclosed space of ground, particularly the turf within a cloister, known as the cloister-garth. The term is also used to describe a kind of dam or weir for fishing purposes. See Close.

Gartok. Chief town in W. Tibet. It is situated at an altitude of 14,656 ft., 800 m. W. of Lhasa. It was opened in 1904 as a trade mart, with a British commercial agent, as a result of the Young-husband expedition to Lhasa.

Garter King of Arms

Garna. Town of French Cameroons, W. Africa. In the N.W. of the territory, it is situated on the Benue river, which is navigable for shallow boats to this point from June to Dec. It is the chief centre of the Garua district, and station on the Benue route to the Niger.

Garumnian. Local stage of the Upper Cretaceous series of stratified rocks reaching a thickness of 2,500 feet; it is developed in Provence. It is notable on account of a fresh-water origin, containing fresh-water and terrestrial fossil shells.

Garvice, CHARLES (d. 1920). British writer of fiction. He began his remarkable literary career with the publication of a book of verses, and a three-volume novel, Maurice Durant, followed in 1875. But his popularity, first in America, then in the U.K., was based on an almost countless succession of conventional sentimental romances, semi-sophisticated variants of the Cinderella theme, impeccable in their moral tone, which began in 1890 and continued until his death. Characteristic titles include *Just a Girl*; *Her Heart's Desire*; *In Cupid's Chains*; *Love Decides*; *The Gold in the Gutter*; *The One Girl in the World*. These and many others, widely reprinted in cheap editions, made him one of the first of "best-sellers" and brought him a considerable fortune. He died at Richmond, March 1, 1920.

Garvie, ALFRED ERNEST (1861-1945). British divine. He was born of Scottish parents in Poland, Aug. 29, 1861, and educated at George Watson's College, Edinburgh, and Edinburgh and Glasgow universities. He was principal of New College, Hampstead, 1907; chairman of the Congregational Union of England and Wales, 1920; president of the National Free Church Council, 1923; and moderator of the Federal Council of the Free Churches, 1928. For more than a generation the training of ministers for the Congregational Church was largely in Garvie's hands.

Among his published works are *The Christian Personality*, 1904; *Tutor unto Christ*, 1920; *The Beloved Disciple*, 1922; *Christian Moral Conduct*, 1938; and he

A. E. Garvie, British divine

edited the Westminster New Testament. He died March 5, 1945.

Garvin, JAMES LOUIS (1868-1947). British journalist and editor. Born, April 12, 1868, at Birkenhead, of

J. L. Garvin, British journalist

Irish stock, he wrote his first articles for *The Eastern Morning News*, Hull, in 1885. He became leader writer on *The Daily Telegraph*, 1899, and edited the *Outlook*, 1905-06, and *The Pall Mall Gazette*, 1912-15. But he is best remembered as editor of *The Observer* 1908-42; not only did he lift the status of that Sunday newspaper to unprecedented height, but by his own regular long articles therein made himself a forceful political influence, particularly in imperial and foreign affairs. His power lay in his expert evaluation of an immediate situation rather than in consistency to any political principle, apart from unflagging patriotism. When at last his views diverged too sharply from those of his proprietor and he resigned the editorship of *The Observer*, he wrote regularly for *The Sunday Express* for one year and then returned, at Lord Camrose's invitation, to *The Daily Telegraph* as a special political contributor. Garvin edited the 14th edition of the *Encyclopaedia Britannica*, and wrote the official *Life of Joseph Chamberlain*, in two volumes, 1932-33. He was made C.H., 1941, and died at his home at Beaconsfield, Jan. 23, 1947. *Concise Life*, K. Garvin, 1948.

Gary. City of Indiana, U.S.A., in Lake co. At the head of Lake Michigan, 30 m. S.E. of Chicago, it is served by several rlys. The city owes its existence and prosperity to the U.S. Steel Corporation, which in 1905 selected here a site of 8,000 acres of dune and swamp crossed by the Grand and Little Calumet rivers. Some \$25,000,000 was spent on furnaces and ovens, tinplate, cement, and electric power plants, and Gary has become the chief city in the world for steel production, its finished goods ranging from screws to locomotives. Tinplate and cement are also turned out. A few independent enterprises have established plants. Gary has some of the largest and best school buildings in the Middle West. Pop. 111,719.

Gas (word invented by van Helmont from Gr. *khaos*, chaos). Gas is matter in a perfectly fluid state. All forms of matter, solid, liquid, or gas, consist of molecules which attract each other. In a gas, however, the distances between molecules are large compared with their size, and the attractive forces are small compared with those in solids and liquids, hence it is that a gas readily assumes the shape and volume of its container. Whenever a gas is confined within a closed container, it exerts pressure, and Boyle's law states that if the temperature of a confined gas (i.e. of a constant mass) is maintained constant, then the product of the pressure P and volume V it occupies is constant. At a constant pressure the volume V occupied by a given mass of gas is directly proportional to the absolute temperature T (Charles's law).

These two laws can be combined in the relation $\frac{PV}{T} = \text{constant}$, the

value of the constant being dependent on the mass of gas considered. Avogadro's law states that equal volumes of all gases under identical conditions of temperature and pressure contain equal numbers of molecules. Hence if the gas contains n gram-molecules, the previous relation may

be written as $\frac{PV}{T} = nR$ or $PV = nRT$, where R is the universal gas constant and has a value of 8.318×10^7 erg/degree or 1.9869 cal/degree.

A gas which obeyed the equation $PV = nRT$ would be a perfect gas, but in practice no such gas exists, with the possible exception of photon gas consisting of light quanta only. The degree to which the behaviour of an actual gas approximates to that of a perfect gas is dependent upon its nature as well as its condition. In general the greatest deviation is shown by systems of complicated molecules such as those of the vapours of organic liquids under conditions of high pressure and low temperature. Systems of simple molecules, such as the so-called permanent gases, oxygen, helium, hydrogen, etc., which liquefy only at very low temperatures, show a good approximation to the law, and the agreement becomes closer with increasing temperature, at low pressures.

An interpretation of the ideal gas laws was forthcoming from the kinetic theory of gases which

was developed at the same time as the atomic theory of matter. In its simplest form the assumptions underlying the kinetic theory were:

(1) that the diameter of a gas molecule is small compared with the average distance between the molecules, i.e. that the actual volume occupied by the molecules is negligible in comparison with the total volume of the gas;

(2) that the time occupied in an encounter between two molecules is small compared with the time interval between two collisions;

(3) that a large number of molecules exists in the smallest volume of gas with which it is possible to deal;

(4) that the velocity of motion is very great, so that many collisions occur in a short time, and

(5) that the mutual attraction between two molecules is negligibly small and the pressure exerted by the gas is ascribed entirely to molecular bombardment of the walls of the enclosure.

Constant Kinetic Energy

The molecules of the gas in this simple theory are considered to be hard and perfectly elastic spheres so that at constant temperature the kinetic energy of the confined molecules remains constant despite repeated intermolecular and wall collisions.

By considering a cubical box of volume V containing n molecules of individual mass m travelling with velocity c cms. per sec. (which may be resolved into component velocities u , v , and w parallel to the sides of the cube), it can be shown that the changes of momentum experienced by the molecules rebounding from the walls give rise to a pressure P defined by $PV = \frac{1}{3} m n u^2 = \frac{1}{3} m n v^2 = \frac{1}{3} m n w^2$. u^2 , v^2 , and w^2 will be average values, and since a large number of molecules are concerned it follows that $u^2 = v^2 = w^2 = \frac{1}{3} c^2$ where c is the root mean square velocity. Hence it follows $PV = \frac{1}{3} M c^2$ if n refers to the number of molecules in 1 gm. mol. and $M = \text{mass of 1 gm. mol.}$ If a pure gas is in thermal and mechanical equilibrium, then, although the velocities of the molecules may vary from time to time and from molecule to molecule, yet any particular velocity must be equally distributed in all directions at all places.

Since according to the kinetic theory the energy of an ideal gas is entirely kinetic, then it follows that the energy associated with 1 gm. mol. is $E = \frac{1}{2} M c^2 = \frac{3}{2} RT$,

for $PV = \frac{1}{3} M c^2$. Hence the energy of an ideal gas is directly proportional to the absolute temperature, and furthermore the value of c is given by $c = \sqrt{\frac{3RT}{M}}$, i.e. at a fixed

temperature the molecular velocities of different gases are inversely proportional to the square root of the molecular weights. This law was tested experimentally by Graham by allowing gases at a constant temperature to effuse through a porous plug into a Torricellian vacuum, and the times required to produce a fixed fall in the height of the mercury column were noted. He found that the law of effusion was, like Boyle's law, approximately obeyed by real gases. An idea of the magnitude of the molecular velocities is obtained when it is stated that the root mean square velocities of hydrogen and oxygen molecules at 25° C. are respectively 192,000 cms. per sec., and 48,200 cms. per sec.; the latter is equivalent to 1,080 m.p.h.

The variation in the pressure of a given mass of gas with change of temperature has been utilised to define the absolute scale of temperature. Experiment showed that $P_t = P_0 (1 + \alpha t)$, where P_t and P_0 are respectively the pressures of the gas at t° C. and 0° C. and α is the so-called pressure coefficient which is approximately equal to $\frac{1}{273}$ for the inert gases. According to the kinetic theory, then, the lowest temperature obtainable is when $\alpha t = -1$ or $t = -273^\circ$ C., which is defined as the zero of the absolute scale. It follows then that the absolute temperature T corresponding to t° C. is given by $T = t + 273$.

When the temperature of any gas is lowered sufficiently, the pressure remaining constant, it will condense into a liquid. Alternatively at constant temperature an increase of pressure may result in liquefaction if the temperature is below a certain critical value which is a characteristic of the gas. Curves showing the relation between P and V at constant temperature are known as isothermals, and below the critical temperature they show discontinuities at the transition stage between gas and liquid. The failure of the gas equation $PV = nRT$ to predict such changes has led to the formulation of various equations of state, such as that of van der Waals, viz. $(P + \frac{a}{V^2})(V - nb) = nRT$, where V is the volume occupied by

n gm. mol. of gas. The term $n b$ is a correction for the finite volume occupied by the molecules themselves and $\frac{a}{\sqrt{2}}$ is a term introduced by van der Waals to allow for the cohesive force between the molecules, the possibility of repulsion being ignored. The factors $\frac{a}{\sqrt{2}}$ and b may be found from experimental observations on an actual gas, and in the case of the latter constant a value for the effective molecular radius can be deduced from it.

By means of the kinetic theory, formulae can be developed expressing various transport phenomena

in terms of the mean free path (λ) and the average velocity (v) of the gas molecules. These formulae in their simplest forms are as follows:

Coefficient of Viscosity

$$\eta = \frac{1}{3} m n \lambda v,$$

Coefficient of Diffusion $D = \frac{1}{3} \lambda v$,
and Coefficient of Thermal Conductivity $k = \frac{1}{3} C_v n \lambda v$.

C_v is the specified heat per gas molecule at constant volume, n is the number of molecules per c.c., λ , the average distance between inter-molecular collisions, is given

$$\text{by } \lambda = \frac{0.74}{\pi n \delta^2} \text{ where } \delta \text{ is the molecular diameter.}$$

R. W. Stephens, Ph.D.

GAS: FOR LIGHT, HEAT, & POWER

Roy Hayman, F.R.I.C.

This article describes the production and the uses of coal gas, by far the most important gas in commercial use, as well as those of producer gas, blast furnace gas, water gas, petrol air gas, natural gas, butane, acetylene, and hydrogen

A combustible gas burning with a luminous flame was discovered in the neighbourhood of coal fields during the 17th and 18th centuries. John Clayton, rector of Corfton near Wakefield, first distilled coal and lighted the gas produced from it about 1684, though the details were not published until 1740. William Murdoch of Ayrshire was the first to produce illuminating gas for commercial use: in 1792 he used it to light his house at Redruth. In 1798, he lit part of the works of Boulton & Watt (Birmingham), with whom he was then associated, and later lit the cotton mill of Phillip & Lee (Manchester). For his work on gas he was awarded the Rumford gold medal of the Royal Society in 1808.

Samuel Clegg, who succeeded Murdoch at Boulton & Watt, was a pioneer in the invention of gas making and measuring equipment, including the rotating gas meter and the hydraulic main. In 1807, in the face of opposition from many quarters, F. A. Winsor lighted Pall Mall, London. In 1813 Westminster Bridge was lit by gas, and in 1814 the Westminster streets.

Winsor's company, the Chartered Gas Light and Coke Co. (later the Gas Light and Coke Co.) was established in 1812. Other companies arose. By 1817 about 300,000 cu. ft. of gas was sold per day in London; in 1945 the average was 380,000,000 cu. ft. per day.

By 1847 parliament took measures to control the powers of gas companies and the quality of the gas made, and in 1860 allocated an area of supply to each undertaking.

Up to about 1875, gas was used almost exclusively for lighting, its high illuminating power being considered its most important quality. It was burnt from unshielded, flat flame (so-called fishtail) burners. In 1878 Carl Auer von Welsbach revolutionised gas lighting, by the invention of the incandescent mantle (see Gas Mantle). From about 1880, competition from electricity and liquid fuel stimulated the technical development of gas manufacture and devices for its utilisation.

Composition of Coal Gas

The composition and calorific value of coal gas, the type of gas normally piped and sold to consumers in towns, depends on the method by which it is made; its calorific value when distributed as town gas is controlled by Act of parliament. The following is a typical analysis of town gas (gas from a continuous vertical retort, steamed). (Many other minor constituents are present.)

		p.c. by volume
Carbon dioxide	CO ₂	4.0
Unsaturated hydrocarbons	C _n H _m	2.0
Oxygen	O ₂	0.4
Carbon monoxide	CO	18.0
Methane	CH ₄	20.0
Hydrogen	H ₂	49.4
Nitrogen	N ₂	6.2

This gas has a gross calorific value of 475 B.Th.U. per cu. ft. and a specific gravity of 0.48 (air=1.0). C_nH_m varies in composition from about C_{2.5}H_{5.0} to C₄H₈; C₃H₆ propylene is typical.

On complete combustion, town gas produces carbon dioxide and

water vapour according to the following equations:

One cu. ft. of town gas of average composition requires about 4½ cu. ft. of air for complete combustion and produces about ½ cu. ft. of CO₂ and 1 cu. ft. water vapour.

The calorific value and other physical properties of the gas, e.g. its specific gravity, can be obtained approximately by adding up the individual constituents.

Kinds of Coal Used

Coal (q.v.) for gas making should have a high volatile content and should cake. A non-caking coal, e.g. anthracite, does not produce coke, whereas a strongly caking coal produces hard and relatively unreacting coke, but of great value for metallurgical processes. The low carbon bituminous coals with a volatile content 30–40 p.c. of the coal substance are therefore chiefly used for gas making. In general, the greater the calorific value and carbon content of coal, the less its volatile content, and blending of coals may be necessary to suit a particular carbonising plant. Brown coal, or lignite, has been extensively used in Germany for gas making but, on account of its high moisture content, a special technique of drying and briquetting before carbonisation was developed.

The essential manufacturing processes are: (1) the distillation or carbonisation of coal; (2) the cooling and condensation of volatile products; (3) washing of the gas to remove ammonia; (4) purification to remove hydrogen sulphide; (5) measurement of the gas produced; (6) storage in gas holders.

Murdoch originally used long narrow cast iron retorts set horizontally in which coal was charged, leaving a free space at the top. When carbonisation was complete, the charge was raked out, and more coal put in. Fireclay was soon substituted for cast iron, so that high carbonisation temperatures, yielding more gas per ton of coal, could be used. Since 1920 the substitution of silica for fireclay has continued the same trend. Methods of manufacture remain similar. They vary somewhat, but the following is a normal process.

It is essential to distil the coal in closed vessels, from which the volatile matter escapes and is

collected, leaving a porous mass of coke behind. The fireclay or silica retorts used, which may be set horizontally or vertically in brick, are heated by producer gas (*v.i.*) to a high temperature (1,350°–1,400° C.). Horizontal retorts are about 20 ft. long, have the shape of a half inverted D (\cap), or an oval, and are about 24 ins. across (the major axis) and 16 ins. high (the minor axis).

Vertical retorts are about 20 ft. deep, of symmetrical tapering section, either rectangular or elliptical. In horizontal or in intermittent vertical retorts the coal is allowed to remain until recharging is necessary, when the old charge is removed mechanically and a fresh one inserted. In continuous vertical retorts the coal is introduced through the top continuously and slowly works its way down to the base, advantage being taken of gravity for feeding and removal in both types of vertical units. Some 4–8 tons of coal pass through in a day, the operating temperatures being 900° C. –1,350° C. The qualities of the gas are modified by steaming, which forms some water gas and also cools the hot coke at the base of the retort, and maintains a slight positive pressure to prevent the ingress of air when coke is discharged.

There are two stages of carbonisation; in the first the coal substance is broken down and in the second the substances produced in the first are decomposed on the hot sides and spaces of the retort, giving simpler hydrocarbons.

After leaving the retorts through an ascension pipe fixed to the top of the mouthpiece, the hot gases pass through a seal into a collecting main, and then through a water or air cooled condenser. Here the gas flows through a long series of tubes in which most of the residual tar and liquor is removed in liquid form. From this liquor and the tar are produced the valuable by-products of the gas making industry—drugs, dyestuffs, fire chemicals, ammonium sulphate, etc.

The gas is then washed in water scrubbers to remove the rest of the ammonia and the residual tar fog. There are a variety of designs of washers in use. About this stage the gas is assisted in its passage through the plant by "exhausters." Next the gas is led into large boxes containing moist hydrated oxide of iron or bog ore, spread in layers and covering a large surface area. Here the hydrogen sulphide is removed according to the following chief equations:

A number of side reactions also take place producing more complicated sulphur compounds. The "fouled" oxide, which has been largely turned into sulphide, is revived by exposing to moist air when the following chief reactions take place:

The process of revivification is now mainly carried out *in situ*, by mixing a small quantity of air with the gas. Gas supplying companies are under a statutory obligation to remove all traces of H_2S from their product.

To remove traces of organic sulphur compounds which do not come out in the purifiers, catalytic methods involving the use of nickel and molybdenum sulphide and similar bodies have been developed and show promise.

Naphthalene and benzole are then removed from the gas, after which its volume is measured by passing it through large station meters whence it passes to the familiar large capacity storage holders (*see* Gas Holder).

Many distribution systems are fed by dry gas, which reduces rust formation in service pipes to a minimum. To keep the gas dry, it is passed through a dehydrating plant after it leaves the holder. A common system is to pass the gas up a tower down which calcium chloride solution is sprayed. From there the gas passes to the distribution system.

A normal yield from 1 ton of coal carbonised in continuous vertical retorts with a thermal efficiency of 78 p.c. is:

16,000 cu. ft. gas (500 B.Th.U. per cu. ft.)
10 cwt. coke
10 galls. tar
25 lb. fertiliser (ammonium sulphate)
3½ galls. benzole
10 lb. other by-products
80 lb. ash

Gas. Diagram illustrating the arrangement of gas works, showing the course of the gas from the retorts through condensers, scrubbers, and purifiers to the storage holder, and the collection of tar and ammonia by-products

A distribution system must take account of the character of the district, possible future development, peak loads, supply, sources in relation to areas to be served. Distribution may be by high pressure (30-50 lb. per sq. in.) or medium pressure (15-150 ins. w.g.) in trunk mains ultimately producing a pressure in a service through appropriate governors of 3-5 ins. w.g. at consumers' premises. This pressure may be up to 10 ins. in special areas or cases.

Determination of the quantity of gas flowing through a main, or alternatively the diameter of a main to carry a known capacity, can be calculated by the following formulae which take into account the relation between coefficient of friction and diameter of pipe. The expressions are based on the mean figures for rough and smooth pipes:

Low Pressure (up to 10 ins. w.g.)

$$Q^{0.9} = 1170 \sqrt{(hd^4/S^{0.8}L)},$$

High Pressure

$$Q^{0.9} = 1130 \sqrt{\{d^4 \cdot S(P_1^2 - P_2^2)/S^{0.8}L\}}$$

where Q is volume of gas in cu. ft. per hr.; h , pressure in ins. w.g.; d , diameter of pipe in ins.; S , specific gravity of gas (air=1); L , length of pipe in ft.; P_1 , P_2 , absolute pressure in lb. per sq. in. at beginning and end of pipe.

Medium pressure trunk mains are usually of cast iron and vary in diameter from 2 to 48 ins. High pressure mains are usually of steel, of diameter up to 8 ins. Both types of main are suitably wrapped or protected where necessary to guard against corrosion. Service pipes, i.e. the pipes feeding buildings, and appliances are usually of mild steel.

The Gas Mantle

The high quality of the light produced by gas is very largely due to the Welsbach mantle, the mixture for which was patented in 1893, and remains the best yet found. Two systems are used for lighting: low pressure and high pressure. In both, Bunsen burners are enclosed by a mantle of suitable shape, the gas consumption being controlled by an eccentric pin or needle valve in the supply. For domestic lighting and side streets, normal gas pressure is used; for large scale lighting of main streets and shops high gas pressure up to 100 ins. w.g. Sometimes premixed air and gas is used; in such lamps, used in the lighting of many London thorough-

fares, mean hemispherical candle powers of 3,000-4,000 can be readily maintained. Street lighting systems can be, and usually are, automatically lit, a permanent pilot being built into the burner. Many street lights are, in addition, fitted with clock controls which make it possible to light and extinguish the gas at a set time interval.

There are three main domestic uses of gas—viz. for cooking, space heating, and water heating. Flexibility of control, cleanliness, speed of operation, and efficiency are its main advantages in this field. There are over 8,000,000 gas cookers (see Gas Cooker) in use in Great Britain, accounting for about 40 p.c. of the total gas sold. Because of the importance of this cooking load, continuing research goes on to improve the performance of the cooker. On the hotplate, thermal efficiencies of over 50 p.c. are now attainable.

Different types of appliance for heating rooms by gas are described under Gas Stove. The suitable system depends on size of room, use to which it is put, its aspect, etc. The normal flued gas fire has a radiant efficiency of 50 p.c. If it also emits convected heat, it has an efficiency of 60 p.c. A standard for flueless heaters in a well ventilated room is 10 cu. ft. of gas per 1,000 cu. ft. of space.

Domestic Heaters

Radiant heaters are of two types: (a) "black" emitters (i.e. those not radiating light), (b) high temperature emitters. In (a) a hot panel at temperatures of 600° F.-900° F. gives off radiation, the heating effect being analogous to that from a conventional radiator. In (b) the heater has refractory or metal elements which are heated to a high temperature (about 900° C.-1,000° C.) producing a high intensity. In general these heaters are installed above ground level and are used for heating large spaces (factories, churches, etc.). Small models are used as background heaters for "topping up" heating in large rooms.

Appliances for heating water by gas include small and large instantaneous heaters, storage heaters, and central heating units. The thermal efficiency of an instantaneous sink heater is about 80 p.c. Efficient units containing water heater, tank, and necessary piping are designed for insertion complete into houses. All gas equipment of current manufacture conforms to the appropriate British

standard specification laid down to facilitate manufacture and installation.

Other domestic gas appliances available include drying cabinets, irons, and refrigerators. In the domestic absorption type refrigerator, gas heats a boiler, driving off ammonia which is cooled, liquefied under pressure in a closed system, and rapidly vaporised, extracting heat from the cabinet in the process. The resulting gas (helped in its circulation by a flow of hydrogen) is absorbed, returned to the boiler, and the cycle starts again. The system is noiseless, cheap, and efficient, and has very long life owing to the absence of any moving parts.

Gas Used for Power

Gas is used for power in three main ways: (1) for running-in automobile engines; (2) for generating electric power, driving compressors, shafting, etc. (see Gas Engine); (3) for vehicle propulsion.

For running-in engines, gas has the advantages over liquid fuels that (a) it is as cheap to use; (b) with the special carburettor available, perfect mixing is possible; (c) it is possible to run at low speeds without difficulty; (d) there is no wear on cylinders; (e) exhaust gases contain no carbon monoxide, a point of particular importance in small garages and confined spaces; (f) there are no fuel storage and handling troubles.

Propulsion of vehicles by gas is possible by the use either of high pressure gas cylinders in which gas is stored at 2,500-3,000 lb. per sq. in. (these are heavy and involve a high capital cost) or of low pressure gas bags mounted on the roof (these can be easily refilled, but they offer resistance to movement, and need frequent recharging).

Gas in industry has the great virtues of ease of handling, flexibility, and high heat output, the last quality being of great importance in the many forms of heat treatment in the metal industries, such as annealing, hardening, tempering, metal melting, where absence of ash is essential and high rates of production have to be maintained. Temperatures of 1,500° C. are easily obtainable with air blast gas, that is, gas at atmospheric pressure mixed with air at about 10 ins. w.g. Automatic proportioning ensures a correct mixture ratio at all gas rates and pressures.

Other common industrial uses include drying by conveyed and radiant heat, steam raising, banana ripening, bread and biscuit baking, case hardening, sugar boiling, oil and varnish boiling, cremation, rubber vulcanising and moulding, air conditioning, turkish bath heating, fish frying, cooking and heating in hotels, clubs, restaurants, and hospitals. Painted objects passed through black emitter tunnels where the panels are heated to about 650° F., giving a high radiant heat intensity, dry in minutes instead of the hours required by older methods, an important factor in increasing output of a great variety of articles.

PRODUCER GAS. This consists of 20-28 p.c. carbon monoxide, 10-13 p.c. hydrogen, 50-55 p.c. nitrogen, together with small amounts of carbon dioxide, unsaturated hydrocarbons, and methane. It is manufactured by blowing a limited amount of air with usually some steam through a bed of incandescent fuel (coal or coke). The following chief reactions take place:

The net equation is

The process is thus exothermic, and the reaction once started keeps the whole mass hot. Careful control is necessary, to limit the air supply and to maintain a suitable fuel bed temperature (above 1,000° C.); too much air will turn the producer into a coke fire.

The use of steam absorbs some of the liberated heat in the water gas reaction, increases the yield of gas, and prevents formation of hard clinker by moderating the temperature of the fuel bed.

Producer gas has a low calorific value (about 125 B.Th.U. per cu. ft. gross); it is invariably used to heat the retorts in which ordinary coal gas is made, and for this purpose is generated on a large scale and fired round the retort settings. It can also be generated in small units, both static and mobile, of capacities ranging between 2.5 and 22.5 therms per hr. These units are used for driving vehicles. Units working on wood charcoal, lignite, peat, and wood chips are much in use on the Continent. All involve in effect the construction of a fire in a vertical cylindrical chamber through which a limited amount of air and steam is drawn.

Producer gas has a flame temperature of about 1,600° C. (compared with 2,200° C. for coal gas), and requires only about 1 cu. ft. of air to burn 1 cu. ft. The calorific value is one-quarter that of coal gas, and to use the gas in place of coal gas it is therefore necessary to instal mains of four times the capacity or, as is more common, increase the pressure by boosters. This pressure ranges between 12 and 25 ins. w.g., depending on the size of the producer plant. A reserve is thus created which allows for other factors such as the high specific gravity (0.9) compared with 0.45 for coal gas, and which increases the resistance to flow.

BLAST FURNACE GAS. This is rarely used outside the iron and steel industry. When iron is smelted with coke, a blast of air is introduced through the tuyeres at the bottom of the furnace, burning the coke to carbon monoxide. Part of this carbon monoxide is oxidised to carbon dioxide. The gas issuing from the top of the furnace contains about 11 p.c. CO_2 , 27 p.c. CO , 2 p.c. H_2 , and 60 p.c. N_2 . The calorific value is about 95 B.Th.U. per cu. ft.; air in the proportion by volume of 0.7 to 1 of gas is required for combustion. The gas can be used for furnace heating and driving gas engines; but to secure high temperatures, both gas and air must be preheated.

Like producer gas, blast furnace gas contains a great deal of dust, which must be removed, particularly if the gas is required for gas engines.

WATER GAS. This is a valuable agent for the preparation of hydrogen for mixing with coal gas to meet peak loads in town gas supply, and the synthesis of compounds such as methanol. It is made by passing steam over red hot carbon or coke. It is made largely for mixing with coal gas as necessary, to form the town gas sold to consumers. It is made in large generators, and the products are derived from a combination of two reactions:

The first reaction takes place at about 1,000° C., the second at a lower temperature. The net reaction, that is the water-gas reaction, may be expressed as

Blowing steam over the red-hot fuel cools the bed. Plants have been developed which automatic-

ally control the cycle of steaming and air blowing, to maintain an adequate temperature and a satisfactory yield of products.

To increase the calorific value of water gas, gas oil is volatilised in the gas generator. The oil is cracked to simpler hydrocarbons, enriching the product, which is called carburetted water gas (C.W.G.) as distinct from normal or blue water gas (B.W.G.), so called because it burns with a blue flame.

Typical analyses are:

	B.W.G.	C.W.G.
CO_2	3.9	3.7
CO	42.3	34.8
H_2	49.3	37.3
CH_4	0.3	9.0
N_2	4.2	5.9
O_2	—	0.4
C_2H_4	—	1.5
Unsaturated hydrocarbons (C_2H_m)	—	7.4
C.V.		
B.Th.U./cu.ft.	295	495

PETROL-AIR GAS. Petrol-air gas or air gas or carburetted air is made by charging air with the vapour of a liquid hydrocarbon. The plant consists of a generator in which an air-stream produced by mechanical means is led into a carburetting chamber where it is charged with petrol vapour at a constant rate. Care has to be taken to keep the mixture outside the lower and upper limits of petrol and air (8 p.c. and 12 p.c. respectively). It is little used nowadays. It is chiefly of value where coal gas is not available, as the plant can be self-contained and comparatively easily assembled. One method of production is to drip oil on to red-hot bricks and charge air with the resulting cracked vapours. The gas has a calorific value of about 800 B.Th.U. per cu. ft.

BUTANE. Butane ("Calor Gas") ($\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_3$) compressed to a liquid under a pressure of 25 lb. persq. in. is sold in steel containers. The approximate composition is 5 p.c. propane ($\text{CH}_3 - \text{CH}_2 - \text{CH}_3$), 77.6 p.c. butane, and 16.5 p.c. isobutane

The calorific value is 3,260 B.Th.U. per cu. ft. The pressure is reduced to normal (2-4 ins. w.g.) by an adequate spring-loaded high pressure governor. Each container holds about 28 lb. butane, of a heating value of about 6½ therms. It is particularly useful in districts remote from a town gas supply and in yachts and caravans.

NATURAL GAS. This is given off from petroleum oilfields. It is evolved in prodigious quantities in the U.S.A. and Canada, and small quantities are found in England near Heathfield, Sussex. The gas is tapped at pressures up to 40 atmospheres, which is of advantage in distribution since many of the large oilfields in America are up to 1,000 miles from the gas consumers, and a pipe line has to be laid connecting the two regions. It is used to a great extent in America in place of town gas.

Initial composition varies considerably, depending on the well and the quantity drawn from a particular source, but typical analyses are:

	Birmingham	Los Angeles
	Alabama	California
CO ₂	nil	6.5
CH ₄	90	77.5
C ₂ H ₆	5.0	16.0
N ₂	5.0	nil
Calorific Value		
B.Th.U. per	1,002	1,073
cu. ft. gross		

The areas in which natural gas is found cover a wide field from Texas to the Rocky Mountains, and each field has its own characteristics. In the gases from the Appalachian field, for instance, paraffin hydrocarbons predominate, while CO₂ is high in the Rocky Mountain gases. The olefin hydrocarbons, carbon monoxide, and hydrogen are not present in American natural gases. Natural gas is substantially methane, and is an important source of the chemicals used in making synthetic rubber and plastics.

ACETYLENE. This is a supremely important chemical because, apart from its use as a fuel, it is the starting point of a host of compounds from which are derived synthetic rubber, plastics, dyestuffs, drugs, etc. The most convenient and practical method of producing acetylene is by the action of water on calcium carbide as follows:

An alternative method which gives a good yield is to pass hydrocarbon gases rapidly through an electric arc or oxygen-fed flame and cool the products quickly. Another way is to form an a.c. arc in heavy oil, the gases evolved consisting of hydrogen and acetylene, which can be separated. It can also be made from methane by the use of the high tension arc.

Acetylene is easily liquefied (at 0° C. the liquid has a vapour pressure of 25 atmospheres), but it is extremely unstable in this

state, and storage and transport of liquid acetylene can be effected only by compressing the gas to 15 atmospheres at 60° F. into cylinders which have been filled with porous material such as kapok or charcoal. The function of the absorbent is to divide the cylinder into a number of small cells so that in the event of any ignition or decomposition the effect is localised and there is no general propagation of flame or explosion throughout the mass. This is how acetylene is used for oxy-acetylene flames for welding, metal spraying, etc. The acetylene is dissolved first in acetone under pressure to increase the capacity of the cylinder, since 1 cu. ft. of acetone will dissolve 275 cu. ft. of acetylene at 15 atmospheres pressure.

Acetylene has a calorific value of about 1,500 B.Th.U. per cu. ft. and is one of the most powerful combustibles known. The temperature of the hottest spot of an acetylene flame, i.e. the tip of the white cone, is about 3,500° C. The equation for combustion with oxygen is:

Acetylene is much used as an illuminant, particularly in portable installations. Its light is the nearest approach to sunlight known.

HYDROGEN. Hydrogen also is a valuable agent in the chemical industry, apart from its use as a fuel in, for instance, the oxy-hydrogen flame. During the Second Great War, the gas industry made hydrogen in vast quantities for barrage balloons. It is made commercially by electrolysis, or more readily and cheaply by a modification of the steam iron process. In the simplest form, steam is passed over red hot iron when the following reaction takes place:

As developed for large scale production in a gas works, preheated water gas is passed over a bed of iron ore contained in a generator and maintained at 800–1,000° C. The ore is reduced to iron and preheated steam is passed over it. The process is similar to that for making water gas, consisting as it does of alternate periods of blowing, with water gas substituted for air, and steaming to produce the desired product. As in water gas manufacture, a series of equilibrium reactions is set up, involving the reduction of FeO and Fe₃O₄ with H₂ and CO, and close control is

maintained to ensure that the reaction proceeds the right way. The purity of the product is about 99 p.c.

Gascoigne, GEORGE (c. 1525–77). English poet. Born at Cardington, Beds, and educated at

George Gascoigne,
English poet

Cambridge and the Inns of Court, he was M.P. for Bedford, though a notable profligate. He fought in the Low Countries, took part in the famous festival at Kenil-

worth, and Woodstock, to provide entertainment for Queen Elizabeth, and died at Stamford, Oct. 7, 1577. To him is due the first English prose comedy, *The Supposes*, 1566 (an English adaptation of Ariosto's *Gli Suppositi*), which supplied the sub-plot of Shakespeare's *The Taming of the Shrew*. In collaboration with Francis Kinwelmersh he wrote the second English tragedy, *Jocasta*, 1566 (from an Italian version of Euripides' *Phoenissae*); one of the earliest English satires in blank verse, *The Steel Glass*, 1576; the first critical essay on English versification, *Certain Notes of Instruction in English Verse*, 1575; and *Ferdinando Jeronimi*, 1572, probably the first English imitation of the Italian novella. *Consult Works*, J. W. Cunliffe, 1907, etc.; *Life and Writings*, F. E. Schelling, 1894.

Gascoigne, SIR WILLIAM (c. 1350–1419). English judge. He was made one of the king's sergeants in 1397, and chief justice of the king's bench in 1400, enjoying a high reputation for impartiality and fearlessness. He is said to have refused Henry IV's request to pronounce sentence on Archbishop Scrope, who was implicated in Hotspur's insurrection, and is traditionally supposed to have committed Prince Hal to prison for striking him in court (cf. Shakespeare's *Henry IV*, part 2). He either retired or was dismissed from his post soon after Henry V succeeded to the throne.

Sir W. Gascoigne,
English judge

Gascony. One of the old provs. of France. Bounded on the W. by the Atlantic, Gascony lay contiguous with Languedoc and Foix on

the E., with Navarre and Béarn on the S., and with Guienne on the N. Gascon territory would thus fall within the modern depts. of Landes, Hautes-Pyrénées, Gers, and parts of Haute-Garonne, Lot-et-Garonne, Ariège, and Tarn-et-Garonne.

The name comes from that of the Iberian tribe of the Vascones, who invaded the Roman prov. of this district, known as Novempopulana, between 580 and 590, and settled there in considerable numbers. After an unsuccessful invasion by the Frankish king Chilperic, Gascony (Vasconia) was invaded by Thierry II of Burgundy, and Theodebert of Austrasia, in 602, and Duke Genialis was nominated over the province. The people retained a great measure of independence, establishing a ducal dynasty of their own. By 819, Frankish dukes were ruling. A duke Totilus is mentioned as receiving Gascony from Louis I the Pious, and among his successors were Séguin, William, and Arnaud, on whose death, in 864, the Gascons restored Sanchès, one of their old line. His descendants held the crown until c. 1073, when Gascony became merged in Aquitaine.

Eleanor, daughter of William X duke of Aquitaine, brought Gascony as a part of her dowry to Prince Henry of England, later Henry II, in 1152. It thus became part of the English possessions in France. It was governed for a time by Henry's sons Richard and John successively, but its history continued to be closely linked with that of Aquitaine. Simon de Montfort was the most notable of the English governors, 1248-52. There was much internal dissension, the Gascon nobility inclining towards the French allegiance, while the merchant classes favoured the English connexion. The peace of Brétigny, 1360, assigned Gascony definitely to Edward III, with Aquitaine, and Edward in return abandoned all claims to the French crown. It was a storm centre of the Hundred Years' War, and in 1453 united finally with the French kingdom.

The Gascon dialect, which is believed to have changed very little from its medieval form, still prevails in the district. It exercised a considerable influence on the development of the French language during the 16th century, especially through several distinguished writers of Gascon origin, notably Montaigne, and by the infusion of many Spanish and Provençal words and expressions. The ex-

uberant and vaunting character of the Gascon people is proverbial throughout France, the term *gasconnade* being applied to bragging, flamboyant speeches or actions. See Aquitaine; France.

Gas Cooker. Appliance heated by gas and intended for cooking foods in any desired manner.

Gas Cooker. A, hotplate with boiling burners and grill; B, oven; C, control dial of oven thermostat. Courtesy of Cannon Iron Foundries, Ltd.

Sizes and types range from those in family use to very large cookers for canteens, restaurants, etc. The cooker consists of two main parts: (1) a hotplate containing burners for boiling, simmering, frying, and a grill burner for grilling, broiling, toasting, etc. About 70 p.c. of the gas used for cookers is consumed by the hotplate. Hotplate burners can be adjusted by taps to give the desired heat. (2) An oven, consisting of a chamber insulated by slag wool, aluminium foil, air space, etc., and heated by one or more gas burners. In most designs, the temperature of the oven is maintained at any desired level by a thermostat which may be of the expanding rod or liquid bulb type. Some ovens have glass doors so that the food can be seen during cooking without opening the door and wasting heat.

Gas cookers are classified into three types according to the relative arrangements of the oven and hotplate. These are (1) vertical type, having the hotplate fixed above the oven; (2) range type, having the oven by the side of the hotplate with its top level with the latter; (3) raised oven type, having the oven by the side of the hotplate but with the bottom of the oven level with the top of the hotplate. The finish is

usually of vitreous enamel for easy cleaning.

Gascoyne. River of W. Australia, which rises in three head-streams, near the Carnarvon Range, in the N.W. division, and flows in a generally W. course of 300 m., to empty into Shark Bay, near Carnarvon.

Gas-Discharge Tube. Electric lamp in which the light is obtained from an electric discharge between the electrodes in an evacuated glass tube containing a gas. Neon gas gives an orange-red light; argon, pale violet; mercury vapour, blue; and helium, ivory white. See Electric Discharge; Neon Lamp.

Gas Engine. In all types of engine, steam engines and turbines, gas engines, petrol engines, oil engines and gas turbines, heat is developed by the combustion of fuel, and the object of the engine is to convert as much as possible of the heat thus developed into useful work. In the steam engine part of the heat developed is expended in producing steam in a boiler, the remainder escaping in the flue gases, so that only 60 to 80 p.c. passes on to the engine or turbine; which, again, can convert only a fraction of the heat supplied to it into work, the remainder passing out in the exhaust steam.

In the gas engine the generation of heat takes place in the cylinder, thus eliminating the boiler and its losses, and for this reason it is referred to as an internal combustion engine. The discovery of coal-gas by Murdock at the end of the 18th century, and its distribution for illuminating purposes, turned the minds of inventors towards its use for power generation, but earlier attempts had been made to produce an engine depending on generation of heat inside the cylinder.

About 1680 the French scientist, the Abbé d'Hautefeuille, and the Dutch mathematician, Christian Huygens, both suggested a form of engine in which the power was to be derived from the explosive energy of gunpowder. A century later an English patent was granted to John Barber for what he called an "exploder," in which he proposed to explode a mixture of hydrocarbon gas and air, and in that way develop motive power; and in Barber's specification is the first suggestion of the gas engine of which there is any record.

It was not until 1860 that another French inventor, Etienne Lenoir, designed a practical en-

gine, of which several hundreds were made in France and the U.K., although it was of limited power, and consumed much gas—over 140 cu. ft. per horse-power hour. Two years later another French scientist, Beau de Rochas, proposed the adoption of the principle of compressing the mixture of gas and air before exploding it in the engine cylinder, and suggested the working "cycle" which has since been generally adopted. Improvements were added to Lenoir's design by Nicholas Otto and Eugen Langen, and in 1878 the former embodied the principle of compression which had been suggested by Beau de Rochas in a design for an engine which was the first to attain real success.

The principle of the Otto engine may be readily understood by reference to the indicator diagram and Fig. 1. The engine works on a four-stroke cycle, i.e. there is one impulse (explosion) in the engine cylinder to every four strokes of the piston, two forward and two back, or in two complete revolutions of the crank. The cycle is made up of the following move-

ments: (1) the piston advances from A to B, drawing in as it moves the mixture of gas and air. (2) The piston returns to the other end of its stroke, and in doing so compresses the air and gas. This movement is represented by the line *b c*, the height of *c* above the line *a b* representing the degree of compression. (3) The mixture is exploded, and the piston advances a second time, driven forward by the force of the explosion. This movement is represented by the line *c d b*, the height of *d* above the line *a b* indicating the maximum pressure upon the explosion of the mixture. (4) Finally the piston returns from B to A, and drives out as it moves the waste gases resulting from the combustion of the original charge.

The fact that only one power stroke takes place in every four strokes of the engine or two revolutions of the crank

makes it necessary to fit heavy flywheels to single crank engines, since these have to store up the excess power during the explosion stroke by increase of speed and deliver this power to the shaft by a continuous decrease of speed during the remaining three strokes. The heavier the flywheel and the higher the speed, the smaller is the percentage change of speed to deliver a given amount of power. With multi-crank engines, running at a higher speed, more power strokes take place per revolution and smaller flywheels are required.

The earliest method of ignition was by a small gas flame which registered with a hole in the cylinder at the instant when the explosion was required to take

Gas Engine. Indicator diagram, showing varying pressure of gases in cylinder. For explanation, see text

Gas Engine. Typical 4-cycle gas engine. Fig. 1. place. This involved a rather cumbrous slide and it was difficult to prevent leakage under pressure. To replace it came a porcelain tube heated by an external flame and a small valve which admitted some of the charge to the inside of the tube at the right moment. Improved electrical devices enabled the hot tube to be replaced by either a low tension magneto (for large slow speed engines) or a high tension magneto (for smaller engines running at higher speeds). This also enabled the timing of the explosion to be adjusted.

Since the power required from an engine will vary according to the external load, a governor is required to adjust the supply of gas-air mixture to the demand. This may be accomplished (*a*) by cutting out explosions; (*b*) by throttling the mixture; (*c*) by altering the amount of gas entering per power stroke. But (*a*) suits only quite small engines, since it produces considerable speed fluctuations; and (*c*) is unsuitable for small loads, as it leads to erratic combustion.

Commercial coal-gas is convenient as a fuel where a supply is available, and it has a high heating value; but it is relatively costly. Producer gas, generated in either pressure or suction pro-

ducers, is much cheaper, and, until the advent of reliable oil engines, was widely used. Much higher compression is required, since the heating value per cu. ft. of producer gas is only one-fourth that of ordinary coal-gas.

Gas produced as a result of reactions in the blast furnace, containing a large percentage of carbon monoxide, is suitable for gas engines after cooling and cleaning. Engines in iron and steel works are often run on it.

Could an engine be designed in which an explosion would take place at every revolution, double power might be obtained from an engine of a given size, and a more equal turning movement would result. This end was obtained by Dugald Clerk in 1886 by his invention of a two-stroke engine, in which he introduced an extra cylinder, the purpose of which was to draw in and compress the charge and to sweep out the burnt gases from the power cylinder by a blast of air. The principle of the Clerk cycle has been embodied in large gas engines today, some of which have an individual rating of 5,000 h.p., a capacity which it would be difficult to reach in engines of four-stroke type.

Amount of Gas Consumed

The consumption of coal gas in small engines has been reduced to as little as 14 cu. ft. per brake horse-power hour; on Mond gas, experiments have given a consumption of 66 cu. ft. per brake horse-power hour in an engine developing 750 h.p.; while a full load of 1,200 brake horse-power has been developed with a consumption of 102 cu. ft. of blast-furnace gas per brake horse-power hour. The calorific values of the three gases are roughly 550, 140, and 105 B. Th. U. per cu. ft. respectively.

The high temperatures reached by the exploded mixture in the engine cylinder of a gas engine make it necessary to cool the walls of the cylinder, and also in large engines the piston, by circulating water around or through them. Sometimes the heat in the cooling water and the exhaust gases is utilised for generation of steam for special purposes. Owing to the extra cost of the plant required, this is practicable only on a large scale. Small steam engines convert only from 5-10 p.c. of the heat of the fuel into useful work; large modern reciprocating steam engines seldom more than 15 p.c. The gas engine,

however, can convert over 30 p.c. of the heat in the gas to useful work.

A. T. J. Kersey, M.I.Mech.E.

Gas Gangrene. Disease due to the infection of a wound by a variety of organisms. It begins as a darkly discoloured localised swelling which gives crepitation on pressure. Treatment lies with the administration of antitoxin and possibly with surgery.

Gas Heater. The various types, including the gas fire, are considered under Gas Stove.

Gas Holder. Container, popularly known as a gasometer, in which gas is stored after manufacture for distribution to consumers. A secondary but important function is the maintenance of a satisfactory pressure for purposes of distribution. Gas holders may be located either on the site of the works where the gas is produced or at a centre of population; thus one gas producing works may feed three or four gas holder stations. Gas holders are of two principal types: waterless and water-seal.

The waterless type (Fig. 1), widely used on the Continent, was finding increasing favour in the U.K. before 1939. It consists of a cylindrical steel shell, which may be up to 200 ft. in diameter and 300 ft. high (holding some 8,000,000 cu. ft.) in which slides a piston making close contact with the internal walls of the shell. Gas under pressure is introduced below the piston, which rises and falls according to the quantity of gas in storage. A special sealing mechanism maintains a relatively gas-tight joint between the piston and the walls of the holder, and tar of a

Gas Holder. Fig. 1. Example of the waterless type, with a capacity of 1,500,000 cubic ft.

Gas Holder. Fig. 2. Section of a waterless gas holder. A, gas inlet pipe; B, gas outlet pipe; P, piston; S, star seal; L, telescopic ladder; V, vent to atmosphere

fairly fluid consistency is pumped to the top of the holder and allowed to run down the inside walls to assist in making the seal. The great advantage of this type of holder is that the piston maintains a steady pressure on the gas, irrespective of the quantity being stored, and the total contents can be used. The space in the holder above the piston is in communication with the atmosphere through a vent in the roof, and so contains air, which enters or leaves as the piston moves (Fig. 2).

The water-seal type of holder is a cylindrical vessel of riveted iron plates, closed at the top and open at the bottom, with the lower part immersed in a tank of water of such a depth that the holder can be almost completely submerged when it is empty. Usually there are two or more annular sleeves, known as lifts, the upper one of which is roofed with light gauge steel plates to form the crown of the holder. The remaining lifts are open at both ends and move telescopically one within the other with the variations in the quantity of gas in the holder.

The tank in which the gas holder floats is a circular brick, concrete, steel, or cast-iron water reservoir, often built below ground level (Fig. 3). Where the considerable amount of excavation required is not possible, the water tank is built up of steel plates above ground level. The capacity of the tank ranges from 500,000 to 12,000,000 gallons of water. Gas is fed into the holder through an inlet pipe, the mouth of which is above the level of the water in the tank. The pressure of the gas acts on the crown of the top lift

Gas Holder. Fig. 3. Column-guided water seal type. A, B, moving lifts; X, water-seal; C, guiding columns; W, rollers

and causes it to rise as the quantity introduced increases. When it has moved to its full height an annular ring around the bottom periphery engages a ring on the next lift, which in turn rises and engages a further lift until the full height of the holder has been reached. The water in the tank, acting as a seal, prevents the gas from escaping from the bottom of the holder. The joints between the various lifts are rendered gas-tight by a water seal in the annular channel at the bottom of each lift. Gas is expelled from the holder through an outlet pipe.

The pressure at which gas is stored may be only a few oz. per sq. in., and depends on the number of lifts in use; a full holder creates a greater pressure than one nearly empty, owing to the extra sections whose weight is taken by the gas. Since such fluctuations are undesirable, it is usual to pass the gas, after it has left the holder, through a station governor, which maintains a constant pressure in the mains.

The lifts of a holder may be either column- or spiral-guided. The column-guided holder (Fig. 3) moves by rollers attached to the upper part of each lift and working against guides fitted into a series of vertical columns spaced round the periphery of the holder. These columns may be made of cast-iron or of steel lattice girder construction, and are normally mutually strengthened and braced by wrought iron tie rods. The spiral-guided holder (Fig. 4) is also telescopic and works on exactly the same principles, except that the several lifts are maintained in their correct relative position by a series of guides which are attached spirally to the sides of the indi-

vidual lifts and cause each section of the holder to rise and fall with a screw-like action.

Gas Veins. Term used in geology to denote deposits filling non-persistent openings of fair width but limited in length and depth. They are believed to have been opened by tensional forces often aided by solution, e.g. galena and sphalerite veins in limestone.

Gaskell, ELIZABETH CLEGHORN (1810-65). British novelist and biographer. Daughter of William Stevenson, she was born at Chelsea, Sept. 29, 1810, and brought up by an aunt at Knutsford, Cheshire. She married in 1832 William Gaskell, a Unitarian minister and professor of English literature at Manchester, who, to divert her from the sorrow caused by the death of their infant son, persuaded her to try writing fiction.

A first novel, *Mary Barton*, 1848, dealt with working class conditions in Manchester. It won praise from Dickens, who invited its author to contribute to *Household Words*. The result was the appearance as a serial in 1851-53 of *Cranford*, that vignette of a small country town, inspired by Mrs. Gaskell's memories of Knutsford. Other novels included *Ruth*, 1853; *North and South*, 1855; *Sylvia's Lovers*, 1863; and the unfinished *Wives and Daughters*, published posthumously in 1866. In 1857 she published one of her most important works, her *Life of Charlotte Brontë*, which was based on her friendship with Charlotte and her family, and was the first biography of that novelist, upon which all others drew. She died Nov. 12,

Elizabeth Gaskell

1865, near Alton, Hants, and was buried at Knutsford. Biographies of Mrs. Gaskell are by C. K. Shorter, 1908; E. K. Chadwick, 1913; S. Whitfield, 1929; G. Payne, 1930; G. de W. Sanders, 1930; E. Haldane, 1930. Her *Letters to Charles Eliot Norton*, ed. J. Whitehill, appeared in 1932.

Gasket. Rope yarn used for making joints in spigot and faucet pipes. The yarn is rammed well into the joint, and melted lead is then poured in and caulked to complete the joint. It is also a cord or rope, of which the ends of the strands are plaited, secured to a ship's yard, to which a sail is fastened.

Gaskins. Term applied to leggings; packings of hempen cord or rope; part of the thighs of a horse. The word originally denoted the leather hose or breeches of the 16th century, also known as galligaskins.

Gaslight Paper. Paper, used for printing photographs, of such sensitiveness to light that the exposure behind the negative and the development of the invisible image thus produced can be done both by gaslight and equivalent illumination. Gaslight printing offers advantages to amateurs because it does not necessitate the use of a dark room. It was introduced in America about 1897. See *Photography*.

Gas Liquor. Ammoniacal liquor which separates from coal gas in the hydraulic main. The liquid is collected in a well, and contains practically the whole of the ammonia yielded by the coal in the process of distillation. The ammonia is not present in the free state, but is combined as sulphide, carbonate, chloride, sulphate, cyanide, etc. Sulphuretted hydrogen, phenols, and pyridine are also present in the gas liquor. The liquor is distilled to obtain the ammonia, which is combined with sulphuric acid to form sulphate of ammonia, employed extensively as a fertiliser. See *Gas*.

Gas Mantle. Device for obtaining an intensely brilliant source of illumination from town gas or other combustible gases; invented in 1878 by Carl Auer von Welsbach, an Austrian, who had been studying the rare earths. The mantle consists of a fine, cup-shaped mesh which fits over an aerated (Bunsen) flame. The size and aeration of the flame in relation to the size of the mantle are critical. The output of light from the mantle depends upon the temperature to which it is raised by the gas flame. The actual mesh is made from the

Gas Holder. Fig. 4. Spiral-guided water-seal type. R, guide rails; G, guides

oxides of thoria and ceria. A stocking is knitted from artificial silk or ramie thread, cut and tied to the desired shape, dipped into a solution of 99 p.c. thoria and 1 p.c. ceria and, after drying, the silk or ramie base is burnt away, leaving only the oxides.

Gas Mantle. Inverted incandescent mantle. A, clay ring with lugs supporting mantle; B, mesh

from the burner. The lighting efficiency of a gas mantle does not diminish with age or the length of time it is used. Its fragility has always been the mantle's chief drawback.

Gas Mask. The usual official description of this device is *Respirator (q.v.)*.

Gas Meter. Instrument for measuring gas. Gas meters are of several kinds, but the principal types are the wet and the dry. The former consists of two cylinders with their axes horizontal and concentric, one arranged to revolve inside the other. The revolving cylinder is divided into four compartments and works in water which reaches just above the axle. Gas is admitted into each compartment in succession, and in entering drives the cylinder round and raises the compartment out of the water. The movement is recorded by gear train actuated by the revolving axle and provided with dials and clock hands which indicate the number of thousand feet of gas consumed in a given time. While this form of meter is retained at the gasworks themselves for recording the amount of gas produced, the dry meter is now generally used on the premises of consumers in the U.K., but wet meters containing oil are still used widely abroad.

The dry meter consists of a pair of bellows of cylindrical shape filled and emptied alternately by the pressure of the gas itself, the movements being recorded in the same way as the movement of the wet meter. Dry meters are now standardised for dimensions and measuring capacity. Accuracy, performance, etc., are rigorously controlled and the public is protected by the Sale of Gas Act.

Gas Oil. Petroleum distillate used for making gas. It has a boiling range intermediate between that of kerosene and the lightest

lubricating oil fractions. Although the primary use of gas oil has been for oil-gas processes and for carburetting water gas, the greater part of present production serves other purposes, and so there is a tendency for heavier oils to be used in the gas making industry. Gas oil provides a fuel for compression ignition engines (Diesel fuels) and for small domestic boilers. Large quantities are used as absorber oil in the recovery of casinghead gasoline from natural gas and in the recovery of benzol and naphthalene from coal gas. Some 250,000 tons are used annually in the U.K.

Gasoline. Refined petroleum distillate, boiling between 30° and 220° C. and used as a fuel in internal combustion engines which are usually of the spark ignition type. Gasoline, with which benzene, motor spirit, and petrol are practically synonymous, is produced in five ways. (1) By absorption and condensation processes from the natural gas associated with petroleum (natural gasoline; casinghead gasoline). (2) By continuous distillation and fractionation of crude petroleum (straight run gasoline). (3) By cracking of petroleum distillates and residues. (4) By the use of natural gas, the gaseous by-pro-

ducts of cracking, of water gas, etc., either as the original mixtures or separated into the individual gases, for the synthesis of gasolines by alkylation, polymerisation, hydrogenation, the Fischer-Tropsch process, etc. (5) By treatment of coals and coal products by carbonisation and hydrogenation.

Production of cracked gasoline started as a result of increasing demand for motor transport after 1914. Development in engine design made necessary a fuel with better ignition characteristics (measured by octane number) than those of straight run gasoline. This was satisfied by cracked and synthetic gasolines, with or without the addition of compounds such as tetraethyl lead. Straight run gasolines themselves are now cracked (reformed) to suit modern engines.

Chemical stability is assisted by the addition of minute quantities

Gas Meter. Left, wet meter: a, casing; b, revolving drum to compartments (arrows show direction of rotation); c, compartment filling with water which is driving out gas; d, compartment just filled with gas; e, compartment beginning to be filled with gas; f, gas inlet; g, gas outlet. Right, dry gas meter: a, casing; b', measuring compartments divided by diaphragm c; e, e', bellows worked by pressure of gas (e is collapsed, and e' is distended, movement then beginning to be reversed); f', levers attached to bellows, and moving with them to let gas in and out of compartments; g, g', valves; h, gas inlet; j, gas outlet

of cresols, xyleneols, etc., which inhibit the formation of gummy products. Volatility affects the ease of starting of an engine and its acceleration, and more volatile gasolines are needed in cold climates than in hot; hence the need for winter and summer grades. Output of gasoline rose from 4,000 million gallons in 1919 to 35,000 million gallons in 1939.

Gasometry or Gas Analysis. Special branch of chemical analysis. It is employed not only for estimating the purity of simple gases, but for testing the composition of illuminating gas, the efficiency of pyrites roasting fur-

naces, and the wholesomeness of the air of dwelling-houses. Carbonic acid gas is absorbed entirely by a fixed caustic alkali such as potassium hydroxide.

Automatic methods have been devised for use by the technical chemist in analysing coal gas. He tests for (1) carbon dioxide; (2) ethylene and benzene; (3) oxygen; (4) carbon monoxide; (5) hydrogen and methane; (6) nitrogen.

A measured quantity of coal gas is passed in turn through (1) potassium hydroxide; (2) bromine or fuming sulphuric acid; (3) an alkaline solution of pyrogallol, sodium hyposulphite, or phosphorus; (4) ammoniacal cuprous chloride, followed by dilute sulphuric acid. These processes remove the first four constituents, and measurement of the changes produced in each process enables the chemist to determine the quantity of each substance in the sample of gas. The remainder of the sample is then tested for hydrogen and methane, either by combustion with oxygen over palladium asbestos or by explosion, and the final residue is nitrogen.

Physical methods are also employed for testing the purity of gases; e.g. the change of refractive index, or of thermal conductivity, of a gas due to the presence of "adulterants" has been utilised for this purpose.

Gasparin, VALÉRIE BOISSIER, COMTESSE DE (1813-94). French writer. Born at Geneva, she married Count Agénor de Gasparin, a politician prominent in the French Protestant movement, whose views she shared. She wrote books on religious and social themes, notably *Le Mariage au Point de Vue Chrétien*, 1843, and *Il y a des Pauvres à Paris*, 1846 (both awarded the French Academy's Montyon prize). Other works are: *Livre pour les Femmes Mariées*, 1845; *Les Horizons Prochains*, 1858; *Les Horizons Célestes*, 1859, in translations the best known of her books; and *L'Armée du Salut: Lisez et Jugez*, 1883 (on the work of the Salvation Army). She translated some of Dickens into French. She died at Geneva, June 29, 1894.

Gasparri, PIETRO (1852-1934). Italian cardinal. Born at Ussita May 5, 1852, he became professor of canonical law at the Paris Catholic Institute, 1880-98. After three years in S. America as apostolic delegate, he was in 1904 commissioned by Pius X to codify the canonical law, and in 1907 became a cardinal. As secretary of

state to the Vatican throughout the First Great War and until 1930, he negotiated its concordat of 1929 with the Italian fascist government. Gasparri died of pneumonia Nov. 18, 1934.

Gaspé. Peninsula forming the eastern part of the prov. of Quebec, Canada. It lies between the St. Lawrence and Chaleur Bay. The interior is forest land and on the coast are a few fishing villages. There are several mountain ranges and the district is well watered, but owing to the great cold it is thinly populated. The name is also borne by a cape and a bay at the eastern end; on the latter is Gaspé Basin, a fishing centre where Jacques Cartier landed July 24, 1534.

Gaspé Sandstone. Siliceous rock containing fossil plants of Devonian age. It is developed in the Gaspé Peninsula, Quebec.

Gas Poisoning. In domestic and industrial life, condition due to the inhalation of carbon monoxide. This gas, produced when carbon is burnt in a limited supply of oxygen, if present in breathed air in an amount equal to 0.2 p.c., causes poisoning or destroys life. Charcoal fires and slow combustion stoves may produce the gas; exhaust fumes from motor cars contain 6 p.c. and are a frequent source of accident; but the commonest cause of gas poisoning is an escape of coal gas used for lighting or heating. This may arise from the fumes of blast furnaces and in explosions from coal dust (after-damp). Gas for domestic use is deliberately mixed with other odorous gases so that should it escape it betrays its presence.

Carbon monoxide has some 200 times a greater affinity for haemoglobin than has oxygen. Therefore if breathed it replaces the oxygen in the blood stream. It is also a powerful narcotic poison to the tissues, having a special affinity for the nervous system and the heart muscle. The person attacked presents a characteristic cherry-pink colour. Giddiness, noises in the ears, and vomiting may usher in unconsciousness and complete loss of muscular power. The patient must be removed to a pure atmosphere and given warmth, treatment for shock, and artificial respiration to ventilate the lung.

Gas poisoning in war is described under the heading Chemical Warfare.

Gasquet, FRANCIS AIDAN (1846-1929). A British cardinal. Born in London, on Oct. 5, 1846, and

Francis A. Gasquet,
British cardinal
Russell

educated at a Downside, he was ordained priest in 1874, and during 1878 was prior of Downside. In 1886 he began that systematic historical research which resulted in such works as *Henry VIII and the English Monasteries*, 1888; *The Eve of the Reformation*, 1900; *Monastic Life in England*, 1904; *Monastic Life in the Middle Ages*, 1922.

In 1896 he was appointed a member of Pope Leo XIII's commission on Anglican Orders. During 1900-14 he was abbot-president of the English Benedictine Congregation, and in 1907 was president of the commission for revision of the Vulgate. He wrote a *Life of Pius XI* on his election as pope in 1922. Gasquet was created a cardinal priest in 1914, and died April 5, 1929.

Gassendi, PIERRE (1592-1655). French philosopher and mathematician. Professor of mathematics at the Royal College, Paris, he endeavoured to reconcile the Epicurean, atomistic, mechanical theory of the origin of things with the doctrines of Christianity. He affirmed the immortality of the soul and the existence of an independent first cause. He wrote many philosophic and controversial works, notably on Epicurean and against Descartes, and on astronomy. He died Oct. 24, 1655.

Gasser, HERBERT SPENCER (b. 1888). American pharmacologist. Born July 5, 1888, at Platteville, Wis., he studied at the university of Wisconsin and took an M.D. at Johns Hopkins university in 1915. He was professor of pharmacology at Washington university, 1921-31; and of physiology at Cornell Medical College, 1931-35. Appointed director of the Rockefeller institute of medical research, in 1935, and a trustee of the Rockefeller Foundation, he won, with Joseph Erlanger, the Nobel prize for medicine in 1944. The results of their common research had been published as *Electrical Signs of Nervous Activity*, 1937. Gasser also lectured and worked at University College and the National Institute for Medical Research, London, at the Sorbonne, Paris, and at Munich.

Gasserian Ganglion. Mass of nerve cells situated inside the skull on the course of the fifth

nerve. It is now frequently removed, or destroyed by injection of alcohol, in cases of the severe and intractable trigeminal neuralgia known as *tic douloureux*.

Gas Stove. A deprecated term popularly used to describe all types of gas appliance for space heating and cooking. (See Gas Cooker.) Gas space heating appliances are all defined as either principal heating appliances, intended to provide sufficient warmth for comfortable occupation of a room; or alternative or supplementary appliances, available for principal heating in mild weather, but mainly used to give background heating, remove discomfort, and prevent possible dampness resulting from unheated halls, passages, etc.

Appliances are defined by British Standards as (1) independent hearth fires, *i.e.* free-standing units which can be placed in front of a fireplace with or without decorative surrounds; these heat chiefly by radiation, but some provide also an emission of convected heat by passing a current of air round the back of the heated radiants. (2) Panel fires, comprising a complete unit of the radiant gas fire type fixed into and covering a prepared recess, the bottom of which is above floor level. (3) Inset fires, consisting of a complete unit designed to fit into a fireplace to conform with the shape of the existing brickwork. (4) Fixed fuelless heaters, intended to be permanently installed in a position not connected directly to a flue; often misnamed radiators, most types heating mainly by convection. (5) Portable heaters, with means of attachment to convenient gas points as required; these may give either convected or radiant heat or both. See Gas.

Gas Tar or Coal Tar. Term used for the black, semi-solid substance which is a by-product of the destructive distillation of coal. It is very valuable, containing the essential constituents of aniline dyes, oils, etc. See Coal Tar; Dyes.

Gastein. Valley and health resort of Austria, in Salzburg. It lies at a height of about 3,000 ft., fine scenery being provided by the two falls of the river Ache which flows through it. There are several villages in the valley, including Hof-Gastein and Wildbad-Gastein. Wildbad, with its mineral springs, is the chief resort of visitors.

Gastein, Convention of. Arrangement between Austria and Prussia, Aug. 14, 1865, about the

occupation of the duchies of Slesvig-Holstein and Lauenburg. After the war with Denmark in 1864 these two powers obtained the duchies jointly, but jealousies developed. Austria, supported by a majority in the diet of the German Confederation, wished to make Frederick, duke of Augustenburg, ruler of Holstein. Prussia objected and prepared to build a naval harbour at Kiel, but a compromise was effected at Gastein. By this Prussia became responsible for Slesvig and Austria for Holstein, while the former country secured Lauenburg for a money payment. This convention, in Bismarck's words, "papered over the cracks," but they soon reappeared, for in 1866 war with Austria broke out.

Gasteria. Genus of evergreen succulent plants. Of the family Liliaceae, they are allied to the aloe, natives of S. Africa. The leaves are tongue-shaped or sword-shaped, forming a rosette or in two ranks; the flowers tubular, with some shade of red, disposed in long sprays.

Gasteromycetaceae (Gr. *gastēr*, stomach; *mykētēs*, fungi). Large family of fungi of world-wide distribution. The characteristic of the order is that the spore-bearing surface is completely enclosed in a continuous wall (peridium) until the spores are fully developed, when the envelope is ruptured, and the spores set free. It contains the families Phalloideae (stinkhorns), Nidulariaceae (bird's-nest fungi), Lycoperdaceae (puff-balls), etc.

Gastric Juice. Fluid secreted by the mucous membrane of the stomach. In the human being it consists of about 99.4 p.c. of water; .3 p.c. of organic substances, chiefly pepsin; .2 p.c. of free hydrochloric acid; .14 p.c. of sodium chloride (common salt); and smaller amounts of other salts. The action of gastric juice is manifold.

(1) It acts as an antiseptic in virtue of its hydrochloric acid, tending to destroy bacteria and prevent putrefactive processes occurring in the stomach; it also helps to keep the chemical reaction of the small intestine at a level which resists invasion of the mucous membrane by bacilli. (2) It acts on cane sugar, converting it into simpler forms. (3) It curdles milk. (4) It splits fat up into simpler bodies. (5) It converts proteid—the principal nitrogenous constituent of animal food—into proteoses which, after further

change into peptones, are absorbed in the process of digestion. (6) It renders iron more malleable for the production of haemoglobin. (7) It contains an enzyme, "the intrinsic factor," which acts on something present in protein food, "the extrinsic factor," to produce a substance stored in the liver which is the normal stimulant for the formation of red corpuscles by the bone marrow. The gastric juice also contains a second enzyme which goes to form a substance essential to the nutrition of the central nervous system.

Gastric Ulcer. A bodily disorder, the cause of which, like that of duodenal ulcer, is unknown. It is found in relation with a certain temperament, the meticulous and exact. Toxins swallowed by the mouth or absorbed from septic foci in the body may attack a mucous membrane weakened by the ill-balanced acidity of the gastric juice. Pain and tenderness in the epigastrium come on shortly after eating and are relieved by vomiting or alkalis. Blood may be vomited.

Diagnosis may depend on X-ray findings. Medical treatment is by rest, simple diet regularly given which does not excite the flow of gastric juice, the use of anti-spasmodic drugs, and a high vitamin intake to regenerate the mucous membrane. All sepsis, especially of the sinuses, teeth, and tonsils, must be eliminated. Surgical intervention may be necessary if the condition fails to respond to medicine, as perforation of the stomach wall and malignancy are dangers. In older persons partial removal of the stomach may be needed to prevent recurrence of the ulcer.

Gastritis. Inflammation of the mucous membrane which lines the interior of the stomach. Two forms are recognized, acute and chronic. Acute gastritis is a common complaint most often caused by eating unsound or indigestible food, or by excess of alcohol. Gastritis after food poisoning results from bacterial activity. The symptoms of gastric influenza are due to gastritis producing the influenzal toxin. Swallowing irritant gases may also cause gastritis. Irritant poisons may also give rise to acute gastritis.

The symptoms are pain, feeling of distension in the stomach, nausea, vomiting, gaseous eructations, and headache. In severe cases there may be a rise of temperature. The tongue is coated

and diarrhoea may follow if the toxic condition spreads downwards.

The symptoms generally disappear in from one to three days. Medicinal treatment is simple. In most cases a saline purgative should be given after vomiting has been induced. No food should be taken until the symptoms are abating, and then only the lightest diet, such as clear soup, soda water, and dry toast.

Chronic gastritis may follow the persistent eating of unsuitable or indigestible food, or excessive taking of tea, coffee, or alcohol, or the habit of bolting food. The condition may also arise in the course of disease of the stomach such as ulcer or cancer, and it is frequently a secondary result of constitutional disorders such as anaemia, gout, diabetes, etc.

The symptoms are pain in the stomach and sensations of fullness after eating, nausea often most marked on rising in the morning, flatulence, eructations, headache, depression, and lassitude. In prolonged cases there may be marked emaciation. Treatment is general as regards rest and diet, and particular as regards the underlying condition.

Gastrochaena. Genus of marine bivalve molluscs, boring into limestone and sandstone rocks. They secrete a kind of tube, shaped somewhat like a flask, which is usually coated with grains of sand. Only one species occurs round the British coasts, the flask-shell (*G. dubia*).

Gastrocnemius (Gr. *gaster*, stomach; *knēmē*, leg). Muscle which forms the main part of the calf of the leg. It consists in the upper part of two fleshy masses, one springing from the outer side of the end of the femur and the other from the inner side. These heads of the muscle gradually meet as they pass down the leg, and terminate in a broad tendinous band which is continued as a strong tendon, the tendo Achillis. See Tendon.

Gastro-enteritis. Inflammation of the mucous membrane lining of the stomach and intestines. See Enteritis.

Gastronomy. Art and science of the pleasures of the table. One of the most ancient and significant symptoms of the progress of civilization, it shows man's development of a primitive need into a selective appreciation of what, in preparation and combination, is best suited for the creation of a pleasant mood and

as a stimulant for the spirit, as well as for physical well-being. The Chinese, the ancient Egyptians and Jews, the Greeks only during their decadence (an epicure is an erroneous term for an advocate of sumptuous living), and later the Romans developed the culinary art; but often their "delicacies" were selected more for rarity and price than for a particular taste.

The Greek poet Archestratos was praised as the "gastronomical Hesiod." Under Augustus such leaders as Lucullus, Hortensius, and Trimalchio dumbfounded their contemporaries by the luxury of their banquets, and Apicius—in whose name one of the earliest cookery books appeared—ruined himself by the expenses of his table. The art of refined cooking, congenial choice of wines and other drinks, selective application of spices, vanished with the Roman empire, though some of its teachings were preserved by monks and clergy through the Middle Ages. With the enriched ingredients brought to Europe in the wake of the Crusades, and the rediscovery of Greek and Latin literature during the Renaissance, gastronomy was ready to develop, especially in Italy and France.

Pope Pius V, in the later 16th century, had a famous cook, Bartolomeo Scappi, author of a book; the French kings, Louis XIV and XV, fostered the art of the table, and statesmen and princes like Colbert and Condé did not disdain to prepare select meals with their own hands. Germany, where a famous cookery book by Rumpolt was published in 1576, came under that Italian and French influence. Great Britain developed the pleasures of the table to a comparatively high degree, if with a small range.

From the 18th century France gained an unassailable reputation as the paradise of gastronomes. At the École des Ragoûts the teachings of the Sieur de la Varenne, noble head cook of the marquis of Uxelles, were laid down in 1726; Frederick the Great, admirer of all things French, praised the school; French courtiers honoured each other's pampered chefs, and philosophers devoted studies to the meaning of refined eating and drinking. Montaigne was the first; Brillat-Savarin, with his still famous *Physiologie du Goût* (1825), the outstanding one. The gourmet Talleyrand had as cook Carême, author of *Le Pâtissier Pittoresque*

and works of psychological and sociological interest. Balthazar Grimod de la Reynière (1758–1837), in his 8-vol. *Almanach des Gourmands*, anticipated most of what has been evolved as the art of stimulating man's vitality and gifts by a well-selected diet, the correct proportions of vegetables and meat, the proper sequence of wines, the adequate application of spices and condiments.

National and Regional Dishes

The international importance of gastronomy is its function as a link between nations. Prejudice and seclusion vanish when the pleasures of the table are shared and the proper drinks accompanying them loosen the tongue. A particular national, regional, or local character displays itself in special dishes: *bouillabaisse* at Marseilles, duck at Rouen, tripe at Caen, fish and crayfish *blanquettes* at Lyons, goose-liver pie at Strasbourg, baked lobster in Brittany, cheese and cream in Normandy, chicken and mushroom pie at Dijon. Visitors afterwards associate with their hosts the memory of particular joys of the palate they first experienced in their midst; and subconsciously may be affected in favour of industrial products, schools, scientists, etc., of the place where they had that experience. On the other hand, the appreciation by a foreigner of what is offered in justifiable pride, makes the host inclined to take a favourable view of the guest, and amenable to transact business with him.

The direct consequence of a high gastronomic standard is a prosperous tourist trade. In normal pre-war years, e.g. 1930–31, some 1,500,000 foreign tourists travelled in Switzerland, as against only 800,000 Swiss, every year; six millions in Italy, about as many in France. Switzerland drew a surplus of £10 millions, Italy of £26 millions, Germany of perhaps £20 millions directly, and presumably much more indirectly from this "invisible export." Together with scenery and other amenities, the proper practice of gastronomy had a great share in this success; the realization of this fact, after the Second Great War, brought about efforts in Great Britain to overcome the lack of ingenuity, variety, and care in customary methods of food preparation.

It would be wrong to attribute this sociological phenomenon to the western world only. Persians, in their own way, upheld and

developed gastronomy as highly as the French; wealthy Chinese cultivate it to the point of a ritual, and Malays do not lag behind. But with the French it has long been integrated into spiritual life itself; dissertations on cooking and eating, by Lebault or Ruoff, and on wines, by Paul de Cassagnac, and others, form a definite part of French literature.

Edgar Stern-Rubarth, Ph.D.

Gastropoda (Gr. *gastēr*, stomach; stem *pod*, foot). One of the great divisions of the sub-kingdom Mollusca. It includes those molluscs which have the ventral or under side of the body developed in a gliding base. Gastropods may be roughly defined as comprising snails and slugs, terrestrial, freshwater, and marine. The whelk is a familiar example of a marine gastropod. The underside of a gastropod is its organ of locomotion, and its mode of action may be seen by watching a land snail crawl on the window-pane, or a pond snail on the glass front of an aquarium. The body is slowly propelled forwards by a peculiar wave-like movement of the foot.

The body, which lies above the foot, consists of a well-defined head and a visceral hump, covered by an outer glandular layer known as the mantle. In slugs this hump is not very noticeable, but in snails it is long and coiled, and protected by a shell usually more or less conical in form. This visceral hump contains most of the internal organs. During development the internal organs of a gastropod undergo a kind of torsion or twisting, the result of which is to bring the posterior termination of the alimentary canal towards the head and the left-hand organs to the right. The nerve loop which involves the visceral organs thus becomes twisted into a figure of eight. The original left-hand organs, now on the right side, become atrophied, the result being that the internal arrangements of a gastropod are not symmetrical, and there is only one kidney, one gill, and one auricle to the heart.

Another interesting feature is the odontophore or lingual ribbon, situated at the back of the mouth. This is a long, horny band, called the radula, studded with a vast number of minute teeth. When a gastropod is feeding the substance is seized by the jaw, and the radula moves backwards and forwards, and scrapes off minute particles which pass into the stomach.

Gastropods are divided into two sub-divisions; the Streptoneura,

in which the twisting is well marked, and the Euthyneura, in which the visceral hump appears to be partly untwisted. The first sub-division contains two orders: the Aspidobranchia, which have flattened shield-shaped gill filaments, and the Pectinibranchia, in which the gills are comb-shaped. The second sub-division is also subdivided into two orders: the Opisthobranchia, in which the gills are behind the heart, and the Pulmonata, in which the gills are absent and the mantle cavity serves as a kind of lung. Most land and fresh-water gastropods belong to this last order.

Economically, certain marine gastropods are of value as food for man, as the whelk and periwinkle; and several species of land snails are consumed on the Continent, and to a small extent in Great Britain. Some aquatic gastropods do useful work as scavengers, while many of the terrestrial ones do great mischief in gardens by eating the plants.

Fossilised remains are found throughout the stratified rocks. Air-breathing forms were first met

with in Devonian rocks, while fresh-water snails were first found in Purbeck rocks, of much later age. See Mollusca; Snail.

Gastrostomy (Gr. *gastēr*, stomach; *stoma*, mouth). Operation of making a permanent artificial opening into the stomach through which food can be administered. It is performed where there is a stricture or obstruction of the gullet, as, for instance, by malignant disease, which prevents food from being swallowed. Gastrostomy is the operation of opening the stomach. Gastrectomy is the operation of removing the stomach or part of it. See Stomach.

Gastrula. Stage in the development of a multi-cellular organism. The single egg-cell develops by segmentation into a hollow ball of cells; one side of the ball next becomes indented, much as an india-rubber ball may be dimpled, and a thimble-shaped organism results. This is called the gastrula. and is very important as establishing an inner and outer germinal layer. It is the first hint of an organism containing a body cavity. See Embryology.

GAS TURBINE: A ROTARY PRIME MOVER

G. Geoffrey Smith, Author, *Gas Turbines and Jet Propulsion for Aircraft*

This article explains how this type of power plant, although not new in conception, came to the forefront as a practical proposition. The most spectacular of its successes has been in aviation; this is discussed under Jet Propulsion

A gas turbine may be defined as a heat engine in which the potential energy of a fuel is released by combustion and applied to the working medium, air or gas, to produce kinetic energy which is converted to useful power at the shaft by a purely rotary mechanism. Its object is to obtain advantages of internal combustion allied to continuous power generation in a high speed rotating machine instead of intermittent power production in a reciprocating engine.

As in internal combustion piston engines, the main division of types is between those operating on the constant-volume and the constant-pressure cycles. Earliest efforts were directed to the building of units in which fuel was burnt intermittently under constant volume conditions in a closed chamber having timed admission and outlet valves. A plurality of chambers gave approach to continuity of gas flow at the turbine nozzle ring. Later turbines in commercial production and operation were almost exclusively of

constant-pressure type with continuous combustion of fuel in open combustion chambers.

A variant form was the compounded plant in which a highly supercharged, two-stroke, Diesel engine was used as a dynamic combustion chamber for the combustion of fuel in air at higher pressure than was possible in the normal static chamber. All power delivered at the engine shaft was absorbed in driving the supercharging blower and all useful power was obtained from a turbine operated by the exhaust gas. These turbines were all open-cycle plants in which air was compressed, heated, expanded through a turbine, and exhausted to atmosphere. The closed-cycle plant continuously circulated a fixed quantity of the working medium, air or gas, round a closed system comprising compressor, heat exchanger, turbine, cooler. The combustion of fuel was effected externally and applied through the medium of the heat exchanger.

Early development was retarded by low component efficiencies, and

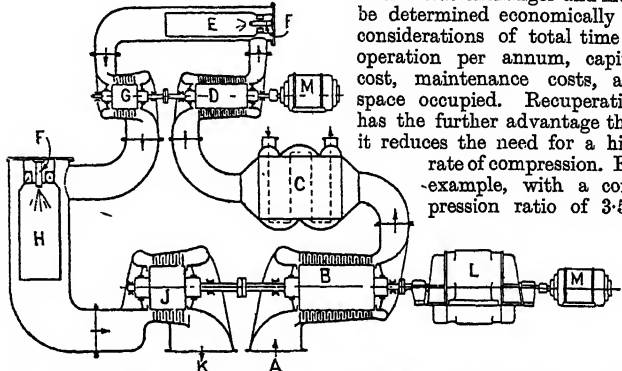

particularly by the low operating temperature of the medium enforced by the relatively poor materials available. For the turbine rotor and blading, steels were required that would withstand temperatures ranging from 600° to 800° C. without scaling, creep, loss of shape or undue reduction of strength whilst under the severe centrifugal loading imposed by high rotational speeds. It is estimated that an increase in gas temperature at the turbine inlet of 100° C. improves thermal efficiency by approximately 25 p.c.

Before the First Great War gas turbines of both constant-volume and constant-pressure types were built experimentally on the Continent by Stolze, Holzwarth, Lemale and Armangaud, and others, but only low thermal efficiencies were achieved and consequently specific rates of fuel consumption were inordinately high as compared with those of the then rapidly developing Diesel engine. The rotary compressor was undergoing intensive development and, somewhat later, the exhaust gas turbine began to receive new attention as a means of driving supercharging blowers to boost the output of aircraft engines. By 1919 a 1,000 h.p. constant-volume Holzwarth turbine built by the German firm Thyssen and operated on coke-oven gas realized a thermal efficiency of 26 p.c. at full load. A Holzwarth gas turbine and generator set developing 3,300 kW (4,420 h.p.) was also produced for the Prussian railway board.

The Swiss firm, Brown Boveri, from 1923 onwards built large

rotary compressor sets driven by turbines running on the hot exhaust gases constituted by the products of chemical and metallurgical processes. Examples are blast installations for steel-works and regenerating air supply for petroleum catalytic cracking plants. From the experience gained

650° C. before the turbine, has a thermal efficiency of about 20 p.c. Thermal efficiency can be substantially improved by a system of "recuperation," in which the exhaust from the turbine is used to heat the air before it enters the combustion chamber. The gain depends on the surface area of the heat exchanger and must be determined economically by considerations of total time of operation per annum, capital cost, maintenance costs, and space occupied. Recuperation has the further advantage that it reduces the need for a high rate of compression. For example, with a compression ratio of 3.5:1

Gas Turbine. Fig. 1. Diagrammatic lay-out of 2-stage gas turbine electric generating plant, without heat exchangers. A, air intake; B, low pressure compressor; C, cooler; D, high pressure compressor; E, high pressure combustion chamber; F, fuel sprayer; G, high pressure turbine; H, low pressure combustion chamber; J, low pressure turbine; K, exhaust; L, electric generator; M, starting motor

with these sets and by the development of a satisfactory combustion chamber to supply the gas, the pure gas turbine with constant pressure combustion was evolved.

Essential components of the simplest plant are an air compressor, combustion chamber, and turbine. A 1,000 kW set of this type, compressing air to approximately 5 atm., using 10 p.c. of the air for the combustion of an oil fuel and 90 p.c. to lower the combustion gas temperature to about

and exchanger area of 0.5 m.² per kW, efficiency will be 24 p.c. while with a compression ratio of 2.5:1 and exchanger area of 2 m.² per kW, efficiency will be 29 p.c.

For generating electricity, gas turbines cost less to instal and to maintain than steam turbines or Diesel engines. Thermal efficiency is lower than that of a Diesel engine, but a cheaper fuel oil can be used; and the use of lubricating oil is almost eliminated. Running costs of a gas turbine having an efficiency of only 22 p.c. would not exceed those of a Diesel engine with an efficiency of 38 p.c.

Plants of more elaborate character involving two stages of compression are built to give higher outputs. In these, air flow is through the low pressure compressor, intercooler, high pressure compressor, heat exchanger, high pressure combustion chamber, H.P. turbine (driving H.P. compressor and the electric generator), L.P. combustion chamber, L.P. turbine (driving L.P. compressor), and is exhausted through the heat exchanger. One installation of this type in Switzerland is a 40,000 kW plant in two sets of 13,000 kW and 27,000 kW.

The application of the gas turbine is not limited to stationary power plants. In 1941 the Swiss federal rlys. put into service the first gas turbine locomotive in the

Gas Turbine. Fig. 2. Complete power unit with the generator and its reduction gear, A. The compressor, B, delivers air through the heat exchanger, C, to the vertical combustion chamber, D, where the fuel is burnt. From the base of the chamber the combustion gases, diluted by the excess air, are led to the turbine, E, and then exhausted vertically, F, through the exchanger, and discharged to atmosphere through the roof of the locomotive

world. Of the single-stage type with a relatively small heat exchanger, the turbine developed 10,000 h.p.; 7,800 h.p. was absorbed in driving the air compressor and 2,200 h.p. remained as useful work employed to drive the electric generator through a reduction gearing.

Gas Turbine. Fig. 3. Axial flow 20-stage air compressor, and 5-stage gas turbine for 3,500 h.p. marine propulsion plant, shown with upper casings removed

Final drive was by traction motors at the axles. Fig. 2 shows the complete power unit. Both Great Britain and the U.S.A. later began developing gas turbine locomotives.

The application of gas turbines to the propulsion of ships (Fig. 3) also seems to offer advantages over other systems in capital cost, weight, space occupied, and quick starting up from cold. The gas turbine itself being, however, like the steam turbine, irreversible, direct propulsion units require reduction gearing and special arrangements for reversing. Electric drive, a separate reverse turbine, and the development of a reliable reversible pitch propeller are among possible methods of overcoming this difficulty. Experimental sets ranging from 500 to 3,000 h.p. have been tested in Great Britain and the U.S.A.

In military aircraft, the gas turbine, allied with jet propulsion, in the space of a few years surpassed the highly developed reciprocating engine for high speed,

high altitude flying. For civil aircraft flying at medium altitude and medium speed, when applied to drive a propeller, it challenges the piston engine.

In the highly specialised form of gas turbine developed for aircraft, component efficiencies have been raised until air compressors of the axial type and single or multi-stage turbines have efficiencies of 88 p.c. and 90 p.c. respectively. Combustion chambers are operated with a total loss of only 4 p.c. Capable of producing vastly increased power in units of smaller specific bulk and lower specific weight, the gas turbine is exercising a revolutionary influence on aircraft design.

Gas Warfare. This subject is fully treated under the heading Chemical Warfare (*q.v.*).

Gata, SIERRA DE. Mt. range of Spain. Lying between the provs. of Cáceres and Salamanca, it is an extension of the Guadarramas on the E., their W. continuation in Portugal being known as the Serra

da Estrella. The maximum elevation is 5,695 ft.

Gate (A.S. *gaet*, gap). Movable barrier, usually hinged, in an enclosing wall or fence to permit ingress and egress. The principal material for gates is wood or metal, or their combinations. The utilitarian and military value of gates was recognized as soon as man began to raise fortified walls round his towns or encampments; they were part of the defensive system of every age. City gates were largely employed by the Romans, and during the empire they became much more ornamental, though they did not lose their military character. The monumental gateways of Rome had two passages, one for entrance and another for egress, and occasionally side passages for pedestrians only. These were flanked by towers, square or circular, and their summits were machicolated.

In the Middle Ages this treatment of gateways was maintained, and extended to feudal castles; bridges were fortified at both ends by powerful gateways; there was frequently a third gate in the middle of the bridge, where toll was exacted. Architecturally, they conformed to the prevailing Gothic style. The 14th century gate at Dinan and the contemporary Porte Guillaume at Chartres may be cited. More modern gateways call for no special remark, but much beautiful ironwork was lavished on gates in the 18th century, the military use of the gateway having then disappeared.

On the other hand, in England the enclosure of fields within

Gate. 1. Gateway at south entrance of Castle Ashby, Northamptonshire, built in 1865. 2. West forecourt gate of Belton House, near Grantham, an example of 17th century work

Photos, by courtesy of Country Life

hedgerows, fences, and walls led to the ubiquitous use of wooden field gates wide enough to admit a cart. These were intended not so much to keep out intruders as to keep cattle from straying. The commonest form is the wooden breast-high single swing gate, known as the five-barred gate, though methods of hanging, types of catch, and other details are infinitely varied throughout the U.K., even from estate to estate. Another form of English field-gate used as an alternative to the stile, and for the same purpose, is the "kissing" gate, which is a wicket-gate (*i.e.* one permitting the passage of one person only) with three gateposts, the free side of the gate so swinging between two of them as to bar the way effectually whichever one it rests against, thus making any catch unnecessary.

Gate. Term used in two senses in metallurgy. (1) The opening in a pair of rolls, used for producing metal sheet or strip in a rolling mill.

(2) The hole in a mould through which the molten metal flows into the mould itself, giving the casting its shape. If the mould is made out of sand, once the pattern has been removed a large down-runner is made and from this a small ingate leads off into the mould proper. The runner becomes filled with liquid metal and so provides a steady supply to the casting as it shrinks. Sometimes for a larger casting, where the shrinkage is correspondingly greater, a feeder cone is also provided to supply extra metal. *See* Foundry.

Gate. Term popularly applied to the total amount of money paid by spectators for admittance to a sporting fixture. In certain events, notably professional boxing, the contestants are entitled to a proportion of the gate.

Gatehouse. Structure above and on each side of a gateway. It was used to guard the solid bridge or drawbridge that gave access to the medieval castle or fortified manor house. The Gatehouse of Westminster was built in 1370 by Walter de Warfield within the precincts of the abbey on a site now occupied by the Crimean Memorial. It was used as a prison by Whitgift in connexion with the eccles. courts, and by the Star Chamber. Here Sir Walter Raleigh spent the night before his execution, and Sir John Eliot, the poets Lovelace and Savage, and other eminent men were incarcerated. After serving as a debtors' prison the

Gatehouse was demolished in 1776, but one of its walls remained until 1836. *See* Westminster.

Gateshead. Co. and parl. bor. and seaport of Durham, England. It stands on the S. bank of the

Tyne opposite Newcastle and joined to it by five bridges, and is on a main railway line. Fine buildings are the cruciform church of S. Mary, a 15th century edifice,

Gateshead arms

rebuilt in the 18th; the town hall, 1868; the public library, in the English Renaissance style; the Shipley Gallery, a classical building containing a fine collection of pictures, the gift of Joseph A. D. Shipley; and the grammar school, standing in spacious grounds. The town has a mechanics' institute, children's hospital, nurses' home and dispensary, a mental hospital, and hospital for infectious diseases, while the corporation maintains swimming baths, cemeteries, an art gallery and recreation grounds. Among the last are Saltwell Park (52 acres), with a fine sheet of water; Windmill recreation grounds (11½ acres); Tyne Vale Park (1½ acres); and the Sunderland recreation ground (2 acres).

The industries include shipbuilding, iron and engineering works, and the making of glass and chemicals. There are large railway shops in the town. There is some shipping, coal being exported. In the vicinity, on the river Team, are Ravensworth, opposite Gateshead Fell; Stella Hall, an Elizabethan mansion; and the ruins of Prudhoe Castle.

Gatehouse, Westminster, before its demolition in 1776
From an old print

Gateshead is an ancient town, and in Roman times was called Gabrostantum. At the Conquest it was a place of importance. Bishop Walcher, a native of Lorraine, made a bishop by the Conqueror, was murdered here in the 11th century. The town's first charter dates from 1164, and it was incorporated in 1661. It was then, as it had been since Norman times, under the authority of the bishop of Durham. It became a parl. bor. under the Reform Act of 1832, a mun. bor. in 1835, and a co. bor. in 1889. Two M.P.s are elected. Pop. est. 113,750.

Gate Theatre. London theatre club in Villiers St., Charing Cross. In 1934 Norman Marshall became director, and in five years produced plays which became famous in London and New York, *e.g.* *Victoria Regina*; *Parnell*; *Oscar Wilde*; *Mr. Gladstone*; *Of Mice and Men*. *Revue*s presented here in the late 1930s gained a reputation for wit and liveliness. On the outbreak of the Second Great War the theatre was closed; it was destroyed by German bombs in 1940-41.

Gath (Heb., wine-press). One of the chief cities of the Philistines, the site of which is uncertain. It stood on the borders of Judah and was famed as the birthplace of Goliath. At one time it was under the rule of the Egyptian kings, and at another had kings of its own, for it was with Achish, king of Gath, that David took refuge. It was conquered by Sargon, king of Assyria. Still existing in the Middle Ages, it was fortified by the Crusaders, captured by Saladin in 1191, and retaken the next year.

Gathurst Powder. Permitted explosive of the non-nitroglycerine type, based on ammonium nitrate (49-52 p.c.) with T.N.T. (13-15 p.c.) as sensitising agent. It is used for coal getting, especially when large-sized material is required.

Gatineau. River of Quebec, Canada. It rises in some lakes in the S. part of the prov., and flows almost due S. until it joins the Ottawa river about one mile below the city of Ottawa. Its length is 240 m.

Gatling, RICHARD JORDAN (1818-1903). U.S. inventor. Born in N. Carolina, Sept. 12, 1818, he qualified as a doctor, but never practised. He invented the machine-gun named after him, a hemp-breaking machine, and a steam plough. He died Feb. 26, 1903.

The Gatling gun, invented in 1862, was of the type known as non-automatic. It had six barrels mounted round a central axis, the barrels and operating mechanism revolving round the axis when a crank was turned. The cartridges were placed in a feeding box on the top, and fell by gravity into the gun as each shot was fired. The barrels were cooled by a water jacket extending about half their length. This gun, adopted by the British army and navy in 1871, was superseded by the automatic machine-gun soon after the South African War. See Machine-Gun.

Gatshina. Russian town, in the Leningrad region of R.S.F.S.R. It is 30 m. S.W. of Leningrad on a lake formed by the river Izhora. Gatshina was originally an estate given by Peter I to a sister; later it was the property of Prince Orloff. Catherine II bought out his heirs and gave the property in 1785 to the future tsar Paul I. From that time dates the fame of Gatshina as the residence of the tsar's heir. In 1797 it became a town. It was the favourite residence of Alexander III.

Gatshina occupies a prominent place in the history of the 1917 revolution. Going there from Petrograd (Leningrad) on Oct. 25, Kerensky used it as a base in an attack against Soviet forces until Nov. 1, when Gatshina was taken by Soviet troops and Kerensky had to flee. On Oct. 19, 1919, Gatshina was captured by Yudenich, and a fierce battle went on in the neighbourhood till Nov. 5, when Soviet troops retook it.

Gatún. Town of Panama, in the Panama Canal zone, belonging to the U.S.A. It stands at the confluence of the rivers Gatún and Chagres, 7 m. by rly. S. of Colon on the Atlantic coast. Here are locks and a dam, part of the canal works. The dam is over $1\frac{1}{2}$ m. long by 2,100 ft. wide at the base; the crest is 115 ft. above sea level and 21 ft. above the normal level of Lake Gatún, and 100 ft. wide.

Gatun, LAKE. Artificial body of water in the Panama Canal zone created by the damming of the Chagres river. It forms a section of the Panama Canal, being from 500 to 1,000 ft. in width and

standing 85 ft. above sea level. The ascent to it is made by three locks from the Atlantic side and three from the Pacific side, the flights being duplicated so that ships can pass upwards and downwards simultaneously. A spillway actuates a hydro-electric station giving power to operate the lock gates, which have an aggregate weight of 25,000 tons.

Gatwick. Village of Surrey, England, 6 m. S. of Reigate. Here are one of the most famous race-courses in the country, and an airport with its own station on the main London-Brighton electric rly. line. Occupied during the Second Great War by training, repair, and other R.A.F. units, the airport became with the resumption of civil flying a base for air charter operators. Pop. (with Charlwood) 2,962.

Gau. Old Teutonic word meaning district. In the old Germanic state it comprised several villages, united for judicial and military purposes, under the control of a count (*Gaugraf*), and corresponded to the English shire or county. It lost its political meaning in the 12th century, but the name survives in Aargau, Torgau, Oberambergau, etc., and was revived by Hitler when he introduced his Gauleiters (*g.v.*). *Pron.* Gow.

Gauchos (Araucanian, friends). Natives of Spanish paternity in Uruguay and the Argentine pampas. One strain claimed descent from the Spanish conquistadores modified in their native environment. Another is largely mixed with Guaycuru blood in Uruguay, with Araucanian on the pampas. Daring horsemen, wielding bola and lasso, they were nomad cattlemen, distinguishable from the Pampas Indians. *Pron.* Gow-chöse. See Argentina; Brazil; Chile illus.

Gaudeamus. Title and first word of an old German students' song in dog-Latin. The theme of it is "let us rejoice, then, while we are young" (*Gaudeamus igitur juvenes dum sumus*). This song gives the title Gaudeamus to a collection of students' and school songs by John Farmer, 1890.

Gauden, JOHN (1605-62). English author and bishop. Educated at St. John's College, Cambridge, he became dean of Bocking in 1641, having parliamentary sympathies, which later events modified. He published several defences of the Church during the Commonwealth, and was made bishop of Exeter in 1660, being translated to Worcester in 1662, but dying May 23. He is

remembered as claimant to the authorship of *Eikon Basilike* (*g.v.*), a controversial point still undecided.

Gaudier - Brzeska, HENRI (1891-1915). French sculptor. He was born at St. Jean de Braye, Loire, Oct. 4, 1891, the son of a joiner, and studied in Germany. The name Brzeska which he added to his own was that of a Polish governess, the two living in London as brother and sister. His chief works represent the culmination of the Vorticist school of sculpture; three are in the Victoria and Albert museum, S. Kensington. He was an initial member of the London Group, and his genius was already evident when at 23 he was killed in the First Great War, June 5, 1915. He was the subject of a memoir by Ezra Pound, a biography by H. Brodzky, another by H. S. Ede (Savage Messiah) and a play by Gordon Daviot, *The Laughing Woman*, 1934.

Gaudy. Term used for a festival of rejoicing or commemoration in an Oxford college. It appears to be derived from Lat. *gaudeamus*, let us rejoice. Gaudy Night was the name of a detective story by Dorothy Sayers, 1935.

Gaugamela, BATTLE OF. Alternative name for the battle of Arbela (*g.v.*).

Gauge or GAGE. Term used for various types of measuring instruments, *e.g.* water gauge, pressure gauge, wire gauge, and also as a standard, *e.g.* railway gauge.

There is a great variety of gauges, many of which are fully described under their various headings. Among them are wire gauges, used for the measurement of the external diameters of wires, certain of which, *e.g.* the Birmingham wire gauge, have become standard in Great Britain; a marking gauge, a tool used by carpenters for scribing a line parallel to the edge of a piece of wood, etc.; rain gauges, used for measuring the rainfall; and water and steam pressure gauges attached to steam boilers, enabling the engineer to ascertain the quantity of water in the boiler and the head of steam. Railway gauge is the width between the lines of a railroad. In Great Britain and most countries of Europe, Canada, and the U.S.A., the standard gauge is 4 ft. 8½ ins. A gauge greater than this is called a broad gauge, one smaller a narrow gauge.

The term gauge is also used in a nautical sense for the relative positions of two vessels and the wind.

A vessel is said to have the weather gauge of another vessel when on the windward side of it, and the lee gauge when on the lee side. In Scotland the term gauger is used for an exciseman, i.e. one who gauges or measures the contents of casks.

A feature in modern engineering practice is the use of gauges and gauging systems. Micrometer gauges, measuring sizes to the nearest $\frac{1}{1000}$ inch or less, have been in use for many years, but the necessity for interchangeability of the large number of similar machine parts involved in mass production has led to universal use of "limit" gauges. A gauge for a cylindrical part is set to two sizes, one marked "Go" and the other marked "Not Go," so that the machinist is relieved of the labour of setting a micrometer to the size and has only to ensure that the "Go" section passes over the diameter and the "Not Go" section does not. A cylindrical gauge, similarly marked, would be used for the hole; it must be so arranged that the shaft with the largest dimensions will pass through the hole with the smallest dimension. The maximum permissible difference of diameter between the smallest shaft and the largest hole is known as tolerance. See Pressure Gauge; Railways; Steam Gauge; Water Gauge.

Gauguin, (EUGÈNE HENRI) PAUL (1848-1903). French painter. Son of a French father and a Spanish mother, he was born in Paris, June 7, 1848. He served in the French navy, and after the Franco-Prussian War worked in a

bank. Becoming interested in Impressionism, though virtually self-trained he gave up his commercial career in 1883, separated from his wife and children, and devoted himself to painting. In 1887 he visited Martinique, and on returning lived with van Gogh (q.v.) at Arles. After an interlude in Brittany, he left in 1891 for Tahiti, to live in complete freedom from convention and adopt native customs. He returned to Paris in 1893 to sell his pictures, but sailed again two years later for his artistic Utopia. He died May 9, 1903, in the Marquesas, where he had spent three years, and was buried there.

Gauguin's art is characterised by the use of brilliant colour and simplified form. His early pictures, like *The Yellow Christ*, and *Jacob's Struggle with the Angel*, are decorative and recall in their feeling of repose the Italian primitives. Later ones were often painted from memory and given Tahitian titles. One of the most famous, *Nevermore*, is in the Tate Gallery, London; many are in the chief galleries of Europe and the U.S.A.

Gauguin wrote an autobiographical novel, *Noa Noa*, published 1924. His *Letters to de Monfried* were edited in 1918, and his *Intimate Journals* in 1936. Among many lives, those of J. G. Fletcher, 1921; J. de Rotonchamp, 1925; B. Becker, 1931; R. Burnett, 1936, may be mentioned. Gauguin with his turbulent character was the model for the hero of Somerset Maugham's novel, *The Moon and*

Sixpence, 1919, of which a film was made in 1942.

Gauhati or GOWHATTY. Town and subdivision of Assam, India, capital of the Kamrup district. Standing on the S. (left) bank of the Brahmaputra, 70 m. E. of Goalpara, it is the largest town in Assam and an important centre of the river trade. A ferry to Pandu joins two sections of the Bengal-Assam railway. The temple of Kamakhya, which stands on an eminence in the neighbourhood, and the rocky islet of Umananda in the Brahmaputra, are places of Hindu pilgrimage. Many ruined temples and quaintly carved slabs found on both sides of the river attest its former greatness as Hindu capital of Kamrup. Down to 1874 Gauhati was the headquarters of the British administration, afterwards transferred to Shillong. Pop., subdivision, 810,032; town, 74,711.

Gaul. Old name for France. It is derived from Gallia, the name given to that country by its Roman conquerors. This Gaul was somewhat larger than the modern France, as it included Belgium and parts of Germany, Holland, and Switzerland. There was also what was called Gallia Cisalpina, or N. Italy. Gaul was conquered by Julius Caesar and organized under Augustus and Tiberius. Its inhabitants were mainly Celts. See France.

Gauleiter (Ger. district leader). Title of a Nazi party official highest in rank under the party cabinet. Each was supreme within one of the 32 *Gaue*—districts roughly corresponding to the former provinces of Prussia, districts of Bavaria, Austria, etc. Progressively this party office was merged with that of provincial governor (*Oberpräsident*), so that the Gauleiters in fact became deputy dictators of between one and three million people each. Goebbels, as Gauleiter of Berlin, also held cabinet office. *Pron.* Gow-lighter.

Gaulle, CHARLES ANDRÉ JOSEPH MARIE DE (b. 1890). French soldier and statesman. Son of a professor, he was born at Lille, France, Nov. 22, 1890, and educated at the Collège Stanislas, Paris, and the École Militaire de St. Cyr. During the First Great War he fought in the 33rd infantry regiment (then commanded by Col. Pétain) in Belgium and Champagne, being promoted capt. 1915. Wounded three times, he was captured by the Germans at Verdun in 1916,

Gauguin. Study of native women, Te Rerioa, by Paul Gauguin, painted after 1891, when he exchanged European civilization for a primitive life in Tahiti

remaining a prisoner until Nov., 1918, although he made five attempts to escape from captivity.

He served in Poland with Gen. Weygand, 1920-21; became prof. of military history at St. Cyr, and passed through the Ecole Supérieure de Guerre. On Marshal Pétain's staff until 1927, de Gaulle was in the Middle East 1929-32, and, promoted col. in 1937, assumed command of the 507th armoured regiment at Metz. In 1934 he published *Vers l'Armée de Métier* (Eng. trans. *The Army of the Future*, 1940), in which he advocated the formation of armoured divs. with lorried infantry; it aroused no interest in France, but a great deal in German military circles.

At the outbreak of the Second Great War, de Gaulle was in command of the armour of the 5th army; in May and June, 1940, as général de brigade commanding the 4th motorised div., he launched successful counter-attacks against the Germans at Laon and at Abbeville. On June 6, he became under-secretary for national defence and war under Reynaud who, however, resigned on the 17th. When Pétain's government appealed for an armistice, de Gaulle escaped to London, where on June 22 he announced in a broadcast the formation, in agreement with the British government, of a French national committee to maintain the independence of France and assume the direction of French affairs outside the occupied soil of France, ending, "The war is not lost, the country is not dead, hope is not extinct. *Vive la France!*" Five days later he announced that a French volunteer legion (the nucleus of the Free French—later Fighting French—forces) would be formed in the U.K. Despite a Vichy decree of July 29 making all French subjects enrolling in a foreign army or enlisting for service with a foreign power liable to the death penalty, and the sentence of de Gaulle himself to death *in absentia* on charges of treason and desertion, supporters escaped in a steady stream to Great Britain. The support he

received from the colonial empire, however, was less than he had hoped—only French Equatorial Africa and the

New Hebrides and New Caledonia declared for him; Catroux, governor of Indo-China, and Legentilhomme, governor of French Somaliland, joined him, but could not bring over their territories; and the failure of his expedition to Dakar (*q.v.*), where, he had been led to believe, he would be welcomed, was a serious setback.

Charles de Gaulle, French soldier and statesman

In Oct., 1940, he set up a council of defence of the empire, and in Sept., 1941, a representative national committee which was in effect a provisional French government. He was in constant touch with the underground resistance movement inside France, which, after negotiations, accepted him as its leader. American recognition in Nov., 1942, of Darlan (*q.v.*) as high commissioner of French North Africa produced a difficult situation; but after Darlan's assassination de Gaulle entered into negotiations with his successor, Giraud, and in June, 1943, became joint president with him of the committee of national liberation (replacing the national committee) formed at Algiers and exercising sovereignty over all French territories outside the enemy's power. Giraud, however, was weak, and without prestige inside France, where he was regarded as an American puppet. In Nov. he resigned, and de Gaulle remained sole president.

De Gaulle returned to Great Britain on June 4, 1944, and on the day of the Normandy landings, June 6, broadcast an appeal to the sons of France to fight with all the means at their disposal at the side of the Allies. Landing in Normandy on the 14th, he received a tremendous welcome at Bayeux and elsewhere. With the committee of national liberation, which had on June 2 assumed the title of provisional government of the French Republic, he entered Paris immediately it was liberated. He at once formed a new government, composed of some of those who had been his colleagues at Algiers, and of members of the resistance movement who had remained in

France, among these being Georges Bidault, leader of the national council of resistance, who became foreign minister. De Gaulle's first act was to abolish the so-called French state set up by Pétain; but he did not restore the constitution of 1875. In Oct. his government was recognized as the provisional government of France by the U.K., the U.S.A., and the U.S.S.R.; and in Dec., with his foreign minister Bidault, he negotiated in Moscow a 20 years' treaty of alliance and mutual assistance with the U.S.S.R. To his steadfast insistence on the status of France through the years of defeat and afterwards, France owed the fact that, though not represented at the Potsdam Conference (*q.v.*), she was recognized there as one of the major allies and allocated a zone of occupation in Germany.

In Nov., 1945, chosen head of the govt. by the newly elected constituent assembly, de Gaulle with difficulty formed a new coalition government. There was disagreement between him and the Left parties in the assembly on many matters, and in Jan., 1946, he resigned without warning. In April, 1947, he proclaimed the formation of the Rassemblement du Peuple Français (rally of the French people) with himself as its head, and as its aim the promotion of national unity. In Oct. R.P.F. candidates in the municipal elections received 38.6 p.c. of the votes cast; in Nov., 1948, they were the largest group (79) elected to the upper house; in March, 1949, they increased their seats in the departmental council from 166 to 389; and de Gaulle steadily advocated a general election to demonstrate the strength of his following.

Gault. Soft, bluish clay of Cretaceous age. It occurs between Lower and Upper Greensand in the south of England. It is used in the manufacture of bricks and tiles.

Gaultheria. Volatile oil used in medicine for the treatment of muscular rheumatism. *See* Wintergreen.

Gaunt. English variant of Ghent. Name borne by John of Gaunt, duke of Lancaster, who was born at Ghent. *See* Lancaster, Duke of.

Gauntlet (Fr. *gantlet*, little glove). In armour, a glove of leather covered with scale-work or overlapping metal plates which permitted the hand to close. It was originally made without separate fingers, and with a metal extension over the wrist. Throwing down a gauntlet was a recognized form of challenge which survives as part of

Gauntlet. Specimens of Italian work, early 16th century
Wallace Collection, London

the British coronation ceremonial. Running the gauntlet was a former mode of punishment in which the offender ran between two rows of men armed with sticks or ropes, receiving a blow from each. Gauntlet here is a corruption of the Swed. *gatlöpp*, lane-run, first anglicised as *gantloope*. See Armour; Challenge; King's Champion.

Gaur or **Gour** (*Bibos gaurus*). Species of large, wild cattle. Found in great herds in forests of India and Burma, they are black in colour, with prominent ears and flattened horns; and often as much as 6 ft. high at the withers.

Gauss. The centimetre-gramme-second (C.G.S.) unit of magnetic flux density. It was formerly used as the unit of intensity of a magnetising field, but this is now known as the oersted. See Degaussing; H. C. Oersted.

Gauss, **KARL FRIEDRICH** (1777-1855). German mathematician and physicist. Born in Brunswick, April 30, 1777, the son of a bricklayer, he was educated by the reigning duke of Brunswick, and became an outstanding mathematician, writing a standard work on the theory of numbers. He studied electricity and magnetism, and formulated the law of magnetic flux density, which states that the number of lines of magnetic induction crossing a closed surface surrounding a magnetic pole of strength M is equal to $4\pi M$. In his honour the unit of magnetic field was called the Gauss (*v.s.*). His calculation of the elements of the planet Ceres placed him in the highest rank of theoretical astronomers. He became director of the Göttingen observatory, 1807, and died there, Feb. 23, 1855. The protective device used against magnetic mines in the Second Great War and known as Degaussing (*q.v.*) takes its name from Gauss.

Gaussberg. Mountain mass of Kaiser Wilhelm II Land, Antarctica. It has an alt. of 1,148 ft., and was discovered by the explorer Drygalski in 1902 and surveyed by the Mawson Expedition, Nov. 22, 1912. It lies between lat 67° S. and the Antarctic circle, long. 89° E.

Gausson, **FRANÇOIS SAMUEL ROBERT LOUIS** (1790-1863). Swiss Protestant theologian. He became pastor of the Swiss Reformed church at Satigny, but was deposed in 1832. In that year he helped to found the evangelical society, and was professor of theology at Geneva, 1836-1857. He died June 18, 1863. His works included Theopneustics and Canon of Scripture.

Gautama (c. 560-480 B.C.). Name of Buddha, founder of Buddhism (*q.v.*).

Gautier, **THÉOPHILE** (1811-72). French author. Born at Tarbes, Aug. 31, 1811, and admitted young

enthusiastic supporter of the master in the "battle of Hernani," and later gained further notoriety with two brilliant but licentious romances, *Albertus*, 1830, in verse, and *Mlle. de Maupin*, 1835, in prose. Though compelled to give much of his energy to journalism, his work in literature was voluminous and varied. In verse his principal volumes are *La Comédie de la Mort*, 1838, and *Émaux et Camées*, 1852. His prose includes many tales and

stories (e.g. *Fortunio*, 1838, and *Jettatura*, 1857); a remarkable piece of archaeological fiction, *Le Roman de la Momie*, 1856; *Le Capitaine Fracasse*, 1863, a dashingly historical novel of adventure; some picturesque records of travel; the charming semi-autobiographical *Paradis des Chats* (published in *Le Figaro*) and *Ménagerie Intime*, 1869; and numerous volumes on the history of literature and art (*Les Grotesques*, 1844; *L'histoire de l'Art Théâtral en France depuis 25 Ans*, 1860; and the posthumous *L'histoire du Romantisme*).

Gautier early outgrew his extreme romanticism, the extravagances of which he satirised in *Les Jeunes-France*, 1833; and in his poetry, in opposition to the prevailing mode, he sought to paint pictures rather than to analyse and express his personal emotions. Unlike most of the romantics, too, he was utterly indifferent to all philosophical and social interests. He died Oct. 23, 1872.

Gauze. A thin, transparent fabric of silk or cotton, and either plain or figured. In true gauze adjoining warp threads are crossed over each other by the action of a special harness in the loom. Spitalfields and, later, Paisley were long noted for their silk gauze manufactures. Plain and medicated varieties are used as surgical dressings. The word is possibly derived from Gaza, in Palestine, whence it was first introduced.

Gavarni (1804-66). French caricaturist. He was born in Paris, Jan. 13, 1804, his real name being Guillaume Sulpice Chevalier. He adopted his pseudonym from the village of Gavarnie, Hautes-Pyrénées, of which he showed a drawing at the Salon, 1829.

Gavarni,
French caricaturist

Settling in Paris, he soon became well known for his elegant drawings of fashionable women in *La Mode*, 1830. Joining the staff of *Charivari*, however, he disclosed his remarkable talent for caricature.

In 1849 he visited England, producing Gavarni in London for *The Illustrated London News*, and his lithograph, *The Highland Piper*, his masterpiece in this style. He died at Auteuil, Nov. 24, 1866. He illustrated Eugène Sue's *The Wandering Jew*, Balzac's novels, and other books.

Gavarni. Lithograph by the French caricaturist from his series entitled *Le Carnaval*

Gavarnie, France. Part of the Cirque, showing the cascade 1,515 ft. in height

Gavarnie. Village of France, in dept. of Hautes-Pyrénées. Lying 12 m. S. of Luz-St. Sauveur, it is famed for a vast *cirque*, a mountainous amphitheatre with a cascade 1,515 ft. in height.

Gavelkind (A.S. *gafol*, tribute; *cynd*, kind). English name for a form of land tenure found in Kent and sometimes elsewhere. Its main feature was that in cases of intestacy the land passed to all the sons equally. This form of tenure was long common outside England, and was customary in the country before the Norman Conquest. Land held in gavelkind could be disposed of by will, and was not forfeited by treason. The widow's dower was one-half, not one-third. One theory is that William the Conqueror granted this privilege to the people of Kent in return for their valour. Gavelkind was abolished in 1926. See Land Laws; Primogeniture.

Gaveston, PTERS (ex. 1312). Favourite and foster-brother of Edward II of England. Son of a Gascon knight, he gained complete ascendancy over the young prince, but his insolence having alienated the great barons he was banished by Edward I. On Edward II's accession in 1307 he was recalled and created earl of Cornwall, and in 1308 was appointed regent during his patron's absence in France. After acting as lieutenant of Ireland he was again compelled to leave the kingdom. In 1311 he returned to England, but in 1312, the barons having leagued against him, he surrendered at Scarborough, and was beheaded on Blacklow Hill, near Warwick, June 19. His body, having lain at Oxford, was, 1315, reinterred at King's Langley.

Gavial or **GHARIAL**. Member of the crocodile family, distinguished

from the others by its very long and slender snout. It is common in India, where it sometimes attains a length of 20 ft., and lives in the larger rivers. It feeds upon fish, and is rarely known to attack land animals, which may possibly be the reason why certain Hindu sects regard it as sacred. Remains belonging to this family have been found in Tertiary deposits.

Gävle. The name of this Swedish seaport is otherwise spelt Gefle (*g.v.*). Gävleborg co. similarly appears as Gefleborg.

Gavotte (Fr.). Graceful old dance in duple time, beginning on the second half of the bar. Many examples are to be found in the suites (*g.v.*) of Bach and other 18th century composers. There are often two gavottes, the first one to be played again after the second. Sometimes the second gavotte is called a musette (*g.v.*). Gavotte was the dance of the Gavots—or people of the Pays de Gap. It was danced at the French Court in the 16th century and was more than once altered to suit new ideas.

Gawaine, SIR. One of the Knights of the Round Table in the Arthurian legend. He was the son of King Lot of Orkney, and nephew of King Arthur. He inadvertently slew a woman early in his knight-hood, and was thereafter bound to fight in quarrels involving a woman.

Gawler. Town of S. Australia. It is 23 m. N. of Adelaide, on the river Gawler, and the centre of a wheat and vine growing area, yielding also gold, silver, lead, and copper. It contains engineering works and foundries, flour mills, and breweries.

Gawsworth. Village of Cheshire, England. It lies 3 m. S.W. of Macclesfield and is charmingly set between small lakes. The church, partly Norman, mainly 15th century, was restored in 1851; it has gargoyles and odd carvings, and tombs and monu-

ments of the Fytton family, of whom Mary may have been the Dark Lady of Shakespeare's sonnets. The rectory dates back to 1470, and there are an Old Hall and a New Hall, the latter built by Lord Mohun. The village shows one of the best tilting grounds of medieval England.

Gay, JOHN (1685-1732). English poet and dramatist. Born at Barnstaple, he began life as a silk mercer, but forsook business for literature. His first real success was a pastoral, *Shepherd's Week*, 1714, written at the suggestion of Pope, to whom he had dedicated

John Gay, English poet

a previous effort. This was followed by *Trivia*, 1716, a description of the moving panorama of the London streets, and by his *Fables*, 1727, which were a notable success. His best work, however, is *The Beggar's Opera* (*g.v.*), 1728, a lyrical drama of thieves and highwaymen. It had a great vogue, and Gay followed it up with a sequel, *Polly*, which, on account of its political references, was prohibited; but it was published in book form, 1729.

Among other pieces from Gay's pen was the well-known ballad, *Black-eyed Susan*. He supplied the libretto for Handel's *Acis and Galatea*, 1732. Gay was a great social favourite. His last years were spent in the household of his friends the duke and duchess of Queensberry, and he died on Dec. 4, 1732. Gay wrote with grace and distinction the artificial verse of the period, but he sometimes shows a true feeling for nature. A complete edition of his poetical works, by J. C. Faber, appeared in 1926. Consult also *Life and Letters*, L. Melville, 1921; *John Gay: His Place in the 18th Century*, P. F. Gaye, 1938.

Gaya. City and district of India. In Bihar province, the latter covers 4,766 sq. m. Gaya is notable for its many associations with the ancient religion of Buddha. Thus at Buddh Gaya is the great temple of that name, which

Gaya, India. General view of the Buddhist temples and shrines in the town

dates back to 543 B.C., and the Barabar Caves, 16 m. N. of Gaya, are regarded as among the oldest existing Buddhist monuments. Gaya city contains the famous temple of Vishnupada and other sacred shrines. Of the total area of the district about two-thirds is under cultivation, watered by right-bank tributaries of the Ganges; and of the cultivated area half is devoted to rice; other crops are wheat, pulses, and oilseeds. There are a number of small industries; carpets and rugs, ornaments, stoneware, and lac being among the manufactures. Pop., dist., 2,775,361; city, 105,223.

Gayal (*Bibos*

frontalis). Species of wild ox found in the hilly regions of N.E. India. It is smaller than the gaur, with which it is said to interbreed, and has straighter horns without any crest between them. It is more often seen in a semi-domesticated state than wild. See Gaur.

Gayal. Domesticated ox kept by the natives of north-east India
W. S. Berridge, F.Z.S.

Gayangos y Arce, PASCUAL DE (1809-97). Spanish historian. Born at Seville, June 21, 1809, he became professor of Arabic at Madrid, 1843, and, in 1881, director of public instruction for Spain. His historical and literary work was mainly that of editing MSS., letters, etc., and his skill in reading 16th century handwriting was of great use to W. H. Prescott, the historian. Gayangos lived much in London, where he died Oct. 4, 1897. He compiled a catalogue of the Spanish MSS. in the British Museum, 1875.

Gayda, VIRGINIO (1885-1944). Italian politician and journalist. He was born at Rome, Aug. 12, 1885, and studied law at Turin university. In 1921 he became editor of *Il Messaggero*, of Rome, and after Mussolini came to power was given the editorship of *Giornale d'Italia*, which became the mouthpiece of the fascist party. After the resignation of Mussolini in July, 1943, Gayda lived in retirement for some months. It was later announced that he had been killed by a bomb, March 14, 1944.

Gay-Lussac, LOUIS JOSEPH (1778-1850). French chemist. Born at St. Léonard, Haute-Vienne, Dec. 6, 1778, he was educated at the École Polytechnique, Paris. Assistant to Berthollet, and to Fourcroy, he was professor of

chemistry at École Polytechnique, 1809, and the Jardin des Plantes, 1832. He was created a peer in 1839.

His chief work in physics was the deduction that a simple ratio exists between the volumes of gases which combine, and that the volume of the resulting compound bears a simple ratio to the volumes of the original gaseous constituents measured at the same temperature and pressure. These are known as Gay-Lussac's or Charles's laws. The former's chemical work included the discovery of cyanogen and its compounds, and an investigation of the properties of iodine.

Died May 9, 1850.

Gaza. Town of Palestine, the modern Guzze or Guzzeh. It lies 50 m. S.W. of Jerusalem, with which there is rly. connexion. Recognized as the key to Palestine from the south, it was always of strategic importance. In Biblical times it was one of the

five chief cities of the Philistines. Here Samson died, "eyeless in Gaza," in Milton's famous phrase. In 332 B.C. it was captured by Alexander the Great after a siege of five months, and afterwards figured extensively in the chronicles of Maccabees and Muslims, Crusaders, and Turks. Napoleon took it in 1799. Situated in the midst of a fertile country near the sea, on the edge of the desert between Palestine and Egypt, Gaza has always been a prosperous town, and before the First Great War was noted for its export of fine barley. Pop. est. 34,170.

BATTLES OF GAZA. These were fought between the British and the Turks in March, April, and Nov., 1917. The British advance into Palestine began in Feb., 1917, and the Turks under Kressenstein took up a strong position on a front stretching from Gaza to Beersheba, through Sheria. British and Anzac troops under Sir Archibald Murray attacked on March 26, enveloping the town from the E. and N. while a frontal attack was also carried out. The initial success was nullified by the arrival of Turkish reinforcements; the British right came under heavy pressure and the whole line withdrew to its original positions on March 28.

The second battle began on April 17. Kressenstein had been heavily

reinforced and had turned his front into a fortress. To the British a division had been added, but the force was too weak for a frontal attack even though supported by tanks. The outer defence line was carried, but the main assault, made on April 19, failed to carry the key position of Ali Muntar and was beaten off elsewhere. The battle was broken off as night fell.

As a preliminary to another assault on Gaza, Gen. Allenby, who had replaced Murray, took Beersheba on Oct. 13 and Sheria on Nov. 6-7, breaking the Turkish left and centre. On Nov. 2 the first line defences of Gaza were taken and held. The town and the rear areas were kept under continuous bombardment, and, threatened by Allenby's move from Sheria, Kressenstein evacuated the town, so that British and Indian troops occupied it with hardly a struggle on Nov. 7. The whole Turkish position was in British hands next day. See Palestine, Conquest of.

Gazala. A town in Libya between Tobruk and Bomba. It was captured from the Italians during the British advance in Feb., 1941, but abandoned in April when occupied by German troops. Following heavy bombing by the R.A.F., Gazala fell to New Zealand troops on Dec. 15. In Jan., 1942, the British forces which had been holding Rommel's Afrika Korps at Jedabia withdrew to Gazala. On June 14, the South African division garrisoning it was evacuated to Tobruk. Gazala was finally occupied by the 8th army on Nov. 13. See North Africa Campaign.

Gazaland OR **GASALAND.** Region of Mozambique, S.E. Africa. It is situated on the border of Southern Rhodesia. The country is mountainous, has an abundant rainfall, and is watered by the Sabi and Limpopo. The chief town is Chai Chai on the Limpopo.

Gazania. Genus of perennial herbs of the family Compositae. They are natives of the Cape of Good Hope. The leaves of some species are entire and lance-shaped; of others, deeply cut into narrow segments. The flower-heads are showy, the ray-florets a tint of yellow, and the tubular florets usually of a darker colour. Many of the garden varieties are hybrids.

Gazebo. Summer-house built to command a wide view over the surrounding country, corresponding to the Italian *belvedere*. The word is the future form of a supposed Latin verb and means I will survey. (Lavabo, a wash-hand basin, I will wash, is a similar

formation.) A bow window is sometimes called a gazebo.

Gazelle (Arab. *ghazal*). Name given to a genus of small antelopes chiefly found in the desert regions of the E. hemisphere. They are the lightest and most graceful of the antelopes, and usually have remarkably slender legs. The majority of the species are less than 30 ins. high. The upper molar teeth resemble those of the sheep.

Gazetteer. Name given to a geographical dictionary or encyclopedia, i.e. a book containing information about towns, rivers, mountains, lakes, etc., arranged in alphabetical order. Gazetteers may be universal, i.e. dealing with the whole world, or local, e.g. a gazetteer of England and Wales. The word referred originally to one who wrote for gazettes, passing thence to those who compiled reference works of the kind in question, and then to such works themselves. In 1695 Laurence Echard brought out *The Gazetteer's or Newsmen's Interpreter*. This was later abbreviated to *The Gazetteer*, and so originated the use of the word in its present connexion.

Gaziantep. Town of Asiatic Turkey, in the vilayet of the same name. An old place, formerly known by its Syrian name, Aintab, it stands 65 m. N.N.E. of Aleppo. It trades in hides, sweetmeats, and wine, and makes leather. Pop. 62,775; vilayet, 293,567.

Gdansk. This is the Polish name for the seaport of Danzig (q.v.).

Gdynia. Seaport of Poland. Situated on the Gulf of Danzig, about 12 m. N.N.W. of that city, Gdynia was founded in 1920 to give Poland a seaport in place of Danzig, which had been declared a free city. A canal runs from Gdynia to the river Vistula. The chief exports before the Second Great War were sugar, dairy produce, coal, and timber. Gdynia was one of the first objectives of the Germans in 1939, surrendering to them on Sept. 14. The port was bombed by Allied aircraft during the German occupation, and was stormed by troops of the 2nd White Russian front, March 28, 1945. Pop. (pre-war), 120,000.

Gazelle. Dorcas gazelle, a native of North Africa
W. S. Berridge, F.Z.S.

Géant, AIGUILLE DU (Giant's needle). One of the loftiest peaks of the Pennine Alps, France. In the dept. of Haute-Savoie, it is about 5 m. N.E. of Mont Blanc, and has an alt. of 13,170 ft. It is crowned with an aluminium statuette of the Madonna. The steep ascent from Chamonix over

the Col (pass) du Géant (11,057 ft.) leads to Courmayeur in Italy.

Gear. Everything in a machine or installation which serves to transmit motion from one part to another. When two shafts are to be connected so that the ratio of their speeds is to be definite and constant, gearing is used unless the distance between their axes is excessive. This consists of a pair of wheels with teeth cut on their circumference or, if the velocity ratio is large, two or more wheels suitably connected.

If the axes of the shafts are parallel, spur gears (Fig. 2) or helical gears are used; if the axes intersect at some angle (usually a right angle) bevel gears are used (Fig. 1); if the axes do not intersect, skew gears (Fig. 6) or worm gears (Fig. 5) are used.

The velocity ratio should remain constant during the whole time of contact of a pair of teeth, otherwise vibrations and noise would result. This is achieved by shaping each tooth to the form of an involute of a circle. Since perfect accuracy of tooth form cannot be guaranteed, much smoother running is obtained by sloping the teeth in an axial direction, as in helical gears. Since a single slope involves an end thrust, double helical gears are used. Double helical drives transmit power from

a high speed turbine to the low speed propeller of a ship.

With a single pair of wheels the driving and driven shafts rotate

Gear. Fig. 5.
Worm gearing

in opposite directions (Fig. 2). With an additional intermediate wheel (Fig. 3) the two shafts revolve in the same direction; this is the principle of one type of reversing gear. The compound

train (Fig. 4) is used where the velocity ratio is large.

Worm gearing (Fig. 5) gives a smooth drive, but with high velocity ratios its efficiency is low. An exception occurs with rear axle worm drives with low velocity ratios, which have an efficiency exceeding 90 p.c. With a single threaded worm as shown, if the wheel has 40 teeth the driving shaft makes 40 revolutions for one of the driven shaft.

A simple form of epicyclic train is shown in Fig. 7. The wheel F

Gear. Fig. 6.
Skew gearing

Gear. Fig. 1.
Bevel gearing

Gear. Fig. 7. Epicyclic reduction gear. For lettering see text

Gear. Fig. 2. Spur gear. Fig. 3. Showing additional intermediate wheel.
Fig. 4. Compound train, used where velocity ratio is large

fixed wheel D having internal teeth. It is possible to obtain high velocity ratios with this type in a compact space, with the axes of the driving and driven shafts in the same line. The differential gear on the rear axle of a motor vehicle is a form of epicyclic gear which allows the rear wheels to travel at different speeds along a curved path. *See* Motor Vehicle.

Gebel Aulia Dam. Irrigation dam on the White Nile in the Anglo-Egyptian Sudan, 25 m. S. of Khartum. Built at a cost of £2,000,000 and completed in 1937, it impounds the silt-free water of the White Nile while the main Nile is in flood and permits perennial cultivation of some 600,000 acres. The dam is 3 m. long with a maximum height of 60 ft. It has 60 sluices, a lock 60 ft. wide, and impounds a reservoir 200 m. long by 2½ m. wide with a capacity of 3,100 million cubic metres.

Geber or 'JABIR (*fl.* 8th century). Arabian chemist. Born at Meshed, he joined the Sufis and shared the exile of the Barmecide viziers of Haroun-al-Raschid. He died probably at Cufa, and is said to have been alive in 813. His reputation in the Middle Ages was that of the greatest chemist of all time. Translations into Latin exist of his *Book of the Seventy* of Johannis; *Book of Poisons*; and *Great Book of Properties*. His complete works in English appeared in 1928. *See* Alchemy.

Gebweiler. Variant spelling of the name of the French town better known as Guebwiller (*q.v.*).

Gecko. Family of small lizards, common throughout warmer climates and everywhere in the tropics. They are of dull colour, with many tubercles on the skin, and have a somewhat repulsive appearance. In most species the toes act like suckers and enable the animals to ascend window panes and run about ceilings. They live on insects and are harmless.

Gecko. The S. European wall gecko, *Tarentola mauritanica*

Geddes, AUCKLAND CAMPBELL GEDDES, 1ST BARON (b. 1879). British politician, diplomatist, and business man. Younger brother of Sir Eric Geddes (*q.v.*), he was born June 21, 1879, educated in Edinburgh, and became a doctor. After active service in the South African War, he was professor of anatomy at the Royal College of Surgeons, Dublin, and at McGill University,

Montreal (to which he returned as principal, 1919-20). Serving in France in the First Great War, he obtained the honorary rank of brigadier-general, returning in 1916 to become director of recruiting at the war office. His success there commended him to the premier, Lloyd George, who appointed him minister of national service, Aug. 1917. He was knighted, and became Unionist M.P. for Basingstoke and Andover, a seat he held until 1920. Meanwhile he had been made a privy councillor (1918), president of the local government board (1918), minister of reconstruction (1919), president of the board of trade (1919-20). In March, 1920, he was appointed British ambassador to the U.S.A., holding that position until 1924, when he entered upon a business career. In the Second Great War he acted as regional commissioner for the S.E. and N.W. regions, and was raised to the peerage in 1942.

Geddes, ANDREW (1783-1844). Scottish painter. Born in Edinburgh, April 8, 1783, he entered the R.A. schools in 1806, and was elected A.R.A. in 1832. He painted several scriptural subjects, *The Discovery of the Regalia of Scotland* (1818), and exhibited at the R.A., 1821. The portrait of his mother (in the Scottish National Gallery) is deemed his masterpiece, but those of George Sanders, Sir David Wilkie, Patrick Brydone, and Dr. Chalmers are notable specimens of his skill. He died May 5, 1844.

Geddes, SIR ERIC CAMPBELL (1875-1937). British business man and politician. Born in India, Sept. 26, 1875, he was educated at Merchiston Castle school, Edinburgh, then went into railway administration, first in America, then in India, and in 1903 with the North Eastern Rly., of which he was soon deputy general manager. During the First Great War he rose

rapidly, together with his brother Auckland, later Baron Geddes (*q.v.*), to wider power. Lloyd George appointed him deputy director-general of munitions supply, 1915. On Haig's staff in France as director-general of transportation, 1916, his authority was extended to cover military railways in all British theatres of war. In 1916, too, he received a knighthood.

Sir Eric Geddes, British politician

Early in 1917 Lloyd George made him navy controller, then, later the same year, first lord of the admiralty. He became Unionist M.P. for Cambridge the same year, retaining the seat until 1922. In Lloyd George's post-war coalition government he was minister without portfolio, 1919, and became the first minister of transport, 1919-21; but he is best remembered for his work in 1921-23 as chairman of a committee to advise on national expenditure, a committee which gave rise to the notorious phrase "the Geddes axe," in reference to the drastic economies recommended. Returning to business life, he became chairman of the Dunlop Rubber Co., in 1923, and later, for a time, of Imperial Airways, Ltd. He died June 22, 1937.

Geddes, JENNY. Scottish kail-wife or vegetable seller. She is famed for having started a riot in St. Giles's cathedral, Edinburgh, by hurling a stool at the dean who read Laud's liturgy there for the first time, July 23, 1637. A stool said to be hers is in the Antiquarian Museum, Edinburgh.

Geddes, SIR PATRICK (1854-1932). British scientist and social reformer. Born Oct. 20, 1854, at Perth, and educated there, he studied under T. H. Huxley at University College, London, and became demonstrator in physiology. He was lecturer in zoology at Aberdeen, in botany at Edinburgh, in natural history in the school of medicine, Edinburgh, and then professor of botany at Dundee, 1883-1919. He took a leading part in educational and social work in Scotland, and helped to found university hostels in Edinburgh, Chelsea, and India.

Geddes was director of the Cities and Town Planning Exhibition. In 1919 he was engaged by the International Zionist Commission to plan the reconstruction of Jerusalem and its proposed university. His chief books were *The Evolution of Sex* (with J. A. Thomson), 1889; *Cities in Evolution*, 1913; and he wrote on biology and botany. In 1932 he was knighted, but died April 17. *Consult* Life, P. Boardman, 1946.

Gee. Radio device developed by the R.A.F. during the Second Great War to enable bombing aircraft to establish their position

accurately by day or night in all degrees of visibility. Gee consisted of a series of radar signals transmitted from a number of ground stations. These signals actuated a receiver in the aircraft, and their time-lag gave the navigator his position relative to the target. The impulses were directed towards the bomber's target, and, in conjunction with another device called Oboe, enabled precision high-altitude bombing to be carried out in any visibility and irrespective of camouflage concealing the target. Gee was first put into operation in March, 1942, and, covering an arc from Great Britain to the Elbe, Hanover, Cassel, and Mannerheim, enabled the R.A.F. to plan 1,000-bomber raids. Gee was later developed as a navigational aid to civil aviation.

Geelong. Second largest city of Victoria, Australia, in Grant co. It stands near the head of Geelong Harbour, an arm of Corio Bay, 45 m. by rly. S.W. of Melbourne, and is the port for the Western Plains wool and wheat, for the accommodation of which there is wharfage capable of taking ships of the largest tonnage. Industries are concerned with textiles, cement, salt, rope, unbreakable glass, fertilisers, tanning, wool scouring, and engineering. Here are the Australian headquarters of the Ford Motor and International Harvester companies. Pop. 41,303.

Geelvink Bay (*Geelvink*, Dutch, yellow finch). Inlet on the N. coast of Dutch New Guinea, between Cape Mamori and Cape D'Urville. It penetrates 120 m. inland, and is 150 m. wide at its entrance. The bay contains several islands, the chief being the Schouten Islands. Japen Biak, in the Schouten Is., was the scene, in the Second Great War, of fierce battles, May 27–June 20, 1944, between Japanese and U.S. forces, including tanks, before its capture by the Americans. Geelvink Channel is off the W. coast of Western Australia.

Geer, LOUIS GERHARD, BARON DE (1818–96). Swedish statesman and writer. Born at Finspång, July 18, 1818, he became president of the supreme courts in 1855. He was minister of justice, 1858–70,

and again in 1873, and while occupying that position introduced the measure establishing two chambers with popular representation, 1866. During 1876–80 he was president of the ministry. He was the author of many volumes of essays, stories, and biography, and published a volume of *Reminiscences* in 1892.

Geestmünde. This German port on the North Sea is now part of Wesermünde (*q.v.*).

Geffcken, FRIEDRICH HEINRICH (1830–96). German statesman and lawyer. Born at Hamburg, Dec. 9, 1830, he studied law at Göttingen and Berlin, and entered the Prussian diplomatic service in 1854. Serving successively in Paris, Berlin, and London, he became a close friend and adviser of Prince Frederick William of Prussia, later the emperor Frederick III. He framed the federal constitution of the German Empire, 1870–71, and

Geelong, Victoria. Civic Centre in Johnstone Park, one of the amenities of this important Australian city

became professor of constitutional history at Strasbourg in 1872.

In 1888 a heated controversy arose on his publication of extracts from Prince Frederick William's war diary calculated to lessen the ascendancy of Bismarck, and Geffcken was indicted for high treason, but acquitted. He died at Munich, May 1, 1896. Among his many writings are *State and Church*, 1875, Eng. trans. 1877, and a volume of essays, Eng. trans. as *The British Empire*, 1889.

Geffrye Museum. London museum of furniture design and craftsmanship. Opened in 1914, it is situated in the Kingsland Road, near Shoreditch Church, and is housed in the old Geffrye, or Ironmongers' Almshouses, founded by Sir Robert Geffrye, or Geoffrey (1613–1703), lord mayor of London and master of the Ironmongers' Company, and opened in 1715. The 14 almshouses and chapel stand round three sides of a court. The collection, partly permanent, partly on loan, includes specimen rooms of dates from

1600 to the present, carved mantelpieces, doorways, and grates, and much beautiful furniture. It is open free daily, except Mon.

Gefle. Seaport of Sweden, and capital of the län or govt. of Gefleborg. It stands at the mouth of the river Gefle, 112 m. N.N.W. of Stockholm. The river here branches into three arms, forming two islands, on which, and on the main shores, the city is built. It is the chief port for the Kopparberg timber and iron district, exporting timber, wood pulp, iron, and joinery. Fishing is extensively engaged in, and there are shipbuilding yards and manufactures of cloth, cotton, machinery, leather, and tobacco. Gefle has a 16th century castle, a town hall, library, technical schools, and theatre. Pop. 41,986.

Gefleborg or GÄVLEBORG. Maritime län or govt. of Sweden. Bounded on the E. by the Gulf of Bothnia, its area is 7,609 sq. m. Its coastline is much indented by small bays, the chief of which is Gefle Bay, in the S.E., and the shores are fringed with numerous islands, none of any great size. Gefle is the capital and chief seaport, other seaports being Soderhamn and Hudiksvall. Of many lakes, the largest is Dellen in the N.E. Rivers are numerous but short, and mostly drain into the Gulf of Bothnia. Pop. 275,528.

Gegenschein (Ger. counter-glow). Faint patch of light several degrees in diameter appearing on moonless nights as a brightening of the zodiacal light (*q.v.*) diametrically opposite the sun. The light is probably sunlight reflected from small meteoric particles scattered throughout a disk-shaped region extending from the sun beyond the earth's orbit. At full phase the individual particles would be brightest, hence the bright patch opposite the sun. Particles $\frac{1}{8}$ in. in diameter and 5 m. apart could produce the observed light intensity.

Gehazi. Servant of Elisha, in 2 Kings chaps. 4, 5, and 8. He was struck with the leprosy of which Naaman the Syrian was cured for having extracted presents from the latter in the name of Elisha.

Gehenna. Name in Biblical and post-Biblical literature of a place of fiery torment. It is derived from Ge-Hinnom, the Valley of Hinnom, a valley on the W. of Jerusalem in which the refuse of the city and the bodies of animals and criminals were burned. In Matt. 5, v. 22, and 10, v. 28 the word is translated hell. See Hell.

Geijer, ERIK GUSTAF (1783-1847). Swedish historian and poet. Born at Ransäter in Värmland, Jan. 12, 1783, he was educated at Uppsala, where he distinguished himself by his monograph on Sten Sture and his aptitude for historical research. He became a lecturer at Uppsala in 1810, and in 1817 professor there, holding also a position in the Swedish public record office. He died at Stockholm, April 23, 1847. Geijer's great work is his *History of the Swedish People, 1832-36*. He was also a poet, a musician, and at one time an active politician. His collected works appeared 1849-56. *Pron.* Yī-er.

Geijerstam, GUSTAF AF (1858-1909). Swedish novelist. Born Jan. 5, 1858, he graduated at Uppsala and worked as a journalist at Stockholm during 1884-93. His first novel, *Deathly Cold*, 1882, showed him to belong to the new realistic school of Swedish literature. Among his many novels may be mentioned *Pastor Hallin*, 1887; *The Head of Medusa*, 1895; *As-tray in Life*, 1897; and the semi-autobiographical *Book of Little Brother*, 1900. He also wrote witty peasant comedies.

Geikie, SIR ARCHBALD (1835-1924). British geologist. Born in Edinburgh, Dec. 23, 1835, he was educated at its high school and university. He entered the geological survey in 1855, and became director of the geological survey of Scotland in 1867. Meantime he had made a reputation as a popular writer on geology in *The Story of a Boulder*, 1858, and *Scenery of Scotland*, 1865. In 1871-82 he was Murchison professor of geology and mineralogy at Edinburgh.

Foreign secretary of the Royal Society, 1890-94, and secretary, 1903-08, his main life work was as director-general of the geological survey of the U.K., and director of the museum of practical geology, 1882-1901. In addition to his *Text-book of Geology*, 1882, he wrote on volcanoes of Great Britain, scenery and its influence on history and literature, and lives of R. I. Murchison and A. C. Ramsay. He was knighted in 1891, and given the O.M. in 1914. His *Scottish Reminiscences* appeared, 1904; *A Long Life's Work*, 1924. He died Nov. 10, 1924.

Geisha. Girl in Japan trained as an entertainer. Taught music, dancing, singing, and the art of conversation from an early age, these professional singing and dancing girls are engaged to tell stories, provide music, and dance

at dinner parties and receptions, and to amuse and enliven the party by repartee, etc. *Pron.* Gay-sha.

Geisha, THE. Musical comedy, written by Owen Hall (James Davis), composed by Sidney Jones, and produced at Daly's Theatre, London, April 25, 1896, where it ran for 760 performances. Many of the lively airs, e.g. *Chin-chin Chinaman*, *The Amorous Goldfish*, and the sentimental ballad *Star of My Soul*, have long outlasted the libretto in popularity.

Geissler, HEINRICH (1814-79). German inventor. Born in Saxony, May 26, 1814, he became a glass blower. For some time he lived in Holland, where he made a number of useful experiments. In 1854 he settled at Bonn, and there he died, Jan. 24, 1879. He invented a sealed glass tube called the Geissler tube, which was used to examine the passage of an electric current through rarefied gases.

Gel. Name given to a colloidal system which occurs as a more or less elastic solid enclosing a part or all of the dispersion medium. If the dispersion medium is water or alcohol, the term *hydgel* or *alcogel* is used. *See* Colloids.

Gela. City of ancient Sicily. It stood on the S. coast and was founded by Greeks. At one time, under the tyrants Cleander, Hippocrates, and Gelo, it was the chief city of Sicily; but after Gelo had transported half its inhabitants to Syracuse, its prosperity declined. Phintias, of Agrigentum, transferred the remainder of the people, in 280 B.C., to a town he himself founded, and Gela fell into decay.

Gelasius I (d. 496). Pope 492-96. Called on to deal with the schismatic followers of Acacius at Constantinople, he tried in vain to reconcile the Eastern Church to Rome. In this and in other matters he strongly maintained the supremacy of the Roman see. He was responsible for putting a stop to the *Lupercalia* (q.v.) at Rome, and for the establishment of ordinations at fixed times, i.e. Ember days. He has given his name to one of the three earliest Sacramentaries or Service books, *Sacramentarium Gelasianum*.

Gelatine (Fr. *gélatine*, Lat. *g-lat-us*, frozen). Constituent of animal tissues, bones, hoofs, etc., which

forms a transparent jelly when dissolved in water. Gelatine is essentially a purified form of glue.

The product is obtained by boiling raw materials in water, skimming and straining the liquid, evaporating the solution at a low temperature, and drying by exposure to the air.

Gelatine is largely used for culinary purposes; as a basis for photographic sensitive surfaces; in bacteriology; as a size for paper; in dyeing; and in making printers' ink rollers. It is soluble in glacial acetic acid, when it

loses its gelatinising power, but the solution forms a useful cement for glass. When gelatine solution is treated with a bichromate salt, allowed to solidify and exposed to light, the gelatine becomes insoluble. This property is used in the carbon process of photography, and the making of washable distempers.

Gelatine Dynamite. Industrial high explosive intermediate in power between blasting gelatine and gelignite. The gelatine compositions have been developed by replacing part of the nitroglycerine in blasting gelatine with oxygen-positive ingredients such as the nitrates of potassium, sodium, and ammonium. Carbonaceous material usually of vegetable origin is added to take up excess oxygen liberated in the explosion. These compositions are applied in ironstone mining and in chambering fairly hard rock. *See* Blasting Gelatine; Explosives.

Gelderland, GUELDERLAND, OR GUELDERS. Province of the Netherlands, formerly a duchy of the Empire. Bounded by the Yssel Lake on the N. and by German territory on the S.E., it adjoins the provs. of Utrecht, S. Holland, N. Brabant, and Overijssel, and is watered principally by the Lower Rhine, Waal, and Yssel, while the Maas (Meuse) forms the S. boundary. The good pasturage supports large numbers of cattle, small estates predominating in the agricultural districts, and corn, flax, beet, and tobacco are important crops.

The capital of the province is Arnhem, other important towns being Zutphen, Nijmegen, Apeldoorn, Elburg, Zevenaar, Wageringen. The province has several main railway lines and many narrow-gauge steam-tramways; the Grift and Apel-

Geisha or dancing girl of Japan, in typical costume

doorn canals are notable. Though generally flat, the country is attractive. (For the bitter battles of 1944 and 1945, see Arnhem; Netherlands; Second Great War.) Area. 1,940 sq. m. Pop. 970,296.

Gelderland was part of the Frankish kingdom of Austrasia. It was made a county by the emperor Henry IV in 1079 for Gerard of Wassenburg, whose descendants became its hereditary rulers. Reynald I was defeated by John of Brabant at Woeringen, 1288, but his son Reynald II extended and strengthened his domains, which were erected into a duchy by the emperor Louis V in 1339. Dynastic quarrels marked the middle of the 14th century, and in 1379 the succession fell to William of Juliers.

Duke Arnold of Egmont ceded the duchy to Charles the Bold of Burgundy in 1472, the latter succeeding in 1473, though strongly opposed by the estates, i.e. a body representative of the nobility and the chief towns. Arnold's son, Adolph, succeeded Charles in 1477. In 1483 Maximilian of Austria assumed suzerainty, but he was challenged by Charles of Egmont, who ceded the duchy to William of Cleves in 1538. In 1543 Gelderland passed to the emperor Charles V, remaining a Hapsburg fief until it became one of the United Provinces in 1578.

Occupied by Louis XIV, 1672-73, part of the province went to Prussia in 1713. The French revolutionary armies invaded it in 1794, and from 1810-14 it was in the French possessions as the dept. of Roer. In 1814 it finally became part of the kingdom of the Netherlands (q.v.).

Gelée, CLAUDE (1600-82). French painter. He is usually known as Claude Lorrain, from his birthplace,

Claude Gelée,
French painter
From an old portrait

Chamagne in Lorraine. Going to Italy as a youth, he was employed in Rome for some years by the landscape painter, Tassi, who aided and encouraged him. He did much open-air sketching, the foundation of his great powers as a landscape painter, and left Tassi in 1625. He then travelled widely, working in Venice, France, and Nancy, returning to Rome in 1627. His pictures soon secured him patrons, and thenceforward he was steadily at work. To guard against the frequent forgeries of his works, he compiled the six volumes of *Libri di Verità* (Books of

Gelée. Embarkation of S. Ursula. Painted by Claude Lorrain for Cardinal Barberini in 1646, now in the National Gallery, London

Truth), in which he drew sketches of all pictures leaving his studio, giving details of dates and ownership. These now belong to the duke of Devonshire, but were reproduced and published in 1777. Claude died at Rome, Nov. 21, 1682.

His works are marked by a richness of detail and grandeur of composition which few of the classical landscape painters have approached. His intimate knowledge of nature, coupled with his delicate sense of colour, produced many scenes of surpassing beauty, although he was quite unable to paint the human figure adequately, sometimes being obliged to have his figures inserted by other hands. Good examples are to be found in the National Gallery, London, especially the *Marriage of Isaac and Rebecca*, and the *Embarkation of the Queen of Sheba*.

Gelignite. Industrial high explosive. It is used for blasting where a cheaper and less violent explosive than blasting gelatine is required. The standard gelignite contains about 60 p.c. of nitroglycerine, which has been made to the consistency of thin jelly by the solution in it of 4 p.c. of collodion cotton, 27 p.c. of potassium nitrate, and 9 p.c. of woodmeal. A little calcium carbonate is present, as in blasting gelatine, and a small quantity of moisture. Gelignite is not so local in its action as blasting gelatine, rocks over a wide area being split into larger fragments. See *Blasting Gelatine*; *Dynamite*; *Explosives*; *Nitroglycerine*.

Gelimer. Last Vandal king. A descendant of Gaiseric, he made himself king of the Vandals in 530 by overthrowing his kinsman Hil-

deric, whom a little later he murdered. He ruled over the Vandal kingdom in Africa for about four years. In 533 his kingdom was attacked by the Romans. A force under Belisarius landed in Africa, and met the Vandals in battle 10 m. from Carthage. There Gelimer's force was routed, and Carthage was entered. However, the king assembled a new army, and a second time gave battle to Belisarius. This took place in Dec., about 20 m. from Carthage, and ended in the defeat of the Vandals. Gelimer fled, but in March, 534, he surrendered. He walked as a captive in the triumphal procession of Belisarius at Constantinople, afterwards disappearing from history.

Gell, SIR WILLIAM (1777-1836). British antiquary and traveller. Son of Philip Gell, of Hopton, Derbyshire, he was educated at Jesus College, Cambridge, became a fellow of Emmanuel, and studied at the Royal Academy school. He was knighted in 1803, on his return from a mission to the Ionian Islands; was chamberlain to Queen Caroline in 1820, and, living thereafter mainly in Italy, died at Naples, Feb. 4, 1836. He wrote a number of authoritative books on the topography and antiquities of Troy, Ithaca, the Morea, Pompeii, and Rome, most of them being illustrated from sketches by himself.

Gellert. Hound given according to tradition by King John to his son-in-law, Llewellyn, in 1205. The story runs that Llewellyn, returning from a hunt at which Gellert had been missing, was met by the dog covered with blood. Hurrying into his castle he found his infant heir's cradle overturned

and blood-stained, and slew the dog believing that it had killed his child; only to find, too late, that the faithful dog had killed a wolf that had attacked the boy. Gellert's grave is shown at the village of Beddgelert, in Wales, near Snowdon. The story, a great favourite with children, was common in Europe in different forms long before, and is probably of Eastern origin.

Gellert, CHRISTIAN FÜRCHTEGOTT (1715-69). A German poet, Born in Saxony, July 4, 1715, he

C. F. Gellert,
German poet
After Anton Graff

was professor of moral philosophy in the university of Leipzig, where his lectures were attended by Goethe. His *Fables*, 1746-48, gained him the name of the La Fontaine of Germany. His moral writings are characterised by deep religious feeling, and he wrote religious poems which Beethoven set to music, also the hymn which in its English version begins *Jesus lives!* Gellert died at Leipzig, Dec. 13, 1769.

Gelligaer. Urban district of Glamorganshire, Wales. It is 14 m. N. of Cardiff, on the Monmouthshire boundary. Its Norman church of S. Cadocus was restored in 1867. Extensive collieries in the surrounding district employ the majority of the pop. Gelligaer is near the site of a Roman hill-fort of the 1st century A.D. The best preserved example of the period, it illustrates with exactitude Josephus's description of a Roman camp. Its four-gated, turreted ramparts enclose 2½ acres, with headquarters, six barracks, two granaries, and extramural baths. Pop. 35,900.

Gellius, AULUS. Roman writer, who flourished in the 2nd cent. A.D. After studying rhetoric and philosophy at Rome and then at Athens, he returned to Rome, where he was entrusted with certain judicial functions. He was the author of *Noctes Atticae*, or *Attic Nights*, so called from having been begun during his stay in Athens, a miscellany in 20 books, of which the eighth is lost. This work has preserved, in the form of quotations, fragments of earlier writers whose works have perished, and contains conversations with learned men on linguistic and literary matters.

Gellivare. A town of Swedish Lapland, in the govt. of Norrbotten. It is 116 m. by rly. N.N.W. of Lulea, and there is also rly. connexion with Narvik, at the mouth of the Ofoten Fjord, on the W. coast of Norway. It owes its importance to the extensive iron mines of Malmberg, a hill 2,026 ft. high, with a mining village. The deposits are among the richest in the world, and a million tons of iron have been exported yearly. The town itself is substantially built, and possesses an old Lapp chapel and an ancient cemetery.

Gelnhausen. Town of West Germany in the *Land* of Hesse. Situated on the Kinzig, a tributary of the Main, 14 m. E.N.E. of Hanau, it carries on a variety of industries, especially the manufacture of rubber goods. Gelnhausen has a distinguished past, having been an imperial town from 1169 to 1803. On an island in the Kinzig are the ruins of a Romanesque castle built by Barbarossa, in 1190. There is a notable church, the Marien Kirche, in the town, dating from the 13th century. Pop. 5,200.

Gelo (Gr. *Gelon*; d. 478 B.C.). Tyrant first of Gela (491) and afterwards of Syracuse (485) in Sicily. In the second Persian war he offered a force of 30,000 men to help the Greeks against the Persians, on condition that he should have the sole command. This the Greeks refused, but Gelo had an opportunity of distinguishing himself nearer home, when Sicily was invaded by the Carthaginians with an immense force under Hamilcar. This force Gelo defeated at Himera in 480 on the very day on which the Greeks gained their victory over the Persians at Salamis. A wise and beneficent ruler, he was styled the saviour of his country, and after his death (478) was honoured as a hero. *Pron.* Jee-lo.

Gelsemine (Ital. *gelsomino*; Arab, *yasmin*, jasmine). The chief alkaloid contained in yellow jasmine (*Gelsemium sempervirens*), another alkaloid, gelseminine, being also present. Gelsemine is extracted from the finely powdered root by means of alcohol. It is very poisonous, and like strychnine has an intensely bitter taste. The total alkaloids present in the gelsemium root is about 0.25 p.c., three-fourths of which consists of gelsemine. It is considered, however, that the medicinal activity of the drug is due to the gelseminine. The tincture of gelsemium is prescribed for neuralgia.

Gelsenkirchen. German city, in Westphalia, centre of the Ruhr coal industry. It stands on the canalised river Emscher and the Rhine-Herne-Canal, 15 m. W. of Dortmund. Gelsenkirchen is the most striking example of German industrialisation; in 1847 its pop. was 600, in 1900, 30,000, and in 1939, 313,003. Through the adjoining towns of Wattenscheid and Steele, it links up with Bochum to E. and Essen to W., forming one huge industrial settlement of 1½ million people. Gelsenkirchen had impressive public buildings before its destruction in air raids of the Second Great War; it was entirely modern, except for the Renaissance castle Horst, dating from 1559. There were two museums, an art gallery, excellent hospitals and sanatoria, a huge People's House (T.U. centre), and several public parks.

Some 24 coal mining enterprises worked 61 pits within the precincts of the city. Iron and steel products, ovens and heating apparatus, glass, and chemicals were also made at Gelsenkirchen. The town was in a desolate state when captured by the U.S. 9th army on April 11, 1945, after several days' fighting; but mining was restarted almost at once.

Gem. Name given to precious stones, especially diamonds, rubies, sapphires, topazes, and emeralds after they have been cut and polished. It is used in a secondary sense for cameos, and the less precious stones, e.g. agates, garnets, jaspers, onyxes. By a quaint conceit the Romans divided gems into male and female according to the depth or lightness of their colour. See Precious Stones; also Artificial Gem Stones.

Gemini or **THE TWINS.** One of the ancient Ptolemaic constellations. Castor and Pollux form the heads of the Twins. Their feet stand on the Milky Way.

Gemma Galgani (1878-1903). Italian saint. Born at Camigliano, Tuscany, March 12, 1878, she suffered from tuberculosis of the spine. After an apparition to her of S. Gabriel of the Sorrows she was instantaneously cured, but later had periodically recurring stigmata. A life devoted to piety and charity, during which she claimed to receive heavenly visitors, ended on April 11, 1903, at Lucca. She was canonised in 1940, because she had practised Christian virtues to an heroic extent.

Gemmation or **BUDDING.** In biology, a term sometimes used for a method of asexual reproduc-

tion, occurring in lowly organisms, which involves the formation of a new individual by the outgrowth and separation of part of the body of the parent. Botanists generally prefer the term **gemma**, since for them budding applies to the expansion of buds, e.g. of

trees. Zoologists incline to the use of the simpler word. The fresh-water polyp, hydra, reproduces under suitable conditions by budding: a bulge appears on the side of its body, enlarging and growing in complexity until it resembles its one parent. Then this "branch" of the parent body breaks away and becomes independent.

Gemmi. Pass or mule-track over the Bernese Alps, Switzerland. It communicates between

Gemmation. A. Piece of sponge laden with buds a-f; i, spicules of buds directed away from their free ends; k, spicules of parent directed towards the osculum, i. B. Bud which has been set free and has become fixed by the extremity

From *The Cambridge Natural History*, Macmillan & Co.

water have gemmules which float to some extent, and those that live in running streams tend to have gemmules which sink.

Gemsbok (*Oryx*). Species of antelope, found in the desert regions of S.W. Africa. It is remarkable for its long straight horns, which sometimes reach a length of 45 ins. The animal is about 4 ft. high, and is grey on the back and sides, with white below. There are black markings on the face, throat, and upper parts of the limbs. It is said that the gemsbok can successfully fight the lion with its horns. The name is Dutch, meaning chamois-buck.

Gendarme (from Fr. *gens d'armes*, men-at-arms). Military policeman. In the Middle Ages gendarmes were the French bodyguards of the king, recruited among the nobility. The Revolution created under the same name a militarised state police force, mounted and on foot, which together with its name was soon copied by many European powers. It usually is entrusted, in rural districts, with the tasks and duties performed in towns and cities by the police, and is recruited from among reliable

former soldiers and n.c.o.s. Members bear arms, and in many countries serve in war as military police. Prussia up to 1806 had a regiment of cuirassiers named Gendarmes. In Italy the gendarmes are called Carabinieri, in Spain Guardia Civil, in Turkey Sabtihs, but everywhere their tasks and equipment are similar.

Gendarme. French military constable

Gender (Lat. *genus*, kind). Classes into which nouns are divided according to sex or absence of sex: sometimes three in number—masculine, feminine, and neuter; sometimes two—masculine and feminine; and in inflexional languages shown by different terminations. But this grammatical distinction is often arbitrary; thus, in Latin *mensa* (table) is feminine, in German *Mond* (moon) masculine, *Sonne* (sun) feminine. In English, grammatical gender does not exist, things without natural gender being neuter. Natural gender, in which sex and gender agree, is shown by special endings (executor, executrix) or by different words (horse, mare; fox, vixen). It is probable that originally the distinction of gender was natural, not grammatical.

Gene. A factor of unknown constitution which induces the appearance of a particular character in an organism containing it. Experimental breeding (see Genetics; Heredity; Mendelism) proves that recognizable characteristics are passed from generation to generation according to certain laws. Since material forming part of

one generation initiates the next, it is presumed that the material holds the cause of the resemblance between offspring and their forebears.

Cytogenetical experiment (see Cytology) indicates that genes occur in linear series along chromosomes, and it has been found possible to determine the relative

Gemmi Pass. One of the gorges in the Bernese Alps threaded by a mule track

Frutigen in Berne, and Leukerbad in Valais, and reaches an alt. of 7,640 ft. The track passes the Dauben See, and is often called the Daube Pass. There is an hotel on the summit, giving a remarkable view, including the Matterhorn, Monte Rosa, the Dent Blanche, and the Wildstrubel.

Gemmule. Small spherical structure formed in autumn by many fresh-water sponges in which certain cells, strongly protected, survive the winter. In spring these cells, by growth and division, produce a mass of living material, which sometimes spreads through and round the old skeleton from the previous year in which the gemmule has remained. Otherwise the cells, washed to a new site, may give rise to a new sponge altogether. In general, those forms that live in still or nearly still

Gemsbok, a long-horned antelope found in South-West African deserts

positions of genes for various characters in the series and so to construct a map showing these positions (loci) in a manner analogous with that in which stations are indicated on maps of railways. Further, extreme magnification of suitably stained chromosomes shows heavily stained portions of chromosomes distributed in a manner corresponding with the distribution of the loci in the maps.

The natural deduction is that the heavily stained regions in the chromosomes are or contain the genes for the characters concerned. This conception is upheld by the fact that, when an aberrant form of organism has arisen spontaneously—a process known as mutation—examination of its chromosomes has often shown one or other of these to be aberrant also, in exactly that position which corresponds to the locus of the gene for the character in which the organism is peculiar. Such results are the basis of the current belief that a gene is a small part of a chromosome. Whether it is a distinct material unit comparable to a chromosome in behaviour though not in size and form, or whether it is simply a localised condition in the chromosome, must still be determined.

Genealogy (Gr. *genealogia*). History of the descent of a family. The principal data are places and dates of birth, of marriage, and of death, names of husbands and wives, particulars as to offices held, or professions, of wills proved, and any other particulars. These may be supplemented by a pedigree, or a family tree, in which the growth of a family is shown in the reverse way, the various generations with their armorial insignia being displayed as fruits of a tree, rooted in the founder of the house.

Genée, DAME ADELINÉ (b.1878) Danish dancer. Born at Aarhus,

Adeline Genée, in the Dance of Bacchus

Jan. 6, 1878, and trained as a dancer from the age of eight, she became *première danseuse* at the Copenhagen Opera in 1895. Her success led to engagements at Berlin and Munich. From 1897 to 1907 she danced leading parts at the Empire Theatre, Lon-

don, notably in *The Press*, Feb. 14, 1898, and appeared in an important revival of *Coppélia* under the title *The Dancing Doll*, Jan. 3, 1905. An exponent of the traditional school of ballet, she also appeared with her own company in the U.S.A., Paris, and in Australia. Her farewell performance was at the London Coliseum, May 11, 1914, but she made short reappearances there in 1915 and 1932. President of the Royal Academy of Dancing, she was made D.B.E., 1950.

General or **GENERAL OFFICER**. Name given to a military officer of almost the highest rank, only field

General. Rank badges on shoulder strap of British general.

marshal being above it. It is used loosely for all officers above the rank of brigadier, as well as for those who are full generals. In the British army there are major-generals (lowest), lieutenant-generals, and generals. The equivalent rank in the navy is admiral, and in the R.A.F. is air chief marshal.

During both Great Wars the commanders of armies were given the rank of general, either temporary or substantive. The term is common to most armies; the French have *général*, *général de division*, and *général de brigade*, and the Germans have a similar order. In the U.S.A. a highest rank of general of the army was created in 1945. The rank brigadier general, abolished in the British army in 1920, was retained in the U.S. army. The word was first used in its present sense about the end of the 16th century. In 1650 Cromwell was made captain-general of the forces of the Commonwealth, and was afterwards known as the lord-general. Marlborough was the captain-general. Later the present forms came into use.

General. Title used in the Roman Catholic Church to designate the heads of some religious orders. Under the pope, the general is the supreme head of his order, and exercises authority over the provincials as they, in turn, control the individual communities in their provinces. The general is usually elected by a chapter of provincials for a period varying according to the order from 6 to 12 years; but in the Jesuit order, for life. Salesian and Redemptorist generals are also elected for life. The generals

live at Rome and are under no episcopal jurisdiction save that of the pope. (See Jesuits.)

The title general is also used by the head of the Salvation Army (*q.v.*).

General Assembly. The name given to the governing body of a Presbyterian church. As a rule, it meets once a year, consists of both ministers and laymen representing the presbyteries of the church, and is presided over by a moderator. It is the final authority on all matters of belief, church discipline, and order. The general assembly of the Church of Scotland, an established church, differs slightly from those of the unestablished Presbyterian churches: at its annual meeting, held in May, the king is represented by a civilian high commissioner and members are sent thereto from the royal burghs and the universities of Scotland. See Presbyterianism; Scotland, Church of.

General Election. Term used for the process of electing the members of a new central or federal, as opposed to a local or regional, government. In the U.K. this means the election of a new house of commons through the exercise of the parliamentary franchise, following a dissolution of parliament. The Act of 1911 reduced the life of a parliament from seven years to five, although there is provision whereby the house of commons may declare a state of emergency to exist and prolong its life by a year at a time. The parliaments sitting in 1914 and in 1939 were both in this manner prolonged because it was thought inexpedient to hold a general election while a European war was in progress. The term of five years, a maximum, is rarely allowed to run out.

To order that a general election be held, writs are issued in accordance with a royal proclamation which dissolves one parliament and summons its successor to meet on a given day. The arrangements for the election in each constituency are in the hands of a returning officer, often the town clerk, who keeps a register of electors. Nominations of candidates being made, each candidate deposits in cash a sum of £150 which is held forfeit if he fails to secure one-eighth of the total votes cast. After the count the returning officer declares the result and issues a certificate to the successful candidate. Each candidate may spend on his campaign up to £450, plus 2d. per head of electors in a county constituency, 1½d. in a borough constituency.

GENERAL ELECTION RESULTS IN THE U.K. FROM 1874

The election of 1874 was the first in which all votes were recorded by secret ballot. The table shows the number of seats gained at each election by the main historical parties only, ignoring independents, etc.

Date	Resulting Distribution of Seats
1874 (March)	351 Conservative; 250 Liberal; 51 Home Rule
1880 (March)	347 Liberal; 240 Conservative; 65 Home Rule
1885 (November)	333 Liberal; 251 Conservative; 86 Home Rule
1886 (July)	316 Conservative; 196 Liberal; 74 Lib. Unionist; 84 Home Rule
1892 (Jun.-Jul.)	274 Liberal; 268 Conservative; 47 Lib. Unionist; 81 Home Rule
1895 (July)	340 Conservative; 178 Liberal; 71 Lib. Unionist; 81 Home Rule
1900 (Oct.)	402 Unionist; 186 Liberal; 82 Nationalist
1906 (January)	379 Liberal; 157 Unionist; 83 Nationalist; 51 Labour
1910 (January)	274 Liberal; 273 Unionist; 82 Nationalist; 41 Labour
1910 (December)	272 Liberal; 272 Unionist; 84 Nationalist; 42 Labour
1918 (Dec. 10)	338 Coalition Unionist; 136 Coalition Lib.; 48 Unionist; 59 Labour; 27 Ind. Liberal; 73 Sinn Féin (seats never taken)
1922 (Nov. 15)	344 Conservative; 143 Labour; 60 Ind. Liberal; 57 National Liberal
1923 (Dec. 6)	258 Conservative; 191 Labour; 158 Liberal
1924 (Oct. 29)	415 Conservative; 152 Labour; 42 Liberal
1929 (May 30)	287 Labour; 261 Conservative; 59 Liberal
1931 (Oct. 27)	472 Conservative; 52 Labour; 35 Liberal National; 33 National Liberal; 13 National Labour
1935 (Nov. 14)	385 Conservative; 154 Labour; 32 National Liberal; 21 Liberal; 8 National Labour
1945 (July 5)	392 Labour; 189 Conservative; 13 National Liberal; 12 Liberal
1950 (Feb. 23)	315 Labour; 297 Conservative (including National Liberal); 9 Liberal

An Act of 1928 gave the right of voting at a general election to all men and women over 21 (with a few disqualifications, e.g. lunacy). Women voted at a general election for the first time, though with limited qualifications, in the election of 1918. Since 1918 all polls have had to take place on the same day—a special Act was needed in 1945 to allow towns taking their summer holidays at the date appointed to vote on a different day. Before 1918 the polls were often spread over a period of weeks, and later polls were often influenced by the declared results of earlier ones. Moreover, a defeated candidate in an early poll might still be in time for election at a later poll in another constituency; thus in the general election 1868, Gladstone,

defeated in S.W. Lancashire, was able to stand and be elected for Greenwich. By the Ballot Act of 1872 open voting at the hustings was discontinued and secrecy ensured by the ballot. Voters must present themselves in person, except that those who, through the nature of their duties (e.g. military service) or for reasons of physical incapacity or necessity to make a journey by sea or air to the polling station, cannot attend may send their votes through the post or appoint a proxy. Only one vote is allowed to each voter, all forms of plural voting being abolished in 1948.

Certain general elections are remembered by popular descriptive labels, usually invented by the losing side. Thus, that of 1900 was the "khaki" election (held to

have exploited the popularity of the S. African war); that of 1918 was the "coupon" election (*see* Coupon); that of 1924 was the "red letter" election, in reference to the astutely-timed publication of a subversive letter alleged to have been written by a Russian Communist leader. That of 1931 was the "doctors' mandate" for healing the country's economic ills. *See* Election; Franchise; Hustings; Parliament; Proportional Representation; Women's Suffrage.

General Headquarters. Administrative centre from which an army commander directs his forces. Here will also be located the commanders of the ancillary services and frequently on active service the air officer commanding, with their respective staffs. In the British Army, communication between front line troops, advanced command posts, and G.H.Q. was maintained by the G.H.Q. Liaison, or Phantom Regiment, a special unit formed in Belgium in 1940. This unit was equipped with motor cycles, fast cars, and light aircraft, and transmitted messages by special wireless sets, using a code the Germans never broke. Some sections were dropped in Normandy before the Allied invasion on June 6, 1944, and others accompanied the airborne and assault troops. They gave the news of the closing of the Falaise gap; reported the movements of the German armour in the Ardennes offensive, Dec., 1944; and announced the Russo-American junction at Torgau. The flash of the regiment was a white P on a black background.

Generalisation. Mental process which, with the aid of abstraction and comparison, discovers the qualities common to a class of individual things and unites them in a single idea called a concept. Generalisation simplifies knowledge by enabling a number of particular ideas to be combined under a single idea; if there were no general ideas, it would be necessary to employ a special name for every individual object.

Generalissimo (Lat. superlative of *generalis*, general). Title conferred occasionally upon the commander of a nation's armed forces or of several army groups. This position was held by Foch, in the First Great War, from March 26, 1918; and by Chiang Kai-shek from 1926. Marshal Stalin was created generalissimo of the Soviet Union, June 27, 1945.

General Medical Council. Authority appointed under the Medi-

cal Act of 1858 to regulate the qualifications of medical practitioners and exercise disciplinary control in certain professional matters. The council is composed of 27 members chosen by the different universities of England, Scotland, Wales, and Ireland, the Royal Colleges of Physicians, Royal Colleges of Surgeons, and Royal Faculty of Physicians and Surgeons of Glasgow, the Apothecaries' Society of London, and the Apothecaries' Hall of Ireland; five members nominated by the crown through the privy council; and seven members elected by the medical practitioners of England, Scotland, and Ireland. Its principal duty is to keep the medical register, *i.e.* the list of medical men who hold diplomas granted after qualifying examinations of a proper standard. Unless a medical man is registered he does not possess the privileges restricted by law to members of the medical profession.

The council alone has the right to place a doctor on the register or to remove his name; to supervise the examinations conducted by universities and medical corporations entitled to grant medical qualifications, in order to satisfy itself that a proper standard of skill and knowledge is maintained; to deal with unprofessional conduct which may render the offender liable to be struck off the register, *e.g.* advertising or canvassing for patients; and to publish, and from time to time issue revised editions of, the British Pharmacopoeia, *i.e.* a book containing a list of medicines and compounds, together with the manner of preparing them and their appropriate doses.

General Paralysis of the Insane. Progressive disease of the brain due to syphilis, associated with mental and physical deterioration and finally dementia and paralysis. The disease begins from eight to 20 years after infection, and is commoner among males than females, though thorough early treatment of syphilis has much modified the incidence of the condition. Pathologically, essential changes are found in the grey cells themselves and the organism of syphilis can be demonstrated in the nerve tissue.

The onset is marked by loss of emotional control, the patient being easily moved to tears or to anger. He loses all power of judgement, and while he conceives brilliant plans, refuses to recognize practical limitations to achievement. In time, excitability gives

way to lethargy, and the patient becomes indifferent to his surroundings, bedridden, paralysed, and incontinent. Tremor is a prominent early symptom affecting speech and hands. Changes in the higher mental controls cause contraction of vocabulary and poverty of expression. Sexual excitement recedes. Attacks resembling epilepsy are later frequent and may be a cause of death.

Diagnosis depends on the positive reaction of the cerebro-spinal fluid, together with recognition of tremor, mental deterioration, and loss of emotional control. This disease is likely to occur when the blood serum and cerebro-spinal fluid are positive in spite of antisyphilitic treatment in the preceding stages of syphilis.

The condition may be arrested or modified by the induction of a high temperature, for which purpose malaria has been used since 1917, the patient being caused to have some ten rigors after being bitten by mosquitoes carrying malarial infection. Diathermy and short-wave are other accepted methods of inducing this high temperature. Injections of arsenic, coupled with bismuth, and large and continued doses of antibiotic drugs are among remedies used.

General Service Medal. First official medal for naval service to be authorised for all ranks of the Royal Navy.

General Service Medal issued in 1847

Instituted in 1847, it covered the period 1793–1840, and clasps were authorised for 250 general engagements, frigate actions, and cutting-out expeditions. One of the earliest clasps commemorated Lord Howe's victory of June 1, 1794. The medal and clasps were issued in 1848 to survivors of the various engagements, likewise the medal and appropriate clasps to officers and men of the army who had served on board ship as marines.

In 1915 a second naval general service medal was authorised for service in minor operations since 1910 not covered by the campaign medals issued to all services for major wars. The medal has a number of clasps, the first being Persian Gulf, 1909–1914, for officers and men engaged in the suppression of the arms traffic. There is a Palestine clasp for naval opera-

tions there between April 10, 1936, and Sept. 3, 1939. See Medals, colour plates.

ARMY. A general service medal for the army and R.A.F. was instituted in 1918 for minor campaigns not warranting a separate medal, bars betokening specific operations. It was awarded for operations in Indonesia and Indo-China 1945–46, with a bar for Palestine 1945–48. The medal has on the obverse the effigy of the sovereign and on the reverse a figure of Victory. The ribbon is purple with a green central stripe. See Africa General Service Medal; India General Service Medal.

General Steam Navigation Co., Ltd. British steamship company. Founded in 1824, it has now a fleet of about

General Steam Navigation Co. flag; red on white background

forty vessels. Its services are the carriage of cargo between London and the ports on the E. coast of England; and London and the North Sea

ports of Germany, Holland, and Belgium, the French Channel ports, Bordeaux, Oporto, and the Mediterranean. In summer, tourists are taken to Southend, Margate, and Ramsgate. Its headquarters are 15, Trinity Square, London, E.C.3.

General Strike. Cessation of work by the general body of wage-earners in the hope of attaining some specified object. The idea of a "sacred holiday month" prepared for and participated in by the entire wage-earning class whose simple "passive resistance" would destroy all existing institutions was put forward in 1831 by William Benbow, a follower of Robert Owen (*q.v.*), and was among the means of action which the Chartists attempted to use. The British Syndicalist Tom Mann, who was against control of industry by parliament, came out in 1911 strongly in favour of "the general strike of national proportions." General strikes were attempted in Sweden in 1902, 1909, and 1910, and in Belgium in 1913, but the unions were not strong enough to secure complete cessation of work. A general strike resulting in a virtually nation-wide withdrawal of labour took place, however, in Great Britain in 1926.

In 1925, when the miners' agreement of 1921 was about to end, the coal industry was losing money. The mine-owners demanded that

the miners should accept lower wages and longer hours, and a stoppage of work threatened. The government (prime minister, Stanley Baldwin) intervened, setting up a commission of inquiry under Sir Herbert Samuel (*see* Samuel, Viscount) and paying a subsidy meanwhile to maintain the existing wage rate. The commission condemned subsidies, and advocated the continuance of private ownership, with, however, some measure of cooperation in selling and the elimination of waste in management, closing of unprofitable collieries, retention of the existing working hours, and a reduction of wages. Under government pressure, the mine-owners accepted the commission's report as a basis for negotiation; the miners rejected it.

The government subsidy expired on April 30, 1926, and on that day, efforts at negotiation between miners and mine-owners by the T.U.C. and the government having failed, the owners posted notices at the collieries that they could no longer employ the miners except at a lower wage. Work in the mines ceased. The general council of the trades union congress (after a meeting at which delegates representing 3,653,000 members voted in favour, and those representing 50,000 voted against, some 300,000 not being represented) announced that it would call a general strike at midnight on May 3-4 unless negotiations had been satisfactorily started.

State of Emergency

On Saturday, May 1, the government declared the existence of a state of emergency and took steps to control food supplies, commandeer all forms of transport, and preserve order.

Negotiations between government and T.U.C. continued; but members of the national society of operative printers and assistants, employed by the Daily Mail, refused to handle Monday's issue of the paper as they objected to the leading article dealing with the proposed general strike.

The government thereupon broke off negotiations. At midnight on May 3-4 trains, omnibuses, and trams throughout the country came to a standstill. On Tuesday no London newspapers were obtainable. Wild rumours circulated. On Wednesday, from the offices of the Morning Post, the government issued an official news sheet, the British Gazette (*q.v.*). Some of the newspapers eventually appeared as small news sheets, many printed by cyclostyle. For

the first time, the B.B.C. came to the fore as a disseminator of news and information.

Sir John Simon, from the Liberal benches in the house of commons, startled the trade unions by a speech maintaining that the general strike was not covered by the Trade Disputes Act of 1906, which had given the funds of trade unions immunity from attachment to cover losses caused by industrial disputes.

Amateur Train Drivers

By the Saturday trains with amateur drivers were able to make slow cross-country journeys. A skeleton service ran on London tube railways. Omnibuses and trams, a policeman by each amateur driver, ran in the towns.

Three days later Samuel was in unofficial contact with the government, the miners, and the mine-owners. In anticipation of an early settlement of the mining dispute, the general council of the T.U.C. decided on May 12 to terminate the general strike, which by that time had lasted nine days, that night, a decision made public by the B.B.C.

Resumption of work did not prove simple: by striking without notice, many of the trade unions had broken agreements arrived at between them and their employers' unions, and it was another five days before the railwaymen, dockers, printers, and transport workers succeeded in adjusting matters and were allowed to return to work. But the miners were to hold out another six months before, their funds exhausted and a winter of starvation in prospect, delegates decided that the dispute must be ended on any terms.

The general strike of 1926 failed; but to guard against the unlikely possibility of a repetition, the government in 1927 passed a new Trade Disputes Act declaring sympathetic strikes illegal. *See* Trade Disputes Acts.

Irene Clephane

General Stud Book. Register of the pedigrees of British race-horses. The first edition was published in 1793, after which it appeared at irregular intervals until 1891, when it became a quadrennial publication, the 31st edition appearing in 1950. This stud book is the only one recognized by all nations; failure of an animal to qualify for inclusion may render its sale abroad impossible. The purpose of the book is to maintain the purity of British blood-stock. It is published by Messrs. Weatherby & Sons, secretaries

of the Jockey Club and National Hunt Committee.

Generator. General term for any machine used for generating electricity, *i.e.* converting mechanical energy into electrical energy. The expression D.C. generator is frequently used in place of dynamo as being more exact for a direct-current machine. A.C. (alternating current) generators or dynamos are almost invariably referred to as alternators, except for the so-called asynchronous or induction generator; this is not a true alternator, consisting as it does of an induction motor (*see* Motor, Electric) which is over-run by mechanical means to a speed greater than normal (*e.g.* when a train coasts downhill), and so returns power to the line.

Other types include the so-called lightning, impulse, or surge generator, used to produce artificial lightning strokes of tremendously high voltage and short duration, for research or testing purposes. These may operate on electrostatic principles (rubbing belts, etc.), or consist simply of a set of condensers (*q.v.*), charged in parallel and discharged in series, to obtain a high voltage. The word generator is frequently used loosely in radio work to denote any assemblage of valves or oscillatory circuits producing a special effect. *See* Electro-magnetic Machine.

Generoso. Peak of Switzerland, in the canton of Ticino. It rises from the S.E. end of Lake Lugano, near the Italian frontier, to a height of 5,590 ft., and is ascended by a rack and pinion rly. from Capolago. There is an hotel on a terrace, 3,960 ft., and another on the Kulm, at an alt. of 5,295 ft.

Genesis (Gr., origin). First book of the Pentateuch or rather Hexateuch. The name is taken from the Septuagint title, the Generation of the World. The Hebrew title is In the Beginning. The book falls into two main divisions: (a) Creation stories and primeval history, Chaps. 1-11, v. 26; (b) History and stories of the patriarchs, from Chap 11, v. 27. It is composed of a number of narratives, more or less independent in origin and based upon popular tradition.

Division (a) includes stories of the creation of the universe, of the fall of man, of the deluge, and of the tower of Babel. Division (b) includes an Abraham narrative, a Jacob story, and a Joseph narrative. Some of the stories in these narratives (*e.g.* that of the deluge) bear some resemblance to

stories found in Babylonian and ancient Egyptian literature. The poem known as *The Blessing of Jacob*, in Gen. 49, is probably one of the oldest pieces of composition found in the Hexateuch. See Bible; Hexateuch; Pentateuch.

Genet. Any member of the genus *Genetta*, found almost solely in Africa, with one species in S. Europe. Genets are allied to the civets and mongooses in a group of carnivores called Viveridae. They look something like stoats, but are more slim and graceful. The face is curiously like that of a cat. Genets have short fur of exquisite texture and in many species of beautiful mottled pattern. They are easily tamed.

Genetics. Science which observes the resemblances and differences between organisms and seeks to account for them. The earliest genetical studies were simple observations on naturally occurring organisms, leading to little more than broad generalisations. Biometric methods introduced by Francis Galton eliminate the indecision inherent in simple observational studies of heterogeneous material. They depend on the statistical analysis of observations of characters which can be measured, e.g. height and weight, and so serve to show the degree to which groups of individuals resemble or differ from other groups. Such methods also indicate that quantitative differences between individuals may result from either heredity or environment.

Experimental breeding owes its origin to Mendel. It involves crossing closely related individuals which differ in one or a few well defined qualitative ways and in studying the incidence of these differences in the progeny. The method has the advantage that the material is under experimental control; environmental effects may be minimised if not entirely eliminated. It has resulted in the elucidation of the laws governing the distribution to future generations of many if not all potentialities. Cytology has found its major application in discovering, in the behaviour of chromosomes through successive generations, the mechanism of Mendelian inheritance. Neither Mendelian laws of the inheritance of potentialities, nor the behaviour of the chromosomes, however, explain fully why an organism comes to be what it is at maturity. Potentialities undoubtedly pass in the gametes to the zygote, but this cell, in all but the simplest

plants and animals, gives rise to the many kinds which constitute the mature organism. Why the processes of cell division, differentiation, and integration go on as they do during development, it is for experimental embryology to determine. See Heredity.

Geneva. A canton of Switzerland, in the extreme W. of the country. Except for a small strip

Geneva arms

of $3\frac{1}{2}$ m. where it adjoins the canton of Vaud, it is surrounded by French territory. Area, 109 sq. m. The river Rhône flows through it from Lake Geneva, at the S.W. end of which it emerges and receives the river Arve. The surface is fairly level and is mostly covered by market gardens, vineyards, and orchards. Watch-making and the manufacture of jewelry are the chief industries. Next to Basel, this is the most densely populated of the Swiss cantons. The majority of the inhabitants are French-speaking, and half are Protestants and half Roman Catholics. The youngest member of the Swiss Confederation. Geneva became a canton in 1815. The capital is Geneva. Pop. 174,855.

Geneva. Largest lake of Central

Europe, called by the French Léman. It lies between Switzerland and France. Its length is 45 m., its maximum width is 10 m., and where narrowest, between Pointe de Genthod and Bellerive, it is 2 m. Crescent-shaped, the N. shore measures 59 m. and the S. shore only 45 m. Area, 225 sq. m. Most of the S. shore belongs to the dept. of Haute-Savoie, France, but the remainder is bounded by the Swiss cantons of Geneva, Vaud, and Valais. The surface is 1,220 ft. above sea level, the depth varying between 240 ft. and 1,094 ft. It is an expansion of the Rhône, which enters it as a silt-laden mt. stream at the S.E. end and emerges at the S.W. corner, clear and blue.

The waters of Lake Geneva are of a beautiful deep blue colour and remarkably transparent, especially near Geneva, the silt being gradually deposited and incidentally diminishing the water area. Like most of the Swiss lakes, it presents the phenomenon of the "seiches" or fluctuations in the level of the water, phenomena which are caused by sudden alteration in atmospheric pressure.

The level is higher in summer than in winter, owing to the melting of the snows. It is not so rich in fish life as many other lakes, but lake salmon, trout, pike, and carp are caught. Remains of lacustrine dwellings have been discovered

Geneva. Plan of the city and harbour on the Lake of Geneva

Geneva. Left, a general view of this famous and beautifully situated city, fourth largest of Switzerland. Right, part of the Calvin Academy, founded in 1559
Courtesy of The Association des Intérêts de Genève

on its shores. It is encircled by rlys. and traversed by steamers, the first being built at Geneva in 1823 by an Englishman. The most important towns on its banks are Geneva, Lausanne, Nyon, Coppet, Vevey, Montreux, Villeneuve, Thonon, Evian-les-Bains, and Ouchy. Some of the best-known verses in canto 3 of Byron's *Childe Harold's Pilgrimage* were inspired by this lake. *Consult Lac Léman*, F. A. Forel, 3 vols., 1892-1904.

Geneva (Fr. *Genève*; Ger. *Genf*). City of Switzerland, capital of the canton of Geneva. It stands at the S.W. extremity of the lake of Geneva, near the confluence of the Arve with the Rhône, 40 m. N.E. of Chambéry and 256 m. S.E. of Paris. It is the fourth largest town in the country. The old part, which is also the commercial centre, lies on the left bank of the Rhône, which divides the city into two portions, connected by several bridges. Since the demolition of the ramparts in 1849-50, Geneva has rapidly spread, wide streets and commodious quays lining river and lake have been constructed, and breakwaters built to protect the port.

Although a famous religious scientific, and literary centre, Geneva has few public buildings of outstanding interest. The Protestant cathedral, founded in the 10th century and consecrated in the 11th, was rebuilt in the 12th and 13th centuries and disfigured in the 18th by Renaissance additions. More tasteful is the adjoining Gothic chapel of the Maccabees, built in 1406 and restored in 1874-88. There are other R.C., Anglican, and American churches. The

town hall dates from the 16th century. The academy, founded by Calvin in 1559, is one of the leading Swiss universities, with a school of international studies.

There are a large, handsome theatre, an athenaeum, and many museums, including the Musée Rath, with pictures and sculptures. There are also historical, natural history, industrial, and archaeological museums, technical schools, and an observatory. The Victoria Hall is a fine building. The city has large manufactures of watches, clocks, musical boxes, scientific instruments, and jewelry, including enamelling and diamond cutting.

Mentioned by Caesar, Geneva became important under the Romans, and the seat of a bishop in the 5th century or earlier. It afterwards belonged to the Burgundians, the Franks, the Empire, and to the counts of Savoy. The prince-bishops of Geneva had a continual struggle to maintain their privileges; this culminated in 1535 in the epoch of unrest caused by the Reformation. The bishop transferred his seat to Gex, and in 1536 Calvin (*q.v.*) came to the city, acquired almost sovereign power, and ruled with a rod of iron in a "Protestant Rome." In the 17th century the dukes of Savoy attempted to recover Geneva, but it was defended by Protestant powers. In the 18th century dissensions arose between the bourgeois and the workers. Geneva was annexed by France in 1792, but upon its liberation in 1815, joined the Swiss Confederation. It was the seat of the League of Nations from its first assembly

in 1920. In 1946 the palace of the League was handed over to U.N.O. for the housing of some of its European services. Pop. 124,431.

Geneva. City of New York, U.S.A., in Ontario co. Situated at the N. end of Seneca Lake, 50 m. S.E. of Rochester, it is served by rly. and barge canal. Nursery gardening is carried on, maize and vegetables are canned, and furnaces, radiators, enamelware, optical requisites, cutlery, and stoves are manufactured. Geneva has an agricultural experimental station, observatory, and state armoury. Settled in 1788 it received a charter in 1898. Pop. 15,555.

Geneva Convention. International agreement regulating the treatment of sick, wounded, and prisoners of war. The death of thousands of wounded after the battle of Solferino (1859) through lack of medical aid, and the endeavours of Henri Dunant, a Swiss doctor who was present, led to the international convention at Geneva for the amelioration of the condition of soldiers wounded in the field (1864). The rules were revised by the Geneva Convention of 1906. As a result of the First Great War, a new convention was made in 1929.

This provides that sick or wounded persons attached to armies must be regarded as prisoners of war and be respected, protected, and cared for without distinction of nationality by the belligerent in whose hands they are. Search must be made for the wounded and dead, who must not be subjected to pillage or maltreatment. All medical units, establishments, and personnel must be respected unless

being used for combatant purposes. Medical personnel cannot be treated as prisoners of war if engaged in collecting or tending the sick or wounded.

Aircraft used as medical transport are also protected, but must not fly over the firing line without permission and must land if called on to do so.

As a compliment to Switzerland, the federal colours reversed—a red cross on a white ground—became the emblem of the medical services. Turkey uses a red crescent and Persia a red sun. The emblem must be shown, and must not be used in either peace or war except for the medical services. This is enforced in Great Britain by the Geneva Convention Acts, 1911 and 1937.

The convention, in dealing with prisoners of war, provides that they are not in the power of the individuals who capture them, but of the government. Reprisals against them are forbidden. They cannot be required to give information except as to their name and rank or regimental number. Provision is made as to treatment, food, clothing, correspondence, parcels, and work. *See* N.V.

Geneva Protocol. Agreement outlining procedure for conciliation, arbitration, and forced compliance with League decisions among members of the League, accepted by the 5th League of Nations Assembly, Oct. 2, 1924, but never ratified by the Powers.

Geneva Spirit (Dutch *jenever*, juniper gin). Distilled spirit flavoured with juniper berries. The name is due to the popular confusion of the word with the town of Geneva.

Quantities are made in Holland, notably at Schiedam, whence gin is often called Hollands or Schiedam. *See* Gin.

Genevieve (c. 422 – c. 512). Patron saint of Paris. Born at Nanterre, the daughter of a shepherd, she came under the influence of S. Germanus, and at 15 devoted herself to the religious life, practising a stern asceticism, though not entering a convent. When Paris was taken by Childeric she was tireless in her efforts on behalf of the citizens, and interceded with the king for the prisoners. She founded the church of S. Denis,

and encouraged the people to resist Attila's invasion. Her tomb is in the church of S. Étienne-du-Mont, Paris.

Geniculate Body. Part of the brain in which the fibres coming from the eyes in the optic tract are sorted out. It is highly probable that here the nervous impulses originating in the reception of light of different wavelengths are analysed to give a perception of colour. It is best developed in the Anthropeidea, where we also find the highest degree of colour vision.

Genie. Good or evil spirit, or manifestation between the spiritual and the animal in Oriental mythology. In the Hindu Vedas they are benevolent, but in the stories of The Arabian Nights and other Eastern tales they are often either evil powers or vaguely monstrous slaves of those possessing some power over their services. The plural is *genii*. *See* Mythology.

Genioglossal Process. On the inner aspect of each side of the front of the lower jaw in man is attached a genioglossal muscle actuating the tongue and used in speech. It used to be considered that the absence of this in fossil skulls meant that the form concerned could not speak, and that its presence indicated the power of

speech, but arguments based upon the presence or absence of this process are not now highly valued.

Genipap (*Genipa americana*). Small evergreen tree of the family Rubiaceae, native to tropical America and the W. Indies. The leaves are opposite, leathery and lance-shaped; flowers bell-shaped, white, in clusters.

The juicy fruit is as large as an orange, but tapering towards each end, with a rather thick, greenish-white rind.

Genissiat. Village of France, near Bellegarde, dept. of Ain. Situated on the Upper Rhône, close to the Franco-Swiss frontier, it has the second biggest hydroelectric project in Europe (after the Dnieper dam, *q.v.*). This is 320 ft. high and backs up the waters of the Rhône for 14 m. Work was begun in 1938, interrupted by the German occupation, resumed under German supervision until sabotage by the workmen brought

it to a standstill, and construction started again late in 1945. The plant is to contain six 975-ton turbine generators, supplying Lyons chiefly, though some power will reach Paris, 160 m. N.W. Part of the station came into operation in Jan., 1948.

Genista. Genus of shrubs of the family Leguminosae. They are natives of Europe, N. Africa, and W. Asia. Native British species are *G. anglica*, needle-furze, and *G. tinctoria*, dyers' greenweed (*q.v.*). *See* Plantagenet.

Genitive (Lat. *genitivus*, belonging to birth). One of the cases (*q.v.*) in the inflexional languages. The term is really a Latin mis-translation of the Greek name *genikē* properly the class-case, expressing in its widest application the relation between one thing and another. The ideas of source, origin, possession, are special aspects of the general meaning. The inflexion survives in the English possessive (John's). *See* Grammar.

Genius (Lat. *genere*, to produce). In Roman mythology, the god of productivity, in a special sense a tutelary divinity. Every man was supposed to be accompanied from the cradle to the grave by his genius, his higher and better self, by whom he was protected and influenced. Special days in a man's life, such as his birthday and wedding day, were made the occasion of festivity and rejoicing, and sacrifice was offered to the genius. Like the individual man, families, cities, states, localities, even baths and theatres, had their genius. In imperial times, the genius of the emperor was an object of worship, even during his lifetime. The genius of a place was usually represented in the form of a snake; that of a man as a youth dressed in a toga with veiled head, carrying a cornucopia. The conception is essentially Italian, although the daemon of the Greeks exhibited certain resemblances.

In modern language, the word genius is used with various shades of meaning. It denotes special aptitude for a particular branch of learning, as a genius for mathematics; distinguishing qualities or characteristics, as the genius of the Anglo-Saxon race; outstanding ability and a person possessed of such. *See* Demonology.

Genoa. Prov. of N.W. Italy, sloping from the Apennines to the Ligurian Sea. Its area is 1,582 sq. m. Curving round the Gulf of Genoa and protected by mts., the coastal tract, called the Riviera, is a famous winter resort. Fertile

Genipap. Foliage and flower head of this tropical tree

and intensively cultivated, it produces fruit, flowers, oil, and wine. The people are hardy and industrious, and make excellent seamen. Ironworking and textile manufactures are carried on. Pop., pre-war, 831,025.

Genoa (Ital. *Genova*). City and seaport of Italy, the capital of the prov. of Genoa. It stands at the head of the Gulf of

Genoa city arms

Genoa, between the rivers Bisagno and the Polcevera, 74 m. S.E. of Turin. The chief commercial port of the country, it is the seat of an archbishop, and possesses a university. The present walls, the third of a series, extend up the slopes of surrounding hills whose summits are crowned with strong forts, batteries, and outworks, enclosing detached houses, terraced gardens, orange groves, and open country. Erected in 1626-32, their circuit is nearly 12 m., and they are pierced by eight gates.

The old part of the city has short, narrow, and dark streets. The cathedral, founded in 985, and rebuilt early in the 12th century, has since been much altered. There are many other churches of the 11th, 12th, 13th, and 15th centuries. Of the many Renaissance palaces, the most im-

Genoa. Map of the province, showing the principal resorts of the Italian Riviera

portant are the Palazzo Municipale, the Doria, the Rosso, the Bianco, the Durazzo-Pallavicini, the Spinola, the Royal, the Balbi-Senarega, and the old palace of the doges. Many are triumphs of architecture, and most contained art treasures and collections of antiquities; both churches and palaces were heavily damaged in the Second Great War.

The city, which is rich in benevolent and educational establishments, has a university, an academy of fine arts, and a Verdi institute of music. The harbour, covering about 550 acres, admits ships of 30 ft. draught. There are a naval harbour, a marine arsenal, and graving, dry, and floating docks—again all heavily

damaged in the Second Great War. Exports in normal times included rice, fruit, wine, oil, silk, hats, hemp, flax, cheese, flour, paper, soap, and marble. The main industries included iron-working, fruit-preserving, sugar-refining, tanning, vesta match and fligree making, and the manufacture of cotton cloth and macaroni.

Genoa was inhabited by Greeks in the 5th and 4th centuries B.C., and was already important in the second Punic War. It was destroyed by Hannibal 205 B.C., and rebuilt by the Romans. On the decline of the Roman Empire it fell under the sway of the Lombards and Franks. Sacked by the Saracens in 936, it developed the spirit of patriotism and independence and the naval prowess for which it has always been distinguished. By an alliance with Pisa against the Saracens, Corsica and Sardinia were jointly won from the Muslims about 1017-1021, but the division of the spoil led to jealousy and a long naval war which ended in the defeat of the Pisans at Meloria, Aug. 6, 1284. During the 11th century Genoa began to take under its protection the towns and territory of the adjoining coast; from the close of the 13th to the middle of the 15th century the Genoese divided with the Venetians the exclusive commerce of Europe in the productions of Asia. Their success in commerce and banking, exciting the jealousy of the Venetians, brought open hostilities. The Genoese were defeated at the naval battle of Chioggia in 1380.

Meantime intestine struggles between the classes, between rival noble families, and the Guelph and Ghibelline feuds, weakened the state, which fell successively under German, Neapolitan, and Milanese dominance. After Chioggia Genoa became subject to France until

Genoa. Plan of the city and harbour of the chief port of Italy

1528. Self-government was restored by Andrea Doria and lasted until the French Revolution and the creation of the Ligurian Republic. In 1800 Genoa suffered a siege by a British fleet and an Austrian army, and capitulated. It was delivered up to the French on their victory at Marengo. Early in 1814 it was taken by the British under Bentinck, but at the peace of Paris the city and territory of Genoa were assigned to the king of Sardinia.

The birthplace of Giuseppe Mazzini, and the seat for centuries of the bankers of the Spanish sovereigns and the outfitters of Spain's fleets and armies, Genoa has been one of the wealthiest, most independent, and prosperous of Italian cities. Pop., pre-war, 634,646.

Docks and munition works were attacked by Allied aircraft during the Second Great War; and on Feb. 9, 1941, the British W. Mediterranean fleet bombarded military targets in and around the port. Towards the end of 1942 Genoa became the main supply port for the Axis forces in N. Africa, and was heavily bombed by the R.A.F. Italian patriots liberated the city from the Germans on April 25, 1945, troops of the U.S. 5th army entering two days later. Fifty-five churches, 13 oratories, three cloisters, 129 palaces and villas, three theatres, and some twenty lesser buildings received damage from air raids; fifteen of these places were listed as damaged beyond repair.

Genoa, GULF OF. Extension of the Ligurian Sea, Italy. From Andora in the W. to Spezia in the E. the entrance is 88 m. across, and the gulf penetrates inland to a depth of 32 m. The coastal strip is divided between the Riviera di Ponente on the W. and the Riviera di Levante on the E.

Genocide. Term in international law. Coined by Dr. Raphael Lemkin, of Duke university, North Carolina, from Gr. *genos*, race, and Latin suffix *-cide*, from *caedere*, to kill, it means the murder, or attempted murder, of a nation, race, or other community. Dr. Lemkin first used this word in his Axis Rule in Occupied Europe, published 1944, though in 1933 he had suggested a treaty declaring attacks on national, eth-

Genoa. View of the harbour and city, and below, the cathedral of S. Lorenzo

nic, or religious groups to be international crimes.

Count three of the indictment of Nazi war criminals at Nuremberg, 1945, included the words: "They conducted deliberate and systematic genocide—namely, the extermination of racial and national groups—against the civilian population of certain occupied territories in order to destroy particular races and classes of people." In this sense, genocide was practised by the Germans on Jews, Gypsies, Poles, Russians and other Slavs. In 1948 the United Nations adopted a convention outlawing genocide.

Genre (Fr., kind, sort). Word meaning mode or style, but specifically employed to describe pictures of everyday life, such as domestic interiors, village scenes, and manners. The French apply the term to various classes of painting by adding a distinctive epithet, as in *genre du paysage* for landscape and *genre historique* for history, but this usage destroys the peculiar significance of the word and is not legitimate. See Dutch School of Painting.

Gens. Term applied by the Romans to a body of people regarding themselves as descended from a common ancestor. Among famous Roman *gentes* were the *gens Julia*, the *gens Cornelia*, and

the *gens Fabia*. In Roman names the gens was indicated by the second name, e.g. Caius Julius Caesar. Broadly speaking, a gens was similar to a Scottish clan. See Rome: History.

Genseric. Popular, but less correct, name of Gaiseric (q.v.), king of the Vandals.

Gentian (*Gentiana*). Large genus of annual and perennial herbs of the family Gentianaceae, natives of all temperate and alpine regions. The leaves are opposite and undivided; the flowers funnel-shaped, purple, yellow, or white. The fruit is a two-valved capsule with many seeds. The flowers of the gentians are among the most beautiful of any plants, the blues often being of a more intense and vivid hue than can be found elsewhere. Of this kind is the Gentianella (*G. acaulis*) of the Alps and Pyrenees, where the large flowers appear out of proportion to the small stemless plant that bears them. Another exquisite bit of colour, though on a smaller scale, is the Spring Gentian (*G. verna*), and a taller plant is the Marsh Gentian (*G. pneumonanthe*).

The yellow-flowered *G. lutea* furnishes the gentian-root used in

Gentian. Root, leaves, and flowers of *Gentiana lutea*

medicine. It contains bitter principles and is used for stimulating the flow of the gastric juices and promoting digestion. The official preparations are the extract, dose 2-8 grains; the concentrated compound infusion, dose $\frac{1}{2}$ -1 fluid dram; the fresh compound infusion, $\frac{1}{2}$ -1 fluid oz.; and the compound tincture, $\frac{1}{2}$ -1 fluid dram.

Gentian Violet. Commercial dye, a mixture of methyl-violet and dextrin. For medicinal purposes it should be free of the latter. A powerful antiseptic, it is used in the treatment of certain skin diseases.

Gentiles (Heb. *gôyim*, Gr. *ethnê*, Lat. *gentes*). Scriptural terms used variously in the O.T. and N.T. Sometimes rendered "nations" and sometimes "heathen," it was originally employed by the Jews in a general sense to mean any nation; or applied figuratively to animals and insects. With the development of the Hebrew idea of "the chosen people" the term Gentiles was applied by them to nations other than themselves. Later, as with Gr. *barbaros*, it became a term of contempt or reproach, but it has been used by Jew and Gentile alike as a synonym for the heathen.

Gentili, ALBERICO (1552-1608). Italian jurist. Born at Ancona, Jan. 14, 1552, he migrated to England in 1580. He taught law at Oxford until 1590, when he moved to London, where he died June 19, 1608. His works *De Jure Belli* (On The Law of War), 1588-98; and *De Legationibus* (On Legations), 1585, are among the European foundations of international law.

Gentleman (Lat. *gentilis*, belonging to a clan). Term which at different periods has had different and never clearly defined meanings. Patents of gentility conferring a coat of arms without a title were sometimes bestowed by the sovereign, now only by the Heralds' College; but the right to wear coat-armour—the test of a gentleman most persistently put forward, and in some circumstances officially recognized—does not apply to every case. Nowadays the term is commonly used to indicate certain standards of behaviour, apart from considerations of birth or rank. In 1920 the French Academy gave the word a place in the official dictionary of France. See *Lady*; *Nobility*.

Gentlemen-at-Arms. Personal bodyguard of gentlemen "extracted of noble blood," established by Henry VIII in 1509 under the title of Gentlemen Speers and reorganized in 1539 as Gentlemen

Pensioners. Except the Yeomen of the Guard it is the oldest military corps in England. In 1834 William IV altered its name to the King's Bodyguard of the Honourable Corps of Gentlemen-at-Arms, and in 1862 it was reorganized on a military basis. It now consists of a captain, a lieutenant, standard-bearer, adjutant—styled the clerk of the cheque—a sub-officer, and 39 gentlemen-at-arms, all officers of the regular army who have received decorations. Their office is to attend the royal person on all occasions of public solemnity. See *Household, Royal*.

Gentlemen's Agreement. An understanding based on verbal assurances or the exchange of mere letters without a formal treaty or legal contract being signed. This is not illegal in the U.K. unless carrying it out involves some illegal action.

Gentz, FRIEDRICH VON (1764-1832). German diplomatist. Born at Breslau, May 2, 1764, he was educated at Berlin and then studied under Kant at Königsberg. In 1785 he entered the public service of Prussia, and on the outbreak of the French Revolution his

literary talents found full play. His uncompromising dislike of the revolution necessitated his quitting Prussia in 1804, and he passed the rest of his life in the service of Austria. He received money for writing against Napoleon. He was secretary to the Austrian representatives at Vienna in 1815, and showed himself as reactionary as Metternich. Gentz died July 9, 1832. His critical essays and memoirs have been published, as have his *Diaries*, 1800-28. *Consult* Secretary of Europe, G. Mann, 1946.

Genus. Group of species whose close resemblance to one another in important features shows them to be related. Genera are distinguished from each other by

greater and more important differences than those that divide the species in the same genus. See *Classification*; *Species*.

Geocentric (Gr. *gê*, earth; *ken-tron*, centre). Term used in astronomy for specifying the motions and positions of planets, etc., as viewed from the earth.

Geode. In petrology, a hollow secretion, or concretion, lined with crystals on the inside walls, occurring in certain sedimentary rocks (usually calcareous or argillaceous), from which it can be removed as a discrete nodule.

Geodesy (Gr. *geodaisia*, land division). Branch of applied mathematics concerned with the measurement of the form and divisions of large portions of the earth's surface, or of the earth as a whole. The term is also used to denote the surveying for large civil engineering undertakings, e.g. construction of rlys., or irrigation schemes, but does not include surveying plots of land for ordinary buildings.

Eratosthenes estimated the circumference of the earth c. 200 B.C.; Galileo and Newton made similar attempts, but no reasonable degree of accuracy was achieved until 1615, when the Dutch mathematician Snell developed the system of triangulation now known as geodesy. The earth's radius is measured by determining the difference in latitude and the distance apart of two places having the same longitude. Determinations of distances on the earth's surface are made by extensive triangulation from accurately measured bases. Geodesy involves the use of the zenith telescope for latitude measurements and of the transit instrument in conjunction with the chronometer for longitude. In 1919 an International Union of Geodesy and Geophysics was formed. See *Ordnance Survey*.

Geodetic Construction. Form of aircraft construction patented by B. N. Wallis, and applied to several outstanding products of Vickers-Armstrongs, Ltd. The term is derived from the same root as geodesy (*v.s.*), a geodetic line being the shortest distance between two points on a curved surface. Geodetic panels used for the basic structure of the wings, fuselage, and tail unit of the Wellington (see *illus.*, p. 138), and its record-breaking predecessor, the Wellesley of 1938, consisted of curved light alloy strips forming a basket-like web. This itself dictated the shape of

Gentleman-at-Arms. Dress of officer in the corps

Friedrich von Gentz, German diplomatist

the wings, etc.; no secondary structure was necessary. Even when covered with fabric, geodetic members saved up to 40 p.c. in weight over normal forms of metal construction, and proved extremely robust under operational conditions.

Geoffrey of Anjou, COUNT (1113-51). The founder of the Plantagenet house, he was born Aug. 24, 1113, and in 1129 married Matilda, daughter of Henry I of England, who bore him a son, later Henry II. The surname Plantagenet (*q.v.*) derives from the plant *genêt* (broom), of which Geoffrey always wore a sprig in his cap. He died Sept. 7, 1151.

Geoffrey of Monmouth (c. 1100-54). English chronicler and creator of the Arthurian legend. He was archdeacon of Llandaff c. 1140, and bishop of

St. Asaph in 1152. His great work, *Historia Britonum*, professing to be a translation from a Celtic source, was written c. 1139. A legendary history of the English people, it was based on the stories of Nennius and on ancient Breton lore. Geoffrey is credited with a *Life of Merlin*, in Latin verse.

Geographical Society, ROYAL. Society for the promotion of exploration and scientific geographical research and the improvement of geographical teaching in universities and schools. Formed in 1830, it has a house at Lowther Lodge, Kensington Gore, S.W., where its meetings are held. The Map Room and Museum at Lowther Lodge are open to the public. The *Geographical Journal*, the organ of the society, is normally issued monthly.

nents which preceded those now in existence, in order to explain the existing land forms which restrain or incite human activities.

The subject matter of meteorology becomes climatology for the geographer who wishes to understand the circulation of the atmosphere in order to realize the effects of air currents, winds, storms, etc., and the rains they bring, upon the labours of men. The conclusions of the biologist show what are the precise plant regions and the definite animal zones.

Throughout the ages geographers have tended to adhere to one or other of two schools of thought, the physical and the humanistic, in accordance with the emphasis they laid upon the environment or the men within it. At present geography would appear to have reached a definite compromise between these two methods.

Analysis of Environment

From the recent advances in other sciences the geographer is beginning to see his way towards separate regional analyses of the world under the heads of land forms, climate, forms of life; he can indicate the relation between these elements of man's environment, and is on the eve of a classification of the physical world into precise regions, so that the physical geographer—the word physical here implying attention to everything which does not deal with man as a sentient being—is almost prepared to submit a thorough analysis of man's environment.

Being supplied with these regional analyses of the world, the humanist has two problems to face, first, the interaction between one type of man and different regions and, secondly, that between different types of men and one region. For example, there are the problems of the Frenchmen of the Paris basin and of the French portion of the Mediterranean area, and of the Californian, the Chilean, and the South Australian in relation to their environment.

But having worked out his results in comparison with the main natural regions of the world, the humanist is faced by a new difficulty. The world is administered politically in regard to empires, kingdoms, and republics, and the political frontiers introduce complications. It is his province to determine the relation of the several states to the natural regions and to explain the size and shape of countries, and the distribution of their inhabitants, in relation to his ideal analysis of the world into regions.

GEOGRAPHY AND ITS USES

L. W. Lyde, Former Prof. of Geography, Univ. Coll., London

This general article on the science of Geography is supplemented by those on Glacier; Mountain; River, and other of the earth's physical features. See also Geology; Map; etc.

Geographical study begins with topography, the accurate description of all parts of the earth, the people who live there, the lives they lead, the kinds of plants, animals, minerals found there; and early in the 19th century the number of topographical facts was so huge that geographers began to compare and classify them in order to reduce the content of geography to manageable dimensions. These processes have resulted in an assumption that the earth comprises a series of definite regions which are so much alike that a clear conception of one specimen of a region suffices for the understanding of the similar areas elsewhere.

The standard illustrative region is the area bordering the Mediterranean, which has warm, wet winters, and hot, dry summers, a characteristic natural vegetation, cultivated crops of a definite type. A knowledge of the shorelands of the Mediterranean Sea implies also a knowledge of California, parts of Chile, the Cape of Good Hope district, and the south of Australia, all of which are Mediterranean regions in this sense.

The Regional Conception

The regional conception, however, is insufficient beyond a certain point, for it ignores configuration of the land, occurrence of useful minerals, and, most important of all, the character and distribution of the population. Within definite limits, however, the regional con-

ception simplifies the geographical story and is, therefore, useful.

During the centuries of exploration geographers were also concerned with the earth as a whole, with the physical forces which influence men's lives, with the scientific classification of all forms of life, including man, and with the history of human development. They have always been interested in the physical sciences, astronomy, geology, meteorology, and biology, and in the human sciences, ethnology, sociology, economics. Since these sciences steadily developed their special knowledge of one aspect of the universe, geographers used their conclusions as a basis for the explanation of many of the observed facts of topography.

Modern geography therefore includes, primarily, a certain amount of gazetteer information, and secondarily, the application of certain scientific conclusions to human activities; it is the study of the earth as the "home of man," of "man's place in nature," and "man and his work." But although the geographer is indebted to other scientific studies, he does not make scientific data a portion of the content of geography until he has applied them to the life of man. From astronomy he borrows facts about the earth as a planet to explain the consequences for man of the daily march of the sun in the sky and the rhythmic swing of the tides in the oceans. From geology he borrows facts about the conti-

This political grouping is of considerable importance for two main reasons. The facts concerning man's labours are usually recorded in terms of political areas, countries or provinces, so that the geographer has some difficulty in determining the sum of human activities in a given region which includes part of two or more countries. At the same time geography is not a study of purely academic interest. Everybody is interested in topographical facts of some kind, if only because he reads his daily paper with interest, and the practical aim of geography is to present so ordered a conspectus of man's life and work in the world of to-day that the student may be able to grasp the complete significance of the topographical facts presented.

Changing and Stable Elements

The ordered view of the world so obtained implies a study of the earth as an environment by natural regions; an acquaintance with the human adjustments to these specific environments and, finally, a knowledge of the world's political units as they are related to the ideal view of the world previously obtained. The topographical subject matter of geography is ever-changing; a new railway or canal, the conquest of the air, a new application of science to industry may alter all values, so that the geographer is required to confine his attention to the more permanent and stable elements of the world and to be ready to adjust his conclusions to the new circumstances as and when they occur.

The geographer is, however, above all else an inquirer, carrying his investigations wider and deeper into man's manifold activities, and at the present there are two lines of fruitful investigation which are being followed. On the one hand, especially upon the Continent of Europe, geographers are completely analysing comparatively small portions of the world, such as Flanders, testing the conclusions already attained on a broader basis and collecting new facts; on the other hand geographers are utilising the conception that the world as a whole is a unit to demonstrate that there are certain fundamental conditions or relationships which can be changed only slowly and after a long interval. For example, a big proportion of the world's raw cotton is grown in the United States, giving that country a dominant position in relation to the cotton markets of the world.

This is a fundamental geographical fact, for it is barely conceivable that any progress in cotton grow-

ing elsewhere in response to any stimulus whatever can materially alter the situation. If India and Egypt improved their output, the States would probably improve in equal proportions; if cotton were grown extensively elsewhere under a system of bounties or artificial encouragement the States would safeguard their interests and take steps to maintain the relative position. The geographer recognizes the nature of the situation and it is his business to ascertain completely the consequences and causes thereof. Contrast, however, the position of the former Russian Empire as a former grower of one-tenth of the world's wheat. It is fundamental that wheat is grown extensively in Russia, but the proportion neither is nor can be constant; and the geographer demonstrates the reasons why wheat is grown and why the quantities grown in Russia must fluctuate in comparison with the total world's output.

The Geographer's Method

The geographer, therefore, takes each country and describes it, so as to specify (1) the type or types of physical conditions of which it is comprised; (2) the kinds of people who inhabit it; (3) the way in which these people react to their environment in comparison with the lives of similar peoples elsewhere and with the lives of different peoples in similar areas; and (4) the relation it bears to the world as a whole. He lays emphasis upon the life and work of man to-day, and in so doing provides suggestions for the immediate future which will control to some degree man's development in the next few decades. **B. C. WALLIS**

The value of geography in education is due to its power of equipping the young citizen with a wide outlook, a sense of perspective and proportion, a familiarity with methods of scientific analysis and a certain manipulative facility. For in giving the wide outlook it does not sacrifice accuracy of detail, while its disregard of non-essentials and its many aspects tend to marked clearness of generalisation along with a multi-fold adaptability. The observation of facts, their verification and their embodiment in a map, are valuable if mechanical, processes within the power of any normal child; the synthesis or analysis of the whole human environment is a study worthy of the close attention of university honoursmen. The relation of natural occupations to natural conditions and natural products involves wide borrowing from such various sciences as

botany, geology, and anthropology. If, therefore, we assume that the ultimate aim of geography is to study the interaction of man and his environment, it is obvious that only scientific methods will carry conviction and that such methods presuppose an adequate knowledge of the fundamental data of the problem. The first step in the collection of such data is the patient observation of facts—extensively and intensively; and extensive observation is the special work of explorers. The general trend of such work in recent times has, therefore, a peculiar significance in relation to this ultimate aim; and among the most significant events of the past few years are undoubtedly the conquest of both poles, the reconstruction of the interiors of Asia and Australia, the partitioning of Africa, and the advances in oceanography.

For instance, already we see that the meteorological work carried out in the Antarctic continent seems likely to be a step towards forecasting the failure of monsoon rains in India during the succeeding summer, *i.e.* a step towards avoiding all the horrors which used to be associated with unforeseen famine in that populous country. The development of Africa, again, seems likely to test vitally the value of European systems of education; for the Bantus, at all events, are a virile, but illiterate people, who are demanding education, and education of the same kind as is given to white children.

International Cooperation

The essential fact is that to-day although the world is practically known, large areas of it still have to be surveyed and properly mapped; and the latter task involves a wide scheme of international cooperation, which is already illustrated by, *e.g.* the International Geodetic Association, the International Council for the Study of Sea Fisheries, and the International Map of 1: 1,000,000.

Side by side with the extensive work of the explorers has been the intensive study of the more advanced countries of the world, leading to most useful generalisations based on detailed and precise knowledge of the conditions—physical, climatic, zoological and botanical, etc.—obtaining in regions of which we have relatively trustworthy historic records for hundreds of years back. And this intensive work is training the new type of explorer, who will organize the new lands—discovered by the old type—on lines favourable to the best development of man in the particular region.

In the organized treatment of all the material accumulated by exploratory and descriptive geography, the modern science of geography fills the gap between astronomy and geology on the one side, and the biological and kindred sciences on the other; but it is impossible to define exactly the precise limits of each, even when it is not a science in the early stages of development. The extreme physical aspect of geography limits it to the investigation of the earth's surface features; the extreme humanistic aspect limits it to man's relations to these features. But any regional synthesis must include vegetational and other biological phenomena, and any discussion of human distributions must include mathematical problems and representations of space relations. The truth lies between the two extremes. We investigate and classify physical phenomena, with special relation to man. Thus, the importance of St. Helena had a different value according as it was estimated by sailors who knew only of wind as motive power, or by sailors who knew also of steam.

Physical and Human Aspects

Logically, therefore, modern geography has three main aspects, the physical base, the human note, and the interaction of the two, and the physical should be treated first. But the physical implies the mathematical; for the object of making careful observations and investigations of the phenomena is to describe and compare various earth-forms and natural regions, and its result is their permanent representation in such a way as to exhibit their location and their space relations. At the same time every precaution must be taken against over-emphasising the importance of the mathematical determination of forms and positions, or the physical determination of the "structure, process, and stage" of the forms thus determined.

Briefly, the geographical problem is the quantitative proof of the manner in which, and the degree to which, the features and phenomena of the earth's surface control the distribution of all mobile elements and organisms; and, though the work cannot go on without the statistical distributions of the map, any more than an epic can be written without an alphabet, it is the dynamical distributions that are epical, and man is the supreme figure. The key words, therefore, are "control," "response," "interaction." The control is mainly physiographical, the response is ontographical, and the interaction is geographical.

The most difficult of all the problems involved, and perhaps the most essential, is to determine exactly what are the relations of the distinctively mobile distributions to the more or less fixed environment, and to express these quantitatively—not only in the "pictorial statistical analysis" of a map, but also in other forms. Already considerable progress has been made in one or two directions towards demonstrating, *e.g.* the exact relation of relief to climate, of climate to plant growth, and of natural vegetation to agriculture. For instance, we know with considerable accuracy the gradient (30° to 45°) and exposure, so as to get a maximum of autumn sunshine, desirable for a champagne vineyard, and the relations of sunlight, temperature, and humidity that give Cognac a monopoly of real brandy.

Political Geography

Similar considerations are true even of political geography. Thus, the exact relation of methods of maintenance to the development of social and political institutions is no longer merely a plausible hypothesis; and, even though we cannot state the relation as a fraction, it is a truth needing no statistical demonstration that, *e.g.* in a region of winter rains, flanked by snow-clad mountains that guarantee abundance of irrigation water in summer, there is no imperative necessity for the work of one season to supply the needs of two. But there are even purely human phenomena about which we can give statistics. For instance, in regard to tropical colonisation, we know the exact wet-bulb temperature at which white men find work impossible even in the presence of a good current of air, and we know that this is the decisive factor. Where the climograph (*i.e.* the average wet-bulb reading) for half the year reaches 70° F., the conditions are not suitable for white men; and this definite climatic boundary includes a great portion of northern Australia.

Similarly it is possible to give definite statistics—though they greatly need to be extended—about the relation of bright sunlight in dry air to the behaviour of, *e.g.* school children in England, textile operatives in New England, and hostesses in Nairobi—where everyone lives in a state of chronic irritability from overstimulation by the bright light. That is to say, we have taken some preliminary steps towards determining the influence of environment even on mental processes.

While the basic configuration of the world has not changed since long before written records were kept, changes wrought by man have affected geography in detail. By means of irrigation he has converted former deserts into rich agricultural areas (*e.g.* the Indus plain; Central Valley, California); by cutting down forests he has changed productive land into desert (*e.g.* North-West Africa).

No development has had a more far-reaching effect on geographical conceptions than the conquest of the air. Islets of the central Pacific, formerly existing in idyllic isolation, became busy junctions on long distance air routes. Mountain masses and great oceans ceased to be almost impassable barriers. In South America, for instance, journeys between the west and the east, formerly a matter of days by sea or by a difficult land passage across some high pass of the Andes, could be made in a matter of hours over the top of the great mountain range. Australia was brought within a few days', instead of six weeks', distance of the U.K.

Flight brought also a new conception to the study of maps, since an aeroplane, at least in theory, could take the shortest distance between two places along the great circle, whether that was over polar or equatorial regions, land or sea.

The invention of the motor car led to a complete alteration in the economy of Malaya and Indonesia, great tracts of their natural vegetation being removed and replaced by plantations of rubber trees. The insatiable demand of the motor car and the aeroplane led to an intensive search for petroleum, and wherever it was found in quantity—in the desert about Mosul or semi-desert farmlands of Texas—towns and industry sprang up.

Commonwealth Geography

For the British, the ramifications of the Commonwealth are a geography lesson in themselves. In every quarter of the globe are territories associated with the U.K. A detailed study of the Commonwealth provides an insight into all aspects of geography—climatic differences and their effects on man and his work; the problems associated with communications by land and sea and through the air; the differing natural flora and fauna of the five continents, and the effects of man's interference on their maintenance or destruction.

L. W. Lyde

Geoid. Term invented to describe the shape of the earth. Like the other planets, the earth is spherical, but not a true sphere. The bulge of the earth which makes its equatorial diameter longer than that through the poles causes the earth to be classed as a spheroid, while minor irregularities have led to the use of the term geoid, which is equivalent to saying that the earth is shaped like itself and like nothing else. See Earth.

Geological Society. British learned society, the oldest geological society in the world. Founded in 1807 and incorporated by royal charter in 1825, it began as a dining club, meeting at the Freemasons' Tavern, Great Queen St., London, W.C. Rooms were afterwards engaged at Garden Court (Temple), Lincoln's Inn Fields, Bedford St. (Covent Garden), until, in 1828, apartments were granted at Somerset House, Strand. In 1874 the society removed to its present quarters at Burlington House, Piccadilly, W.

The society maintained a valuable museum of rocks, minerals, and fossils until 1911, when the collections were dispersed owing to the growth of the library. British collections were then presented to the Museum of Practical Geology and collections from abroad to the British Museum of Natural History. The society meets monthly from Oct. to July. Its publications include the society's Quarterly Journal and Abstracts of Proceedings. Two series of its valuable quarto Transactions were published between 1811 and 1856, but none has been issued since. The U.S.A. has a geological society with similar aims.

Geological Survey of Great Britain. The Geological Survey of Great Britain and the Museum of Practical Geology form a branch of the dept. of Scientific and Industrial Research. The Geological Survey was inaugurated in 1835 as a part of the Ordnance Survey; the Museum of Practical Geology was constituted later to house collections made by the Geological Survey and to demonstrate the economic applications of geology. The joint institution, formerly housed in Jermyn Street, now occupies a building in Exhibition Road, S. Kensington, opened 1935. There are a Scottish office in Edinburgh, and district offices in Manchester and Newcastle-upon-Tyne. The staff includes over 60 geologists.

The principal function of the Geological Survey is to prepare

maps showing the nature and distribution of subsoils, rocks, and minerals in Great Britain. All available data from surface inspection, and from excavations, mines, and borings, are recorded and correlated; Acts of parliament make it obligatory to notify the Geological Survey before deep boring for minerals or water is begun. Maps on scales from 6 ins. to the m. to 25 m. to the in. are published, as are the survey's descriptive memoirs by H.M. Stationery Office. Virtually the whole country has been surveyed on the inch to the mile scale. Special attention is given to coalfields, areas containing minerals,

and the distribution of underground water resources.

Exhibits in the museum illustrate the processes of physical geology, the regional and economic geology of Great Britain, and the economic mineralogy of the world. They include illuminated dioramas, relief models, maps, photographs, and specimens, a unique rotating relief globe 6 ft. in diameter, showing the geology of the world, and a collection of precious stones. The galleries and library are open to the public without charge. There is special accommodation for visiting research workers. Lectures are arranged for the public.

GEOLOGY: STUDY OF EARTH'S FABRIC

Gilbert Wilson, Ph. D., F.G.S., Lecturer in Structural Geology, Imperial College of Science and Technology

Here is an outline of the growth of Geology, and of its application to the study of the earth's age and prehistory, and to practical problems of mining and engineering. See also articles on Cambrian System; Devonian; Fossil; Volcano, etc., and on the cognate subjects of Geography; Geophysics; Mineralogy; Oceanography; Petrology

Geology (Gr. *gē*, the earth, *logos*, a discourse) is primarily the scientific study of the rock structure of the earth, its history, the processes by which the past and present features of the earth have been formed, the evolution of animal and plant life, as shown by fossils and their relationships to existing forms, and the development of the earth's natural resources for the benefit of mankind.

Geology as at present understood dates from the publication in 1795 by James Hutton of A Theory of the Earth, with Proofs and Illustrations, a work which attracted little attention until John Playfair produced in 1805 Illustrations of the Huttonian Theory, which was much clearer and more readable than Hutton's original work. Before this time, though much was known about fossils and minerals, geological theories were rarely based on observed facts, and were in many respects limited by Biblical history and the idea of a universal Noachian deluge.

With Hutton's and Playfair's sound work to build on, geology rapidly developed as a science. It received added impetus from Sir Charles Lyell's Principles of Geology, 1830-33, and from the stratigraphical work of William Smith, father of British geology, who worked out the general succession of the sedimentary rocks of Great Britain, correlating them by their fossils, and in 1815 published the first coloured geological map of England.

William Smith's work on the mapping of Great Britain has been continued and amplified by the Geological Survey of Great Britain (*v.i.*), founded in 1835 with Sir H. T. De la Beche as its first director. The survey gives priority to economic geology, *i.e.* to investigation relating to coal, iron, water supply, etc.—and to areas of scientific importance. The countries of the British Commonwealth, as well as most other countries, maintain their own geological surveys, the work of which has led in many cases to the active development of mining and other industries.

Departments of geology now exist at all universities, and apart from honours courses in geology itself, it is often taken as a subsidiary subject. It is a subject in the examination for association in the Institution of Civil Engineers.

Numerous geological societies read, discuss, and publish papers. The International Geological Congress meets once every three years in different countries. The Geological Society of London has rooms in Burlington House, Piccadilly, W.1, and publishes a quarterly journal. The Geologists' Association, with branches in the provinces, holds regular monthly meetings, conducts field excursions, and publishes the results of original work in its proceedings; and in many parts of Great Britain there are local geological societies and publications. The Geological Magazine contains numerous articles on British and foreign geology.

HISTORICAL GEOLOGY OR STRATIGRAPHY. This is the study of the history of the earth as shown by the rocks, their age relationships as observed in the field, and by the fossils they contain. (The detailed investigation of fossils is Palaeontology, *q.v.*) By accurate identification of the fossils in a rock, its geological age can be determined. Hence by consideration of the character of the rocks, their distribution, and the fossils in them, it is possible to delimit the land and sea areas of bygone ages, and to deduce their climatic conditions, a study known as Palaeogeography (*q.v.*).

The Solar System

The origin of the earth is bound up with that of the whole solar system. Early philosophers put forward numerous untenable hypotheses. The theory of Laplace (1796), that the solar system has consolidated from a rotating spiral nebula, obtained almost universal acceptance, until the publication in 1904 of the "planetismal hypothesis" by Chamberlain and Moulton. In this it was suggested that the earth grew by the coalescing of meteorites in space. These were considered to have been derived from the sun by the wrenching away of a portion of its surface during strong tidal movements created by the sun's passage close to another larger star. The meteorites, were thus considered to be condensed and solidified fragments of the detached gaseous mass. On collision they would combine and grow into larger bodies, which in turn would unite and so steadily increase in size. In the earlier stages the mass was believed to have been molten from the heat of impact, when the heavier metallic material in the melt would sink inwards and form the earth's heavy core or barysphere. Lighter material would tend to float or be concentrated upwards, forming the rocky crust or lithosphere, in which geologists are interested. This in turn would be covered by still lighter material—water, which forms the hydrosphere, and air, which forms the atmosphere.

More recently Jeans and Jeffreys have enlarged and modified this hypothesis, and have produced the "tidal theory," by which the planets were formed directly from the cooling of a detached portion of the sun's surface, without the intermediate meteorite stage. In many ways the tidal theory was considered more satisfactory.

The state of the original earth crust is purely speculative; but

the accepted theory is that it must have been a thin shell constantly broken by volcanic eruptions and dragged apart by sub-crustal convection currents in the underlying molten interior. As it cooled and thickened, it became more stable, and water began to collect on it. Streams and rivers then began to flow, and to erode the surface unprotected by vegetation, the detritus they carried being deposited in hollows to form the first sedimentary rocks. Gradually the earth's surface assumed the general character it now has; but it was devoid of life until primitive algae (sea-weeds), worms, jelly-fish, etc., began to develop. Not until the Cambrian period do truly identifiable fossils appear. In the Pre-Cambrian, which probably embraces three-quarters of the earth's geological history, such animals as did exist had not developed hard parts, *e.g.* shells of lime or of horny substance called chitin, and consequently left no evidence of their existence. The fossils of the Cambrian period, however, are of relatively highly developed creatures which must have had a long line of ancestors.

The Laws of Stratigraphy

The geological ages of rocks are determined by the relationships of the rocks to each other, and by the fossils found in them. To decide the age of unfossiliferous rocks or of rocks that have been highly metamorphosed or contorted is often very difficult. Age relationships of rocks are established by what are termed the laws of stratigraphy. These are:

(a) *The Law of Superposition.* A bed or stratum which lies on another was laid down later than the lower one, and hence is younger. This is also true of lavas poured out on the earth's surface or sea bottom. Difficulties arise in application of this law in cases where the strata have been steeply tilted or even inverted by folding or thrust-faulting resulting from intense earth movements.

(b) *The Law of Fossil Content.* The same species of fossils occur in rocks of similar age. Once a particular species has evolved and died out, it does not reappear. Some species were very short-lived, and the strata containing them can be dated with precision. Others persisted for a long time—even geologically speaking—and are little help in determining age.

(c) *The Law of Intrusion Sequence.* Igneous material on its way from depth in the earth towards the surface penetrates the

overlying strata. Rocks thus penetrated must therefore be older than the intrusion that cuts through them. Similarly the relative ages of intrusive masses can be determined by observing which cuts which. Often the more recent molten material has been chilled by, and has a fine-grained selvage against, the pre-existing older mass. In some cases, however, the separation of the two may be very difficult.

Successive Groups of Strata

If there is no break between successive groups of strata and each bed lies directly on the next, the succession is said to be conformable. However, earth movements occurred frequently during geological time, and the rocks then in existence have been folded, tilted, and faulted, and raised above sea level. Erosion has then taken place and the beds have been worn down so that the edges of the strata have been exposed on the land surface. The older rocks will then terminate abruptly and at an angle to any later ones deposited on the surface of erosion, there is a break in the sequence, and the two groups are said to be in unconformable relationship to each other. The plane of junction separating the older deformed and eroded beds from the newer strata is termed the plane of unconformity. Such a plane indicates a marked break in the record over the area where it occurs.

Geological history is subdivided by such breaks, which were formed at times of mountain building movements, transgressions or retreats of the sea, or important climatic changes. Many of them are world wide and can be used in broad age correlations of strata over long distances. They are often accompanied by marked changes in the fauna of the rocks.

Geological time can be divided by means of these breaks in the sequence and the changes they wrought into four great divisions (eras or epochs). These in turn can similarly be sub-divided into periods or systems, which are named after the locality where they were first investigated, *e.g.* Cambrian from N. Wales, Permian from Perm in Russia, etc. The systems are again divided into sub-systems termed groups, series, or stages, which may have local names, or may be called after some marker fossil, in which case they are termed zones. A series may contain more than one zone.

These time divisions are not of equal length, nor do they repre-

sent the deposition of equal thicknesses of sediment. They form an entirely relative time-scale, made approximately absolute by investigation of uranium and other radio-active minerals occurring in the rocks. It is known that these radio-active elements break down through a succession of stages until they produce lead of a certain character. By accurate analysis of the uranium to lead ratios in the igneous rocks associated with the strata of which the geological age has already been determined, the corresponding absolute age in millions of years can be ascertained.

The accompanying table shows the geological time scale or stratigraphic column, with eras or epochs subdivided into periods, and the absolute time scale in millions of years. The time of important mountain building movements is also indicated, and notes on other geological phenomena associated with the periods are given in the last column.

Remains of early man begin to appear in deposits of Pleistocene age. Man-like apes are believed to have been in existence in Mid-Miocene times; but the earliest chipped flints so far recognized as being possibly of human workmanship are found in strata believed to be of Upper Pliocene age. Bones of true man were found at Piltown in Sussex in gravels of early Pleistocene age, and elsewhere in deposits of much the same period. *Homo sapiens* did not appear until well into Pleistocene times. The Upper Pliocene beds containing the chipped flints are considered to be about 600,000 years old.

PHYSICAL GEOLOGY. This is the study of the processes by which geological phenomena are brought about. It covers the manner in which erosion wears away the land, the movement of material so loosened to the sea and its deposition, the upheaval of rocks to form mountains, volcanic activity,

earthquakes; and it endeavours to explain the forces which bring these things about. Many of the processes of the past can be observed going on in the present, and this continuity of physical processes led to Lyell's theory of uniformitarianism—the present is the key to the past. In principle, this is probably true; but still unknown factors may modify the dictum. For instance, though the processes of erosion, earth movement, volcanism, etc., were probably similar through past geological time to those which can be seen at present, the rates at which they worked in the past cannot be estimated.

In the past there were undoubtedly long periods when the earth's crust was more stationary than it is at present; there were also others when it was undergoing large scale movements. When the crust was thinner, it is reasonable to suppose that volcanic activity was more violent and more

GEOLOGICAL TIME SCALE

TIME MIL. YEARS	ERA	PERIOD	MOUNTAIN BUILDING MOVEMENT	REMARKS
0	Quaternary	Recent or Holocene		
		Pleistocene		Ice Age. Early man
		Pliocene		
	Kainozoic (or Tertiary)	Miocene	Main Alpine Folding	
50		Oligocene		Volcanic Activity in N.W. Scotland and Ireland
		Eocene	Early Alpine Folding	Mammals become prevalent
100	Mesozoic (or Secondary)	Cretaceous	Laramide in U.S.A.	Chalk of N.W. Europe
150		Jurassic		Age of reptiles and primitive birds
		Triassic	Appalachian and Hercynian Foldings	Desert conditions in Great Britain
200	Palaeozoic (or Primary)	Permian		Desert conditions in Great Britain
250		Carboniferous		Formation of coal in Great Britain, N.W. Europe, and U.S.A.
300		Devonian	Caledonian Folding	Old Red Sandstone Age of Fishes
350	Pre-Cambrian	Silurian	Taconic in U.S.A.	Volcanic activity in Lake District and N. Wales
400		Ordovician		Fossils become common
500		Cambrian		In N.W. Scotland
		Torridonian	Post-Lewisian	
		Loughmyndian		In Shropshire
		Uriconian	Post-Charnian	
		Charnian		Charnwood Forest
		Mona Complex		In Anglesea
2000		Dalradian Series		In Scotland, of disputed age, but probably Pre-Cambrian
		Moine Series		

NOTE. The rock-groups of Pre-Cambrian age occur in widely scattered areas throughout Great Britain. Their ages relative to each other are unknown

wide-spread. While, therefore, the actual processes probably worked in much the same manner, it is likely that they did so at different rates and on a different scale.

Any part of the earth's surface which rises above the sea is immediately subjected to attack by atmospheric agencies and in time will be worn down. Rain falling on the rocks attacks them chemically by solution or reaction. Heating by day and cooling by night causes rock particles to expand and contract so that they become loose and fall. Freezing and thawing of water in the rocks has the same effect, and may cause the breaking off of large rock fragments. These accumulate at the foot of cliffs to form scree. Chemical decomposition of the rocks produces soil. The combined action of these various agencies is referred to as weathering.

Formation of Streams and Rivers

Erosion is the combination of weathering and the removal of the broken material by water, wind, or ice. That part of the rainfall which does not evaporate from the surface of the ground or percolate deeply into the rocks runs off the surface to form streams and rivers. This flowing water transports away the loose soil and broken rock fragments, so removing the protective blanket of weathered material from above the rocks, and thus permits the action of rock-breaking and decay to penetrate deeper. As streams flow they erode their banks and their beds by the transport of rock and sand which is being rolled, dragged (bottom carriage), or bounced (saltation) along by the water. Swirling currents carrying pebbles will drill pot-holes in the stream bed; river curves become undercut on the convex side, and in this way valleys are deepened and broadened. Rivers cannot erode their beds deeper than the sheet of water into which they flow, and this limit is known as the base level. The high ground between river valleys is, in most cases, purely an uneroded residual portion of the earth's crust which is slowly wasting away.

Because rocks have different compositions and hardnesses they have different resistances to erosion. In this way valleys often follow the strike directions of softer beds, shales, etc., and are bounded on either sides by escarpments (*q.v.*) of more resistant strata. With prolonged periods of time and a stationary base level all the high ground will be re-

duced in elevation to a low undulating surface across which sluggish rivers slowly meander. Such a surface is termed a peneplain (Latin *pene*—almost). Re-elevation of the land or sinking of base level would cause the rivers to resume a more rapid flow, and this would start the cycle over again with their cutting back into the old surface.

Ice, in the form of glaciers or ice-sheets, is also a powerful agent of erosion. Glaciers descending from high mountains carve deep U-shaped valleys which often have nearly vertical walls. As they melt, the loose rocks and rock-flour they carry is dumped as moraines and is carried away by streams. In Pleistocene times much of northern Europe, Asia, and America was covered by great ice-sheets. In Britain they extended approximately to a line from the Bristol Channel to Harwich. North of this line much of the country is covered by a veneer of boulder clay left behind as the ice melted. The rocks below have been smoothed and striated by the ice and the stones it contained. Erratic blocks of rock transported by the ice have been left scattered about, sometimes many scores of miles from their place of origin. Glaciers such as those at present existing in high mountains were obviously active in the areas of N. Wales, the Lake District, and Scotland, and much of the scenery there owes its origin to glacial erosion.

Sand Transported by Wind

In desert areas, wind is the dominant agent of transport. Sand can be moved great distances by the wind, and what is eroded from one area becomes piled up in another. Fine dust from the deserts gets carried high into the atmosphere, is transported in suspension in the air, and is finally deposited outside the desert area as loess. The loess deposits of China cover hundreds of square miles of country S. and S.E. of the Gobi Desert. The sand blasting action of wind-driven sand etches and erodes the rocks with which it comes in contact. Soft beds are picked out, joints and planes of weakness are enlarged, and the rock masses are often carved into the most fantastic shapes. Because the main volume of sand is transported on or a few feet above the ground surface the rock masses are under-cut and eventually fall.

Material eroded from the land by water, wind, or ice may be

deposited on land as *e.g.* sand dunes, moraines, or river terrace gravels. Such land deposits are said to be continental in origin. Most material, however, is washed down into the sea and is deposited on the continental shelves or in partially enclosed seas such as the Mediterranean, Hudson Bay, and the North Sea. This detritus, whether it be brought down by rivers, or derived by wave action from neighbouring shores, has for its source of origin pre-existing rocks, and is called terrigenous. With it may be associated deposits of chemical or of organic origin, such as certain limestones formed by precipitation, or deposits made up of shell fragments or coral reefs. These deposits laid down in the sea are marine deposits. In the past when the oceans spread over what are now low flat land areas, similar deposits to those accumulating in shallow water nowadays were laid down. Old shore lines (littoral deposits), with boulder and pebble beds grading to beach sands, are recognizable. Delta and estuarine deposits can be distinguished in the older strata, and all show affinities to present day sedimentation.

Evolution of a Mountain Range

In some areas the ancient deposits show pronounced local thickening. Such zones of thick deposits occur as elongated basins of sedimentation, having widths of 100 to 200 m., and lengths up to several thousands of miles. The deposits they contain are all recognizably of shallow water origin, so that the beds must have been laid down in a trough of which the bottom was subsiding at a rate approximately equal to that at which the sedimentary material was being washed in. Such areas of thick deposition are called geosynclines, and their formation is the first stage in the evolution of a mountain range. The Appalachian geosyncline in the U.S.A. contains a thickness of sediments of about 30,000 ft.

Geosynclines develop when there is downwarping of the earth's crust brought about by compressional forces of enormous magnitude. The geosynclinal phase lasts a long time, and several geological periods may be represented in the accumulated deposits. Some volcanic activity usually accompanies the downwarping of the trough, and ancient submarine lava flows are often interbedded with the sediments.

Eventually the combined effect of the downwarping and the weight of the sediments in the trough causes the crust beneath to yield to the compressional forces, and the sides of the geosyncline are crushed together. The soft recently formed deposits of the trough are squeezed out over its margins with the production of great recumbent folds and flat lying planes of thrusting. The folds and faults become steeper near the centre of the one-time trough, and the amount of movement seen may not be so intense. The beds are thus forced upwards and outwards, while the foundation of the geosyncline is driven downwards into the deeper levels of the earth. This develops not only visible elevation in the form of a mountain chain on the surface, but also a root below. The forming of a folded mountain system is almost always accompanied by volcanic activity. The process is probably going on in the E. Indies at present. In the cores of ancient, now denuded, ranges, large masses of granite have invaded the mountain roots, and have worked their way upwards by assimilating the original country rock or by wedging off large blocks of the overlying material. Granite intrusions are often elongated parallel to the trends of the fold belts, as in Brittany, and the W. coast of Canada. Associated with the intrusive rocks are veins and masses of many minerals.

Formation of Metamorphic Rocks

The rocks of the cores of mountain ranges tend to be highly altered or metamorphosed by the heat of the advancing granitic bodies, and by solutions which permeate the rocks from depth. The formation of these metamorphic rocks is one of the major problems of petrology. Near the margins of the ranges, or where folding has not been so intense, slates are often formed. Within the more central zones the intruded and permeated rocks are altered to schists and gneisses to such an extent that their original character may be almost obliterated; and in extreme cases they may be entirely granitised, that is converted by recrystallisation to a rock which has the appearance and composition of granite, without ever having passed through a molten phase.

Once a mountain range has become elevated, it is immediately attacked by erosion, and begins to be worn down. However, because the crustal material of the

earth is lighter than that which lies below the crust, the root of the range tends to rise. The removal of material from the exposed top of the range, by lightening the load, accentuates this tendency. This continues until the crust, where it bulged downwards to form a root below the range, has been more or less levelled off and equilibrium is restored. Because of this uprising of the range as a whole while erosion is active, the deep core of the fold system and its granites are now exposed along the sites of many ancient mountain chains which now form flat or gently undulating country.

Earth's Deep Zones

Erosion has exposed sections of the earth's crust in old folded belts and in areas of ancient Pre-Cambrian rocks; but what lies below the continental crusts or below the ocean depths cannot be discovered by direct observation. Detailed geophysical work, especially on the speed and behaviour of earthquake waves, combined with the study of volcanic rocks which have come up from below has, however, yielded fruitful results. It is now agreed that the crust of the continents, apart from a layer of sediments, is mainly composed of rock having the composition of granite or granodiorite, with a specific gravity of about 2.7, and a thickness of 10-15 km. or about 10 m. Below this superficial crust, the rock becomes heavier and is probably more in the nature of gabbro with a thickness of 20-30 km. (about 20 m.). Below these two layers, which are believed to be crystalline and solid, is a surface of discontinuity by which earthquake waves are refracted. Here the rock material seems to behave like basaltic glass, which is solid and brittle for a suddenly applied stress, but for a long applied stress yields like a viscous fluid and flows. This zone grades down into heavier material, possibly peridotite or eclogite (*q.v.*), which continues to the central core of the earth at a depth of about 3,000 km. (1,900 m.). The core is heavy and is probably composed of iron and nickel.

Below the oceans the light granitic layer is either very thin or is absent altogether. Consequently the heavy gabbroic layer must be thicker, and, because it weighs more, the surface of the crust is lowered, and water has collected in the great depressions so formed. The continental masses

being lighter are similarly raised up, and the two great areas of the earth—continents and oceans—are balanced above a potentially fluid substratum.

This balancing of the crust is referred to as isostasy. If two adjacent and sufficiently large areas of the crust are not balanced, the lighter is expected to rise so as to permit inflow of heavier material below, while the heavier area, on the same principle, will sink. In the case of a newly formed mountain range of which the roots have been downfolded into the more basic and heavier substrata, there is a natural tendency for uplift. As already mentioned, it will continue and be accelerated by erosion until the root disappears by adjustment or melting and lateral flow beneath the crust.

The deeper layers of the crust are hot and may be above their normal melting point, but they are under such pressure from overlying material that their fluidity or even their actual melting is restrained. Should that pressure be released without fall in temperature, then the rock will melt and magma—molten rock containing dissolved gases—will be produced. Hence when cracks occur in the earth's crust, if they continue far enough, they will tap the deep-seated magma-producing layers, and the molten rock will rise upwards. Near the surface the magma will lose its gases and will form lava.

Evidence from Lava

Such cracks have occurred at various times, and extensive lava floods have been poured out on the surface with little or no explosive volcanic activity. Typical areas are the Hebrides, Iceland within historical times, the Deccan of India, and Patagonia. In all cases the lava has been olivine basalt, which supports the evidence for an underlying basaltic layer below the crust.

Modern volcanoes lying along a visible fracture zone in the crust are those of E. Africa, in the Rift Valleys. Volcanoes in the oceanic islands, *e.g.*, Hawaii, remote from the continents, emit lavas which are dominantly basaltic in character. Volcanoes active in land areas erupt lavas which are intermediate in composition between basaltic and granitic.

In all mining and many engineering problems, geology is important. The tracing of coal-seams and ore deposits which may be faulted and folded, and pre-

dicting how they will be lying ahead of the working face is essential in planning future development. The location of tin, gold, or platinum bearing gravels is a problem involving knowledge of the behaviour of rivers combined with the recognition of those rocks from which such minerals are derived. The summing up of the potentialities of a prospect, as to whether the lodes seen on the surface are of such a nature that they may reasonably be expected to continue in depth, is based on geological knowledge. Oil exploration is highly skilled geological work demanding an understanding of geological structures, stratigraphy, fossils, and often geophysical methods of investigation.

The engineer needs geology in the location of water, and in any deep foundation work that may have to be undertaken. Particularly is this so in the location of dam sites—there have been several catastrophic dam collapses because the geology of the foundations was not properly investigated. The location of road materials and building stones is another task in which the geologist can assist; and the thorough investigation of any area through which a tunnel of any magnitude is to be driven is now recognized as a geological problem.

Jeffreys, 1933; Physical Basis of Geography, S. W. Wooldridge and R. S. Morgan, 1937; The Strength and Structure of the Earth, R. A. Daly, 1940; Outlines of Structural Geology, E. S. Hills, 1940; Textbook of Geology, 5th Edition, P. Lake and R. H. Rastall, 1941; A Geology for Engineers, F. G. H. Blyth, 1943; Principles of Physical Geology, A. Holmes, 1944; Dating the Past, F. E. Zeuner, 1946; The Pulse of the Earth, J. Ungrove, 1947; H.M. Geological Survey, British Regional Geology (18 handbooks covering Great Britain).

Geometer Moth. Group of moths whose caterpillars are often called loopers from their curious mode of progression. They have

Geometer Moth.
Caterpillar of Brindled Beauty Moth

only two pairs of prolegs, placed close to the rear of the body, and walk by alternately drawing up the body into a loop and

then extending it. Many of these caterpillars when at rest look exactly like dry twigs. The word geometer is from Gr. *geōmetrēs*, a land-measurer, hence the name Geometridae for the family to which these insects belong. See Caterpillar.

Geometrical Progression. Series of numbers in which the ratio or multiplying factor between the successive terms is constant. Thus, 1, 2, 4, 8, 16 is a G.P. of five terms, and, as each term is twice the preceding one, the ratio is 2. Similarly, 1.05, 1.05², 1.05³ . . . 1.05¹² is a G.P. of 12 terms with a common ratio of 1.05. Generally a G.P. is of the form $a, ar, ar^2, ar^3 \dots ar^{n-1}$, a representing the first term, r the common ratio, and n the number of terms. The sum of such a G.P. is given by

$$S = a(r^n - 1)/(r - 1),$$

or if the ratio is less than 1,

$$S = a(1 - r^n)/(1 - r).$$

Thus, in 2, 6, 18, 54, the first term, a , is 2; the common ratio, r is 3; the number of terms, n , is 4.

The sum of the G.P. is $\frac{2(3^4 - 1)}{3 - 1} = 80$.

In the G.P., 1, $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$, the first term is 1, the ratio is $\frac{1}{2}$, and the number of terms is 6;

hence the sum is

$$\frac{a(1 - r^n)}{1 - r} = \frac{1 \{1 - (\frac{1}{2})^6\}}{1 - \frac{1}{2}} = \frac{1 - \frac{1}{64}}{\frac{1}{2}} = \frac{63}{32} = 1\frac{31}{32}.$$

Sometimes a G.P. with ratio less than 1 continues indefinitely. In this case

$$S = a + ar + ar^2 + ar^3 + \dots$$

$$rS = ar + ar^2 + ar^3 + \dots$$

Subtracting,

$$(1 - r)S = a$$

$$S = a/(1 - r).$$

Geometrical progression arises in applications of compound interest, such as annuities and mortgages, depreciation, etc., and examples of growth or shrinkage at a constant rate.

Geometric Mean. Term used to denote the middle or average value of two quantities considered in respect of a steady rate of change from one to the other. Thus the geometric mean of 2 and 18 is 6, for 6 is 3 times 2 and 18 is 3 times 6. In general the geometric mean of a and b is \sqrt{ab} . The geometric mean is more correctly used than the arithmetical average in many investigations, e.g. the mean of population at ten-yearly intervals.

GEOMETRY: MEASUREMENT OF SPACES

T. A. A. Broadbent, Editor, Mathematical Gazette

This outline of the development of the oldest of the sciences is supplemented by further information under Conic Sections; Coordinates; Fourth Dimension; Mensuration, etc. See also Descartes; Einstein; Euclid, etc., and articles on Algebra; Arithmetic; Trigonometry

Geometry is the science of spatial relations. The name is derived from two Greek words (*gē*, the earth, and *metrein*, to measure), suggesting that geometry began with land-surveying and measurement. Greek tradition states that Thales brought the study of geometry to Greece from Egypt, but the Egyptian knowledge of geometrical facts and mensuration appears to have been unsystematic and particular. The ancient Sumerian (Babylonian) civilization had made similar progress.

The Greeks turned this Egyptian and Babylonian mensuration into a science, by seeking for general theorems which should embrace a multitude of particular cases, and by systematising such general theorems into a logical sequence, proceeding from stated definitions and axioms by strictly deductive reasoning. Thus while the Egyptians knew that if a triangle has sides of lengths 3, 4, and 5 units, the angle opposite the largest side is a right angle, the Greeks dis-

covered and proved the general theorem of Pythagoras, that if in a triangle ABC, $AB^2 + BC^2 = CA^2$, then the angle at B is a right angle, and conversely. They also set this theorem as a link in a logical chain of theorems concerning triangles.

The best as well as best-known text-book of Greek geometry was Euclid's Elements, written about 300 B.C. for the use of students at Alexandria. Beginning with definitions of the concepts used, axioms or "common notions" and permissible constructions (by ruler and compass), Euclid derives a sequence of geometrical results by strict logical inference from his definitions and axioms, so that whatever is not explicitly stated as an axiom must be proved. For example, he proves that any two sides of a triangle are together greater than the third, as a consequence of his definitions and axioms, so as to avoid making any further assumptions, however plausible. Euclid's logic has been

shown to be faulty in some places, and some of his methods have been improved; but his geometrical insight was deep, his logic keen.

Euclid's propositions are of two kinds, theorems and problems. A theorem is the deduction of a geometrical result from those previously established. A problem proposes some geometrical construction, such as to draw a perpendicular from a given point to a given line; the method is given, and its correctness demonstrated by a theoretical proof.

The first six books of the *Elements* deal with triangles and circles in one plane. The first two books deal with triangles, parallels, areas of triangles and parallelograms: Books III and IV with circles and their relations to triangles and polygons. Book V explains the theory of ratio and proportion, and Book VI applies this theory to similar figures (having the same shape but differing in size). Books VII–X are arithmetical; Books XI–XIII consider the geometry of figures in three-dimensional space.

Apollonius on Conics

The Greeks paid great attention to curves other than the circle, particularly to the conic sections (ellipse, parabola, hyperbola). These curves are obtained by cutting an ordinary right circular cone by a plane. They can also be exhibited as the shadow of a circular disk on a plane surface. Apollonius (c. 200 B.C.) wrote the classic Greek treatise on conics, comparable in power with Euclid's *Elements*. The astronomical discoveries of the 16th and 17th centuries gave a fresh importance to conics. Kepler inferred from observations that the planets move round the sun in ellipses, and Newton showed that this empirical law is a mathematical consequence of his law of universal gravitation.

Archimedes, a little senior to Apollonius and perhaps the greatest Greek mathematician, devised geometrical methods which led towards the infinitesimal calculus of Newton and Leibnitz; he also applied geometry to physics.

In astronomical matters, the Greeks, probably following the Babylonians, dealt mostly with angular measurement. Although the Greeks were hampered by a lack of suitable symbolism for arithmetic and algebra, the beginnings of trigonometry can be seen in Greek geometry.

The development of algebra in the 16th century led to Descartes' fusion of algebra with geometry.

about 1640. If steps in a plane are counted positive to the N. and negative to the S., steps E. positive and steps W. negative, then the position of a point in the plane can be determined with respect to the N.-S. and E.-W. lines (called the axes of coordinates, OX, OY) by two numbers or "coordinates," namely the steps E. and N., in that order. Thus, in

the figure, P is fixed by its coordinates (4, 3), Q by (–3, 2), R by (–4, –3), S by (2, –2).

Generally, the position of a point can be fixed by its coordinates (x , y) where x and y are any two numbers, positive or negative, denoting the perpendicular distances of the point from OY and OX respectively.

Now, for instance, suppose that a point P is on a circle centre O and radius r . By Pythagoras's theorem, $ON^2 + NP^2 = r^2$, so that the coordinates of any point on this circle satisfy the equation $x^2 + y^2 = r^2$, and no other point in the plane will have coordinates satisfying this equation.

The Value of Coordinates

Descartes recognized that to each curve there will be a corresponding equation between the coordinates, such that each point on the curve has coordinates satisfying this equation, and no other point has coordinates which satisfy the equation, so that the equation characterises the curve; geometrical properties of the curve will correspond to algebraic properties of the equation, and *vice versa*. The method of algebraic geometry is therefore potent for the discovery of geometrical results by algebraic methods, and for the application of geometry to other branches of mathematics. The conic sections, *e.g.* can all be represented by equations of the general (second degree) form $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$

where a , b , c , f , g , h are numerical constants whose values fix the

particular conic or class of conic. For example, the curve is an ellipse, parabola, or hyperbola according as h^2 is less than, equal to, or greater than ab .

Cartesian methods extend to three dimensions, and curves and surfaces in space are more easily studied by coordinate methods than by purely Euclidean methods, partly because the geometrical representation of solid figures on a plane sheet of paper presents difficulties. Most advances in solid geometry have been made by coordinate methods.

Differential Geometry

The algebraic method is also the basis of the applications of the infinitesimal calculus to geometrical problems such as those concerning tangents to a curve, area bounded by a curve, length of a curve, curvature of curves and surfaces. From this has developed the subject of differential geometry, with its recent applications to n -dimensional space, to non-Euclidean spaces, and to the theory of relativity. A second advance made in the 17th century was the beginning of projective geometry, due to Desargues, though the extensive development of this branch did not take place till the early part of the 19th century.

Imagine a point-source of light, and a plane sheet of glass on which a diagram is drawn. The shadow of this diagram can be cast on a second plane, producing there a diagram which is called the "projection" of the former. By altering the relative positions of the source of light and the two planes, the original figure will give rise to a great variety of projected figures, because of distortion of lengths and angles. But certain properties of the figure will remain as properties of the projection: straight lines will project into straight lines, two curves intersecting at a point P will project into curves intersecting at the projection of P, and so on. Thus projection may be used (a) to derive from a simple figure properties of a more complicated projection; (b) to recognize a large variety of apparently different theorems as projective instances of one general theorem. For example, it can be shown that the projection of a circle is always a conic: hence (i) certain properties of the circle can be extended to conics by projection, (ii) a large number of separate properties of the ellipse, parabola, and hyperbola can be classified as projective cases of one single result.

Orthogonal projection can be regarded as a limiting case of general projection, but is a study of importance for its own sake, since it is the basis of practical geometrical drawing and of the applications of geometry to *e.g.* engineering and architecture (plan and elevation). Given a point *P*, let *PM* be the perpendicular from *P* to a fixed plane; then *M* is the orthogonal projection of *P*, and a figure described by *P* will give rise to a figure described by *M*. Thus the orthogonal projection of a circle is an ellipse, which is another way of stating that if an ordinary right circular cylinder (whose cross-section is therefore a circle) is cut obliquely by a plane, the section is an ellipse.

Non-Euclidean Geometry

In Greek times, geometry was regarded as a mathematical study of the "real" space of the physical universe, the axioms or "common notions" being obvious truths. The parallel postulate of Euclid, concerning the angles made by a transversal with a pair of parallel lines, effectively a definition of parallelism, could hardly be regarded as an obvious truth, and many attempts were made to deduce it from the other axioms. These attempts were bound to fail, since it is now known that the parallel postulate is not a logical consequence of the other axioms; Euclid's postulate amounts to saying that through a given point only one parallel to a given line can be drawn, but it is possible to construct logically perfect systems of geometry in which two parallels or no parallel can be so drawn. The first such systems were devised by Lobachevsky and Bolyai in the early 19th century, and have led to a view of geometry different from that taken by the Greeks. Modern geometry is a logical system of inference from a set of undefinable entities by means of axioms of relation between these entities, and is thus an entirely abstract science. It may happen that phenomena in the material world appear to correspond to the entities and axioms of geometry, and so the geometrical inferences can be applied to these phenomena; it is then a problem of importance to discover a geometry which appears best to fit the physical facts. Euclidean geometry adequately describes space on a small scale; but on an astronomical scale non-Euclidean geometry may give a better description. Such questions

have played a prominent part in the development of the theory of relativity. Here also the purely mathematical concept of a space of more than three dimensions has been of great value. While human physical perceptions extend only to a three-dimensional space, it is possible to construct an abstract geometry for space of any number of dimensions, on the basis of fundamental indefinables and axioms about their relations. Hilbert has defined a space in which the number of dimensions is infinite.

Later Developments

Other 19th century developments include: line geometry, due to Cayley and Plücker, in which lines and systems of lines are regarded as the fundamental concepts, rather than points and systems of points; geometrical transformations, studied particularly by the Italian geometers; Klein's unification of Euclidean and non-Euclidean geometries through projective ideas, and his assimilation of geometry with the theory of groups.

The vector and tensor analysis which is extensively used in relativity theory is derived partly from Hamilton's quaternions and Grassmann's *Ausdehnungslehre*, where a theory of vectors is given, a vector being essentially a straight line of given length and direction, and partly from the work of Riemann, Christoffel, and Ricci, which is fundamentally a study of the theorem of Pythagoras generalised to *n*-dimensional space and of curvature in such a space.

Bibliography. The Thirteen Books of Euclid's Elements, Sir Thomas Heath, 1908; History of Greek Mathematics, Sir Thomas Heath, 1921; Analytical Geometry of Three Dimensions, D. M. Y. Sommerville, 1934; Introduction to Projective Geometry, C. W. O'Hara and D. R. Ward, 1937; Foundations of Geometry, G. de B. Robinson, 1940; A History of Geometrical Methods, J. L. Coolidge, 1940; Introduction to Analytical Geometry, I, II, A. Robson, 1940, 1947; Non-Euclidean Geometry, H. S. M. Coxeter, 1942.

Geomorphology (Gr. *gē*, earth; *morphē*, shape). Study of the shape of the earth's surface. In its widest sense it includes the problem of the shape and arrangement of continents and oceans, as well as the investigation of present-day land forms, mountains, valleys, coasts, etc., produced by earth movements or carved by erosion. Geology deals with the history of

such land forms; geomorphology is concerned with their present configuration. *Consult* Geomorphology: An Introduction to the Study of Landscape, C. A. Cotton, 1939.

Geophagy or **EARTH EATING**. Widely spread custom of eating various forms of earth, chiefly clay. Its purpose is dietetic, medicinal, or sacramental. In New Caledonia, cakes of iron-manganese earth are eaten after copious meals; in New Guinea, soapstone is preferred. The Dyaks of Borneo eat a mixture of red ochre and an oily clay; the Hopi Indians of N. America eat clay mixed with potato.

Geophilus (Gr. *gē*, earth; *philos*, loving). Genus of blind centipedes which live under ground, whence their name of earth-loving. They prey mainly upon worms, which they attack in their burrows and on the ground.

Geophysics. Collective name given to the branches of physical science which are concerned with the earth and its atmosphere. Meteorology, seismology, atmospheric electricity, and terrestrial magnetism are thus geophysical subjects. Geology and geography, which chiefly describe the structure of the earth rather than account for natural processes, are not regarded as coming within the range of geophysics, although there is overlapping to a limited extent. *See* Geodesy.

Geopolitics. German political doctrine which explains political tendencies and developments by the influences of geography. It maintains that the policy of every nation is determined by its geographical position, and the necessities imposed on it by space prove more effective than ethical or ideological factors.

Geopotential. Term in physics. A body is said to acquire potential energy when its position is changed in a field of force, *e.g.* when a mass is raised through a vertical distance against gravity. When considering matter under the influence of the gravitational field of the earth, geopotential is the term applied to the potential energy of unit mass, the zero of potential referring to sea level. The force of gravity, however, is greatest at the poles and least at the equator; hence the higher the latitude the greater the energy needed to raise a body to a given altitude. In other words, the level at which a specified geopotential is reached becomes lower as one approaches the poles. In meteorology, the consideration of air movements is facilitated by expressing the posi-

tion of parts of the atmosphere in terms of geopotential rather than height. Results of balloon soundings are published internationally with reference to geopotential levels. See Energy.

George, THE. Part of the insignia of the Order of the Garter. It is an enamelled gold pendant, representing S. George slaying the dragon, and is suspended from the collar. There is a "lesser George" with the same device on an enamelled ground, surrounded by an oval garter. See Garter.

George. Lake of Africa. It is in the S.W. of the Uganda protectorate, forming a N.E. extension of Lake Edward, with which it is connected by a narrow channel.

George. Salt lake of New South Wales. It is 25 m. S.W. of Goulburn, and is an isolated basin with no outlet. Sometimes nearly dry, it measures usually 25 m. by 8 m.

George. Lake of New York, U.S.A. Situated in the E. part of the state, between Washington, Essex, and Warren cos., it stretches N.E. to S.W. for 35 m., and has a breadth varying from 1 m. to 3 m. Picturesquely located among the foothills of the Adirondaeks, it is a shallow, clear water lake, studded with small islands, and is drained by a stream into Lake Champlain.

George (Gr. *gegyros*, husbandman). Masculine Christian name. Although that of the patron saint of England, it did not become popular there until after George I came to the throne. The German form is Georg and the French Georges. Georgina and Georgiana are feminine forms.

George. Patron saint of England. He is generally identified with George of Cappadocia, who was put to death by Diocletian, April 23, 303. The only historical fact is that he was martyred at Lydda. According to the Golden Legend, having slain a dragon, he put off his knightly habit, gave all he had to the poor, went forth to

preach Christianity, and was martyred in 287.

S. George first became recognized as England's patron saint under the Norman kings. In 1344 Edward III founded the Order of the Garter with S. George as its badge, and some years later Edward IV built the present magnificent S. George's Chapel at Windsor, where, in the reign of Henry V, the supposed heart of the saint was deposited as a precious relic. S. George is also the patron saint of Portugal and of Aragon. His festival is April 23.

George I (1660-1727). King of Great Britain and Ireland. Born at Hanover, March 28, 1660, he was

George I (I)
After Kneller

the son of Ernest Augustus afterwards elector of Hanover, and was baptized George Louis. His mother was Sophia, a granddaughter of James I. In 1682 he married a cousin, Sophia Dorothea, but the union, partly owing to the prince's numerous infidelities, was unhappy, and in 1694 the princess was divorced. George served with his father's troops against the French, but much of his early life was given up to pleasures of the grosser kind. In 1698 he became elector of Hanover and in 1701 the Act of Settlement recognized his mother and then himself as heir to the throne of Great Britain. In 1707 he commanded an imperialist army in the War of the Spanish Succession, but resigned in 1710.

On Aug. 1, 1714, George succeeded Anne as king. Although neither popular nor instructed, he had a certain common sense, while his ignorance of English compelled him to leave much to his ministers. By accident or design, therefore, he may be described as a constitutional sovereign; his reign strengthened the power of the cabinet in British politics. As a European figure he was of much importance. The king died at Osnabruck, June 11, 1727, and was buried at Hanover. Of his mistresses the most prominent were the ladies created duchess of Kendal and countess of Darlington. There are Lives by L. Melville, 1908; J. F. Chance, 1909; Sir H. M. I. Terry, 1927.

George II (1683-1760). King of Great Britain and Ireland. The son of George I, he was born Nov. 10,

1683, at Herrenhausen, when his father was electoral prince of Hanover, and baptized George Augustus. His early life was passed in Hanover, and at the head of some Hanoverian troops he served against France in the War of the Spanish Succession. The Act of Settlement of 1701 placed

George II (II)
After Zeeman

him in the succession to the throne of Great Britain, and in 1706 he was made duke of Cambridge, but a proposal that he should reside in England fell through. At Hanover he lived until 1714 the somewhat coarse life of a prince who was without either ambition or culture. In 1714 the prince followed his father to England, and for thirteen years he was prince of Wales. The relations between the two had been bad for some time, and in London they reached such a state that the prince was ordered to leave the court. He replied by setting up a court of his own, which became the centre of all opposition to George I and his ministers.

In 1727 George became king, and he reigned for 33 years. The reign may be divided into two parts, the break being the resignation of Walpole in 1742. In both he acted as a constitutional sovereign, realizing that there was a new power in the state—the will of the people. His own quarrels with his father were repeated in the case of himself and his son Frederick, who, driven from court, formed his own circle of opposition to the king and the ministry. He had the sense to heed the wise advice of his wife Caroline, but took several mistresses, both before and after her death. In addition to Frederick, George had a son, William Augustus, duke of Cumberland, and five daughters. He was the patron of Handel and the founder of the university of Göttingen. George died at Kensington Palace, Oct. 25, 1760. There are memoirs of the reign by H. Walpole, rev. ed. 1847; Lord Harvey, rev. ed. 1931; and a study of the king by R. J. Lucas, 1910.

George III (1738-1820). King of Great Britain and Ireland. The eldest son of Frederick, prince of Wales, he was born June 4, 1738, and was baptized as George William Frederick. His father died in 1751, and he was educated under the eyes

S. George, the patron saint of England. From a medal by W. Wyon, R.A., 1851

of his mother, Augusta, a princess of Saxe-Coburg, and the earl of Bute, who became the head of his household in 1756. Their aim

George III
After Lawrence

was to make him a king of the older type, one who dominated domestic and foreign politics, rather than one of the constitutional type as was his grandfather, George II. In Oct., 1760, he became king.

George was the first ruler of his house who could claim to be a Briton born and bred. His reign began with an attempt to secure power for himself. The earl of Bute succeeded Pitt and Newcastle in 1761, but he left office in 1763, and it was evident that some other method or some other minister would have to be tried if the plan was to succeed. Other prime ministers, less pliable, followed, but by 1770 the king had formed his own party, the king's friends, and Lord North became premier. For twelve years George directed, through him, the affairs of the country, the period being marked by the War of American Independence. In 1780 the king's mind gave way, and a regency was necessary, but he soon recovered and was able to throw his influence into the prosecution of the war against France and to declare strongly against any concessions to the Roman Catholics. From time to time fresh attacks of insanity came on, and in 1811 he was finally incapacitated. He lingered, however, until Jan. 29, 1820, when he died at Windsor.

George was neither a wise nor a constitutional king, and a good deal of responsibility attaches to him for the misfortunes of the reign. His private life, on the other hand, was blameless, and in his later years his popularity was great. His homely ways inspired Gillray's affectionate caricatures of "Farmer George." In Charlotte, princess of Mecklenburg-Strelitz, he found a partner to whom he was ideally suited. His family consisted of nine sons and six daughters; the sons who grew to manhood being George IV, William IV, and the dukes of York, Kent, Cumberland, Sussex, and Cambridge. George's correspondence, ed. Sir J. Fortescue, was published 1927-37. *Consult* Life, J. D. G. Davies, 1936; Royal George, C. E. Vulliamy, 1937.

George IV (1762-1830). King of Great Britain and Ireland. The eldest son of George III, he was born in London, Aug. 12, 1762, and was baptized as George Augustus Frederick. A few days afterwards he was created prince of Wales. With considerable abilities, he was carefully educated, but he early entered on a life of extravagance that continued to the end.

The prince of Wales became prominent politically owing to the insanity of his father. In 1788 the country was agitated over the question of the regency. Should the prince, as Fox contended, become regent by right of birth and receive the kingly power without limitations, or should the office be conferred upon him subject to certain restrictions laid down by Parliament? The latter view, that of Pitt, prevailed, but George was then regent for only a short time. In 1811, however, the king's insanity returned and he became regent again, retaining the position until his accession in Jan., 1820.

George IV
After Lawrence

As ruler of the country between 1811 and 1830, George IV was neither successful nor popular. He resisted reform as long as he could, for he was old and feeble when he consented to the measures that granted relief to Nonconformists and Roman Catholics.

The chief interest of the reign, from the popular point of view, was in the relations between the king and his wife, Caroline of Brunswick, whom he married in 1795. The two soon separated, but their discords were the subject of public inquiry in 1806 and of great public excitement when he became king. A bill to deprive the queen of her royal position was introduced, but it failed to pass, public sympathy being vociferously on the side of the lady.

George had a succession of mistresses—Mary Robinson, the actress, Lady Jersey, Lady Hertford, Lady Conyngham, and others. His most lasting union was with Mrs. Fitzherbert, who secretly became hismorganatic wife in 1785 and lived with him until 1813. His only legitimate child, the princess Charlotte, died in 1817, a year after her marriage with Leopold, prince of Saxe-Coburg. The king's

admirers called him the first gentleman of Europe, and his courtly behaviour and early good looks partly justified this; but the popular verdict was "a bad son, a bad husband, a bad father, a bad subject, a bad monarch, and a bad friend." The nation paid his gambling debts and financed his extravagance and debauchery; but George was a patron of those painters and writers he admired, and the creator of Brighton. He died at Windsor, June 26, 1830. Creevey, Croker, Greville, Holland, etc., left memoirs of his reign and character; *consult also* The First Gentleman of Europe, L. Melville, 1906; Life, R. Fulford, 1935.

George V (1865-1936). King of Great Britain, Ireland, and the British dominions beyond the seas, emperor of India. Born at Marlborough House, June 3, 1865, second son of the prince of Wales, afterwards Edward VII, he was christened George Frederick Ernest Albert. After private tuition together with his elder brother Albert Victor, later duke of Clarence, they both entered the navy, 1877, joining the Britannia at Dartmouth, and voyaged to the W. Indies in the Bacchante 1879-80, then sailed on a world cruise later in 1880, the first of a series of voyages which made George a more experienced traveller than any of his predecessors on the throne. He became a sub-lieut. on his 19th birthday, and was promoted lieutenant in 1885 after further training at Greenwich, where he obtained a 1st class in seamanship and gunnery. Appointed to command the gunboat Thrush, 1890, he sailed her to the W. Indies and back, being promoted to commander on his return.

In 1892 the sudden death of his brother placed George in direct succession to the throne, curtailing his naval career. Created duke of York, he married, July 6, 1893, Victoria Mary, only daughter of the duke of Teck, in the Chapel Royal, S. James's, and forthwith entered upon a succession of public duties in London and the provinces and in Ireland. With his father's accession to the throne early in 1901 those responsibilities increased. As duke of Cornwall and York he toured the British dominions with the duchess, leaving England in the Ophir, March 16, 1901, and returning Nov. 1. The chief purpose of the tour was to open the first federal parliament of Australia, May 9. On Nov. 9 he was created prince of Wales, and on Dec. 5 delivered a notable

speech at Guildhall, London, the theme of which was "Wake up, England!" The prince and princess visited India, 1905-06, and Canada, 1908 (for the Quebec tercentenary).

Succeeding to the throne May 6, 1910, George was crowned June 22, 1911. Meanwhile, in Feb., 1911, an old and malicious rumour that he had contracted an earlymorganatic marriage in Malta was finally quashed in a successful action for criminal libel brought against E. F. Mylius, and in an authorized public denial from the king. In Nov., the king and queen sailed in the Medina to preside at a coronation durbar at Delhi, India, Dec. 12; there also he announced the transfer of the capital of India to Delhi and laid the foundation stones of New Delhi.

Events of his Reign

The chief political events in which he was concerned during his 25-year reign were the dispute over the house of lords in 1910-11; the controversy over Home Rule; the First Great War; and the economic crisis of 1931. At the very outset he was confronted by his duties as a constitutional monarch with the necessity for agreeing to the exercise of the royal prerogative in the creation of enough new peers to establish in the house of lords the will of an electoral majority respecting the powers of that house. (See Parliament Act.) In the event the prerogative did not need to be used. In July, 1914, at the height of the Home Rule crisis, when talk of civil war was to the fore, he took the initiative in summoning the opposing party leaders to a conference at Buckingham Palace, but the conference brought no solution. During the First Great War he visited his armies in France several times (in Oct., 1915, he was badly injured there by a fall from his horse); while at home the royal household set an example of behaviour to all classes, in particular the banning of all alcoholic drinks from royal establishments for the period of the war being widely copied. The king and queen were indefatigable in performing their round of war duties, especially in their visits to hospitals and munition factories. As for the politico-economic crisis of Aug., 1931, the king acted with impressive promptness in hastening from Balmoral to London to consult the various party leaders, and there is no doubt that his part in the establishment of an all-party national government was a very real one. Moreover, the consistent tact and

courtesy which marked his relations with the first Labour government did not pass unnoticed.

But his greatest achievement as king lay in the unwearied correctness of his demeanour as a constitutional monarch and his adherence to an ideal of personal service which created higher standards for the principle of constitutional monarchy. He remained especially mindful of the responsibility devolving upon him as the first sovereign to wear that symbolic crown which is the sole political link of the British Commonwealth.

George V making one of his four Christmas broadcasts to his peoples as "head of this great family"

A far more remarkable aspect of his kingship was the personal respect in which he came to be held in his own lifetime, a respect which deepened into a unique affection. His duties brought him into contact with all classes. The crowds learnt to applaud his quiet dignity on official occasions such as the annual ceremony at the Cenotaph, when he led his people in a simple act of homage; but they appreciated even more wholeheartedly his more informal appearances at the Cup Final, the Derby, the Wembley exhibition of 1924-25, and several royal command variety shows. The public was ready to share in the joys and sorrows of his family life—marriages of his children, bereavements, the birth of grandchildren—as with a friend.

During a long and serious illness, contracted at the end of Nov., 1928, and caused by a virulent abscess at the base of the lung, it is possible that his subjects throughout the Empire were somewhat surprised at the intensity of their own anxiety and their own subsequent relief when he was out of danger and able to be moved to Bognor (Feb., 1929) for convalescence. There is certainly no doubt that some six years later, on the

occasion of his Silver Jubilee, May 6, 1935, when the king and queen attended a thanksgiving service in St. Paul's cathedral, it was the king's turn to be surprised at, and moved by, the display of love and loyalty with which he was everywhere greeted. If one act of the king had contributed more than any other to the warmth of personal feeling which reached its climax on Jubilee day, it was the institution in 1932 of an annual Christmas afternoon broadcast, in which he interrupted his own private festivities for a few moments to speak from the quiet of his study at Sandringham House to all his peoples, as "head of this great family." No monarch before him had the opportunity to make his voice so familiar to all his people; no man could have better seized the opportunity to make that voice beloved.

The King's Last Illness

On Jan. 17, 1936, it was first announced from Sandringham that the king was ill and that bronchial catarrh had led to disquieting cardiac weakness. On Jan. 20, at 9.25 p.m., was issued the memorable message: "The king's life is moving peacefully to its close. This was broadcast at 9.30 and thereafter repeated to a silent and waiting empire at quarter-hour intervals until midnight. The king died at 11.55 p.m. His body was moved to London, where it lay in state in Westminster Hall until Jan. 28, the day of the funeral. During the last hours his four sons mounted guard over the catafalque for a period. After a London procession the king was buried in St. George's chapel, Windsor.

King George was an enthusiastic philatelist, possessing a unique collection of British stamps. He was also at one time reckoned one of the six best shots in the country.

There were six children of his marriage: Edward (b. 1894), who succeeded him as Edward VIII (see Windsor, Duke of); Albert (b. 1895), later duke of York and King George VI (q.v.); Mary (q.v., b. 1897), later countess of Harewood and princess royal; Henry (b. 1900), later duke of Gloucester (q.v.); George (1902-1942), later duke of Kent (q.v.); and John (1905-1919). In 1917, by royal decree, George V changed the name of the royal house from Saxe-Coburg to Windsor, and thereby became the first monarch of that house. Consult George V, Arthur Bryant, 1936; King George V J. Gore, 1941.

Gordon Stowell

H.M. KING GEORGE VI

Beverley Baxter, Writer, Journalist, Politician

This account deals mainly with the personal life of George VI who, called unexpectedly to the throne, fulfilled his task with marked success in a period of change and disruption unequalled in human experience. For political and military aspects of his reign, see entries under United Kingdom; the various Dominions; India, etc.; Second Great War, etc.; and biographies of outstanding personalities of the time

Prince Albert Frederick Arthur George was born at York Cottage, Sandringham, Dec. 14, 1895, second son of the then duke and duchess of York, later to become King George V and Queen Mary. At the time of his birth he was fourth in succession to the British throne, then occupied by Victoria, his great-grandmother. With his elder brother, Prince Edward of York, later to become successively prince of Wales, Edward VIII, and duke of Windsor, Prince Albert received a general education

under private tuition, then entered the Naval Training College at Osborne in 1909, and in 1913 sailed in the Cumberland on an instructional cruise to the W. Indies, Canada, and Newfoundland. On his return he was gazetted midshipman in the Collingwood. He cruised with her in the Mediterranean, and was on board as she proceeded to her war station in Aug., 1914.

During the First Great War he suffered considerable ill-health from gastric trouble, and was

frequently in hospital. He was present and under fire at the battle of Jutland, 1916, and was mentioned in dispatches. But in Nov., 1917, the presence of a duodenal ulcer was revealed, necessitating an operation and an end to service afloat. In 1918, having served as a ground officer in the R.N.A.S., he was gazetted captain in the newly established R.A.F., serving on the staff of Sir John Salmond at Spa after the armistice. In Aug., 1919, he qualified as a pilot, and was promoted squadron leader and later wing commander, 1919.

From 1919 to 1920 he was a member of Trinity College, Cambridge, and attended lectures in the schools of history, economics, and civics, founding the basis of a permanent interest in and understanding of industrial problems. In June, 1920, he was created duke of York, earl of Inverness, and Baron Killarney, taking his seat in the house of Lords the same month. From this time he entered upon a succession of duties at home and abroad.

Marriage and Tours Abroad

On April 26, 1923, the duke was married at Westminster Abbey amid scenes of enthusiasm to Lady Elizabeth Bowes-Lyon, youngest child of the earl and countess of Strathmore. They resided first at White Lodge, Richmond. In 1924-25 the duke and duchess made a prolonged tour of East Africa and the Sudan; then in Jan., 1927, they embarked on a great imperial mission, culminating in the opening of the new Australian federal parliament buildings at Canberra. They sailed in the Renown, visiting the West Indies, the Islands of the Caribbean Sea, and Fiji, and staying one month in New Zealand before continuing to Australia, where the new parliament buildings were formally opened May 9, 1927. The Renown brought the duke and duchess home in June and they took up residence at 145, Piccadilly, London.

Particular interests with which the duke of York identified himself at home included the Safety First movement, the British Empire Cancer Campaign, the Playing Fields Association, and the Industrial Welfare Society. Out of the last grew his scheme of the Duke of York's camp for public school and industrial boys, inaugurated at Dymchurch, Kent in the summer of 1921 and later moved to Southwold. He became a regular attendant at this camp,

George VI. His Majesty the King in the uniform of an admiral of the fleet

George VI. From childhood to sovereignty. 1. Aged 8 years. 2. Naval cadet, 1912. 3. At the time of his marriage, 1923. 4. On his 51st birthday. 5. At the microphone, Christmas, 1942. 6. "Great Chief" of the Duke of York's boys' camp

joining his young guests annually, whenever possible, in their camp meals, games, and sing-songs. He was also an enthusiastic freemason, being provincial grand master of Middlesex at the time of his accession. His last public appearance as duke of York was at his installation at Edinburgh as grand master mason of Scotland.

On the abdication of Edward VIII, Dec. 11, 1936, the duke succeeded to the throne as George VI. He was crowned in Westminster Abbey on May 12, 1937. His first state engagement was a visit to Belfast with the queen in July, 1937. They paid a state visit to France of four days' duration in July, 1938. But their most momentous visit was to Canada and the U.S.A., May 6-June 23, 1939. They sailed in the liner *Empress of Australia*, and toured across Canada to the Pacific, the king unveiling the

Canadian national war memorial at Ottawa en route. On the return journey they crossed into the U.S.A., June 7, and were cordially received at Washington by President Roosevelt. This was the first time a British monarch had set foot in the U.S.A., and the welcome was markedly cordial. The king and queen visited New York (and the World's Fair held there) on June 11.

During the Second Great War Throughout the Second Great War, in addition to his arduous state duties, the king found time to visit many military camps, airfields, naval stations, and munitions factories. He visited the B.E.F. in France in Dec., 1939, and examined sectors of the Maginot line. In June, 1943, he spent a fortnight with the British and U.S. armies in N. Africa, and included a day in Malta. On June 16, 1944, ten days after

D-day, he visited Eisenhower's advance H.Q. in Normandy, travelled to the Italian front five weeks later, and spent a further six days with his armies in Belgium and the Netherlands in Oct.

Early in June, 1945, he visited the newly-liberated Channel Is., and on July 4 opened the N. Ireland parliament in Belfast for the first time. At Plymouth on Aug. 2 he met President Truman, then returning from the Berlin conference.

In Feb., 1947, the king and queen sailed with their two daughters in the *Vanguard* for a state tour of S. Africa and Rhodesia, during which he opened a session of the Union parliament at Cape Town. Throughout the visit the keynote was an emphasis on his position and authority as king of South Africa. The royal family returned to England on May 11.

Not even a courtier could say that King George's personality

had gripped the imagination of the British people as had that of his elder brother. By comparison he was little known. He had been content to be the younger son of his father, fulfilling such duties as were required of him at home and abroad without seeking or attracting the limelight.

He had faced life with a serious physical infirmity. He stammered so that even ordinary conversation could be an ordeal to him. For no discoverable reason certain consonants affected the nerve centres, resulting in a long and painful silence. At the age of 14 he determined to master his defect. He read aloud for hours until he could not endure the sound of his own voice. His conversation became almost normal but any public utterances set him back. By the time he came to the throne he had acquired a masculine baritone voice, of musical quality and almost devoid of hesitancy. In the same way, during his years of service in the navy he had to fight for health as he had fought against stammering, and again he won. In middle age he had become consistently well with great power of endurance; the announcement, Nov. 23, 1948, of an indisposition so serious that a state visit to Australia and New Zealand, projected for 1949, had to be indefinitely postponed, came therefore as a shock to the public. He was suffering from an arterial obstruction affecting the feet, particularly the right foot, necessitating prolonged rest and eventually (March 12, 1949) an operation of lumbar sympathectomy. This was successful.

Family Life

It was centuries since a prince of England in direct line of succession to the throne had been allowed to marry one of the king's subjects. That the duke chose wisely was demonstrated to the whole world. The family life of George VI became an inspiration to the nation in a period of shifting values. There were two children of the marriage, Elizabeth Alexandra Mary (b. 1926) and Margaret Rose (b. 1930). The silver wedding of the king and queen was celebrated in 1948 by their attendance at a special service at St. Paul's cathedral.

King George's coronation was one of the last great scenes of pageantry before the outbreak of the Second Great War. By that time the true character of the king had begun to make itself felt. The tour of the king and queen in

Canada in the spring of 1939 evoked such enthusiasm that the queen spoke of it as their second coronation. The 1947 tour of S. Africa was a heartening demonstration of the continued strength of Commonwealth loyalty and solidarity.

King George VI came to the throne when the country was in the shadows, and his reign was to see the most cruel war of all time, followed by social and political upheaval. Yet the institution of constitutional monarchy was not weakened but took on increased strength. The character of King George had much to do with this, for he had become a wise counsellor whose judgement and high sense of honour won the respect of all who had access to his presence.

George I (1845-1913). King of the Hellenes. Born at Copenhagen, Dec. 24, 1845, a younger son of Christian IX of Denmark and a brother of Queen Alexandra, he was named Christian William. In 1862 the Greeks were looking for a king to replace the expelled

George I, King of the Hellenes

Otto. By request, the British government nominated the young prince of Denmark. His selection was approved by the Greeks, and he took the name of George, resigning at the same time his rights to the crown of Denmark. His long reign, which began in 1863, was on the whole successful. But towards the end of his life his country was drawn into the Balkan War, after it had previously carried on a struggle with Turkey. On March 18, 1913, in the midst of the Balkan struggle, the king was murdered by a subject while visiting Salonica. His wife was Olga, a Russian grand duchess. His son Constantine succeeded him.

George II (1890-1947). King of the Hellenes. He was born at Tatoi, near Athens, July 20, 1890, the eldest son of King Constantine. He married Princess Elizabeth of Rumania, and came to the throne upon the second abdication of his father, Sept. 27, 1922, but a series of political risings led to his being forced into exile, Dec. 18, 1923. On Nov. 3, 1935, a plebiscite showed a large majority in favour of restoring the monarchy, and King George was recalled. He soon sus-

pending the constitution and upheld the dictatorship of Gen. Metaxas.

At the outbreak of the Italo-Greek war in Oct., 1940, the king assumed command of the army, but was compelled to flee to Crete with his government on

George II, King of the Hellenes

April 23, 1941, when German troops were nearing Athens. Taken off the island by a British warship, he went to Cairo and London. In 1943 he announced that as soon as the Greek government was re-established, free general elections would be held. Civil war breaking out late in 1944, he appointed Archbishop Damaskinos (*q.v.*) as regent, Dec. 31. A peace treaty provided for a plebiscite on the question of the king's return. In 1946 the royalist party became the strongest in parliament; the plebiscite favoured the king; and he returned to Greece in Sept., but died in Athens after a heart attack, April 1, 1947. His brother Paul succeeded him.

George (1819-78). King of Hanover. Born in Berlin, May 27, 1819, he was the only son of Ernest Augustus, who became king of Hanover in 1837. In 1833 he became blind, but this was not considered a bar to his accession in 1851. His illiberal ideas involved him in constant quarrels with his subjects, leading to his expulsion in 1866, when Hanover was annexed by Prussia.

George found a refuge in Austria, where he worked hard but vainly to recover his lost land. He died in Paris, June 12, 1878, and was buried at Windsor. He is known as George V, his four predecessors being also kings of Great Britain. His only son was Ernest, duke of Cumberland.

George (1832-1904). King of Saxony. Born at Dresden, Aug. 8, 1832, he was the youngest son of King John (1801-73). He was gazetted into the artillery in 1846 and commanded a cavalry brigade in the Austro-Prussian War of 1866. In 1888 William I made him a Prussian field marshal. On the death of his brother Albert, in 1902, he succeeded to the throne, and died Oct. 15, 1904.

George, Sir Ernest (1839-1922). British architect. Born in London, June 13, 1839, he was educated at Brighton, Reading, and the Royal Academy. He received the queen's

gold medal of the Royal Institute of British Architects in 1896. President of the institute 1908-09, he was knighted in 1911 and elected R.A. in 1917. Examples of his work are to be seen in the Royal Exchange buildings, the Golders Green crematorium, also the Royal Academy of Music, the Shirpur Palace, India, and in the restoration of Berkeley Castle. He died Dec. 8, 1922.

George, HENRY (1839-97). An American economist. Born at Philadelphia, Sept. 2, 1839, he

Henry George

became a printer in California, and from that a journalist. He began to study economic questions, and in 1871 made himself known by his book, *Our Land Policy*.

In 1879 this appeared as *Progress and Poverty*, and became enormously popular in Europe as well as in America. George became the apostle of land nationalisation, which he proposed to bring about by means of the single tax. He died Oct. 29, 1897. He also wrote *Protection and Free Trade*, 1886; *The Condition of Labour*, 1891; and *Principles of Political Economy*, 1898. *Consult Life*, by his son Henry, 1900.

George, STEFAN (1868-1933). German poet. He was born July 12, 1868, at Bingen, educated at Darmstadt, and lived for a time in Paris, coming under the influence of Mallarmé and Baudelaire and making the acquaintance of Verlaine. George founded, in 1892, *Blätter für die Kunst*, with the motto of Art for Art's Sake. He published in 1907 *Der Siebente Ring*, and in 1914 *Der Stern des Bundes*, his best known works, noted for perfection of form. His later works were *Das Neue Reich*, 1928, and *Gedichte*, 1931. The translator of Dante, Baudelaire, and Shakespeare's sonnets, he expresses in poetry a mystic symbolism. Died at Locarno, Dec. 3, 1933. *Pron. Gay-org.*

George, WALTER GOODALL (1858-1943). British athlete. Born at Calne, Sept. 9, 1858, he made his first success in 1877. Quickly establishing himself as a pre-eminent runner in all distances over the half-mile, he won in 1884 the half, mile, and four miles championships in one afternoon at Birmingham, and in the same year

created records for nearly every distance from 1,000 yds. to 12 m. Turning professional, he covered the mile in 1886 in the world's record time of 4 mins. 12½ secs.; this record stood for 37 years. George won 12 amateur track championships and over 1,000 prizes. He died at Mitcham, June 4, 1943.

George, WALTER LIONEL (1882-1926). British author. Born and educated in Paris, he took to journalism in 1907. His first work was *France in the 20th Century*, 1908. His novels, in which he deals outspokenly with life's problems and presents an interesting amalgam of English and French methods, include *A Bed of Roses*, 1911; *Israel Kalisch*, 1913; *The Making of an Englishman*, 1914; *The Stranger's Wedding*, 1916; and *Caliban*, 1920. His studies, *Women and Tomorrow*, 1913; *Intellect of Woman*, 1917, are notable. He died Jan. 30, 1926.

George Cross. Decoration created by King George VI on Sept. 23, 1940. Ranking next to the Victoria Cross (*q.v.*), it is primarily intended for men and women in all walks of civilian life, but there is also a military division. The immediate object of its institution was to reward acts of gallantry arising out of enemy action during the Second Great War, but it is also given in peace time.

Designed by Percy Metcalfe, the George Cross is of silver, with four equal limbs having in the centre a circular medallion bearing the design of S. George and the dragon, surrounded by the inscription "For Gallantry." In each of the four angles between the limbs are the letters G VI. The reverse is plain and bears the name of the recipient and the date of the award. The cross is suspended from a dark blue ribbon threaded through a bar adorned with laurel leaves. *See Medals colour plate.*

The first recipient was T. H. Alderson, a rescue-party leader,

who received the decoration on Oct. 1, 1940, for devotion to duty during an air raid on Bridlington. In April, 1942, the George Cross was awarded to the island of Malta. It replaces the Empire Gallantry Medal of 1923, and holders of the latter living in 1940 were given the George Cross.

George Dandin; *ou, Le Mari Confondu* (George Dandin; or, The Baffled Husband). Three-act comedy by Molière, first produced at Versailles, July 18, 1663. Dandin is a rich peasant who marries above his station and has the privilege of settling the debts of his wife's parents. They with their daughter render his life wretched, especially by making him out to be wrong when he is right; hence his remark, *Vous l'avez voulu, vous l'avez voulu, George Dandin!* (You would have it, you would have it, George Dandin!).

George Medal. British decoration created by King George VI on Sept. 23, 1940. Like the George Cross, it is primarily intended for civilians, but there is a military division for members of the armed forces performing acts of gallantry having some bearing on civil life. The medal was frequently awarded during the Second Great War to troops removing unexploded bombs in cities. *See Medals colour plate.*

Georgetown. Seaport and capital of British Guiana, S. America. It stands near the mouth of the river Demerara, with a fortified harbour and lighthouse. The city, sometimes called Demerara, lies below the level of high water, which is kept out by a sea-wall called the Ring. The houses are mostly of wood, the streets are broad and shaded by palm trees, and there are several canals. The chief buildings are the Anglican and R.C. cathedrals, government buildings, several colleges and hospitals, botanical gardens, museum, library, and an asylum.

The rlys. connect up with *Ma-* haica and Rosignol, extending about 80 m.

There are 272 m. of good motor roads. The climate is humid and hot, and owing to the swampy surroundings is unhealthy. Exports include coffee, sugar, cocoa, rum, gold, diamonds, oils, and balata. The town's chief difficulty, a lack of good drinking

Georgetown, British Guiana. Government buildings of the S. American colony

water has been overcome by boring artesian wells and the provision of storage tanks. Pop. 75,539.

Georgetown. Part of the city of Washington, D.C., U.S.A. Standing on the Potomac, at its confluence with Rock Creek, about 2 m. W. by N. of the Capitol, it is primarily a residential district. Georgetown university, founded in 1789, is the oldest R.C. university in the U.S.A.; its school of foreign service provides training for diplomatic careers. Until 1871 Georgetown was a separate city, but then was incorporated in the District of Columbia, and seven years later became part of Washington. See District of Columbia.

Georgetown. Seaport of S. Carolina, U.S.A., a port of entry and the co. seat of Georgetown co. Situated at the head of Winyah Bay, it is 14 m. from the Atlantic and 60 m. by rly. N.E. of Charleston. The Big Peedee and other rivers which flow into the bay there provide inland navigation for a 1,000-mile area. An important shipping point for rice and indigo in the 18th century, it was first colonised about 1700, and the town was laid out before 1734. Georgetown's factories include turpentine distilleries and the largest pulpboard mill in the world. Exports include rice, timber, turpentine, naval stores, cotton, tobacco, and fish. Here Lafayette first landed in America, April 24, 1777. Of the pop. of 5,559, about 65 p.c. are negroes.

George Town. Seaport of the Straits Settlements, capital of Penang. It stands on the N.E. shore of Pulo Penang, also called Prince of Wales Island and Arca Island, with a fine harbour, second only to Singapore, on the W. coast of the Malay Peninsula. It is strongly fortified. The chief exports normally are rice, sugar, pepper, and tin. A mixed pop. includes Indians, Chinese, and Malays.

George Town was severely damaged by Japanese bombers during the invasion of Malaya in Dec., 1941. On Dec. 19 it was completely denuded of troops and Europeans, and the Japanese entered next day. Following the Japanese capitulation, Royal Marines went ashore at George Town on Sept. 3, 1945, after a local agreement had been signed on board H.M.S. Nelson.

Georgia. One of the original 13 states of the U.S.A. Chartered in 1732, it was the last British colony established, and was named after George II. It is in the S.E. of the country, bounded N. by Tennessee

and N. Carolina, W. by Alabama, S. by Florida, and E. by S. Carolina and the Atlantic. In area 58,876 sq. m., it is the largest state E. of the Mississippi and the one with the largest wooded area. Its coastline is broken and fringed by numerous islands, separated from the mainland by shallow sounds.

The surface comprises three natural divisions: Upper Georgia, the mountainous region of the N.; Middle Georgia, a fertile plateau; and the swampland of Lower Georgia. The chief rivers are the Savannah, the Ogeechee, and the Altamaha, all of which flow into the Atlantic, and the Chattahoochee and the Flint, which unite to form the Apalachicola flowing S. into Florida.

Sea island cotton grows in the coastal belt, and Georgia ranks third among the cotton producing states of the U.S.A. Sugar, peanuts, maize, tobacco, and peaches are abundant crops, and the forests provide half the nation's naval stores. The pastures feed a million head of cattle and as many swine.

The first colonists settled at Savannah in 1733, under a scheme sponsored by Gen. Oglethorpe. Georgia became a province twenty years later. Savannah was captured by the British during the American Revolution, and held until 1782. The Creek and Cherokee Indians were removed from the state between 1832 and 1838. Georgia seceded from the Union in 1861, but was readmitted in 1870. After occupying Atlanta, Gen. Sherman made his famous march to the sea, which he touched at Savannah.

Consult A Standard History of Georgia and Georgians, L. L. Knight, 1917; Physical Geography of Georgia, L. La Forge, 1925.

Georgia, GULF OR STRAIT OF. Inlet of the N. Pacific Ocean, dividing Vancouver from the British Columbian mainland. Its N. extension, Queen Charlotte Sound, connects with the Pacific Ocean, while its S. continuation leads to Juan de Fuca Strait and Puget Sound. Its length is about 250 m., its breadth 29 m.

Georgia. Map of this Caucasian republic of the U.S.S.R. lying between the Black and Caspian Seas

Asbestos, barite, bauxite, manganese, and iron ore are mined, and kaolin and fuller's earth are produced. Manufactures include clothing, iron and steel goods, and Portland cement.

Georgia has the highest negro pop. of any state—1,084,927 of a total of 3,123,723. Among the universities are several for negroes. Two senators and 10 representatives are returned to congress. Georgia alone in the U.S.A. has lowered the voting age to 18. The capital is Atlanta; Augusta, Macon, Columbus, and Athens are other cities, with the seaports of Savannah, Darien, St. Mary's, and Brunswick.

Georgia. Constituent republic of the U.S.S.R. It has an area of about 26,570 sq. m. and an est. pop. of 3,542,300 and is bounded N. by the Caucasus mts., E. by Azerbaijan S.S.R., S. by Armenia S.S.R., S.W. by Turkey, and W. by the Black Sea.

A deep valley corridor runs 500 m. between the Black and Caspian Seas, with the Caucasus rising steeply above it to the N., and the Armenian mts. skirting it almost as steeply on the S. The foothills from both ranges meet across the valley about 100 m. from the Black Sea, and form a watershed, the Suram mts. W. from these low mts. flows the

Rion to the Black Sea, and E. flows the Kura to the Caspian. Georgia is the land along these rivers for 250 m., and the highlands N. and S. that enclose the valley.

Through the two valleys, and tunnelling the Suram mts., is the rly. from Batum to Baku, the centre of a petroleum industry, and an oil pipe-line follows the rly. to the Black Sea. Georgia to E. of the watershed is grouped around the capital, the ancient city of Tbilisi, formerly Tiflis; the W. slope centres on Kutais. Batum, in Adzharia A.S.S.R., serves the whole Transcaucasian area as its port, and Poti at the mouth of the Rion serves Kutais province. N. of Poti a strip of Black Sea coast including Sukhum has been incorporated as Abkhazia A.S.S.R., in Georgia. This district, backed by the slopes of the Caucasus, resembles the Riviera in its agreeable climate, but is more fertile. It lacks rlys., but a main road connects it with the rly. junction of Santredi on the Rion.

Georgia has an exceptionally wide range of produce: wheat, maize, barley, cotton, and tobacco, and tea on the coastal strip. Rice is grown in the S.; experiments have been made in sowing it by aircraft. Plants include bamboo, eucalyptus, and the tung tree, while the Armenian hills are richly timbered. Below Tbilisi are wide cattle-breeding steppes. Silk is extensively produced. The vine flourishes, especially on the Caucasian side of the Kura valley. Olives, citrus fruits, apricots, peaches, plums, and apples abound. The country is rich in minerals, manganese and coal occurring in deposits each estimated at 250,000,000 tons. There is also some copper and oil.

Although their country forms one of the world's natural highways from E. to W., the Georgians have maintained their independence for 2,000 years, preserving their identity, language, and religion. In 302 B.C. they threw off the yoke of Alexander the Great. Christianity became the state religion in A.D. 323, and despite invasions by Arabs, Turks, Persians, and the Mongol Jenghiz Khan and Tamerlane, it prospered until the Bolshevik revolution.

Georgia was annexed to Russia by consent in 1801, when its king, George XIII, appealed to the Christian tsar of Russia for protection against the Turks. But attempts to Russianise the country and its people failed. When the Bolsheviks seized power in 1917,

Georgia, Azerbaijan, and Armenia agreed to form an independent federal democratic republic known as Transcaucasia. A united parliament (Seym) met April 22, 1918, but the new republic was soon dissolved into its three former constituents, and Georgian independence was proclaimed on May 26. On Feb. 25, 1921, following a revolution, the Georgian S.S.R. was set up. Next year the Transcaucasian republics were revived, and in 1936 all three members became constituent republics of the U.S.S.R. J. V. Stalin was born in Georgia and began his revolutionary career there, being exiled to Siberia in 1905 for his activities in Batum. Consult History of the Georgian People, W. E. D. Allen, 1932.

Georgian. Mompesson House, in the Close, Salisbury, typical of this style of domestic architecture
By courtesy of Country Life

Georgian. Style of architecture which prevailed in Great Britain during the reigns of the first three Georges (1714-1820). A product of the later Renaissance, it owed its inspiration mainly to Sir Christopher Wren. Its best characteristic was simplicity of plan and elevation; its worst was a tendency towards the pedantic. Wren's example was followed by numerous professional architects.

Contemporary with him were William Kent, who made an effective design of the Horse Guards, Whitehall, and spoilt a good portion of Wren's interior decoration at Kensington Palace; Isaac Ware, who built Chesterfield House, and in the middle of the 18th century was considered the leading authority on architectural

matters; and Sir William Chambers (*q.v.*), who was responsible for Somerset House (*q.v.*), one of the finest creations of Georgian classicism in London. Not even Chambers's work, however, escapes pedantry.

It is chiefly in the smaller houses that the significance and charm of "Georgian" may be found. In the towns uniformity was principally aimed at, and any one of the many Georgian streets in London can show that Georgian architects, in achieving uniformity, gained also two other essentials of successful street architecture—repose and dignity. In plan the Georgian house is a plain rectangle, solidly constructed, frequently of red brick. Its façade is always of the plainest, and is pierced by symmetrical rows of tall "sash" windows.

A porch was exceptional, and the typical Georgian doorway was enclosed by classic columns carrying their correct entablature, and surmounted by a hood which varied in shape and in the extent of its projection, the tendency being towards a shallower type.

The roof was invariably "hipped," i.e. it sloped backwards from each side, and the front slope was pierced by a row of dormer windows. At the beginning of the period it was the practice to extend the roof so as to form overhanging eaves with a heavy wooden cornice; later, the roof was stopped at the edge of the walls by a more or less substantial parapet which

had the effect of heightening the façade and hid the dormers. The interior decoration of Georgian houses culminated in the work of Robert Adam (*q.v.*) and his brother. Georgian architecture has been revived with success in the building of garden cities and suburbs. See Architecture; consult also The Decorative Part of Civil Architecture, W. Chambers, 1825.

Georgian Bay. Opening of Lake Huron, Canada. It is the N.E. arm of the lake, and is almost cut off from the main waters by a peninsula which is part of Ontario, and Grand Manitoulin Island, the opening between the two being only about 30 m. wide. It is about 120 m. long and 50 m. broad, and its various bays receive several of the rivers of Ontario.

Georgics (Gr. *geōrgikē*, husbandry). Didactic poem by Virgil, in four books. Composed 37-31 B.C., it deals with agriculture, fruit trees, domestic animals, and bees. It abounds in passages of great beauty, while technically it is a flawless poem.

Geothermal Gradient. Geological term denoting the rate at which the rock temperature rises with increasing depth below the surface of the earth. The increment in temperature in the upper part of the earth's crust is generally assumed to average 1° C. for every 30 metres of depth; at this rate the temperature should be 100° C. at about 10,000 ft. In coal and oil fields, and near recent igneous activity, the geothermal gradient is steeper, whilst in stable regions of considerable geological age, it is less.

Geotropism (Gr. *gē*, earth; *trōpē*, a turning). The bending of part of a plant in response to the influence of gravity. Typically main roots grow vertically downwards, main shoots upwards. The effect of gravity on either type of organ in any other orientation is

independent people, being merged in the Avars (*q.v.*).

Gera. Largest town of Thuringia, Germany. It stands on the White Elster, 35 m. S.S.W. of Leipzig. An important rail and air junction, and until 1920 the capital of the former principality of Reuss, it was first mentioned as a settlement in 995, and from the 13th century belonged to a junior branch of the Saxon dynasty. The chief buildings include the town hall, 1571; two fine churches, S. Trinity and S. Salvator, dating respectively from the 13th and 18th centuries; and an orphanage, now a museum. Industries include the manufacture of textiles, machinery, and various kinds of leather. Engineering plants employed some 20,000 workers before the Second Great War. Pop. 83,775.

Gerace. City of Italy, in the prov. of Reggio di Calabria near the ancient Locri. It stands on the slope of a mountain, at an elevation of 1,570 ft., 4 m. from the sea, 58 m. by rly. N.E. of Reggio. It has a restored cathedral, wrecked by an earthquake in 1783, with Romanesque remains. In the

from which, by rly., it is 306 m. distant, N. by W. It is also the terminus of a rly. which penetrates inland for 600 m., serving the Yal-goo, Mt. Magnet, Cue, and Nannine goldfields. Exports comprise not only gold, silver, and lead, but also wool, wheat, and tomatoes, the produce of this area. Pop. 5,150.

Geraniaceae. Large family of plants, chiefly herbs. They are natives of temperate and tropical regions. The leaves are opposite or alternate, of varied form; the flowers regular or irregular. Many species have astringent or aromatic properties, or abound in volatile oil. Others are rich in oxalic acid, and some have edible tubers. They are so called from the resemblance of the seed-pod to a crane's bill (Gr. *geranion*).

Geraniol. An unsaturated alcohol occurring in many essential oils; particularly palmarosa oil from the grass *Cymbopogon martinii*. It is important in the perfumery industry, a basis of artificial floral oils, e.g. notably rose.

Geranium. Typical genus of the family Geraniaceae. It consists mostly of small plants with small

Geranium. Foliage and flowers of, 1, *G. sanguineum*, Europe and Western Asia; 2, *G. anemoniaefolium*, Madras; 3, *G. lucidum*, Europe, West Africa, Asia

to produce a higher concentration of auxin in the lower side. As a result the lower side of a shoot and the upper side of a root so affected grow faster till the tip is directed upwards or downwards as the case may be.

Gepidae. An ancient Teutonic people, whose home in the 3rd century A.D. is said to have been the islands in the Baltic at the mouth of the Vistula. Akin to the Goths, and speaking a similar language, they accompanied them in their advance southwards and settled in what is now Hungary. After suffering defeats from Attila and Theodoric, they were conquered by the Lombards in 566. They are not heard of again as an

vicinity are sulphur springs and iron and coal mines, while the district is noted for its wine called Lacrima di Gerace. The ruins of Locri, founded in the 7th century B.C., lie nearer the coast, and near the old Torre di Gerace were discovered ruins of an Ionic temple. *Pron.* Jay-rah-chy.

Geraint. A British legendary character. Tributary prince of Devon, and one of the knights of the Round Table, he appears in the Mabinogion romance, Geraint the son of Erbin. In Tennyson's *Idylls of the King*, Geraint is married to Enid, daughter of Yniol.

Geraldton. Port of W. Australia. It stands on Champion Bay, and is the chief town N. of Perth,

regular flowers and palmate or divided leaves, often with a pungent odour. *G. anemoniaefolium*, native of Madras, however, has a somewhat shrubby stem a foot high, and large purplish-red flower. *G. pratense* (Europe) has large blue flowers, and the equally fine *G. sanguineum* (Europe and W. Asia) has blood-red flowers. *G. lucidum* (Europe, W. Africa, Asia), though its bright rosy flowers are small, has a handsome appearance with its red stems and general shining glossiness. *G. tuberosum* and *G. dissectum*, from S. Europe and Australia respectively, have edible tubers. Garden geraniums are really pelargoniums (*q.v.*). See Balsam; Herb Robert; Woodsorrel.

Gerard OF CREMONA (c. 1114-87). Arabic translator. Born at Cremona, he lived mostly at Toledo in Muslim Spain, where he began a series of translations of Arabic works into Latin. Of these perhaps the most important were a version of the *Almagest* of Ptolemy, and translations of the works of Hippocrates, Galen, Aristotle, Euclid, Abulcasis, Al-Kindi, Alfarabi, Geber, and Avicenna. Gerard was mainly responsible for the dissemination of that mature Oriental wisdom which so greatly helped the development of western arts and sciences.

Gérard, Étienne Maurice, Count (1773-1852). French soldier. Born in Lorraine, April 4, 1773, he

Étienne Gérard,
French soldier

entered the army in 1791 and became chief-of-staff to Bernadotte by 1805. He was prominent in the battles of Austerlitz, 1805, Jena, 1806, and Wagram 1809, fought also in Spain, and in recognition of his part in the victory of Bautzen, 1813, was made a count by Napoleon. In 1814 Gerard made his peace with the new regime, but rejoined Napoleon on his return from Elba and fought at Ligny. He was permitted to return to France in 1817, was made a marshal in 1831, and, commanding the Belgian expedition, took Antwerp in 1832. He died in Paris, April 17, 1852.

Gérard, François Pascal Simon, Baron (1770-1837). A French painter. He was born in Rome, May 4, 1770, and studied in Paris under David, being made a member of the revolutionary tribunal in 1793 by his master's favour. His first great success as an artist was with *Bélisaire*, 1795, and after the praise he received for a portrait of Madame Bonaparte, 1799, he became the most famous portraitist of his day. All the chief figures of the age were portrayed in his cold colour and classic style, and he died at the height of his fame, Jan. 11, 1837.

Gerard, John (1545-1612). English botanist. Born at Nantwich and educated as a surgeon, in early life he travelled in N. Europe, and settled to practise in Holborn, London. On the hill facing the Fleet river he had a wonderful physic garden with over 1,000 species of plants, of which he published a list, 1596. He is chiefly

famous for his *Herball* or *Generall Historie of Plants*, 1597, an important botanical work, based on the *Pemptades* of Dodoens, 1583, while the large majority of the woodcuts were derived from the *Eicones* of Tabernaemontanus, published at Frankfurt, 1590.

John Gerard,
English botanist

Gérardmer or **GEROMÉ**. Town of France. In the dept. of Vosges, it is 18 m. S. by W. of St. Dié. It stands near the lake of the same name, high among the mountains, and is, on account of the beautiful scenery around it, much visited by tourists. It has some manufactures and its cheeses are famous. In the market place is an enormous lime tree, 300 years old. There are baths and a hydropathic establishment in the town. Gerard, duke of Alsace in the 11th century, is its reputed founder.

Gerasa. Ancient city of Palestine, a member of the Decapolis, now in Transjordan. It is situated among the mountains of Gilead, about 20 m. E. of the Jordan, and is now called Jerash, possessing notable remains of the 2nd and 3rd centuries A.D. It has been identified with Gadara and other places, but the identification is open to doubt. In 1925 excavations here brought to light stage doors and columns of a Graeco-Roman theatre intact.

Géraud, André. French journalist, better known under his pseudonym of *Pertinax* (q.v.).

Gerber's Law. A theoretical relationship between the safe range of stress and the corresponding mean stress and the ultimate stress of a metal. The law has been used by metallurgists, but it is no more general in application than are many other similar formulae.

Gerbrandy, Pieter Sjoerds (b. 1885). Dutch jurist and statesman. He was born April 13, 1885, and educated at the gymnasium in Zetten and the free university in Amsterdam. Called to the bar in 1911 and a member of the Friesland provincial government from 1919, he was a professor of commercial law at the free university, 1930-39. Appointed minister of justice, he came to England with the rest of the Netherlands government in May, 1940, succeeding D. J. de Geer as prime minister in Sept. He was also minister for colonies, 1941-42, and for the coordination

of warfare, 1942-45. He returned with his government to the Netherlands in May, 1945, but, in conformity with his wartime declarations, resigned immediately. An active promoter of broadcasting, Gerbrandy published a book on television in 1939.

Gerenuk. East African antelope. Reddish fawn in colour, with a wide band of black down the back, it is remarkable for its very long neck which is out of all proportion to its body and gives it almost the appearance of a diminutive giraffe. Its chief food is the leaves and twigs of small trees and bushes.

Gerhardi, William Alexander (b. 1895). British author. He was born in St. Petersburg (Leningrad), Nov. 21, 1895, son of a British cotton-spinning manufacturer, educated in St. Petersburg and at Worcester College, Oxford. He went with the British military mission to Siberia, 1918-20. His first novel, *Futility*, appeared in 1922. His books include a critical study of Chekhov, 1923; *The Polyglots*, 1925; *Memoirs of a Polyglot* (autobiography), 1931; *The Casanova Fable* (with Hugh Kingsmill), 1933; *Of Mortal Love*, 1936; *The Romanoffs*, 1940; *The Sorrowful Planet*, 1945; *Highlights of Russian History*, 1947.

Gerhardsen, Einar (b. 1897). Norwegian politician. As one of a gang of road repairers in 1914, he became interested in the Norwegian labour movement. Appointed secretary of the Labour party in 1936, he was mayor of Oslo when the Germans invaded Norway in April, 1940; he left the capital with the government, but returned to his post in July. Dismissed by the Germans, he worked on the roads and joined the underground resistance movement; was deported to Germany in 1941; but was brought back to Oslo in 1944 and held at the Gestapo headquarters as a hostage against R.A.F. raids. After the liberation of Norway in May, 1945, he resumed his mayoralty and chairmanship of the Labour party, and became prime minister, being confirmed in office by the elections of 1945 and 1949.

Gerhardt, Elena (b. 1883). German soprano singer. Born at Leipzig, Nov. 11, 1883, she studied at the conservatoire there under Hedmond and later under Nikisch. She became one of the foremost singers of *Lieder*, her interpretation of the songs of Schubert, Schumann, Brahms, and Wolf establishing her fame throughout Europe and the U.S.A. She was first heard in England in 1906 and

in the U.S.A. in 1912. She gave series of recitals regularly in London, Paris, and New York, and made gramophone records.

Géricault, JEAN LOUIS ANDRÉ THÉODORE (1791-1824). French painter. Born at Rouen, Sept. 26,

J. Géricault,
French painter

1791, he studied art under Vernet and Guérin. His careful picture of a mounted chasseur officer at the Salon of 1812 was his first success in his series of military subjects.

After fighting for the king in the Hundred Days, he visited Rome and Florence. His most notable picture was *The Raft of the Medusa*, 1819 (Louvre), a shipwreck scene of exceptional size (24 ft. by 18 ft.), painted with a fine sense of natural form and dramatic detail, and much admired by the romantic school of painters. It was exhibited with success in London, 1820-22, where Géricault then lived. He died in Paris, Jan. 26, 1824. His work marks the breaking away of French painting from the classic tradition of David.

Gerizim. Hill of Samaria. It stands near Shechem or Nablus, and is associated with an adjoining hill, Ebal. The curses and blessings in connexion with the law were pronounced respectively from these two hills, and the Samaritan temple was built on the former.

Germ (Lat. *germen*, bud). In embryology, the vital particle from which an organism (animal or plant) develops; in bacteriology, a bacillus or micro-organism which causes a disease. The term is also used for the beginning of a thing, e.g. the germ of an idea. See *Bacillus*; *Bacteriology*; *Embryology*.

German, SIR EDWARD (1862-1936). British composer. Edward German Jones was born at Whitchurch, Salop, Feb. 17, 1862, and studied at the Royal Academy of Music. In 1888 he became musical director at The Globe theatre, London, and while there produced the incidental music to *Richard III* (1889), which first made his reputation. This was enhanced by music to *Henry VIII*,

Sir E. German,
British composer
Russell

especially the dances, written for The Lyceum in 1892. German completed Sullivan's unfinished opera, *The Emerald Isle* (1901), and composed *Merrie England* (1902), *A Princess of Kensington* (1903), and *Tom Jones* (1907). His other works include symphonies, a Welsh Rhapsody, and *Theme and Six Diversions* for orchestra. His work is marked by a fluency and melodiousness which made it widely popular. Knighted in 1928, he died Nov. 11, 1936.

German Catholics. Religious sect founded in 1844 by two dissenting R.C. priests, independently of each other, with a first large congregation at Breslau. The movement, which wanted independence from Rome and rejected large parts of the R.C. dogma, spread rapidly and held a council at Leipzig, presided over by Robert Blum, the leader of democracy executed in 1848. In 1846 there were 200 congregations and 70,000 officially registered members. The new church declined under the reactionary measures, merged with other sects, or lost its members by emigration to the U.S.A. and conversion to Protestantism.

German Freedom Party. Anti-Nazi movement established in Germany in 1937. The party claimed to represent all classes, former political parties, and chief religious bodies. It circulated a manifesto and operated mobile broadcasting stations. Hitler singled it out for direct attack in Oct., 1937, and many members were hunted down by the Gestapo. During the Second Great War broadcasts in the name of the Freedom Party were occasionally picked up emanating from an unknown station in Germany. The first issue of *Die Zeitung*, a Free German newspaper, appeared in London on March 12, 1941. A related movement in the U.S.S.R. received official recognition, a Free German army being formed under Field Marshal Paulus, who surrendered at Stalingrad. This force in 1946 was stationed in Poland.

Germania. Latin name for Germany. As such it is the title of the work of Tacitus on the manners and customs of the tribes of Germany about the opening of the Christian era, this being the chief authority on the subject. It is also used as a personification of the German people as *Britannia* is of the British. An example of this is the gigantic statue of *Germania*, 33 ft. high, which stands on the Niederwald, overlooking the Rhine. It commemorates the Franco-

Prussian War of 1870-71 and the consequent union of Germany.

Germanicus, CAESAR (15 B.C.-A.D. 19). Roman general. A son of Nero Claudius Drusus, Germanicus was nephew of the emperor Tiberius. Having distinguished himself against the Pannonians (A.D. 7-9), in 12 he was consul, and as commander in Gaul and on the Rhine, quelled a dangerous mutiny. To occupy his soldiers, he crossed the Rhine, attacked and defeated the Marsi and Chatti, and in 16 obtained a victory over Arminius on the Campus Idistavisus, near Hameln on the Weser.

Germanicus
From head of marble
statue found at Gaius
1782, now in the Louvre,
Paris

Recalled to Rome by the jealous Tiberius, he was sent with extensive powers to settle affairs in the East. His mission was successful, but he was continually thwarted by Calpurnius Piso, governor of Syria, probably instructed by Tiberius. Returning from a visit to Egypt, he died at Daphne, near Antioch, poisoned, it was said, by Piso. His body was taken to Rome and buried amidst general grief. His free translation of the *Phaenomena*, an astronomical poem by Aratus, is extant. Among his children were the future emperor Caligula and Agrippina, mother of Nero.

Germanium. Rare metal, first identified by C. Winkler in 1886, after a careful analysis of the silver mineral argyrodite. He discovered that it fitted into the place in the periodic table reserved by Mendeléeff for "eka-silicon" and thus it is one of the elements which the Russian chemist was able to predict long before its actual discovery.

Germanium, symbol Ge, occurs associated with silver, copper, cadmium, zinc, and other metals, chiefly at Freiberg, Germany, whence its name, and also in the mineral euxenite. The extraction is carried out by chemical means after fusion with sodium carbonate and sulphur, or by volatilisation of the tetrachloride. The metal is greyish white with a crystalline structure and melts at 958° C. The atomic number is 32; atomic weight 72.60; and its crystal structure is of the diamond type with an interatomic distance of 2.44. It burns in the Bunsen

flame without colouring it, but resists atmospheric corrosion. Insoluble in hydrochloric acid, it is readily dissolved by aqua regia. The structure of gold-germanium alloys has been studied and they may be used for gold solders, 12 p.c. germanium giving a eutectic which melts at 356° C.

German Measles or RUBELLA. Feverish condition quite distinct from ordinary measles and from scarlet fever. The incubation period is about a fortnight to three weeks, and the condition is infectious for a day or two before the fever declares itself. The infective agent is probably a filterable virus. Occurrence of German measles in a pregnant woman appears to have some association with congenital malformation in the child.

A catarrhal stage is followed by a rash, and there is inflammation of the glands of the neck. This enlargement of the glands of the mastoid and occipital regions is characteristic of the disease. The degree of fever is slight and usually a quick convalescence ensues. Papular in its first stage, the rash suddenly fuses and resembles that of scarlet fever, appearing on the face and neck and invading the trunk.

Treatment consists of simple nursing and the alleviation of the symptoms. For practical purposes the patient ceases to be contagious when the rash has faded and the catarrh has subsided.

Germans Abroad. An organization, originally mainly a cultural one, systematically transformed by Nazi infiltration and domination into a main instrument for Hitler's plan of world conquest. It was based on three existing organizations: the Volksbund für das Deutschtum im Ausland, founded 1881; the Deutsches Auslands-Institut, 1917; the Bund der Auslandsdeutschen, 1918; all activities being merged in 1933. It was controlled first by the Nazi party's office of foreign policy, under Rosenberg, later under Ribbentrop; then in 1937 transformed into a branch of the foreign office under Bradford-born Bohle, responsible only to Hitler and Hess.

The purpose of turning all German-born, German-speaking, or "racially" German groups within foreign countries into auxiliaries of a programme of conquest was systematically fostered by literature; by the acquisition or subsidising of newspapers and periodicals; by huge festivals in

Germany to which masses of such Germans from abroad were invited; and by the sending out of Nazi, and the training in Germany of foreign, "leaders," speakers, spies, saboteurs. Rosenberg had tabulated as Germans Abroad:

9,000,000 in the U.S.A.
3,500,000 in Czecho-Slovakia
1,300,000 in Poland
1,300,000 in the U.S.S.R.
800,000 in Rumania
800,000 in Brazil
725,000 in the British Commonwealth (except the U.K.)
750,000 in Yugoslavia
550,000 in Hungary
360,000 in Danzig
130,000 in Lithuania
125,000 in Chile and other S. American states
70,000 in Latvia
30,000 in Estonia

totaling with smaller groups in other countries over 20,000,000.

Preparations proved successful in, e.g., the plot of the German Bund in the U.S.A. and the espionage and sabotage organized by it; armed pseudo-military organizations in Argentina and other S. American countries; clashes arranged immediately before the Nazi attack on Poland; the whole Sudeten German revolt that led in 1938-39 to the dismemberment of Czecho-Slovakia. In countries with an originally "Germanic" population themselves—Switzerland, Luxemburg, Holland, Flanders—there were coloured-shirt bodies with "Führers" of their own, but the purpose and technique, under direction from Berlin, were identical. Bohle and other speakers had by 1936 openly revealed their aims.

German Silver. Name covering a group of alloys, whose chief constituents are copper, zinc, and nickel. Compositions vary between 50 and 65 p.c. copper, 20 and 35 p.c. zinc, 10 and 30 p.c. nickel. The alloys get their name from the characteristic colour, which is due to the decolorising effect of the nickel on what would otherwise be a brass. They are used for fittings, ornaments, motor car radiators, etc., and commonly as the basis for chromium- or silver-plated goods such as candlesticks and spoons. The alloys may be drawn, spun, rolled, or wrought. Castings have a heavily cored structure typical of an alpha solid solution. White copper, used in Saxony from remote times, and the Chinese packfong, were probably the forerunners of German silver.

German Sixth. In music, chromatic chord consisting of a bass note with a major third, perfect fifth, and augmented sixth

above it, as here shown. It belongs to the key of its major third—in this example C—but it can be used also in other keys.

The origin of the name is obscure. See Augmentation; Chromatic; Harmony; Interval.

German Tinder or AMADOU. Hard, corky substance of *Fomes fomentarius*, a destructive tree-fungus, after it has been cut in thin slices, hammered out, and treated with saltpetre. Before the invention of the friction-match it was much used to obtain fire from the flint and steel tinder-box. Pieces of the dried fungus, without treatment, will smoulder for hours after a corner has been ignited. Without the saltpetre it was used in the contrivance of caps and other articles of clothing. An inferior amadou is made from *Fomes igniarius*.

Germantown. Former borough of Pennsylvania, U.S.A., in Montgomery co. In 1854 it became a part of Philadelphia. A residential district, about 5 m. N. of the central point of the city, it contains several historical houses, and is notable as the site of the first paper mill erected in the U.S.A., and for the publication of the first American edition of the Bible in a European language.

Germantown was settled in 1683 by thirteen families from Crefeld, Germany, and became a borough in 1689. It soon became a stronghold of the Society of Friends, who built a meeting-house here about 1693. It has two inns, the King of Prussia and the Mermaid, dating from the 18th century. Its founder, Francis D. Pastorius, was a schoolmaster here, and is notable as one of four who signed the first public protest against slavery. In 1789 an attempt was made to fix the capital of the U.S.A. at Germantown, and it was actually the capital in 1793, owing to an outbreak of yellow fever in Philadelphia (q.v.).

The battle of Germantown was fought between the British and the Americans, Oct. 4, 1777. A British force under Sir W. Howe was in the town when it was attacked by Washington. With his men advancing in two bodies, he attempted a surprise, but after an initial success this failed. There was some fighting in and around the houses, but the end was the retreat of the Americans with a loss of about 700 men. The losses of the British were fewer.

GERMANY: ITS PEOPLE AND ITS HISTORY

EDGAR STERN-RUBARTH, Ph.D., and J. G. ROBERTSON

A description of the physical features and natural resources of Germany and an account of the people and their former industries and activities is followed by an historical narrative covering eleven centuries, with separate sections on literature and art; for German music, see Music. History since 1939 is given in the subsequent article, Germany in the Second Great War. See also articles on German cities, rivers, mountains etc.; rulers and statesmen; scholars and men of letters; and the various states of the federation

Germany, as a political unit under varying names, has been the most powerful state in Central Europe since the disintegration of the Roman Empire. Though shifting its borders frequently and considerably in the course of centuries, it has occupied in the main the plains between the Alps and the North Sea and Baltic, between the Rhine and the Oder, sometimes embracing part of what was later France, Italy, Austria, or Poland. The German republic of 1919 bordered on the Netherlands, Belgium, Luxemburg, France in the W.; Switzerland, Austria, and Czechoslovakia in the S.; Poland and Lithuania in the E.; and Denmark in the N. Its sea coast was slightly over 1,000 m. long. Its total area, as established by the Versailles treaty, covered 181,770 sq. m., 27,000 sq. m. less than that of Imperial Germany. In consequence of defeat in 1945, not only were the temporary conquests and annexations of Hitler cancelled, but Germany lost vast parts of her former territory: East Prussia and Silesia, as well as portions of Pomerania and Brandenburg.

Physical Features

The N. of the country is flat. In the centre a range of hills and mts. cuts across from W. of the Rhine to the Sudeten range between Elbe and Oder. The highest points are, in the centre, the Harz mts., where the Brocken is 3,730 ft. high; in the E., the Giant mts. (Riesengebirge) with a peak of 5,260 ft. In the S., the Black Forest and ridges of the Alps with their spurs determine the mountainous character of the landscape; in the former rises the Feldberg, nearly 4,900 ft., in the latter the Zugspitze, 9,715 ft. Many of these upland landscapes are famous for their rich and varied vegetation, climbing and sporting facilities, attractive views, and hostleries: apart from those named, there are the Taunus and Odenwald hills, the former with such famous spas as Wiesbaden and Homburg; the Spessart, Vogelsberg, and adjoining Thuringian Forest; and the Iron mts., the "Saxon Switzerland," near the great Saxon cities.

The German rivers take their direction from the character of the landscape. The Rhine, Weser,

Elbe, and Oder were German waterways leading to the country's N. shores, while in the S. the Danube, springing from the Black Forest, flows with its Alpine tributaries E. to the Balkan plains. With their affluents and a network of canals these rivers gave Germany a system of fluvial transport of 7,650 m. Among tributaries, the Neckar, Main, Moselle, and Ruhr are those of the Rhine; the Aller that of the Weser; the Saale, Havel, and Spree join the Elbe; the Neisse and Warthe flow into the Oder; among Danubian streams are the Isar and Inn. The great ports of Bremen, Hamburg, and Slettin lie respectively near the mouths of Weser, Elbe, and Oder; Emden, Lübeck, and Kiel are other seaports; the former free city of Danzig, annexed by Hitler Sept. 1, 1939, and Königsberg came respectively under Polish and Russian administration in 1945.

The Kiel Canal

The Kiel Canal, over 60 m. long, connects the North Sea and the Baltic; since its opening in 1895, artificial waterways have linked most of the greater German rivers, from the system of the Rhine to that of the Danube.

The large number of lakes is another characteristic. Lake Constance (Bodensee) is shared by Switzerland, Austria, Bavaria, Württemberg, and Baden. There are beautiful and frequented lakes in S. Bavaria, e.g. Chiemsee, Ammersee, Tegernsee, Königsee, Walchensee, the last-named being exploited for one of the biggest electric power plants in the country. Berlin is surrounded by lakes, of which the best known is the Wannsee. Mineral springs abound, and since Roman times there have developed in Germany many spas and health resorts, with the appropriate science and technique and adequate hotel-keeping for every class of visitor. Recently the Frisian Islands, Rügen, and some coastal towns and villages have become holiday resorts.

The German climate, though widely varied, is on the whole warmer in summer and colder in winter than that of Great Britain; the mean temperature is 49° F., but there are parts in S.W. Germany where the July mean is as high

as 70° F., and in N.E. Germany, where the Jan. mean is as low as 24° F. The rainfall varies from 66 ins. a year in the Harz and other mts. to 20 ins. in the central and eastern plains; average 27.5 ins.

Of German soil, either wooded or under forest cultivation, as state or other public property, there was in 1935 a total of slightly over 30 million acres, or 27.2 p.c. of the country. Special laws compelled the owners of private forest to replant after cutting down their timber, and forestry was a highly developed branch of public service, backed by science. In the lesser hills and in the plains deciduous trees predominate, while in the higher ranges coniferous trees, although mixed with beech, oak, etc., prevail. Game, once abundant in all wooded parts, has become sparse, except in reservations. Bear and lynx have vanished; the marten has to be preserved, as well as the beaver; wild cats and badgers exist here and there. Deer, hare, and less often hart, are the main quarry of hunters, besides pheasant and other birds, among them the rare heath cock and rarer mountain cock.

Increase in Population

Latest pre-Nazi figure, Jan. 1, 1933, gave the pop. of the Reich, including the Saar area returned to Germany in 1935, as 66,141,153, as against about 41 millions in 1871, and 61,800,000 in 1920, after the loss of territories taken by France, Poland, etc. The increase before 1914 was between 11.4 and 13 per 1,000 per year; between 7.1 and 8.8 in the years 1922-33, it was artificially increased during the Nazi period by marriage premiums, propaganda, and wage and tax concessions. The cities showed a remarkable growth from 1871. Then only eight had 100,000 inhabitants; there were 57 such in 1935, Berlin and Hamburg each having over 1,000,000. This development was due mainly to the general trend of industrialisation at the expense of agriculture. From about half in 1871, the agricultural, horticultural, and sylvicultural population had dropped by 1935 to 30.5 p.c. of the total, though the loss by emigration, 4.3 per 1,000 per year during 1881-85, had dwindled to next to

nothing around the turn of the century. Subsequently the farming estates in north and east had to import seasonal labour, and the Ruhr and other mines permanent workers, from Poland, Russia, Italy, and Austria.

The social structure of the population showed that in 1933 there were 5.5 million independent people in business or professions, 5.3 million employees, clerks, and civil servants, 14.4 million workers, and 5.4 million relatives collaborating in the trade of the family head. The religious composition—in 1933, before the Nazis expelled and persecuted the Jews and attacked the churches—was 64.4 p.c. Protestants (of several denominations), 32.3 p.c. Roman Catholics, 0.9 p.c. Jews, 2.4 p.c. of another or no faith.

INDUSTRIES. As against the 30.5 p.c. in agriculture, etc., there was in 1933 16.5 p.c. of the working population engaged in trading and transport, and 41.4 p.c. in industry. The latter figure was increased during Hitler's preparation for war, though no reliable figures are available. This development was favoured by the wealth of coal of certain areas, the Ruhr basin, the Saar, Upper Silesia, and central Germany, where, besides coal, enormous layers of lignite are exploited for heating and power-generating purposes. Of both coal and lignite the annual production averaged 150 million tons, valued at £200 millions for the former and £40 millions for the latter. The necessary complement for basic industries, iron ore, was available only in small quantities after the return of Alsace-Lorraine to France, so that German industry, from 1920, depended upon imports for over 80 p.c. of one of its essential raw materials. On the other hand, Germany possesses very rich deposits of potash; small oil fields (considerably enlarged under the pressure of war); and mines for a number of other ores.

Every Kind of Production

German industries comprised virtually every kind of production. Having developed later than those of Great Britain, they started competing in the world's markets with cheaper, often shoddy, products; yet, helped by clever engineers and scientists, around the turn of the century they began to offer serious rivalry to British, and later American, goods, in quality as well as in price. A rapid transformation of the once individual enterprises into huge

combines, trusts, cartels, and syndicates, and a rising standard of living and education among the workers, represented by increasingly powerful trade unions, fostered this evolution.

The far-reaching social measures of 1881–1911 were due less to direct Socialist influence than the attempt to thwart Socialism. They included compulsory insurance against illness, accident, invalidity, and old age, completed finally in 1927 by that against unemployment. Wages were, in most industries, lower than in Great Britain and the U.S.A., but permitted a decent standard of living to the manual workers; education was largely free, or subsidised and cheap enough for workers' families to enter the best schools and talented children to join the universities.

Industrial Combines

The leading enterprises, those of the coal and iron barons of the Ruhr—Krupp, Thyssen, Stinnes, Kirdorf, Hoesch, Haniel, Mannesmann—often took even before 1914 the form of huge combines with ramifications among overlapping enterprises. In the electrical industry, the Siemens combine and the A.E.G. (General Electric) numbered their employees by the hundred thousand; in the dye and chemical industry, in which Germany was then leading the world, five or six main companies, each with 10,000–20,000 workers, created a cartel in 1904 which finally, in 1925, led to a complete merger embracing many other big plants, known as I. G. Farbenindustrie. Steel plants combined in a similar huge trust. The Hamburg-America and the North German Lloyd shipping companies, with several others, pooled their resources. With a majority share acquired by the state, the main electric power plants were united. By clever and unscrupulous exploiting of the inflation of 1920–23, the Ruhr magnate Hugo Stinnes brought into being a colossal heterogeneous trust comprising coal, iron, engineering, shipping, newsprint, hotel, and building interests which, though it split after his death in 1924, left its imprint upon German industrial life.

The workers used their strength in parliament and government to secure stability of wages and conditions. The republic accordingly had created a generally satisfactory system of compulsory arbitration in all kinds of labour conflicts, with superior courts to enforce decisions. In fact, without

the world economic crisis of 1930–31 and the ensuing severe unemployment and wage-cutting by government decrees, it seems likely that the rapid process of concentration among both the industrialists and the employees would have led to a compromise granting a high measure of social justice.

TRADE FIGURES. The German output of industrial products, for home consumption as well as for export, grew faster than that of any other European country. Under 3,000 million marks in 1880 (20 marks = £1 gold) for exports and home use alike, the trade figures rose to 6,000 and 5,000 million marks respectively in 1900; 11,600 and 10,900 million marks in 1913 and, after the setback of war, again by about 1925; in 1927–29 about 15,000 million marks each for exports and home use were shown. While previously imports—in consequence partly of American loans—exceeded exports, the foreign trade balance showed a surplus of exports from 1929 to 1933. Per head of pop. the total foreign trade (import and export) was 126 marks in 1880; 258 in 1910; 416 in 1929; 159 in 1932.

The setback during the world crisis was partly made good by great public works and an extension of electric light and power, gas and water schemes, sports arenas, and workers' model settlements. The obligatory public insurances, applicable to 20 million people, cost about 550 million marks per year for medical and health services alone, apart from 350 millions for indemnification for accidents, 725 millions for invalidity, and 230 millions for widows' and orphans' annuities.

Collapse of Pension Schemes

Big combines had supplementary pension schemes and assistance organizations. The whole system, safeguarded at first by strict state control and a careful distribution of funds, was sadly depleted and undermined by the unscrupulous confiscation of most of these investments by the Nazi authorities, in exchange for promissory notes and uncontrolled war loans and bonds. After defeat in 1945 the insurance had to be improvised, and grants made did not approach those of earlier years.

SCIENCE AND TECHNIQUE. The great chemical industry, with its virtual world monopoly in some pharmaceutical products, was the result of laboratory research on the largest scale, financed and equipped by the companies themselves. Progress in the electrical

field was due to the research of hundreds of scientists in the laboratories of Siemens, A.E.G., etc. Optical and surgical instruments, the former above all made by the Zeiss plants at Jena, had an international reputation. The production of nitrogen from air for fertilisers and later for explosives; of liquid fuel from coal; of a large range of artificial fibres for textiles, resulted from planned co-operation between industry and science. Technical high schools, equivalent in their requirements for admittance and in their final degrees to universities, were, however, strictly separated from the latter, at Charlottenburg, Hanover, Aachen (Aix-la-Chapelle), Darmstadt, Munich, Brunswick, Dresden, etc. Forestry, viticulture, and beer brewing had their own old-established high schools. German surgeons, physicians, dentists, linguists, and economists ranked very high.

Control of Education

Even under the Weimar republic, education was left to the control of individual states. It was completely centralised only by the Nazis for their perverse ends. Schooling was obligatory everywhere from the completion of the 6th to the 14th year, and regular evening classes until the age of 18 were then compulsory. During the period of conscription, up to 1918, success at the final examination at a *Realschule*, which taught two foreign languages and some science, carried the privilege of serving only one instead of two or three years with the forces, and of eventually qualifying for a reserve officer's commission; as did attendance at a *Gymnasium* (public school). This generally accepted belief in higher education was implanted and developed, not exclusively in a benevolent and progressive spirit, by the Imperial government. It was made to serve the creation of that obedience, discipline, militarism, and false pride of race and regime which were exploited by Bismarck, William II, and finally Hitler for the most ambitious and egoistic ventures in world politics.

TRANSPORT. The fact that Germany developed the most comprehensive transport system of any great power can be explained from a similar political motive. With long frontiers difficult to defend and always at least two potential adversaries in France and Russia or Poland, the military-minded rulers of Germany felt themselves compelled to have every possible

facility for moving masses of troops and war material from one end of the Reich to the other. Railways, made state properties during 1872-95, increased from 23,400 m. in 1870 to exactly 70,000 m. in 1930. The mesh of motor highways built under but planned before Hitler, if on less strategic lines, supplemented this rly. network with communications equalled only in the U.S.A. Inland navigation helped the movement of heavy goods, such as coal, ore, timber, grain, and bricks. Even before the Nazi interest in aviation for warlike ends, a considerable air transport system had been developed, from 1926 mainly the monopoly of the government, with a frequent service, mostly by Junkers aircraft, according to time-tables. Efficient bus services were owned by local government or, as in Bavaria and Saxony, by the state. Other bus routes in thinly populated parts were run by the postal authorities, often irrespective of revenue.

THE GERMAN CHARACTER. The "nation of poets and thinkers," as the Germans were called when split into small sovereign states, had, from the creation of Bismarck's empire, nearly unanimously adopted the Prussian method of bullying a way into the comity of the Great Powers. While frequently modest, simple, and home-loving in private life, and hard-working, in many ways idealistic, in their work, the Germans in the mass proved susceptible and willing instruments of propaganda.

The German Character

Even the feminine element—submissive in Imperial days, more active and frequently pacifist in the early days of the republic, and taking an active share in parliament and public life—gave way to the temptation of seeing the menfolk "martial" once more, of being flattered, cajoled, and finally directed into its sphere of *Küche, Kinder, und Kirche*—kitchen, children, and church.

The peculiar traits shown by the German people, if not as a whole, at least by its most distinctive parts, during half a century and more, cannot be the result of any inherent racial character. For there is no German race. About 100 million people speaking German inside and outside the Reich are no more of one blood than the 200 millions who speak English, the 90 millions who speak Spanish, or the 150 millions who speak Russian. They are Franks in the W. and centre, Dinarrians like

some Balkan people in the S., Slavonic in the E., and Teutonic only in parts of the N. Their outlook on life, behaviour to other nations, and what for simplification is called their militarism are the result of circumstances: teaching, example, and leadership. Given to a strong inferiority complex, the result of centuries of dismemberment and political powerlessness, the Germans, and in particular their Prussian overlords, have been inclined to overcompensate it by an aggressive attitude in periods of success and unity, however brought about. Forced to work hard on a densely populated, essentially poor soil, they are inclined to make discipline an end in itself, and fall an easy prey to superiors who abuse this inclination for their own ends.

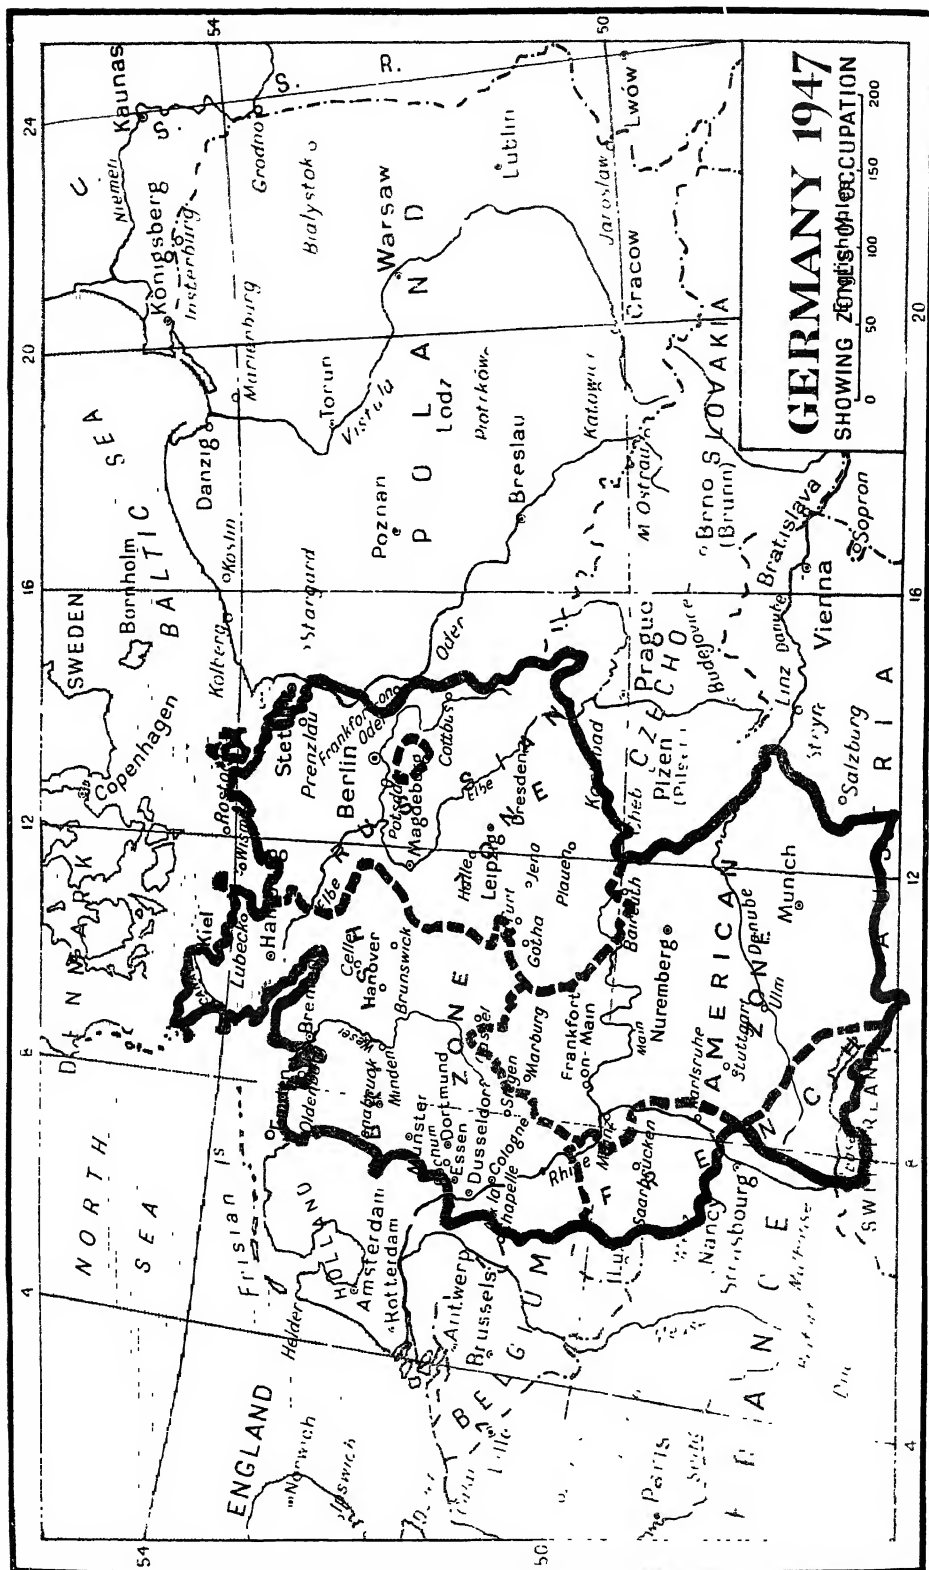

HISTORY. Germany—Empire, or Kingdom, or Holy Roman Empire, as she was called at different times—had no centralised monarchy such as developed in France and England at an early period. Except for a few strong rulers who temporarily wielded supreme power, Germany was a federation of semi-independent regional rulers, frequently fighting with each other or against their imperial overlord.

Early Trends

Three characteristics in particular account for the trend of her history from Carolingian days, when first those former Roman colonial outposts among wild tribes developed into some sort of a nation: (1) the old Teutonic custom of electing the ruler, in disregard of hereditary claims; (2) the contempt in which the ancestral tribes held the arts and industries of peace and the comforts of civilization, leaving agriculture and handicrafts to their women and slaves, and exalting warfare, hunting, drinking, and gambling; (3) the rivalry of the German kings and emperors with the popes for primacy within the Holy Roman Empire.

The first led to numerous civil wars between claimants to the German crown; the second to a comparatively late development of cities and urban culture; the third to centuries of campaigning in Italy which weakened Germany proper and the hold of its rulers over their own country. In consequence of the diversion of that interest came the frequent raids by neighbours—Norsemen on the coasts, Hungarians, Avars, and Slavonic peoples from E. and S.E., and, in later centuries, Frenchmen, Swedes, and Russians. So the German population, already in its

Note: a U.S. enclave surrounding Bremen, Bremerhaven, and Wesermünde, within the British zone, was transferred to British administration on Dec. 10, 1945, except for the actual ports, which the Americans retained until the end of military government in Sept., 1949. Berlin (*q.v.*) was divided into its own four occupation zones

ancestral composition including Slavonic, Celtic, and Dinaric elements, became a complex mixture, retaining its Teutonic character only in part of the N.W.

In the Palaeolithic period man lived in Germany, where the stone and bone implements that he used have been found. In the Neolithic age he was spread over a good deal of the country, this being proved by the discovery of his dwellings, implements, and graves. The Bronze age saw a marked increase in the civilizing agencies, and soon the people possessed chariots and other weapons, lived in strongly built houses, and knew something of the arts and refinements of life. To this they were helped by a trade with the Mediterranean regions. Such is the evidence of the soil and the spade; written evidence begins with the Romans.

Roman Settlements

After a first assault upon the Roman empire itself, by two migrating German tribes, the Cimbri and Teutones, at first victorious in S. Gaul, Spain, and N. Italy, and finally annihilated by Marius at Vercellae in 101 B.C., Rome soon started in turn the conquest of these unruly neighbours. In 55 B.C., the year he first landed in Britain, Julius Caesar crossed the Rhine in pursuit of retreating tribes, and conquered some of them; after his day began the military settlement of the Romans along the valleys of the Rhine and the Danube. After the defeat of Varus by Arminius in A.D. 9, these rivers were regarded as the boundaries of the empire, and camps were established along or near the two valleys. From these sprang many of the German cities of today, Cologne, Mainz, Cleves, Treves, Augsburg, Spire, and Worms; therein through the dark ages, that followed there lingered traces of Roman civilization.

Now and again, in the early centuries, the Romans moved across from these rivers into Germany, but without achieving any real successes in the interior. Tacitus, in his *Germania*, names a large number of tribes in Germany, but most of these are names only, and in a century or two most had disappeared from history.

From one of these names came our word Germany. Julius Caesar referred to a group of tribes as Germani, and later Tacitus used the name, although for a different group. The latter author perpetuated it, moreover, in his invaluable work, and thus it became the Latin, and later the English, name

for the country. The Latin-speaking Germans of the monasteries, however, when their land was part of the Frankish empire, called it Francia, and later, as a single German speech came into existence, the word Deutsch was evolved. From this came Deutschland, although it was not generally used until the 15th century, this delay being due to the inclusion of Germany in the Holy Roman Empire with the sonorous description of its ruler as Imperator Romanorum.

Gradually, as in Britain, the Roman power grew weaker, and in the 3rd and 4th centuries the Romans were compelled to fight hard against tribes who refused to acknowledge their authority. Among these was the confederation known as the Alamanni, who carried the war on to Roman soil. From the east came an inrush of Huns, who swept across the land, and then with the appearance of the Franks the history of the land becomes a little clearer. From about 600, certain tribes or groups of tribes bearing familiar names appear, and a fairly continuous story can be traced.

Kingdom of Clovis

The chief of these tribes were the Franks, the Saxons, and the Bavarians. The Franks settled in both France and Germany, and the state they founded covered a considerable portion of each, a fact which does something to explain the long struggles for the possession of Alsace-Lorraine and the neighbourhood. Under Clovis, who died in 511, they became a kingdom, and this kingdom of the Franks grew into the empire of Charlemagne, the Frankish part of Germany being that lying along the Rhine, while its ruler had a more or less vague authority over other parts. In addition to this kingdom, Germany appears at this time to have been divided into Swabia, Saxony, Thuringia, and Bavaria, with an eastern portion inhabited by Slav tribes, some of whose names were perpetuated in Pomerania, Brandenburg, etc.

The kingdom of Clovis became that of the Merovingian kings of the Franks, under whose feeble rule the German tribes conquered by Clovis became again independent. Then followed the rise of Pepin of Heristal and the Carolingian family. Pepin and Charles Martel recovered the lost authority of the Franks over the Bavarians and the Thuringians, who were included in the great empire of Charlemagne.

Having become the king of the Franks, Charlemagne soon made

his rule effectual in western Germany, save only over the Saxons. A war with them was decided upon, and after a struggle lasting for about 30 years they were brought under his authority. He turned his arm also against the Slavs, who for many years had been troubling the eastern part of Germany.

Establishment of Christianity

Christianity in Germany, though introduced by the Romans in the border areas protected by the fortified line along Rhine and Danube, dates in the main from the missionary work of the Wessex priest Winfrith (680-755), later called Boniface and ordained bishop and archbishop of Germany by the Pope. With mostly English or Irish helpers, he converted the still heathen tribes, founding monasteries and churches in Bavaria, Thuringia, on the Rhine, and among the Frisians, among whom he was finally slain by a fanatic. Though at first much of the progress towards Christianity was superficial, and many of the converts were certainly only obeying the orders of a king when they were baptized, the monasteries and churches, which became centres of learning and civilizing and humanising agencies, were of incalculable benefit to the people.

Closely associated with this religious movement was the revival of learning. Much has been written about the scholars, Alcuin and others, whom Charlemagne gathered around him; while his love of learning was revealed in other ways. The revival which he encouraged produced a literature, almost wholly monastic, narrow in outlook, but yet of great value for the life of the age. Schools also, again solely under ecclesiastical influence, were founded.

About the social and economic life of the Germans at this time only generalisations are possible. Without stressing the frequently quoted remark of Tacitus about their hatred of town life, it is certain that the vast majority of them lived in the country. Trade was yet in its infancy, and the nearest approach to a town community was the group of dwellings housing its dependants that sprang up around a rich abbey, the palace of a king, or the seat of a bishop. There were settled the smiths who made weapons of war and of hunting, and a number of other skilled craftsmen whose work was of a more ornamental kind. But the tilling of the soil and the care of cattle were evidently the main occupations of the people.

The small communities in which the people lived were largely self-governing. Defence, one of their main considerations, had to be provided for, and there was probably some regular system of dividing the arable lands among the villagers or marksmen. In some way or other they contributed to the revenues of their chief or king; they were liable to be called upon to go and fight for him, and collectively they were responsible for the peace in their village. Force, tempered by custom, was the law under which they lived.

Division of Charlemagne's Empire

Soon after the death of Charlemagne, in 814, his great empire fell to pieces, and in 843 a most important arrangement was made between his grandsons. By a treaty signed at Verdun, the empire was divided, and that part which lay to the east of the Rhine, together with some smaller portions on the west, was given to Louis. Later generations labelled Louis the German, and although his kingdom was known as East France, it was really Germany, and he may fairly be called the first German king. He made Ratisbon his capital, and ruled over a good deal of what is now Germany, while his people had a vague idea that they formed a distinct unit in Europe. In 870, after the death of Lothair, a brother for whom the "middle kingdom" of Lotharingia had been created, Louis the German gained most of it by treaty with Charles the Bald of France.

Louis died in 876 and his kingdom soon fell to pieces. His son Charles the Fat inherited it as he did most of France proper, but he was unable to defend it from the attacks of the Magyars, invaders from the east, who had been kept in awe by Charlemagne. He was troubled, too, by the Northmen, or Danes, as the English called them; and, like Ethelred of Wessex, paid them to go away. At length the Germans, eager for security, deposed him, choosing in his stead his nephew Arnulf. Ranke describes this event, which took place at Tribur in 887, as "the first independent action of the German secular world." Arnulf, however, died a few years later, leaving only a boy to succeed him.

At this time the misery of Germany was extreme. Deep in the German mind was the idea that they had the right and the power to choose their king, and to this old expedient they now turned again. The prelates naturally took the lead, being educated, rich, and influential, and, with some of the secular nobles, they fixed upon Conrad,

a powerful man in Franconia, and in 911 they chose him as king.

By this time feudalism, or something like it, had appeared in Germany. Desiring protection, men had promised, in return therefor, their services to some powerful person in the neighbourhood, thus becoming his vassals. So appeared the beginnings of a hierarchy at the head of which was the king. Some of the reforms introduced by Charlemagne had been in the same direction, but it was in the years of disorder and danger that it made the greatest progress. In the various areas in which the people had the same speech sympathies, there was a tendency to look to one powerful man to lead the movement for defence, and he became the duke. Thus in Franconia, Bavaria, Saxony, Swabia, and Lorraine dukes appeared about this time, and they were sometimes strong enough to stand up to the king. They ruled over the duchies as independent kings, and this age is sometimes known as that of the great duchies.

About the same time, on the frontiers of Germany margraves were appointed to defend the borders or marches, and they too had great powers over the districts under them. Both Austria and Brandenburg, the parent of Prussia, were originally mark districts.

Reign of Otto the Great

Conrad's successor was Henry the Fowler, the first ruler of the Saxon house that supplied Germany with kings until 1024. He was chiefly concerned in looking after Saxony, and left the rulers of the other duchies very much to themselves, but there was a change when his son, Otto the Great, became king. A great man, inheriting certain advantages from his father, he was in reality the ruler of all Germany. It was one of the recurring periods when the barbarians were harassing the land, but Saxony was already safe, and it was near Augsburg, in S. Germany, that he won his great victory over the Magyars. All the duchies passed into his hands, or those of his nominees, and for once Germany had a king to whom there was no possible rival. In 962 he conferred a questionable benefit on the country by securing for himself the title and dignity of Roman emperor. He revived the empire of Charlemagne, and made Italy, and not Germany, the centre of interest for his successors. Otto II, and then Otto III, followed. Each left the Germans very much to themselves; in 1000, like the rest of Christendom, they believed the end of the world to be at hand.

In 1024 Henry II, the last ruler

of the Saxon house, died, and the electors chose another Franconian, called Conrad the Salian. He, like Henry the Fowler, was the first of a line, which endured until 1125. The chief event of this century was the struggle over investitures, that culminated in the appearance of Henry IV before Gregory VII, at Canossa, and ended in the concordat of Worms. The main importance of this contest, as far as Germany was concerned, was rather in the stimulus it gave to civil war and disorder. The pope found eager supporters in all those who disliked the rule or person of Henry IV. The Saxons were especially aroused against him, and there was a good deal of fighting in that duchy.

In 1138 there appeared as a candidate for the throne, vacant by the death of Lothair, Conrad of Hohenstaufen. He was elected, although not unanimously, for there was a rival candidate who was strong enough to take up arms, but in the end he prevailed, and his house ruled Germany until 1254. Conrad himself was a man of no great parts, but it was otherwise with his successors, Frederick I, and Frederick II.

Under the Hohenstaufen, the condition of Germany became very bad. It was fairly peaceful during the reign of Frederick I, who realized, as Otto the Great had done, that a king's first duty was to protect his people. He, however, spent German lives and German money freely in Italy, and the end of his reign was marked by the rebellion of his powerful vassal, Henry the Lion, of Saxony. Frederick was still strong enough to drive Henry into exile, and to break up his great duchy, which had been the foremost obstacle to a real royal authority since about 1124. Henry VI and Frederick II cared less for Germany.

Hohenstaufen and Welfs

When Henry died, in 1197, there was a struggle for the vacant throne, the opposing parties each choosing a king, and then taking up arms on his behalf. They were the Hohenstaufen and the Welfs, and the two kings, Philip from the former, and Otto from the latter, fought without a real decision for sixteen years. There was a chance of peace when Otto IV was crushed in 1214, but the ambition of Frederick II renewed the unrest. The quarrel with the pope gave the king's enemies in Germany a powerful weapon of offence, while the faction leaders also made good use, from their own point of view, of the enmity between Frederick and his son.

Frederick II died in 1250, the most brilliant personality among German rulers, though his interests centred chiefly on Italy. His son Conrad, beaten and disheartened, soon left Germany. The years 1254-73 are known as "the anarchy" or "the interregnum," during which even foreigners, like Richard, earl of Cornwall, set up as claimants to the throne.

No one had any real power, for at this time, apart from the court and surroundings of the king, there was no central authority. In this fact lay the mischief done by the continual expeditions to Italy. A regent or someone of the kind was left behind, but the machine he controlled was deprived of its principal parts. Thus came a chance for the ambitious among the princes and prelates. Civil wars were inevitable. The barons and their troops plundered wherever they could, causing an immense deal of suffering among the peasantry. Something of the kind happened in England and France, but to nothing like the same extent. Moreover, in those countries the hereditary character of the kingship made for stability.

The early part of this period was marked by the spread of Christianity; the latter by the growth of towns. Otto the Great especially believed in securing the aid of the Church, and about his time many bishoprics and monasteries were founded, mainly, but not solely, in the newly conquered regions. The energies of Christianity were also aroused by the Crusades, in which several German kings and many princes participated.

Trade and Townships

Other causes, the growth of trade being prominent, led to the increase in the number and size of the towns. As in England, kings found that selling privileges to them was an easy way of raising money. The general disorder added to their strength, for their walls were generally able to keep out the marauding bands, and the benefits secured by living therein were increasingly appreciated by the countrymen. Many of them were independent states in all but name, and the eagerness with which kings sought their aid is eloquent of their position at this time.

In general, during these years the size of Germany was being increased. There were set-backs, it is true, as towards the end of the 10th century, but notwithstanding this the gains were considerable. Henry the Fowler began the work of bringing the Slavs over his eastern frontiers into his duchy. Other kings carried on

wars with Poles, Bohemians, Danes, and others, whose rulers now and again owned themselves as their vassals, but the important fact was not so much this as the steady roll of German influence eastwards. On the borders were watchful and ambitious men, lords of a piece of debatable land, small but capable of indefinite expansion by the sword. One mark district was extended until it became Brandenburg, while another area of expansion was in the south-east, Styria, Carinthia, and thereabouts. In 1250 the Elbe was far from being the boundary river it had been 300 years before.

Rise of the Hapsburgs

Under the conditions prevailing after 1250, it mattered little to the princes whether Germany had a king or not, but the pope was anxious for one, and at his instigation the electors met in 1273 and chose Rudolph of Hapsburg, a count ruling over some land in what is now Switzerland, and one who had made a reputation as a fighter. From this date until 1866, with only one long break, a member of this family was the senior of Germany's rulers, the one with the greatest prestige, though not always with the greatest power. The Hapsburgs were Roman emperors and German kings as long as the empire lasted; and as Austrian emperors were of high consequence in Germany until the events of 1866.

But Rudolph secured something intrinsically more valuable than the throne of a disunited country. The result of some fighting with the king of Bohemia, he took the duchies of Austria, Styria, and Carniola, and by giving these to his sons he began the long association of his family with the duchy that grew into the empire of Austria. When he died in 1298 his son Albert was not elected king, but he made war upon his successful rival, Adolph, who was killed in battle. Albert then secured the throne.

Albert's reign was brief, and when it ended there was another fight, this time between one of his sons, Frederick, and Louis, a member of the Wittelsbach family. The latter soon became the emperor Louis IV, another ruler who spent his strength freely, but without advantage to his country, in a quarrel with the pope. The next emperor, Charles IV, was a son of the king of Bohemia, and to him, also, though for a different reason, Germany was only a secondary consideration. Charles was followed by his son Wenceslaus, who was dethroned by the electors

because he was too idle to attend to his duties, and then came another son, Sigismund. On Sigismund's death in 1437 a Hapsburg was again chosen king, and the election soon became a mere form, a Hapsburg being chosen as a matter of course.

The emperor, however, was by no means the only ruler in Germany, nor was he necessarily its most powerful figure. From one end to the other were states, bewildering in number and of every conceivable size and shape, ruled by counts, marquesses, dukes, and some, not less important, by bishops and abbots. By virtue of the Golden Bull of 1356, which definitely established seven electors, these were winning an exceptional position, standing out amid the crowd of petty rulers. They were the king of Bohemia, the rulers of the Palatinate, Saxony, and Brandenburg, and the archbishops of Mainz, Cologne, and Treves. With Austria and Bavaria these were henceforth the chief of the German states, and much of Germany's history is that of their rivalries and growth.

In Germany by this time something like a parliament had developed. Called the Reichstag, it met at the instance of the king in any city in which he was. At first, as in England, the members sat all together, but gradually they became divided into three houses, the college of electors, the college of princes, i.e. all the rulers save the electors, and the college of free cities.

The Hanseatic League

Two other movements should be mentioned—the Teutonic Order and the Hanseatic League. The knights of the former, the crusades being over and their occupation gone, accepted an invitation from the bishop of Prussia to help him to conquer the heathen Prussians. This the soldier monks did and the country, roughly the district now known as East Prussia, became the possession of the order, its ruler being the grand master. German immigrants settled in the land, and towns were built therein.

The Hanseatic League arose, c. 1200, from an association of German towns for mutual protection. There were a number of small alliances, which the conditions of the time almost compelled, but this one became unique as a trading confederation. It had its own fleet, and was strong enough to fight, as it did against Denmark for instance, but its main activities were commercial. It was independent of any German authority, save that the free cities owed a certain allegiance to the king, and

GERMANY: MAPS ILLUSTRATING MEDIEVAL AND LATER DEVELOPMENT OF THE COUNTRY. See also map facing p. 3728

so was in practice a state within a state—*imperium in imperio*.

The long reign of Frederick III (1440-93) came to an end with the Middle Ages. The central authority was feeble than ever, while the Hohenzollerns in Brandenburg, the Wittelsbachs in the Palatinate and in Bavaria, and other rulers were making their states much larger and stronger.

The Renaissance and Reformation

The Renaissance and the Reformation, the movements that mark the end of the Middle Ages, had profound results in Germany. Maximilian, who became king in 1493, was a prince of the Renaissance type. Of his many activities, one was an attempt to improve the government of Germany as a whole. He divided the land into circles, each responsible for the maintenance of order within its own area, and this arrangement lasted, but in the larger sense his plans ended in failure, the vested interests being too strong for him.

Maximilian's failure compelled his successors to rely more, when force was needed, upon Austria, where their rule was effective, rather than upon the princes of Germany, who had axes of their own to grind, when troubles with foreign nations, especially France, arose. To make this separatist spirit more pronounced came the Reformation, with the cleavage of opinion that made Germany the most divided of all European states. Charles V was the most powerful ruler that Germany had seen since Charlemagne, but that was because he ruled over Spain and Spanish America, and was in close alliance with his brother Ferdinand, who owed to him the archduchy of Austria. The support which the princes gave him, both in his wars with France and in his efforts to settle the religious difficulties, was fitful indeed. The treachery of one of them, Maurice of Saxony, was sufficient to make this powerful potentate a prisoner.

The formation of a definite party, the Protestants, among princes and people, was followed by an outbreak of the peasantry, not in the main a religious movement. Many attempts were made to end the general unrest that continued after the peasants had been crushed, and a certain amount of success attended the religious peace of Augsburg, 1555. This adopted the principle that the religion of the prince must be the religion of the land. Numerically, towards the end of the 17th century, the Protestants were superior to the Roman Catholics. Not only were the former dominant in most

of the north, but they had a strong following in the rich cities of the south-west. Its two sections, however, were as bitterly opposed to each other as they were to the Roman Catholics. The Calvinists had no share in the benefits of the peace of Augsburg.

The Thirty Years' War was the inevitable outcome of the religious troubles. Charles V, and after him his brother Ferdinand and the latter's son Maximilian II, had made efforts to compose the religious and allied differences, but after a time the rulers began to display a less conciliatory spirit towards the Protestants. The counter-reformation began its work, and the Roman Church won back much that it had lost.

But something must be put down to a more material cause. One of the questions of the day concerned the ownership of the extensive lands that had belonged to the Church. Many of them had been seized by the Protestants, and about their possession strife was continuous, for the Roman Catholics demanded restoration. At length the year 1552 was selected as the dividing line; all that was then in Protestant hands was to remain so, all seized after then was to be returned.

Edict of Restitution

Just after the Thirty Years' War began Ferdinand II became emperor. This selection was the result of a family conclave. Young and vigorous, he was a contrast to his predecessors, Rudolph II and Matthias, while his training had made him anxious to crush rather than conciliate the Protestants. In 1629, flushed with victory, which, however, was only temporary, he issued the edict of restitution. This was intended to recover for the Church lands which she had lost through their rulers becoming Protestants, for a number of prelates had adopted the newer faith and, retaining everything, had simply been transformed from ecclesiastical into secular rulers.

The war lasted until 1648, by which time Germany had become a battlefield for nearly all the nations of Europe. It had been stripped bare by foreign soldiers; many towns had been plundered, and numberless villages had been destroyed; the population had been reduced probably by one half.

Between the peace of Westphalia of 1648 and the Napoleonic upheaval Germany was less of a united state than ever. The treaty granted toleration to the Calvinists equally with Roman Catholics and Lutherans, and so made peace on

this matter possible. But in another direction its results were less beneficial. The princes were free from now to form alliances with foreign powers, their states, especially the larger ones, thus becoming to all intents and purposes independent. The history of Germany becomes more than ever that of its parts.

The Wars with France

Internally, the cardinal fact of German history during the 17th and 18th centuries was the rise of Prussia; externally it was the series of wars against France. The latter began with the reign of Louis XIV, whose policy of enlarging France was made easier by the existence of Germany as a loose confederation of states. He persuaded or bribed some of the princes to fight for him, the visible results of his earlier wars being the acquisition of Alsace and Lorraine. The emperor did what he could in their defence, but he had two frontiers to protect, while the only force he could get came from his own Austria and from such princes as chose to help him.

This was even truer of the wars that opened with the accession of William III to the English throne in 1688 and ended with the treaty of Utrecht in 1714. France secured help from Bavaria, while the resistance to her policy came mainly from Austria and Britain.

The dominant figure in 18th century Germany is Frederick the Great. Steadily Prussia had emerged from the mark state of Brandenburg to one of the powers of Europe. In 1648, or soon afterwards, all Pomerania had been added, there were other acquisitions, and a century later Silesia was seized. Germany was divided into two armed camps, one supporting Prussia and the other Austria, and the contest between the two, ended temporarily in 1748, was fought out again in the Seven Years' War. Later there was some trouble about the succession to Bavaria, where the ruling family became extinct in 1777. This, however, passed to another branch of the Wittelsbach family, thus uniting the Palatinate with Bavaria.

The Revolutionary Wars

In 1789 the French Revolution began, and soon Austria, Prussia, and most of the other German states were drawn into the war against France. In the same period the two chief German countries were with Russia making an end, in their own interests, of Poland. In 1795 Prussia was compelled to give up her possessions on the left bank of the Rhine to France, and to withdraw from the war, but it

was continued by one or other, with Germany as the chief battleground.

In 1806 the emperor Francis II resigned the imperial crown, and the Holy Roman Empire came to an end. Germany was now in theory, what she had long been in practice, a geographical expression, while her master, one who carved her into pieces as he liked, was Bonaparte. In 1806 the Prussians were beaten at Jena, and in the years following a new spirit arose in that country, and to some extent in other parts of Germany. It resulted in a rising, the war of liberation, against Napoleon, and his final defeat at Waterloo.

Napoleon, in 1806, had formed a confederation of German states, the confederation of the Rhine, but a more lasting one came into being at the peace of 1814. This sealed and stamped a territorial revolution of the first magnitude, for the Germany of the Middle Ages, with its prince-bishops and the like, had finally disappeared. Most of the 300 states had vanished, so the boundaries of the others were altered beyond all recognition. Only 39 remained, and these formed the new German Confederation, or Bund. Austria and Prussia were its chief members; among the others were the kings of Bavaria, Hanover, Saxony, and Württemberg.

The history of the next fifty years is mainly a struggle for constitutional liberty. Several of the states had a landtag, or other assembly of nobles and prelates, but there was nothing in the way of representative institutions, nor had any government any idea of its responsibility to the people in the modern sense. The rulers fought hard against this movement, but it was too strong to be crushed. Saxe-Weimar leading the way, several rulers granted constitutions to their people.

The Frankfort Parliament

Another movement of the time was towards uniformity in commercial matters. Trade could never flourish in a country where import duties varied with each state, and where every few miles a new boundary with the inevitable custom house appeared. The first attempts led to the formation of three distinct trading areas, but soon these were united into the Zollverein of 1834. Austria stood outside this, making Prussian dominance easier. In 1848, as there had been to a lesser extent in 1830, there were revolutions throughout Germany. The passion for union was by no means satisfied with the association of 1814, and consequently a powerful

agitation compelled the Bundestag to agree to the meeting of a national parliament at Frankfort. The members, who were elected by a wide franchise, met to draw up a constitution for a united Germany. Having decided to have an emperor, they offered the honour to the king of Prussia, but he declined it, and as far as immediate results went the Frankfort parliament was a failure.

The duel between Austria and Prussia for the headship of Germany was now entering upon its final stage. In 1849 Prussia managed to form a union, but here she met with a rebuff; troubles in Hesse led to the entrance of Austrian and Prussian troops, called in by conflicting authorities. War seemed inevitable, but at the decisive moment Prussia gave way, and among other things the new union was dissolved. The terms of Austria's diplomatic victory were in the convention of Olmütz, and the Bund received new life.

Annexation of Slesvig-Holstein

Other attempts at a union followed, but meanwhile the Slesvig-Holstein question had dominated German politics. The war of 1850 against Denmark was waged nominally by the Bund, but in reality by Prussia, aided by some of the other states. This soon came to an end, but diplomacy continued its efforts at a settlement. In 1863, this not having been reached, the Bund again interfered; this time Saxony and Hanover took the lead, Prussia and Austria disapproving of their action. The two latter powers, however, fearing for their prestige, announced their intention of acting as independent states, invaded Denmark, crushed the Danes, and took over Slesvig and Holstein.

This gave Bismarck, Prussian chancellor, a pretext for war with Austria. The latter wanted the Bundestag to decide the future of the duchies. Prussia suggested a drastic reform of the confederation, from which Austria should be excluded. Both presented their suggestions to the federal diet, which accepted that of Austria. War was at once declared by Prussia, and on July 3, 1866, Austria was totally crushed at Sadowa. The majority of the German states, including Hanover, Saxony, and Bavaria, shared this humiliation, for they had fought against Prussia. The war ended the connexion of Austria with the other states of Germany and led to other changes, increasing Prussia's power and size. A new union was set up, the North German Confederation: its

head was the king of Prussia, and it included all the states N. of the Main.

The final step in the union of Germany followed the Franco-Prussian War. The Prussian army, this time aided, not opposed, by those of Bavaria and the other German states, again proved its prowess. In Jan., 1871, the North German Confederation gave way to the German empire, or Reich, with William I of Prussia as its first emperor. To this was given the federal constitution which, except for the disappearance of the emperor, it retained in the main after the revolution of 1918. The Reich consisted of 26 states, although one of these, Alsace-Lorraine, was not given equal privileges with the others. Save it, all were represented in the Bundestag, while the people sent their representatives to the Reichstag, but the affairs of the empire were mainly controlled by Prussia.

Policy of William II

The history of Germany from 1871 to 1914 was first a policy, that of Bismarck, of unifying the country on the Prussian model, and later that of William II, one of ambitious plans of world dominion that led to war. Under Bismarck a supreme court of justice was set up at Leipzig, and a common monetary system was established. Education was organized on Prussian lines, while under her control came most of the armies and the railways of the other German states.

William I died in 1888, and Bismarck resigned in 1890. William II had his chancellors, but he took a large share himself in the work of government. Socialism made great strides; for instance, at the general election of 1912 that party polled more votes than any other. More remarkable was the industrial progress of Germany.

The exact share of the emperor and his advisers in starting the First Great War, 1914, is perhaps doubtful, but it is certain that the German people heartily supported it, and that they believed they would win. They fought and endured well, though the peace proposals of Dec., 1916, showed something wrong. In Jan., 1918, there were risings in Hamburg, Munich, and elsewhere, but the collapse did not come until Oct. There was a revolution, almost bloodless; on Nov. 9 the emperor abdicated, and soon a republic was proclaimed. The other German rulers followed his example, and Germany became a federation of republics which was to endure until 1945.

BETWEEN THE WARS. On Oct. 3, 1918, when defeat had become a certainty and the despair of the masses reached danger point, Germany received her first parliamentary government, under Prince Max of Baden. It brought Socialists into the cabinet, and enforced the Kaiser's abdication, but could not prevent a revolution, which started by creating workers' and soldiers' councils on the Moscow pattern. But the Social Democrats found support from the bourgeois elements and what was left of the armed forces. A provisional government suppressed Spartacist (Communist) revolts by force.

Social Democrats in Power

The government arranged elections for a constituent assembly on Feb. 6. Socialists proved to be the strongest party, but needed the Democrats and the R.C. Centre in order to work against the opposing Independent Socialists, Conservatives, and Liberals. The primary duty of the first cabinet, under Scheidemann, with Ebert as provisional president of the republic, was to draw up a new constitution; this conferred all authority over finance, armed forces, and transport upon the Reich. Communist revolts were suppressed with bloodshed, while in Paris the foreign minister, Brockdorff-Rantzau, was confronted with the Versailles peace treaty. Over its terms the cabinet resigned, the Democrats refusing to sign. The signature was given on June 28 by the Socialist Müller and the Centre minister Bell. The national assembly moved from Weimar to Berlin, and the Democrats rejoined the cabinet.

Comparative calm was interrupted by the Kapp *putsch*, a seizure of Berlin by irregular armed forces on March 13, 1920. The members of the cabinet, however, escaped to Stuttgart; from there they frustrated the reactionary attempt by proclaiming a general strike. A Communist revolt in the Ruhr followed; because, in its suppression, German forces technically infringed upon armistice terms, French troops occupied Frankfurt. In S. Germany strong opposition to the trend towards Berlin centralism provoked friction, especially with Bavaria; in the Rhineland a separatist movement had the support of the French military authorities. Plebiscites prescribed in East and West Prussia, the Danish borderland, and Upper Silesia had brought, on the whole, results favourable for Germany, but clashes occurred in Silesia.

It is disputable how far the Allied reparations demands—reduced first from 226 to 132 milliards of gold marks, and subsequently reduced still further by the Dawes and Young plans contributed to German inflation and decay of the currency. At the end of 1923 a new currency (Rentenmark), based upon a state imposition on all immovables, stabilised the flood of paper money at the rate of 1 Rm. for 1,000,000 millions of the old marks. The complete loss of titles in the old currency inflicted upon people living on annuities, savings, and former investments, made it necessary to reevaluate their claims. Apart from deliveries in kind—coal, timber, chemicals—for which the Reich had to indemnify the industries engaged in fulfilling reparation demands, on top of such payments in gold and foreign currency as it discharged, came the "passive resistance," which was the German government's answer to the French occupation of the Ruhr valley, to complete the breakdown of the financial structure.

France Occupies the Ruhr

The French premier, Poincaré, occupied the Ruhr as a reprisal for Germany's failure to fulfil her economic and financial obligations. Great Britain refused participation, and the U.S.A. withdrew its forces from German soil. A general strike of the Ruhr workers, acts of sabotage, the creation of a customs frontier by the French, new proposals for settlement from Berlin, all failed to bring about a solution.

Thereupon the leader of the Liberals, Gustav Stresemann, hitherto in opposition, undertook the formation of a new coalition government and, as chancellor, negotiated a capitulation and, with the French Radical, Edouard Herriot, and the British Socialist, Ramsay MacDonald, a compromise over future reparations payments, July-Aug., 1924. A Right-wing coalition followed after elections in Dec., but Stresemann remained, in this and all governments until his death in 1929, foreign minister and the dominating figure.

Stresemann's suggestion of a Rhine pact, a reciprocal guarantee of frontiers, succeeded in Oct., 1925, at the Locarno conference (*q.v.*). In the wake of this understanding, a number of restrictions were lifted from the Rhineland. Allied military commissions were withdrawn, and in Sept., 1926, Germany was received into the League of Nations at Geneva in a generally hopeful atmosphere.

Yet all this served to accentuate reactionary and nationalist trends negligible under the previous conditions of general distress. Illegal military or pseudo-military organizations, responsible for political assassinations, *e.g.* of the former finance minister Erzberger, the Bavarian premier Eisner, the foreign minister Rathenau, created trouble at home and with foreign countries. A *putsch* in Munich on Nov. 9, 1923 by a wildly anti-democratic and anti-Semitic party led by Adolf Hitler had to be suppressed with bloodshed. The election, after President Ebert's premature death on Feb. 28, 1925, of the former Field Marshal von Hindenburg as president did not contribute to conciliation.

Berlin Treaty of 1926

At Genoa, in 1922, Rathenau had concluded the Rapallo treaty with the Soviet Union, re-establishing diplomatic relations and cancelling all reciprocal war claims. After Locarno there followed the Berlin treaty of 1926, securing reciprocal neutrality as to Germany and Russia in the event of war with a third power.

In 1929 Germany applied once more for a modification of the reparations terms. Granted after two Hague conferences, it was publicly repudiated by Hjalmar Schacht, head of the Reichsbank. This action led to the first official combination of the *Deutschnationale* (Conservative) and the National Socialist (Nazi) parties. Heinrich Brüning, as chancellor, tried to continue his work but, under the blows of the world economic crisis, had to ask for a moratorium on all reparations payments, secured with the U.S. president Hoover's help in 1931. Unemployment rose rapidly; cuts in public expenditure and wages did not alleviate the burden.

At the next election, Sept. 14, 1932, the Social Democrats gained 143 seats, and the Nazis increased their Reichstag membership from 12 to 107. The government tried to govern by decrees; but two further elections merely increased the opposition. After semi-dictatorial Right-wing experiments under Franz von Papen and Kurt von Schleicher as chancellors, at a time when nearly one-third of Germany's working population was living on the dole, Hindenburg was persuaded to charge Hitler, who now had 196 followers in the Reichstag out of 584, with the formation of a government, mainly on his own terms, Jan. 30, 1933 (*see* National Socialism).

GERMANY UNDER HITLER. On Feb. 27 a gang of Nazi leaders and tools set fire to the Reichstag, upon which Hermann Goering, its speaker and Hitler's chief lieutenant, accused Communists of this and other misdeeds, and a huge bogus trial was staged at Leipzig. Hitler's government, meant to be a coalition, was turned into a dictatorship by a largely falsified election on March 5, which gave the Nazis 288 seats out of 647, reduced to 566 by the cancellation of 81 Communist seats. There were mass arrests of Left-wing politicians and officials. The Nazi aims henceforth were ruthlessly pursued: abolition of all Versailles restrictions; rearmament; recovery of lost territories; conquest of "living space" at Russia's expense; and, finally, world domination.

Hitler Chief of the State

Unemployment was abolished by a planned economy, mainly or wholly devoted to gigantic armament works and other warlike preparations. Opposition was quashed by concentration camps and mass murder, e.g. on June 30, 1934, of Schleicher and others. The death on Aug. 2 of the senile Hindenburg was exploited to make Hitler simultaneously chief of the State and head of the government. In Sept. Germany left the League of Nations; on March 16, 1935, Hitler abolished the Versailles restrictions upon the size and armament of German forces; on March 7, 1936, his troops reoccupied the Rhineland, demilitarised for ever under the peace treaties. That year, together with Mussolini, he sent troops and squadrons of his newly created air force to Spain, to fight with General Franco's Nationalists against the Republicans.

After having instigated a frustrated *putsch* in Vienna, during which the Austrian chancellor Dollfuss was murdered on July 25, 1934, Germany enforced the *Anschluss* with Austria by military occupation, March 11-12, 1938.

The German people were persuaded or convinced of Hitler's superiority and luck, or silenced by coercion, concentration camps, torture, Gestapo terrorism, and death. They were strengthened in this attitude by the Munich agreement of Sept. 29, 1938, by which Great Britain and France, with Mussolini's concurrence, allowed Hitler to mutilate Czecho-Slovakia, after threatening war. The subsequent violation of this agreement by the occupation of the whole

country on March 15, 1939, ended the period of "appeasement." A week later Hitler annexed Memel.

Pledges were given by Great Britain and France to Poland, Rumania, and such other neighbours of Germany as did not still rely on their neutrality in a coming war. British negotiations with Moscow were opened but frustrated by a clever stroke by Hitler, in the form of the Ribbentrop-Molotov pact of neutrality, Aug. 23. Germany embarked on Sept. 1, 1939, upon the Second Great War by annexing Danzig and invading Poland.

LANGUAGE. The language spoken by the greater part of the inhabitants of the former German Empire, and by the Germans of Austria and Switzerland, is known as High

divided into two main dialects: Bavarian, which includes German Austrian, E. of the river Lech; Alamannic, including Swabian, Alsatian, and Swiss, W. of that boundary, and Upper Franconian to the N. The line of demarcation between High German and Low German runs approximately from Maestricht to Düsseldorf, then, after a slight curve to the S., through Minden, Magdeburg, Wittenberg, Lübben, and Fürstenberg. Low German includes Lower Franconian, which developed into modern Dutch and Flemish, and the Saxon dialects (Westphalian, Low Saxon, etc.); these continue to exist in the form of various so-called Plattdeutsch dialects.

Middle High German

Old High German is a richly inflected speech with full endings, and a wide range of vowel sounds. In the course of the 11th century, this dialect gave place to Middle High German. The flexional endings were reduced to a more or less uniform e-sound; and the simplification of the language brought with it a syntax to a greater extent dependent on word position.

Middle High German was the language of Germany from the 11th to well into the 15th century, and passed gradually into New High German or Modern German, the principal changes which mark the transition being a lengthening of short vowels in open positions, e.g. *grāp* to *Grāb*; *lēben* to *lēben*; a reduction of certain diphthongs to monophthongs, as *guot* to *gut*;

Ä u ß t v n f a s t g g j f j n j g t i k l l M m
 Ä u ß t v n f a s t g g j f j n j g t i k l l M m

Ä u ß t v n f a s t g g j f j n j g t i k l l M m
 Ä u ß t v n f a s t g g j f j n j g t i k l l M m

German Language. Script forms of the 26 characters in the German alphabet, the capitals and small letters side by side with corresponding Roman type capitals and small letters beneath each pair

German, and forms a branch of the Germanic, or Teutonic, family of Indo-European languages. The separation of High German, that is to say, the speech of the "high" lands of the S. from the parent stock, probably took place in the 7th century, and was marked by a change in the consonantal system, known as soundshifting, or, in English, as Grimm's Law (*q.v.*). This change is exemplified by the consonants in such cognate words as the English *ten*, German *zehn*; English *do*, German *tun*.

The first period of the development of High German, known as Old High German, lasted from approximately 600 to 1050. The principal dialects were Upper German,

dienen to *dienen* (ie pronounced *ec*); also the reversal of the process in *zit* to *zeit*, *mūs* to *Maus*, *hiute* (where it is pronounced like modern *ü*) to *heute*.

Uniformity in High German speech was brought about by three factors: the union of the German states under the medieval empire, which necessitated a generally understood language for government purposes; the invention of printing, which made it desirable that books should appeal to as wide a public as possible; and, most important of all, the influence of Luther's Bible, which was translated into a carefully selected language representing a compromise between N. and S. Thus the

spread of a uniform literary High German language was largely dependent on the spread of the Reformation itself. In the 17th century, High German deteriorated seriously, owing to the promiscuous introduction of foreign words.

While the German language has changed little since the time of Goethe and Schiller, German style has undergone considerable development in the direction of flexibility and clearness; and successive legislation in the German-speaking states has brought about a uniform system of orthography. An effort has also been made throughout Germany, Austria, and Switzerland to maintain the purity and uniformity of German pronunciation by means of a fixed standard in the language of the stage. The claims of the dialects for serious recognition, however, make themselves still heard, not merely in the N., but also in the southern states, especially in Bavaria and Austria.

LITERATURE. The literature of the earliest or Old High German period calls for little comment, its interest being mainly linguistic. The chief monuments are a gospel-harmony in verse by Otfrid of Weissenburg, a ballad, *Das Ludwigslied*, and voluminous glosses and translations by Notker Labeo, a monk of St. Gall, indeed, the most interesting documents of the 9th century are not High, but Low German—namely, the fragmentary alliterative ballad, *Das Hildebrandslied*, and an old Saxon epic of the Life of Christ, *Der Heliant*, or *The Saviour*. In the 10th century, under the Saxon emperors, the vernacular fell into disfavour, and such literature as there was, the Lay of Waltharius, *Ruodlieb*, a forerunner of medieval romance, *Ecbasis captivi*, an early form of the Beast saga, and the plays of Roswitha, a nun of Gandersheim, were written in Latin.

French Influence

In the 11th century, when the Middle High German period opens, literature, hampered by the ascetic spirit of the Church, made at first slow progress; but French influence soon found its way across the Rhine. Before the 12th century was half over the Germans were acquainted with the Song of Roland, the epic of Tristan, and had themselves, under Provençal stimulus, begun to cultivate a lyric poetry or Minnesang, of wonderful freshness and purity. By the end of the 12th century Middle High German poetry had reached its zenith. In the courtly epic, Heinrich von Veldeke, author of the *Eneit*, had given place to Hart-

mann von Aue, Wolfram von Eschenbach, and Gottfried von Strassburg. To the first we owe versions of the French romances of Erec and Iwein, the legend of Gregorius, and that most charming of Middle High German idylls, *Der arme Heinrich*; to Wolfram a German romance of Parzifal which transcends all others in mystic depth and romantic suggestiveness, and to Gottfried a German Tristan which gives rein to the emotional paganism of the Middle Ages.

More peculiarly German is the great epic *Das Nibelungenlied*—not unworthily described as the German *Iliad*—which unrolls with relentless tragic power the story of Siegfried's death and Kriemhild's revenge. Another epic, *Gudrun*, more loosely constructed but of gentler beauty, deals with sagas of the North Sea; others, of varying merit, constitute the so-called *Heldenbuch*.

Literature in the Middle Ages

The glory of Middle High German literature is Walther von der Vogelweide, the greatest lyric poet of the Middle Ages. Walther's strength lies not solely in the unrivalled beauty of his love songs, but in the width of his range; he is not merely a minnesinger, but also a political poet. All this remarkable outburst of poetry dates from the last years of the 12th and the first two decades of the 13th centuries. Thereafter Middle High German literature fell into diffuse imitation and degenerated rapidly. Of the later poets, Konrad von Würzburg, who cultivated the epic, and Neidhart von Reuenthal, a lyric poet, are the most eminent.

A period of confused and ineffectual literary effort now set in, in which old forms and new ideas jostled together. On the one hand the Germans gave themselves up to mysticism and allegory; on the other they imitated the incisive and witty literature of the humanists, from whom they also learned the art of translation. But there is little originality until the end of the 15th century, when two outstanding works appeared, *Das Narrenschiff*, by Sebastian Brandt, which foreshadowed the coming Reformation, and the Low German beast epic, *Reynke de Vos* or *Reynard the Fox*. The 16th century is the century of the Reformation. Martin Luther himself is its chief man of letters; his translation of the Bible is the greatest German book of the century, and his hymns are its most characteristic lyric expression. Under his influence the drama sprang into new life; at first restricting itself to Biblical themes, but later drawing freely

on the wealth of story liberated by the Renaissance. A typical German dramatist of the 16th century is Hans Sachs, the cobbler of Nuremberg, who especially excelled in the comic *Fastnachtspiele* or *Shrove-tide plays*; and in his hands also the *Meistergesang* flourished, a form of poetry which took the place of the medieval Minnesang. The 16th century was also the great age of German *Volkslied*.

17th and 18th Centuries

Besides the drama, the most virile form of literature was satire, which with the grim Catholic monk, Thomas Murner, attained a fierceness and brutality without example in any other period. Later in the century Johann Fischart, an Alsatian, led German prose into lines of Rabelaisian extravagance, without an adequate substitute for Rabelais' humour. The promise of the 16th century was not fulfilled, for in the 17th Germany was devastated by the Thirty Years' War. Literature fell almost exclusively into the hands of learned poets like Martin Opitz, Paul Fleming, Simon Dach, and Andreas Gryphius, who sought to impose on the Germans a rule-bound literature on strictly classic lines. The literary spirit of the nation is to be found not here, but in its religious poetry, above all, in the hymns of Paul Gerhardt, and in *Grimmelshausen's* romance *Simplicissimus*, which held the mirror up to the long war with relentless realism. The peace of Westphalia (1648) left Germany exhausted, and the literature of the later 17th century consists mainly in imitations of the French gallant novel, and in bombastic verse which reduces to absurdity the "preciosity" of Marini and Guarini.

At the opening of the 18th century an endeavour to introduce a classic taste in accordance with the tenets of Boileau was apparent. The chief representative of this movement was J. C. Gottsched, the literary dictator of Leipzig, whose *Kritische Dichtkunst* appeared in 1730. But this pseudo-classicism soon found itself in conflict with new doctrines more in harmony with nature, which had found their way to Germany from England. With the conflict in 1740 between the champions of these ideas, the Swiss critics, J. J. Bodmer and J. J. Breitinger, and Gottsched, the new era may be said to open. C. F. Gellert, who won great popularity with fables in the style of La Fontaine, introduced the *comédie larmoyante* from France and the Richardsonian novel from England, and, in 1748, F. G. Klopstock published the first cantos of

Der Messias, a religious epic inspired by Milton. Even more significant was Klopstock's lyric poetry, which broke the fetters that had so long hampered the German lyric.

Meanwhile, in S. Germany, C. M. Wieland contributed to the liberation of German letters with poetry in the spirit of Ariosto, with psychological fiction and a translation of Shakespeare; while another and greater writer, G. E. Lessing, inaugurated the classic age in German literature. With his *Miss Sara Sampson*, Lessing introduced into Germany the tragedy of common life, with *Emilia Galotti* he perfected this type of drama, and with *Minna von Barnhelm* he gave Germany's 18th century literature its greatest comedy. As a critic, Lessing stands in the first rank.

Influence of Lessing

His *Laokoon*, which prescribes the boundaries between plastic art and poetry, and his *Hamburgische Dramaturgie*, which interprets the modern drama by the light of Aristotle, were text-books which profoundly influenced subsequent developments in Germany and in Europe. Lessing's later years were overshadowed by his battle for tolerance and enlightenment with the Lutheran clergy, a conflict which left an enduring monument in the drama *Nathan der Weise*.

Before Lessing's career had reached its close another movement, the so-called Sturm und Drang or Storm and Stress, had broken over Germany, which was immediately inspired by Rousseau and continued the emancipatory work begun by Klopstock. Its pioneer was J. G. Herder, a thinker of prophetically modern sympathies, and at his hands J. W. von Goethe was initiated into the new ideas. Goethe's *Götz von Berlichingen* and *Werthers Leiden* were the chief works of the Sturm und Drang. A number of gifted, if unbalanced, young dramatists gathered round Goethe, J. M. R. Lenz, F. M. Klingner, H. L. Wagner; and in 1781 J. C. F. Schiller made his début with his tragedy, *Die Räuber*, to which were added a few years later *Fiesco* and *Kabale und Liebe*.

The culminating phase of 18th century classicism is symbolised by the close friendship of the two leading poets in Weimar between 1794 and Schiller's death in 1805. In these years Schiller wrote his ballads and his magnificent series of dramas from *Wallenstein* to *Wilhelm Tell*; Goethe published *Wilhelm Meisters Lehrjahre* and *Hermann und Dorothea*, while the

first part of *Faust* followed in 1808. The minor literature of the time reflects more or less faithfully the return to classicism, although in the popular stage plays, notably by Iffland, Schroder, and Kotzebue, and in the novels of J. P. F. Richter, the old Sturm und Drang spirit is still in evidence.

Goethe, who died in 1832, was the acknowledged head of this literature, his chief contributions to it after 1808 being, in lyric poetry, *Der Westöstliche Divan*; in fiction, *Die Wahlverwandtschaften* and *Wilhelm Meisters Wanderjahre*, to which may be added his autobiography, *Dichtung und Wahrheit*, and, in the drama, the second part of *Faust*. But in this period the dominating force in German literature was not classicism but romanticism. The Romantic Movement falls into four clearly marked phases: the first is that of the so-called Romantic School, founded in 1708 and led by J. L. Tieck, Novalis, and the brothers Schlegel; the second, which is associated with Heidelberg, encouraged, under the leadership of L. A. von Arnim and C. Brentano, the study of the Middle Ages and of the literature of the people; a third phase, to which belonged the lyric poets J. von Eichendorff, A. von Chamisso, and W. Müller, had its centre in Berlin, and effectually broadened the basis of romanticism; a final period of romantic decay includes the morbid supernaturalism of E. T. A. Hoffmann and the Orientalism of F. Rückert.

Heine and His School

To the last phase of romanticism belongs one poet of supreme genius, Heinrich Heine; but Heine at an early stage declared his sympathies with the school of "Young Germany." This school, whose leaders were, besides Heine, Ludwig Börne and Karl Gutzkow, was essentially anti-romantic; under its protection journalism encroached on literature, and political idea took the place of poetic sentiment. The Young German lyric reflected the revolutionary spirit between 1830 and 1848; its novel, as represented by Gutzkow and later by F. Spielhagen, G. Freytag, and the Plattdeutsch writer, F. Reuter, busied itself with social problems. Meanwhile the Germans were also cultivating assiduously the short story: B. Auerbach with his *Schwarzwälder Dorfgeschichten*, T. Storm with his tales of romantic retrospect, Paul Heyse with his finely chiselled style and Italian sympathies, and the two Swiss masters of fiction, G. Keller

and C. F. Meyer, have won for the German short story a high place in European fiction.

Although to a large extent overshadowed by Schiller, the German drama struck out, under romantic influence, into new paths, the chief representatives being H. von Kleist in Prussia, and F. Grillparzer, the national dramatic poet of Austria. To the post-romantic epoch belong O. Ludwig and F. Hebbel, the latter one of the most original dramatic poets of the 19th century. After the revolution of 1848 German literature, like German political life, passed into a period of comparative stagnation; but just in these years German scholarship, and especially German historical study, the latter under the leadership of L. von Ranke, were extraordinarily productive. The most interesting literary work emanated from a group of writers in Munich, and with Munich also was associated Wagner, whose music dramas helped to revive an interest in theatre and drama.

Literary Influences from Abroad

As the century drew to its close the Germans, always sensitive to outside influences, absorbed the literary ideas in vogue in France, Russia, and Scandinavia, and under this stimulus cultivated the naturalistic novel and the drama of *milieu*. The great success was attained by the drama, whose chief representatives were H. Sudermann and G. Hauptmann; while in lyric poetry men like D. von Liliencron and R. Dehmel, in the epic, the Swiss, C. Spitteler, broke effectively with the old romantic tradition. The outstanding personality of the last epoch was F. Nietzsche, who was not merely a thinker of powerful originality, but also a lyric poet of genius. It has been claimed with some justice that his ideas, working on immature minds, helped to precipitate the catastrophe of 1914.

J. G. Robertson

The beginning of the 20th century, with its trend towards social criticism, favoured the entry of women into the world of German writing. Gabriele Reuter, Helene Böhlau, Clara Viebig, and Ricarda Huch rank among the best novelists of the early 20th century. Ellen Key was a precursor of the later psycho-analytical school, which developed simultaneously with that of the *Heimatkunst*, the art of catching the spirit of the author's particular district. The Austrian R. H. Bartsch, the Prussian T. Fontane, the Frisian G. Frenssen, the Rhinelander J.

von Lauff, are outstanding among that large group.

It was superseded, during and after the First Great War, by a neo-romantic school, with a historical offshoot: B. von Munchausen's ballads, H. Eulenberg's short stories, P. Scheerbart's and G. Meyrink's Wellsian fantasies, E. von Keyserling's novels, typify that trend. In poetry, it is reflected to a varying degree by R. M. Rilke, H. von Hofmannsthal, and S. George, though a perfecting of form and style has led to their being called neo-classics.

The Modern German Novel

But the term neo-romantic is justified for the masters of the modern German novel, whose purpose, apart from pure art, is a profound criticism of the author himself and of his time. Supreme among them, possibly one of the greatest figures of German thought and literature of all time, was Thomas Mann. Jacob Wassermann, the Austrian Arthur Schnitzler, later Arnold Zweig and Bruno Frank, deserve high praise. As dramatists F. Wedekind, Schnitzler, his fellow-countryman H. Bahr, G. Kaiser, and the Radical Ernst Toller, created a lasting impression. While fertile in talent deserving temporary success, as seen in the verse of worker-poets and the war novels of E. M. Remarque and others, the republican period of 1919-33 produced no new genius.

The Nazi period was sterile. What William II had in vain endeavoured to provoke by bribing art and literature, a style that would glorify his dynasty, that Hitler and his minions tried to produce by dictation and force. This proved an utter failure, drove men like Mann, Zweig, Frank, Werfel, and Feuchtwanger into exile, and the few remaining authors and poets to mendacity, and finally needed a grotesque exaltation of inferior Nazi diletanti to fill the academies and learned societies. Meanwhile the Nazis exploited authors, historians, and philosophers of the past, like Fichte and Treitschke, by extracting from their work such parts as gave an interpretation advocating racialism and militarism. Nor did the first period after the Nazi collapse favour the resurrection of German writing. No new names were forthcoming, and the well-known authors mostly stayed in the lands of their adoption.

ART. Though Teutonic art in its origin and for long afterwards lacked both spontaneity and voi-

ume, the earliest artists were also the greatest. The art instinct of the people went out, copiously and gloriously, towards the material and tangible, and in the design of cathedrals, town halls, and private houses, and the carving of wood and stone, showed consummate skill. Medieval German architects worth mentioning are Erwin von Steinbach, architect of Strasbourg cathedral, Joerg Ganghofer, builder of Munich cathedral, and Hans Stettheimer, who designed many S. German churches. So are the unknown sculptors of the Bamberg horseman and of the Naumburg statues.

Opulent burgomasters and merchants, by no means averse from pomp and ostentation, had neither the knowledge nor the taste to encourage painters, who had to look for patronage in the main to the Church, as at Cologne, and to the wise munificence of an occasional emperor. Purely native effort soon spent itself, and the painters, to some extent distrustful of themselves, had the sense willingly to submit to the formative influence of foreign schools, first of the Netherlands, next to Venice and Italy, and lastly of France.

Dürer and Holbein

In the beginning their work was violent in colour, and realism was apt to be overdone and coarse. In portraits and single figures and limited groups they were quick to seize character, but regarded strength rather than beauty, and the dominant note was marked individuality. The men of genius were rare and their achievement but served to illuminate the comparative sterility of their fellows. Throughout the period ending with Adam Elsheimer (1578-1628), when Italian influence became predominant for a century, only four names can be said to be household words: Albert Dürer, Hans Holbein the Younger, Grünewald, and Lucas Cranach.

Dürer was a man of almost as universal accomplishment as was Leonardo da Vinci, though he missed the latter's suavity, refinement, and sense of colour. His portraits of himself and of Hieronymus Holzschuher are marvels of technique, while his drawings for wood and metal are the theme of undiminished admiration. Holbein's power, preserved in such pictures as the Madonna painted for Jacob Meyer, burgomaster of Basel, and his portraits of George Gisze, a merchant of the London Steel-yard and of Christina Sforza,

duchess of Milan, purchased in 1909 for £72,000 and presented to the British nation, ran on more gracious lines. To these it will suffice to add the Madonna with the Violet, by Stephen Lochner (c. 1400-50), the first truly tender and charming figure painted in Germany, and the Holy Family at the Fountain, by Albert Altdorfer (c. 1480-1538), greatest of the "Little Masters." Where the sculptors were many and distinguished it may be unfair to particularise, but the work of Adam Krafft (c. 1455-1507) and Peter Vischer (1455-1529) may be mentioned.

Effect of the Thirty Years' War

Italian influence—the influence of an Italy, too, whose prime was past—was established early in the 17th century. The incompatibility of the southern and northern temperament foredoomed their projected union to failure, but another and overwhelming disaster befell German art, which was paralysed for generations by the ruin, misery, and demoralisation consequent on the Thirty Years' War (1618-48).

However, in spite of the appalling results of the political turmoil and dynastic squabbles, the friends of the Italo-Teutonic alliance maintained their foolish advocacy. Winckelmann's laudation of the art of the ancients (1764) was so far mischievous that it led to blind faith in the classical as art's be-all and end-all, and those who espoused his teaching diverted German artists from thoughts of the present and more especially, the future. Lessing continued the parable, and landscape and genre were for a time despised. Beauty was everything, Nature nothing. Even Goethe joined the reactionaries. "Art," he said, "has been written in Greek, not in German."

But to all save its devotees classicism was as sawdust. It suffered a natural death, giving place to the monkish asceticism of the Nazarenes—a nickname of reproach which they proudly adopted as a happy designation of their coterie—whose prophet was Wackenroder (1773-98), whose cult was that of the Madonna, and to whom a picture-gallery was as a temple of Christian worship, the very gate of Heaven. The leading exponents of their art creed were Peter Cornelius, Frederick Overbeck, William Schadow, Philip Veit, Schnorr, and Edward Steidle.

They gave themselves away as artists when they relinquished drawing from the model as an

injury to idealism and from the nude as a menace to modesty. For the rest, the art-loving public grew weary of anaemic scriptural pictures and didactic or namby-pamby anecdotes—excellent in design, but poor in colour and wholly destitute of vigour—and with avidity went after the strange gods to the west of the Rhine. Nor did the Romanticists, who sought inspiration from the Old Testament or Shakespeare and the poets, fare any better. The promise that underlay the monumentalism of Alfred Rethel (1816–59) was cut short by madness, and though Moritz Schwind (1804–71) got more out of legend and fairy tale, which he saw with the eye of a modern, than all the other Romanticists combined, that way salvation did not lie.

If the art of sentimental Germany lacked essential truth because it was non-human, the art of the Germany of blood and iron, by which it was succeeded, developed remarkable technical qualities, and several painters of the first rank, who had the courage to rend the shackles which had bound their fathers and colleagues, frankly going to the *ateliers* of Paris for what the Frenchmen could teach and they learn. Concerning the Exposition of 1855 Edmond About had said truly and wittily "If you meet with a good German painter you can compliment him in French."

Twentieth Century Portraiture

Among the men who led the anti-sentimental revolution were Anselm Feuerbach (1828–80), Charles Piloty (1826–86), whose technique was rendered the more conspicuous by a feeling for colour which his compatriots of the preceding generation had disdained, and Gabriel Max, whose pictures possess a personal handling that removes them somewhat from the school with which nationality associates him. But Adolph Menzel (1815–1905), own brother to the French Meissonier, was the painter of most distinctive force and versatility, who owed least to anyone, who was virtually self taught, and excelled equally in colour and black-and-white.

In modern portraiture, which is the measure of the greatest in figure painting, Francis Lenbach (1836–1904) proved that he could hold his own with the ablest, whether of the 17th or the 19th century. Of the realists, none has a better claim to mention than the greatest painter modern Germany has produced, William Leibl

(1844–1900), whose *joie de peindre* recalls the most zealous of the Dutch artists. Others who may be named are Eduard von Gebhardt (1838–1925), Hans Thoma (1839–1924), Max Liebermann (1847–1936), Fritz von Uhde (1848–1911), Max Klinger (1857–1920), and Stuck (1863–1928).

Before and during the First Great War a strong reaction against Impressionism began to make itself felt. It affected the German masters of this originally French school of art, Lovis Corinth and Max Slevogt themselves, giving more vigour to their already powerful style. It provoked interesting experiments in Cubism, such as Lionel Feininger's mysterious groups of buildings, and an Expressionism in

which Oscar Kokoschka (later in London) and others found their own new ways. Abhorred as Leftists and internationalists by Hitler, they had to make way between 1933 and 1945 for third-rate practitioners.

GERMANY IN THE SECOND GREAT WAR

W. Burmeister, Resident Tutor, London University

This is an account of German events from the civilian angle during the years 1939–47. For later history see N.V. For German military history of the period see Europe, Western: Its Liberation; Russo-German Campaigns; Second Great War. See also biographies of Goebbels; Goering; Hitler and other Nazi leaders

After the defeat of France, Hitler declared in July, 1940, that he could see no reason why the war should continue. German propaganda described this declaration as a "peace offer," and Britain's refusal to accept it was cited for years in Nazi propaganda as proof that the British government was responsible for the continuation of the war.

Listening to foreign broadcasts in Germany was on Sept. 1, 1939, made a crime punishable by penal servitude or, in certain cases, by death. After the first leaflet raid by the R.A.F., it became punishable to touch any leaflet dropped from the air. From time to time during the war the German authorities announced sentences and executions under these decrees. Anti-Bolshevist propaganda was stopped and trade between Germany and the Soviet Union continued smoothly, right up to June 22, 1941, the day of the German attack on Russia.

The persecution of the Jews, pursued relentlessly since 1933, was intensified almost immediately Hitler had entered upon this, "the greatest of all struggles." Mass deportation of German Jews to Poland began in Oct. At the same time, any German who might show sympathy with them was threatened with dire punishment. Before these deportations began Jews had been deprived of all civic rights: they had re-

ceived no clothing coupons, had been allowed to shop only between 4 and 5 p.m., and had not been allowed to use air raid shelters, one of the objects of the Nazis being to give the ordinary German the feeling that there were people much worse off than himself. In the autumn and winter of 1940 the Gestapo started to kill thousands of Germans said to be incurable, mentally defective, or too aged or infirm to be of any use in the war effort. Both Protestant and R.C. churches made useless protests against these so-called "mercy killings."

Extermination Camps

The concentration camps of Dachau, Belsen, Buchenwald, and many others were established long before the war. The number of concentration camps, some of them in fact extermination camps, grew until mass murder became an industry carried on by special units of the S.S., officially named Death Head Formations. In one of these death camps at Auschwitz (Oswiecim) about four million people were murdered between 1941 and the end of the war.

R.C. church schools, monasteries, and convents were closed, and measures were taken against other R.C. institutions and practices. Protestant pastors, especially those belonging to the Confessional Church, were arrested in great numbers or sent into the army or into munition factories for com-

pulsory labour. A ban was imposed on the sale of all religious literature, and on the sending of such literature to men in the armed forces. The Nazi determination to stamp out Christian belief and practice weakened later, however, not only because of the growing resistance of the churches. The early onset of an exceptionally hard winter, the miscarriage of Hitler's strategic plans in Russia, involving tremendous casualties and hardships for the German forces engaged, and the intensification of raids by the R.A.F. strained the whole Nazi system, so that the energetic pursuit of the plan to suppress the churches seemed likely to endanger both the unity of the home front and discipline in the army.

Hitler as Army Leader

In Dec., 1941, Hitler relieved Field Marshal von Brauchitsch of his post as c.-in-c. and personally assumed the leadership of the army. Under him was Field Marshal Keitel, chief of the high command of the armed forces, and General Halder, chief of the army general staff. In addition there was an operational staff under General Jodl. So confident had Hitler been of a rapid victory over the Red Army that he had neglected to make preparations for a winter campaign. In the middle of the winter, on Dec. 20, Goebbels, minister of propaganda, launched an appeal for warm clothing and blankets as a Christmas present from the German people to the soldiers on the Russian front, where frost-bite had assumed the dimensions of a catastrophe. A few days before, on Dec. 11, Hitler had declared war on the U.S.A.

Enormous losses in men and material in the Russian winter campaign of 1941-42 compelled the Nazi government to intensify the regimentation of the human and material resources of Germany, her satellites, and the occupied countries. New restrictions were imposed upon the manufacture of consumer goods, although even then there was still nothing like the austerity freely accepted in Britain. According to the German ministry of labour, in Jan., 1942, the total German labour force had fallen from 26 million before the war to about 24 million, including over two million foreign workers from Italy and the occupied countries, but not counting 1.6 million prisoners of war who had been put to work. Some of the foreign workers, of

whom just over a million were Poles, had been attracted by bribes and promises of a higher standard of living; but from 1941 onwards the Nazi authorities had to resort increasingly to threats, compulsion, and brute force, and in March, 1942, Sauckel, Gauleiter for Thuringia, was appointed labour controller for the whole Reich. Once an obscure agitator, and one of Hitler's old guard, he had, by a process of expropriation and blackmail, risen to the ownership and control of industrial enterprises employing many thousands of workers. He was equipped with sweeping powers for the mobilisation of German and foreign labour.

All through the war Germany had a system of differential food rationing. Consumers were grouped into the following categories: children, under 3, 3 to 6, 6 to 10 years; juveniles, 10 to 20 years; normal consumers over 20; night workers; heavy workers; very heavy workers. Bread, potatoes, fruit, fish, and vegetables as well as meat, fats, and sugar, were rationed in Germany, but there was a considerable traffic in food between town and country; and German soldiers abroad sent home quantities of food, apart from official requisitions carried out by the German occupation authorities. The first large scale cut in rations, affecting bread, meat, and fat, was made in the spring of 1942, and the dismissal of Walter Darré, prophet of the "blood and soil" theory, from his post of minister of food and agriculture and Reich peasant leader, in May, 1942, was probably connected with this deterioration in the food situation. His place was taken by Backe, his former under-secretary.

Himmler Controls all Police

The growing weight of British bombing produced changes in German internal organization. In June, 1942, Himmler (*q.v.*) took over the A.R.P. services and re-organized them under the title of A.R.P. Police. All branches of the German police force had already been integrated with the S.S. through a system of dual membership whereby higher police officers were also high ranking members of the S.S. Inside the S.S., and indeed inside almost every organization and institution in Germany, there operated the special security service, the S.D. The Waffen-S.S., the fully mobilised and heavily armed section of Himmler's S.S. guards, of an

estimated strength of 250,000-300,000, was entirely independent of the army. Its chief task was to fight the guerrillas behind the German front in Russia, and the growing resistance movements in all the occupied countries of Europe. The cruelty and brutality it displayed were calculated not only to intimidate workers in the resistance movements but also to frighten the Germans themselves into even more unconditional obedience. Non-German units were added both to the S.S. and the Waffen-S.S. and sometimes stationed in Germany.

Hitler, Supreme Law Lord

In April, 1942, Hitler addressed a special meeting of his Reichstag, and proclaimed himself supreme law lord. He announced that, anticipating the agreement of the Reichstag, he had already "ruthlessly eliminated" a number of people who had not proved equal to the strain of the war on the Russian front. In May, it was announced that 14 Germans had been executed in Mannheim for attempting to undermine the war effort. In Aug., Hitler appointed Dr. Thierack minister of justice and ordered him "to build up a National Socialist administration of justice as I direct," and if necessary "to depart from existing law." Since 1934 Thierack had been president of the so-called peoples' court in Leipzig and had passed sentence of death on thousands in that capacity. In Aug. also Professor Brandt, one of Hitler's personal doctors, was appointed special commissioner for health services, with power to allocate doctors, hospitals, and medical supplies between military and civilian claims; in Oct. Dr. Ley, head of the Nazi labour front, was appointed Reich housing commissioner and equipped with dictatorial powers to solve the growing housing problem caused by R.A.F. attacks. These were only two of a number of special commissioners created during 1942, apparently in the belief that difficulties could be decreed out of existence.

On Jan. 30, 1943, Hitler had been in power for 10 years. For the first time the anniversary was not celebrated. Hitler did not speak because, it was explained, he could not leave the front. Next day the Russians announced the annihilation of the German 6th army at Stalingrad.

On Jan. 28 Sauckel issued a decree requiring all German men between 16 and 65 and all women

between 14 and 45 to register at local labour exchanges for national defence work. Only women with one child below school age or two children below 14 were exempted. The Germans were told that there were more women than men in British war factories; that the Russians were a nation of underfed and badly clothed slaves who were being driven to work and to fight by commissars armed with whips and machine-guns; that Roosevelt was cancelling all democratic liberties; but that in Germany total war was still, for millions, nothing but a slogan. Except for air raids, said an official announcement, people at home had been living, in comparison with the soldiers, as though there were no war at all.

The official admission from Hitler's H.Q. that Stalingrad was lost came on Feb. 3. All places of entertainment were closed for three days as a sign of national mourning, and the Nazi leaders used fear of the fate which Germany would suffer if Bolshevism were to be victorious as a spur to flagging energies. Possible saboteurs and traitors still to be found in Germany were threatened with growing ferocity. The man-power drive was extended to the occupied countries; in France, with the connivance of the Vichy government, French workers were recruited for Germany by mass deportation.

Widespread Allied Air Attacks

By the summer of 1943 there was no place in Germany out of reach of Allied air attack, the weight of which sometimes exceeded in a week the bomb load dropped by the Luftwaffe on London during the whole of the years 1940-41. In all the large industrial cities extensive areas were in ruins. Luftwaffe opposition, A.A. batteries, and the A.R.P. services were beginning to wilt. German men, women, and children, terrified and exhausted, streamed from their burning cities into the surrounding countryside. In addition, the authorities ordered large-scale evacuation. German home propaganda simultaneously denounced the "Anglo-American air terror" and reminded the Germans of the spirit shown by the British in 1940.

Himmler, now minister of the interior and "plenipotentiary for the administration of the Reich," announced in Oct. that 104,286 persons had been killed in air raids in 12 German cities during April 1 to Oct. 25, 1943; in Hamburg

alone the death roll was nearly 30,000. According to official German estimates published in Nov., 80 p.c. of the built-up areas of Cologne, Hanover, Cassel, and Mannheim had been destroyed, 70 p.c. of Hamburg, 60 p.c. of Essen, 30 p.c. of Munich. Large parts of Berlin were destroyed in a series of heavy raids during Nov.

The July Plot

Throughout the spring of 1944, the German forces were being driven back in Russia, in the Balkans and in Italy. The German power of resistance in the W. had been steadily undermined by an incessant and overwhelming air offensive. In May the Nazi government announced the appointment of political commissars in all units of the German army. On June 6 the Allies landed in N. France. Six weeks later, on July 20, an attempt was made on Hitler's life by high-ranking officers at his headquarters in East Prussia. A number of his staff were killed or injured, but Hitler escaped with minor injuries. The placing of the bomb was part of a plot to overthrow the Nazi regime which had started before the outbreak of war.

When Hitler came to power in 1933 the German generals had hoped to use him and his party as an instrument in their policy of rearmament and military aggrandisement. They turned a blind eye to the origins and criminal nature of the men he appointed as ministers. For a time they were able to keep the army outside the control of the Nazi party. In 1934 they even compelled Hitler to destroy the S.A. (Brown Shirts), a possible counter-organization, in the purge of June 30. During the following years, however, Hitler succeeded in dominating the army, partly by concentrating all other instruments of power in the hands of the Nazi party—the police, the Gestapo, the administrative machine, the direction of public opinion and of economic activity—and partly because his political and military judgements, up to the attack on the Soviet Union, proved to be better than those of the generals. They feared difficulties from the reoccupation of the Rhineland, but there was none. They planned to remove Hitler at the time of the Munich crisis because they expected a war for which they were not fully prepared, but Chamberlain came to Munich and the agreement gave Hitler all he wanted. In 1939 Hitler told them there would not be war on two fronts, and the Western Powers

proved unable to interfere with the campaign in Poland. Hitler changed the military and strategic plans for this campaign, taking more risks than the generals were prepared to accept, and he proved right. His campaigns in Norway, the Netherlands, Belgium, and France were swift and successful beyond anything they had dared to hope. Those generals who were not inspired with uncritical admiration by these successes were removed from their positions, retired, or given a state funeral after they had met with an accident. The majority remembered that they owed their epaulettes to Adolf Hitler. In the Russian campaign the more cautious and conservative of the generals were proved right for the first time. But their previous surrenders to Hitler and their complicity in his preparations for aggression had left them with little power and less resolution. Moreover, at this stage the price of Hitler's overthrow was unconditional surrender to Germany's enemies. So the majority remained loyal to the oath which Hitler had compelled them to take.

Failure of the Plot

In describing the plot of July 20, the Nazis spoke of "an insignificant military clique." On the contrary, it was a far-flung conspiracy. Many of the officers involved had held or were still holding high positions in the German army. The man who placed the bomb, Colonel Count von Stauffenberg, was chief of staff, home army, and associated with him were the scions of some of the oldest Junker families. In addition, a considerable number of civilian groups, ranging from Conservatives to Socialists, were in various degrees connected with the plan. This diversity of men, and of motives, was one of the plot's weaknesses. It caused endless delays and prevarications. The plan also required the death of Hitler to create the necessary psychological shock and consequent paralysis of the Nazi forces. But Hitler escaped.

The narrow failure of the attempt to overthrow the Nazi regime, a failure in which Hitler claimed to see once more "a confirmation of the task imposed upon me by divine providence," was followed by ruthless extermination of all those who had taken part in the plot or were merely suspected of having done so. German records of names and places show that more than 4,950 Germans were destroyed in this purge. Hundreds of executions were carried out, and

Hitler had them filmed. Some of the generals involved, like Fromm, c.-in-c. home army, attempted to save themselves by abandoning their fellow conspirators. Some, like Col. Gen. Beck, former chief of the general staff, committed suicide. Hitler's former favourite, Rommel, was ordered to commit suicide. The rest sent messages of loyalty.

Among civilians implicated were Dr. Karl Goerdeler, former burgo-master of Leipzig, Wilhelm Leuschner, a Socialist trade union leader, Ulrich von Hassell, a former German ambassador to Italy, who were captured some weeks later and executed in Sept. A few days after their execution it was announced that Dr. Rudolf Breitscheid, a former leader of the Social Democratic party, Ernst Thaelman, former leader of the German Communist party, and other political prisoners in the Buchenwald concentration camp had been killed during an alleged air raid by Allied forces.

Formation of the Volksturm

Himmler now succeeded Fromm as c.-in-c. of the home army. His rivals in power during this last stage of Hitler's dictatorship were Martin Bormann, head of the party chancellery, and Josef Goebbels, who tirelessly proclaimed to the German people that new secret weapons were about to change the whole aspect of the war, and that the use of the flying bomb had created panic in London and chaos in Britain's air defence. Goering was eclipsed owing to the failure of his Luftwaffe. Yet another "total mobilisation" was ordered by Hitler, and Goebbels was appointed plenipotentiary for this. Hitler's state of health was now so bad that little was seen or heard of him during the next few months.

By the end of Sept., British and American troops were fighting on German soil. Germany's satellites were turning against her one by one. In the middle of Oct. Hitler announced the formation of the *Volksturm*, a German home guard comprising all able-bodied men from 16 to 60, under the command of Himmler and officered by members of the Nazi party. Boys of 15 were asked to volunteer for the army, those who had reached the age of 16 were called up, still younger boys and girls were compelled to perform auxiliary duties under the direction of the Hitler Youth. In all areas threatened by invasion, men between 16 and 65 and women between 18 and 55 were conscripted for work on fortifications and trenches. All places of enter-

tainment were closed; there was a severe cut in rations, and there was talk of German guerrillas preparing to fight the enemy in any part of Germany which might be conquered.

Rundstedt launched the last German offensive of the war in Dec., 1944, in the Ardennes; but in little more than a month it was beaten, while the Russians had cut off Silesia and East Prussia from the rest of Germany, and hundreds of thousands of German refugees were fleeing in snow and frost before the advancing Red Army.

In April, Himmler, Keitel, and Bormann issued a joint warning to all military and civilian authorities that anybody who surrendered a German town or village would be sentenced to death, and the German radio continued to announce executions carried out under this decree; and advancing British and American troops uncovered the horrors of Belsen and Buchenwald concentration camps.

With Germany virtually split into two by the Allied advance from E. and W., the Soviet armies launching their offensive against Berlin, and German resistance in Italy and the Ruhr collapsing, it was announced that Field Marshal Kesselring would command the Southern Redoubt where the last stand was to be made. But neither the Southern Redoubt nor the underground resistance by the "Werewolf" organization, announced on April 1, was to materialise.

The Last Days in Berlin

Hitler refused to leave Berlin, and Goering asked on April 23 that leadership of the Reich should be handed over to him, in accordance with the decree of 1941 which had appointed him Hitler's successor. Hitler thereupon accused Goering of high treason, had him arrested, but spared his life after he had agreed to resign all his offices. On the following day Himmler, without Hitler's knowledge, offered to surrender to the Western Allies only—an offer that was rejected. Hitler married Eva Braun on April 29. Next day both committed suicide and their bodies were burned in the chancellery garden, now encircled by the Russians. Goebbels and his family committed suicide on May 1. On the same day Doenitz, speaking over the Hamburg radio, announced that Hitler had fallen, and that he had taken over the government. Five days later Doenitz dismissed Himmler, Goeb-

bels (of whose death he did not know), Rosenberg, and Thierack.

Meanwhile, German forces in Italy surrendered unconditionally on April 29, in N.W. Germany, the Netherlands, and Denmark on May 4, in Austria on May 6. Only in Czecho-Slovakia were any German troops still fighting. The general unconditional surrender of Germany's armed forces to all the Allies was signed at Reims on May 7, and confirmed in Berlin next day.

Nazi Leaders in Eclipse

Himmler committed suicide when arrested by British soldiers a fortnight after the surrender. Goering's arrest was announced on May 10. Doenitz, with all the members of his "government" and of the German high command, was arrested by the Allies on May 23. Many other German political, military, and industrial leaders were arrested during the following month. A number of them, including Goering, Hess, Ribbentrop, Ley, Rosenberg, Streicher, Keitel, Funk, Schacht, Speer, Papen, Fritzsche, Sauckel, and Doenitz, were indicted for crimes against peace, war crimes, and crimes against humanity, and brought before a military tribunal at Nuremberg on Nov. 20. It lasted for ten months, sentence being pronounced on Oct. 1, 1946. Goering, Ribbentrop, Keitel, and nine others were condemned to death; Hess, Doenitz, and five others to terms of imprisonment. Schacht, Papen, and Fritzsche were acquitted. The German population showed relatively little interest in this thorough examination of a tremendous and disastrous epoch of their own history.

Germany, her eastern provinces annexed by Russia and Poland, was divided into four zones of occupation, under the military government respectively of Britain, the United States, the Soviet Union, and France. The Nazi party and its dependent organizations were dissolved and prohibited. In the Potsdam agreement of Aug., 1945, the occupying Powers declared that one of the main purposes of the occupation was to prepare for the reconstruction of German political life on a democratic basis, and for Germany's eventual peaceful co-operation in international life. They succeeded in restoring order from the chaos they found, and by the autumn of 1946 elections had been held for provincial parliaments, while provincial govern-

ments, with limited powers, had been established.

The four Powers were, however, unable to agree on many of the issues involved, in particular on the political structure of Germany, the re-establishment of German economic unity, the amount of reparations and the method of extracting them. Economic conditions, especially the food situation, steadily deteriorated, although Great Britain and the U.S.A., at the expense of their taxpayers, imported supplies into the W. Western Germany had always received a large part of its food supplies from the eastern provinces, but these deliveries stopped with the occupation. Moreover, between 8 and 10 million Germans, expelled from the territories annexed by Poland and from the Sudeten area of Czecho-Slovakia, had been added to the population of the western part. The low ration scale fixed could not be honoured, partly because food imports (for which no payment was available) fell behind schedule, and partly because German farmers hoarded food instead of complying with the regulations for its surrender to the common pool.

Low Output of Ruhr Coal

Industrial production in the W. fell far below even the level permitted by the Potsdam agreement. The output of Ruhr coal, vital to industrial activity in France as well as Germany, remained low. Industrial production was also hampered by the appalling housing conditions, due to Allied bombing, by the growing physical weakness of the workers and by their uncertainty about the future on account of the dismantling of plant for reparations and the destruction of installations as part of the Allied policy of destroying Germany's war potential. Co-operation between the different provincial governments was inadequate, and the agreement reached in 1946 between the British and American governments for the economic fusion of their two zones did not prove as effective as had been hoped in meeting the situation, which was rendered even more unstable by the failure of the Allies to agree on the terms of a treaty of peace with Germany. For later history see N.V.

Germ Cell. Unspecialised or generalised cell in a living body. Whereas a protozoan (*g.v.*) can perform most of its functions in all parts of itself, in the metazoa there

has developed a specialisation of parts which has led to great advances in the total repertory of the animal at the cost of its sacrificing in each part the capacity to do anything other than the limited function of that part. Thus, practically speaking, muscle-cells only contract, and nerve-cells only conduct, as a result of their life-process or metabolism. Some cells remain unspecialised.

These are destined to give rise to the eggs and sperms from which the next generation will arise by a process of differentiation, which means specialisation, of parts. All cells of the body possess a full complement of genes (*g.v.*) carried on chromosomes (*g.v.*). These genes, in the somatic cells, mediate the growth and division and specialisation of the various types of cell in their various locations. In the germ cells, however, the genes do not mediate any specialisation; they merely mediate an unspecialised metabolism and a particularly modified division.

This division of germ cells is called meiosis (Gr. reduction) because in it the full complement of chromosomes, and so of genes, is reduced to half. The somatic cells of the animal contain a double set of chromosomes derived one set each from the animal's two parents. The products of a meiotic division are issued with one complete set only. The set is complete in the sense that it contains one gene of every *kind*. Whether the representative of that kind which goes to any product of such a division comes from the animal's father or mother is a matter of chance. This is what makes the combination of genes at the union of egg and sperm truly a recombination.

Germersheim. German town, in the Rhineland-Palatinate. It stands at the junction of the Queich with the Rhine, 9 m. S.S.W. of Spires (Speyer). Its interest is mainly historical, although until the First Great War it was a minor fortress. The chief buildings are churches and a hospital, and there are some small industries. Germersheim was a Roman station, and in the Middle Ages a free city. It was then a fortified town with a citadel. In 1622 it passed into the possession of the house of Hapsburg, but in 1644 and 1674 was taken by the French. Austria recovered it in 1702; France claimed it in 1715; at the peace of 1814 it became part of Bavaria, and later it was fortified anew. Pop. 3,850.

Germicide. Substance capable of destroying disease germs. The word is substantially synonymous with disinfectant, but differs in meaning from antiseptic, with which it is often confused. See Antiseptics; Disinfectant.

Germinal. Seventh month in the year as rearranged during the French Revolution. It began on March 21 or 22, and the name means the month of buds.

Germinal Disk. Small part of the surface of a spherical egg cell where there is little or no yolk. An egg is a single cell, whether the microscopic egg of a mammal or the enormous yolk of an ostrich egg. (The yolk alone is the egg to the biologist.) In egg cells with little yolk, more or less normal metabolism can occur all over; in egg cells with an enormous amount of yolk, metabolism is greatly impeded. In yolk egg cells there is always a germinal disk, where development begins, fertilisation takes place, demands for food and oxygen are greatest, and the embryo is formed.

Germination (Lat. *germinatio*, budding). Sprouting of a seed or spore. See Botany; Cotyledon; Dormancy; Seed; Spore.

Germiston. Town of the Transvaal, S. Africa. It is 9 m. by rly. S.E. of Johannesburg, and 36 m. S. of Pretoria. It is an important gold-mining centre and was formerly known as Elandsfontein Junction. Palmietfontein airport is a terminal of B.O.A.C. and S. African Airways. Here is a station of the Victoria Falls and Transvaal Power Co., which supplies power to many of the mines. There are also manufactures of chemicals, agricultural implements, and hardware. The European pop. of 51,744 is the sixth largest among towns in the Union.

Germ Layers. In the development of many eggs a hollow sphere is formed, one side of which becomes pushed in. That part of the hollow sphere which remains on the surface is called the ectoderm, or outer skin, that part pushed in is the endoderm, or inner skin. Between these layers there grows a third, the mesoderm, or middle skin. There is a high degree of constancy in the fate of these layers from form to form, homologous structures in different forms being made out of the same layer. Collectively these layers are called the germ layers.

Gérôme, JEAN LÉON (1824–1904). French painter. Born at Vesoul, May 11, 1824, he studied under Delaroche, making

a successful début at the Salon in 1847 with *The Cock Fight*. Many of his subjects were classical, with a touch of modernity in the treatment, and he had a competent technique. Awarded the Legion of Honour in 1855, he became commander in 1878.

Jean Léon Gérôme,
French painter

In 1863 he became professor of painting at the École des Beaux Arts and in 1865 was elected a member of the Institute. His best known works include *The Age of Augustus* and *The Birth of Christ* (bought by the state), *The Duel of Pierrot*, *Phryne Before the Areopagus*, and *The Death of Caesar*. Latterly Gérôme turned to sculpture, achieving success with figures of Bellona, Napoleon, The Gladiator, and Tanagra. He died in Paris, Jan. 12, 1904.

Gerona. Maritime prov. of N.E. Spain, in Catalonia. It slopes from the Pyrenees to the Mediterranean. Area, 2,264 sq. m. Traversed by the Barcelona-Perpignan rly., it is bounded on the N. by France, on the S. and E. by the Mediterranean, and on the W. by Barcelona prov. One of the richest provs. of Spain, it carries on a large trade, and produces minerals, fruit, fish, timber, cork, copper, lead, iron, ochre, and wine. The coastline, known as Costa Brava, is wildly picturesque and the most popular summer resort in Catalonia. It is indented by a large bay, the Gulf of Rosas, to the N. of which is Cape Creus, the most easterly point in Spain. Portbou, close to the French frontier, is the leading port in the prov., which has a pop. of 326,290.

Gerona (anc. *Gerunda*). City of Spain, capital of the prov. of Gerona. It stands at the confluence of the rivers Ter and Oñar, 52 m. N.E. of Barcelona, on the main rly. from Barcelona to Perpignan. It is connected with its suburb El Mercadel beyond the Oñar by a bridge. Its cathedral, begun early in the 14th century, stands on the site of an earlier edifice, and is a unique specimen of Gothic architecture. The manufactures include paper and textiles. Coal, iron, and lead are mined. Pop. 24,000.

Gerona was a place of some importance during the Punic Wars, and it has had a tempestuous history, having been besieged numerous times. It is principally famous for its heroic defence by a few

Spaniards and English volunteers against the French in 1809, the garrison finally capitulating through famine and disease. The city suffered severely from floods in 1762 and in 1829. Its bishopric dates from the 3rd century.

During the Spanish Civil War, after the fall of Barcelona to Franco's Nationalist Forces, Jan. 26, 1939, Gerona became crowded with Republican refugees streaming towards the French frontier. Gerona itself fell on Feb. 4. See Figueras; Spanish Civil War.

Gerontius. General in the service of Constantine (*q.v.*), the usurping tyrant in Gaul. After Constantine's defeat in 408, Gerontius rebelled against him, proclaimed Maximus, belonging to the household troops, and possibly his own son, emperor, and, having put Constantine's son Constans to death, set out in pursuit of Constantine, who was in refuge in Arles (Arles). Meantime, Honorius had dispatched troops against Constantine, and, securing his person on the surrender of the town, put him to death. Gerontius fled before Honorius's superior forces, but was seized by his own mutinous troops, who resented his severity. These fired the house in which he took refuge with his wife and one faithful servant, and, after a brave resistance, Gerontius slew his wife and servant at their own request, and then stabbed himself.

Gerry, ELBRIDGE (1744-1814). American statesman. Born at Marblehead, Mass., July 17, 1744, he became a member of the general court of Massachusetts, where he showed an open hostility to British rule. In 1776 he was a member of the Continental Congress, and was active in the preparation of the Declaration of Independence, of which he was a signatory. In 1797 he was one of a mission sent to the French Directory to arrange for the recognition of the republic. Governor of Massachusetts 1810-12, he was largely responsible for a law which gave rise to the term gerrymander (*v.i.*). In 1813 he became vice-president of the U.S.A., dying at Washington, Nov. 23, 1814.

Gerrymander. An American term for a method of arranging the boundaries of an electoral division so as to give an unfair

advantage to a particular party or candidate. The name originated in 1812, when Elbridge Gerry was governor of Massachusetts. The Republican majority in the state legislature divided Essex county in such a way as to ensure success at the next election. Gilbert Stuart, the painter, happened to call at an office where a map, showing the distortion of this district, hung on the wall. He added with a pencil a head, wings, and claws, and remarked "That will do for a salamander." "Better say a gerrymander," commented someone, and the term passed permanently into American politics. A notorious example occurred in 1890, when William McKinley lost his seat in congress, because his opponents, having gained control of the Ohio legislature, removed from his constituency the sections containing most of his supporters.

Gers. Dept. of S.W. France. Its area is 2,428 sq. m. Tributaries of the Garonne, the Gers, Baise, Save, Gimone, and others coming down from the Pyrenees are the chief rivers. The Adour also flows through the dept. The dept. is a hilly area, especially in the S. Wheat, maize, and oats are grown; wine and brandy are made; and horses, cattle, sheep, and poultry are reared. Auch is the chief town; others are Lectoure, Mirande, Condom, and Lombez. Before the Revolution this dept. was mainly in Gascony. Pop. 190,405.

Gershwin, GEORGE (1898-1937). American composer. Born in Brooklyn, Sept. 26, 1898, of Jewish parents, he made his name as a composer of dance music for George White's Scandals, 1920-24. His musical comedies, in which the Astaires appeared, included *Lady Be Good!* 1924; *Stop Flirting*, 1925; *Funny Face*, 1927. In larger compositions he blended a haunting lyrical note with syncopated rhythms, and his *Rhapsody in Blue*, 1923, was long in the orchestral repertory. With a concerto in F, 1925; *An American in Paris*, 1928; *Second Rhapsody*, 1931, Gershwin elaborated this method, but his most ambitious work was *Porgy and Bess*, 1935, an opera based on negro themes which ran in New York and London. He died at Hollywood, July 11, 1937. A film, *Rhapsody in Blue*, based on his life and music, appeared in 1945.

Gerson, JEAN CHARLIER DE (1363-1429). French scholar and divine. He was born in humble

Elbridge Gerry,
American statesman

circumstances at Gerson, Dec. 14, 1363, and educated at the college of Navarre, Paris. Taking holy

J. C. de Gerson,
French scholar

orders, he became canon of Notre Dame and chancellor of the university of Paris in 1395. He worked hard to check the careless lives of the clergy, to end the Great

Schism then dividing the papal court, and to amend the too scholastic education of the university. His outspokenness led to his withdrawing to Rattenberg in Tirol in 1418 for a time, during which he wrote his best known work, *On the Consolation of Theology*. Later he retired to a monastery at Lyons, where he died July 12, 1429.

Gersoppa. Village and falls of Bombay, India, in the Honavar sub-division of North Kanara district. The great ruins of Nagar-bastikere, the capital of the Jain chiefs of Gersoppa (1409-1610), are about 1½ m. E. of the village. According to tradition the capital contained 100,000 houses and 84 temples. The Gersoppa Falls, which are unrivalled in India, lie 18 m. E. of the village, and are on the Sharavati river. At this spot the river has a breadth of about 230 ft., and the water falls over a cliff 830 ft. high in four leaps, called the Horseshoe, Roarer, Rocket, and Dame Blanche.

Gerstacker, FRIEDRICH (1816-72). German traveller and writer. Born at Hamburg, Nov. 10, 1816, he went to America, where he travelled extensively afoot during 1837-43. Having told his experiences in a series of diary-letters, he returned to Germany to find himself famous. Thenceforth he devoted himself largely to descriptive books of travel. He went round the world, 1849-52; journeyed in S. America, 1860-61; in Egypt and Abyssinia, 1862; and in N. and Central America and the W. Indies, 1867-68. He also won success with some fiction largely inspired by his travel experiences. He died at Brunswick, May 31, 1872.

Gerstenhofer Furnace. Type of roasting furnace first used at Freiberg in Germany, but also extensively employed at Swansea for the roasting of pulverised copper matte. It is a shelf furnace in the form of a square shaft, across which are arranged at equal distances, and one above the other,

a number of horizontal fireclay bars. The ore is introduced at the top and falls from bar to bar, arriving at the bottom to a very large extent desulphurised. *See* Furnace.

Gertrude. Name of two saints of the Latin Church. (1) Gertrude (d. March 17, 659), a daughter of Pepin, the father of Charlemagne, was the first abbess of the convent of S. Gertrude at Nivelles, Belgium. On the high altar of the existing (11th century) edifice is a beautiful 13th century reliquary of S. Gertrude, who is revered as the patron of travellers and pilgrims and as giving protection against rats and mice. Her festival is kept on March 17.

(2) Gertrude, born at Eisleben, Saxony, Jan. 6, 1256, became an abbess. She had many visions and wrote some mystical exercises. She died in 1311, and her festival is kept on Nov. 15.

The name, of Teutonic origin, means spear maiden and is one of a group to which Gerald belongs. It is found in the Nibelungenlied and is a popular feminine Christian name in England.

Gerund. In grammar, a noun formed from a verb. In English it is obtained by adding *-ing* to the verb, e.g. walk, *walking*. Like the infinitive, or any other noun, the gerund may be subject or object of a verb: compare "walking is good exercise" with "I enjoy walking." When the gerund is part of a compound noun it is identical in form, though not in meaning, with the participle, a verbal adjective. The different use is seen in *singing* bird (a bird which sings—adjective—participle) and *singing* lesson (a lesson in singing—noun—gerund).

Gervinus, GEORG GOTTFRIED (1805-71). German author. Born at Darmstadt, May 20, 1805, and educated at Giessen and Heidelberg, he became a teacher. His *History of German Poetry*, 1853, is a work of great value; the nucleus had appeared between 1835 and 1842 under a different title. In 1837 appeared his *Foundations of History*. He was appointed professor of history and literature at Göttingen, where he was one of the seven professors expelled in 1837 for their protest against the unconstitutional acts of Ernest Augustus. Gervinus was anxious for the unity of Germany, and in this cause he founded in 1847 *Die Deutsche Zeitung*, and in 1848 was a member of the Frankfurt parliament. His other works include *Shakespeare Com-*

mentaries, Eng. trans. 1863. He died March 18, 1871.

Geshur. One of the ancient states of Palestine, lying E. of the Jordan. David married a daughter of its king, and it was here that Absalom took refuge.

Gesner, KONRAD VON (1516-65). Swiss zoologist. He was born at Zürich, where he passed the whole of his life as a physician, and, latterly, a lecturer in physics. His *Historia Animalium*, 1551-58, established him as the father of modern zoology, but he was known to his contemporaries almost solely as a botanist and naturalist, earning the name of the German Pliny. He also wrote *Bibliotheca Universalis*, an encyclopedia of writers and languages. He died Dec. 13, 1565.

Gesneriaceae. Large family of herbs and shrubs. They are chiefly natives of the warmer regions of America. Some of the species, such as *Gloxinia*, have tuberous roots. They have opposite, wrinkled leaves, and showy tubular flowers of scarlet, blue or, sometimes, white.

Gessner, SALOMON (1730-88). Swiss poet. He was born in Zürich, April 1, 1730, where he set up as a

Salomon Gessner,
Swiss poet

bookseller, but soon turned to literature, also painting and engraving landscapes. He won his chief popularity in Germany by his sentimental Idyllen, 1756. His *Tod*

Abels (Death of Abel), 1758, written in an irregular kind of loose poetry, enjoyed considerable success in Germany, and was translated into six European languages. By 1788 it had passed through 30 English editions, and was praised by Scott and Byron. In 1772 he issued a second series of Idyllen, and *Letters on Landscape Painting*. His Idylls, with one of the Letters, were translated into English, 1798. Died March 2, 1788.

Gesso (Ital., plaster). Preparation of plaster used as a ground for painting or laid over another substance for the same purpose. It must be used with care, as it is liable to chip. Gesso duro (hard plaster), specially made of gypsum, has been utilised for sculpture work, generally in low relief. *See* Painting; Sculpture.

Gestapo (Ger. abridgement of *Geheime Staatspolizei*, secret police of the state). Nazi organization.

It was founded immediately after Hitler's advent to power for the specific purpose of preventing opposition to, or criticism of, the government, and for eliminating potential adversaries or politically undesirable elements, whether Germans or citizens of subjugated countries. Members of the Gestapo were recruited from the most rabid Nazi party adherents.

Originally there was a Gestapo in each individual German state; thus the Prussian organization was the instrument of Goering in his capacity of Prussian prime minister.

Beginning with that of Bavaria in Nov., 1933, these bodies were amalgamated under Himmler, and soon wielded unlimited power of life and death over all Germans and subject persons. Their ramifications and spies penetrated into every corner of public and private life; searches, arrests, detention in concentration camps, tortures, and murders were uncontrolled, and against the Gestapo there was no appeal. Every member of the organization, which was believed to total 150,000, most of whom operated in mufti, had authority over all other officials, irrespective of rank, and could draw upon the S.S. and armed forces for assistance.

Strict discipline was maintained, and eventually members were themselves spied upon by a super-Gestapo (*Sicherheits Dienst*, security service, commonly called S.D.). The virtual head of the Gestapo under Himmler was Heydrich, assassinated at Prague in 1942; he was succeeded by the Austrian Kaltenbrunner. The Gestapo and S.D. were both indicted as criminal organizations at the Nuremberg trials and found guilty on all counts.

Gesta Romanorum (Deeds of the Romans). Medieval collection of tales from Roman history and other sources, probably compiled about the close of the 13th century. The object was to provide stories which could be used to enforce or enliven lessons from the pulpit. The collection was first printed at Utrecht in 1473, the first English edition being issued by Wynkyn de Worde about 1510. There have been many later versions, the fullest being that by C. Swan, 1824, new ed. 1905.

Gestation (Lat. *gestatio*). The act of carrying the young in the womb or uterus from conception to birth. In the human species the average duration of gestation is 278 days. No legal limit is laid down in England or Scotland for

divorce proceedings or deciding legitimacy. In 1921 Lord Birkenhead held on medical evidence that 331 days was not impossible. See Pregnancy.

Gesture Language. Communication of thought by movements of parts of the body other than the organs of speech. Gesture may be (1) explicit, as in pointing or holding up a coin; (2) pantomimic, as in pretending to drink; (3) emotional, as in shrugging the shoulders; (4) conventional, as in raising the hat.

Gethsemanē. The garden near Jerusalem which tradition marks as the scene of Christ's betrayal

All these forms denote concrete ideas rather than words. The last three may consist of grimace; the first three are mutually intelligible to persons of every grade of culture when for any reason unable or unwishful to converse by speech. Conventional gesture may be unintelligible without previous explanation. Natural gesture never attained the power to communicate abstract ideas, or to represent the more complex parts of speech. It reached its highest developments in recent centuries among the Indians of the N. American plains and the populace of Naples.

No normally speechless community has ever been recorded. Voluntary vows of silence, such as those taken by some Trappist monks, and the involuntary silence of deaf mutes have led to the invention of conventional systems of manual signs (see Deafness illus. p. 2605). See also Language; Phonetics; consult A Psychology of Gesture, C. Wolff, 1945.

Getae. Thracian tribe, later called Daci. Their earliest home was on both banks of the Ister (Danube) from its mouth as far as the Tisia (Theiss). Byrebastas (Boerebista) founded a Daco-Getic kingdom about 50 B.C., which after his death fell to pieces. It was revived during the early empire, but the territory was conquered by Trajan (A.D. 106) and

made a Roman province. The Getae were a religious people, who are said to have believed in the transmigration of souls and to have worshipped a certain Zamolxis, sometimes identified with Sabazius the Thracian Dionysus. In spite of the similarity of name, they were no way akin to the Goths, by whom they were absorbed in the 3rd century. See Dacia.

Gethsemanē. Isolated spot on the slope of the Mt. of Olives, about $\frac{1}{2}$ m. from Jerusalem. A garden in Gethsemanē was a favourite resort

of Christ, and it was there, or near by, that He was betrayed by Judas. A garden, still preserved as the actual one, is considered by modern explorers to be too near the city walls. Excavations were carried out in the garden in 1920, in the course of which remains of a 4th century and a 13th century church were discovered. The subject of the agony in the garden has inspired

painters, e.g. Bellini, Mantegna, to produce masterpieces. See Jerusalem.

Getter. Device used in high vacuum apparatus to remove the last traces of gas. In the manufacture of thermionic valves for radio, cathode ray tubes, etc., it is essential to attain a high state of vacuum. This is effected by various forms of vacuum pump, and the valve is then sealed with a getter inside, usually in the form of a flat pellet. The getter is then volatilised by electrical heating, usually induction, and by some means, either chemical combination or physico-chemical absorption, it collects such gases as remain and then deposits itself on the inner surface of the glass bulb of the valve. Getters are commonly made of barium, aluminium, magnesium, and their alloys. See Radio Valve; Vacuum.

Gettysburg. Bor. and co. seat of Adams co., Pennsylvania, U.S.A. It is 70 m. N. of Washington and 25 m. S.W. of Harrisburg by rly. It was planned in 1780, named after General James Gettys, made a co. seat in 1800, and a bor. in 1806. Of its two Lutheran institutions, the theological seminary dates from 1826 and Gettysburg College from 1832. The field of the great battle of July 1863, was dedicated in Nov., 1863, as a national cemetery; it contains 3,629 graves and a number of

memorials, including one which, surmounted by a statue of Liberty, has at its foot figures symbolical of War, Peace, History, and Plenty. A peace memorial, with a flame burning from dusk to dawn, was dedicated by President F. D. Roosevelt, July 3, 1938. Pop. 5,916. See Gettysburg Address.

Gettysburg, BATTLE OF. One of the decisive conflicts of the American Civil War. It was fought at Gettysburg, Pa., July 1-3, 1863. The Federal army of the Potomac, 82,000 men, under General Meade, defeated the Confederate army of North Virginia, 73,000 men, under General Lee, but the Confederate leader escaped by a masterly retreat across the Potomac, withdrawing his broken army into Virginia. The losses were estimated as follows: Federals, 3,072 killed; 14,497 wounded; 5,434 prisoners and missing; Confederates, 2,592 killed; 12,709 wounded; 5,150 prisoners and missing. See American Civil War.

Gettysburg Address. Delivered by President Lincoln when, on Nov. 19, 1863, a national cemetery was dedicated at Gettysburg, Pa., where the previous July, Meade had defeated Lee in a battle which proved the turning-point in the American Civil War. The chosen speaker was Edward Everett, regarded as the most eloquent American of his time; not a sentence of his two-hours' oration is remembered today. Towards the close of the ceremony, 266 words were added by Lincoln. They made little impression upon the audience, but they are now recognized as in the front rank of American oratory and one of the treasures of English prose. They have been carved in marble on the Lincoln memorial in Washington.

"Fourscore and seven years ago," Lincoln said, "our fathers brought forth on this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war, testing whether that nation or any nation so conceived and so dedicated can long endure. We are met on a great battlefield of that war. We have come to dedicate a portion of that field, as a final resting-place of those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this. But, in a larger sense, we cannot dedicate—we cannot consecrate—we cannot hallow—this ground. The brave men, living and dead, who struggled here, have

consecrated it, far above our poor power to add or detract. The world will little note, nor long remember, what we say here, but it can never forget what they did here. It is for us the living, rather to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us—that from these honoured dead we take increased devotion to that cause for which they gave the last full measure of devotion—that we here highly resolve that these dead shall not have died in vain—that this nation, under God, shall have a new birth of freedom—and that government of the people, by the people, for the people shall not perish from the earth."

Geulincx, ARNOLD (1624-69). A Belgian philosopher. Born at Antwerp, Jan. 31, 1624, he became professor of philosophy in the universities of Louvain, 1646-58, and Leyden, 1665-69. He founded the system of philosophy known as Occasionalism (*q.v.*).

Geum. A handsome, hardy, dwarf perennial herb of the family Rosaceae. Natives of Great Britain, India, and N. America, the height of geums varies from one to two ft. The flowers are red, white, and yellow, and they are propagated by seed in spring, and by division of the roots in autumn. For rock gardens *G. montanum*, which has rich yellow flowers in abundance in early spring, is the most attractive. Herb Bennet and Water Avenas are two wild British geums.

Gevaert, FRANÇOIS AUGUSTE (1828-1908). A Belgian composer. Born at Huyse, in E. Flanders, July 31, 1828, the son of a baker, he studied at the conservatoire at Ghent. He became organist of the Jesuit church there. During 1867-70 he had a post at the Paris academy of music, and in 1871 was made director of the Brussels conservatoire. His compositions include many operas; he wrote on the history and theory of music in ancient times, and a standard *Traité d'Instrumentation*, 1885. He died in Brussels, Dec. 24, 1908.

Gevensberg. Town of Germany, in Westphalia. It lies 6 m. W.S.W.

of Hagen, on the Westphalian coal-field, and is a modern industrial town, known for its manufactures of cutlery, stoves, and iron and steel products. Pop. 23,150.

Geyser (Icelandic *geysir*). Hot spring from which water is intermittently forced into the air like a fountain. Geysers are characteristic of regions of recent volcanic activity, whence they derive their heat. They are almost confined to three areas: Iceland, New Zealand, and Yellowstone Park, Wyoming, U.S.A. The height to which the water is ejected sometimes exceeds 200 ft. "Old Faithful" in Yellowstone Park, so called because of its regular eruption at approximately hourly intervals, discharges over 10,000 galls. to a height of about 150 ft.

Geyser vents are usually pools surrounded by a mound of geyserite or sinter, material deposited from the hot water as it cools and evaporates. From the centre of the pool a pipe descends into the earth. Measurements show that the temperature of the water in this pipe increases downwards until it is well above the normal boiling point of water. It is prevented from turning into steam by the pressure due to the weight of the column of water in the pipe. Because more water is discharged from some geysers in eruption than could be contained in the pipe itself, it is suggested that the latter is connected with subterranean reservoirs. These must also be filled with superheated water and probably some steam.

With continued heating, the water in the bottom of the pipe begins to boil, and the rising steam causes some water at the top and in the pool to flow out. This preliminary discharge lowers the pressure at depth and the equilibrium of the whole system is disturbed. Immediately this occurs the water in the system is converted into superheated steam which discharges up the pipe, and eruption ensues. After the discharge the pipe and reservoirs gradually fill up again, mainly with water occupying cracks in the rock. Once the system is refilled the cycle starts afresh.

Geyser. Name given to a domestic appliance for the rapid supply of hot water at a single point, e.g. to a bath or wash-basin. It consists essentially of a long coil or spiral of tubing through which water continually flows from the source of supply to the outlet. The tube is exposed to a gas or other flame, a large surface of

Geum. The variety Lady Stratheden. Courtesy of Cutlers

1 Crow's Nest Geyser, New Zealand. When in eruption it invariably gives two jets at an interval of 90 seconds.
 2 Waikite Geyser, one of the largest in North Island, New Zealand. 3 Geyser in Yellowstone Park, Wyoming.
 4 Wairoa Geyser, New Zealand, near the scene of the eruption of 1881

GEYSER: EXAMPLES OF NATURE'S WONDERFUL BOILING FOUNTAINS

water (but a comparatively small volume) thereby being heated at one time. All such appliances should be properly vented to the open air, to allow the products of combustion to escape; and be fitted with a baffle to prevent down draught, which might extinguish the flame and cause unconsumed gas to enter the apartment. See Hot Water Supply.

Geyserite. Variety of opaline silica found in deposits round the geysers of Iceland, New Zealand, etc. Found in masses of pearly lustre sometimes of great beauty, it consists chiefly of silica with 10 to 12 p.c. of water.

Gezer. A city of Palestine, 16 m. W.N.W. of Jerusalem, commanding the Philistine plains. It was the dowry of the Egyptian

1925, enables an area of 850,000 acres of hitherto waste land to be cultivated. About a quarter of this forms one of the world's largest cotton-growing areas, which in 1944-45 yielded over 1,000,000 cwt. of 315 lb. seed cotton.

Ghadames, GADAMES, OR RHADAMES. Oasis and town in the extreme W. of Libya, N. Africa. It is 300 m. S.W. of Tripoli, and is an important centre for the caravan trade of the interior. In Roman times it was known as Cydamus. Pop. 7,000.

Gharbiyeh OR GHARBIEH. Maritime prov. of Lower Egypt. It contains the districts of Borollos, Desug, Fua, Kafr-el-Sheikh, Karfel-Zayat, Mehalla-el-Kubra, Santa, Sherbin Talkha, Tanta, and Zifta. Area, 2,818 sq. m. Pop. 1,967,894.

Ghardaia. Town and oasis of Algeria, in the Sahara. It is about 310 m. S. of Algiers, is walled, and is surrounded by fruit plantations. It is on one of the principal caravan routes from N. Algeria to the Sahara. Ghardaia gives its name to a territory of S. Algeria. Pop. 166,366.

Ghat (Hindu, path of descent). Flight of steps upon a river bank in India. Designed primarily to facilitate bathing, drinking, and other ritual acts, they served as landing-places, and are found along the Ganges at every city from Calcutta to Hardwar. Of the 47 ghats at Benares (*q.v.*)—surmounted by temples, rest-houses, images, and holy wells—five are visited by all pilgrims.

Manikarnika, the most sacred, and Smashan—the burning ghats—have cremation grounds. Munshi is the most picturesque, Ghosla the most massive, Sivala the handsomest, although rivalled by one at Maheswar on the Narbada. The term is used for the scarped sea faces of the Deccan peninsula, the Western and Eastern Ghats.

Ghats. Two great mt. ranges of India, called respectively the Eastern Ghats and the Western Ghats. Between them lies the triangular tableland of the Deccan. The Eastern Ghats, a line of small ranges, begin in Orissa, and continue through Ganjam and Madras to the Nilgiri plateau, where the junction is effected with the Western Ghats. They approach the Bay of Bengal in Ganjam and Vizagapatnam, but afterwards their course lies inland, leaving between them and the sea a long stretch of low country with a maximum width of 150 m. The Western Ghats, whose length is 1,000 m., form a sea-wall for the W. side of the peninsula, the Palghat Gap being the main route through this barrier. To the N., near Bombay, two rlys. scale the precipitous face, that climbing the Bhore Ghat being a marvel of engineering.

The two ranges have determined political developments on the coasts of S. India. To the E. the wide lowlands facilitated the spread of civilization, and it was there that the capitals of the great kingdoms of S. India were established; but on the W. side the inhabitants of the narrow coast land, being virtually cut off from the interior by the Western Ghats, were left to develop their own civilization.

Ghazali, ABU HAMID MOHAMMED EL- (1058-1111). An Arabian philosopher and theologian, called the proof of Islam. He was born and died near Tus, in Khorasan, where he founded a Sufi monastery. Ghazali combines a firm adherence to orthodox Islam with neo-Platonism, and a generally sceptical attitude towards all philosophy. In his *Revivification of the Sciences of Religion*, he seeks to free Mahomedanism from a dead and uninspiring formalism.

Gezer. Ruins of the bath house of Simon Maccabaeus (c. 143 B.C.), who took the town from the Syrians

princess whom Solomon wedded. Assyrian, Egyptian, and Hebrew inscriptions help the dating. R.A.S. Macalister's excavations (1902-09) revolutionised Palestine archaeology. His memoir (1912) illustrates 4,000 objects. Some pertain to thick-skulled Neolithic cave-dwellers living before 3,000 B.C., who practised cremation, kept domesticated animals, and used bone implements. To a taller race, who buried their dead and practised human sacrifice, may pertain a rock-bored water-tunnel 219 ft. long. Semitic settlers (2,500 B.C.) are represented by their high place; Egyptian influence appears (1,400 B.C.); Philistine graves contain human remains, and silver and gold work.

Gezira. Region of the Anglo-Egyptian Sudan. Also called the Blue Nile province, it is situated between the Blue and White Nile. Exceedingly fertile, it produces maize and cotton. The irrigation system of the Gezira plain is based on the Sennar dam on the Blue Nile, 160 m. S.E. of Khartum. The scheme, put into operation in

Ghat. Hindus laying a pyre at a burning ghat, Benares, where bodies are cremated

Ghazi (1912-39). King of Iraq. Educated at Harrow, he succeeded his father, Feisal I, as second king on Sept. 8, 1933. The next Jan. he married Princess Aliyah, daughter of ex-King Ali of the Hejaz: a son Feisal was born May 2, 1935. Ghazi was an enthusiast for modernising his country and a keen sportsman. He died April 4, 1939, from injuries received in a motor accident, and was succeeded by his son Feisal (b. 1935).

Ghaziabad. Sub-division of the United Provinces, India, in the Meerut district. Area, 493 sq. m. Of the total area, about three-quarters is under-cultivation, indigo being one of the important crops. Ghaziabad town is on the trunk road from Calcutta to Peshawar, and is an important rly. junction. Pop. 23,834.

Ghazipur. District of the United Provinces, India, in the Benares Division. Its area is 1,306 sq. m. Of the total area, three-quarters is under cultivation; of the cultivated area, about half is devoted to rice and barley; other crops are peas, pulses, and sugarcane. Ghazipur town contains the tomb of Lord Cornwallis, who died there in 1805. Pop. 31,326.

Ghazni, GHIZNI, OR GHUZNEE. Town of Afghanistan. It is about 80 m. S.W. of Kabul, and a place of some commercial importance. Though it stands over 7,700 ft. above sea level, wheat and barley are grown in the neighbourhood. In the 10th and 11th centuries it was the great and flourishing capital of the Ghaznevids, a race of princes who ruled over an empire that included most of Afghanistan and Persia, as well as a large part of India.

They gave place to the princes of Ghur, one of whose sovereigns burned Ghazni, and established himself as head of an empire even larger than that of the Ghaznevids. The ruins of the old town, which are extensive, lie about 3 m. N.E. of the present town, which is on the caravan route from Persia to India, by the Gomal Pass. An old castle dominates the town. In the Afghan Wars Ghazni was captured by Lord Keane in 1839, but the Afghans retook it in 1842, losing

it again same year to the British under Gen. Nott. Pop. 14,000.

Gheel. Town of Belgium, in the province of Antwerp, lying about 28 m. E. of Antwerp, on the Albert Canal. It is noted for its insane colony, in which some 3,000 mentally afflicted persons are boarded out with the townsfolk for family treatment under official supervision. The colony dates from the 6th century, when according to legend S. Dymphna was murdered at Gheel by her father, and miraculous cures were effected among pilgrims to her tomb, especially in cases of mental trouble. Thus the townsfolk have long been accustomed to the presence of the insane in their midst and made a practice of receiving them into their homes.

The patients are divided into two classes: private paying patients living in the charge of persons known as *hótes*, and poor people in the care of *nourriciers*. The system aims at providing a life near to that which the patient might have enjoyed had he not become insane, and at restoring mental sufferers to a useful place in the community. The colony became a state institution in 1852.

Fifteen days of fighting at Gheel in Sept., 1944, caused widespread damage, including the burning of the fine Gothic church of S. Dymphna, and its annexe, the ancient *chambre des malades*. Pop. 14,600.

Ghent (Fr. *Gand*). Third city of Belgium, capital of the prov. of E. Flanders. It lies 31 m. N.W. of Brussels, at the meeting of the

rivers Lys and Schelde, the arms of which intersect the city in all directions. An important rly. centre, with two large stations, it is situated in the midst of flat, well-cultivated country. Ghent is connected with the S. arm of the estuary of the Schelde at Terneuzen, about 21 m. N.N.E., by a ship canal, built 1826-27, and deepened 1895-96, and has such

good inland waterway communications that it is Belgium's second port. Apart from its administrative importance and its Flemish university (founded 1816), Ghent has cotton and linen manufactures, tanneries, breweries, engineering works, and sugar refineries; a busy trade in timber, phosphates, flax, cement, ores, coal, etc.; and many nurseries and hothouses. Ledeborg, Mont-St. Amand, and Gentbrugge are populous suburbs. Pop. 159,321.

Its many old buildings in the Flemish style, the narrow, curving lanes, and the countless bridges and waterways make Ghent one of the most picturesque of Belgian cities. Foremost among the historic buildings is the cathedral of S. Bavon, the city's patron saint, founded about 940, which became a cathedral in 1559. The exterior is plain, but the interior is full of beauty. The choir dates from the 13th century, the nave and transepts from the 16th, and in the cathedral is the famous altar-piece of The Adoration of the Lamb, painted 1420-32 by the van Eycks; some panels of the complete work were sold in 1816, but were returned to Ghent from Berlin by the treaty of Versailles.

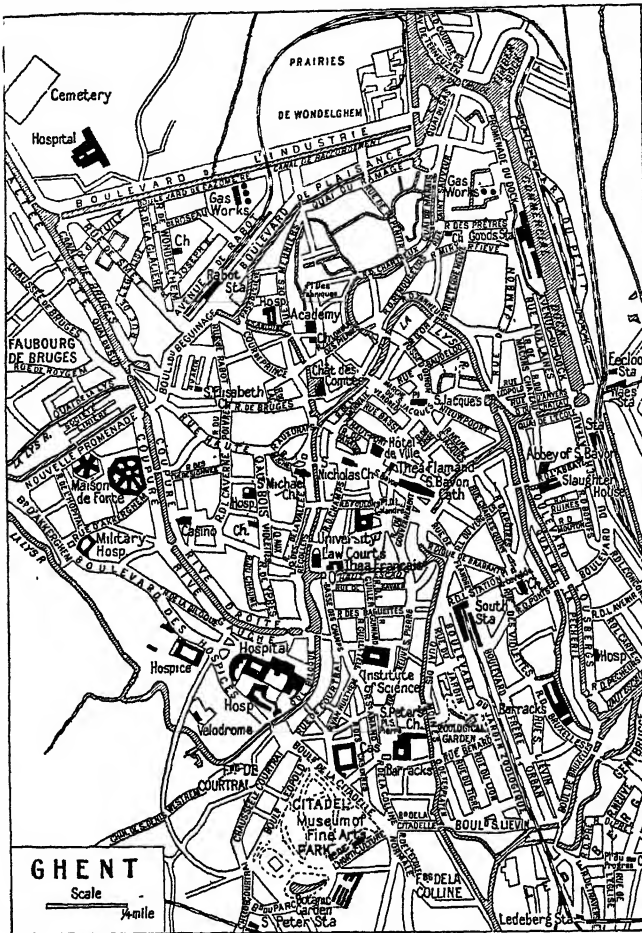

The hôtel de ville is a large block dating in part from the close of the 15th cent., with fine façades of 16th cent. Gothic and early 17th cent. Renaissance styles. A lofty belfry (390 ft.), built mainly in the 14th century, stands in the centre of the town, and not far off is the castle of the counts of Flanders, a typical medieval stronghold founded in the 9th and rebuilt in the 12th cent., the seat of the council of Flanders from 1407 to 1778.

Ghent arms

Ghent. 1. Cathedral of S. Bavon. 2. Château du Diable, 13th century. 3. North façade of the Hôtel de Ville, dating from the 15th century

Ghent. Plan of the city, showing principal buildings and docks

The history of Ghent is closely interwoven with that of Flanders. It was in existence by the middle of the 7th century, and Baldwin, 1st count of Flanders, made it one of his strong points in 868. During the 13th-15th centuries Ghent became one of the greatest marts of W. Europe, and the burghers, always known for their turbulence and independence, increased their strength by their accumulated wealth; the story of the van Artevelde, and the determined revolt against Philip of Burgundy, 1448-53, were typical of Ghent's character in those days. At the same time the arts flourished in Ghent, which the van Eycks made a great centre of Flemish painting. During the troubled times of the 16th century the city suffered severely, especially after her surrender to the duke of Parma in 1584.

In 1794 Ghent was made the capital of the newly created French

dept. of the Schelde, but became part of the United Netherlands in 1814, and part of Belgium in 1830. Several treaties are named from their having been concluded here, notably the pacification of Ghent, by which the N. and S. provs. united against Spain in 1576, and the peace of Ghent between Great Britain and America, 1814.

The city was occupied by the Germans in the First Great War from Oct. 12, 1914, to the armistice. In the Second Great War it was bombed by the Germans in May, 1940, falling to them on the 24th. Railway yards and factories were targets for Allied bombers, May-July, 1944, and there was fighting in and about Ghent Sept. 5-10, before troops of the British 2nd army liberated the city.

Gherba. Island in the Gulf of Gabes, Mediterranean Sea, belonging to France. It lies off the E. coast of Tunis, 12 m. E.S.E. of

Sfax and S.W. of the island of Kerkena, from which it is separated by a narrow strait. It is 10 m. in length from W. to E., and 5 m. from N. to S.

Ghetto (Ital.). Word translated into English as Jewry, and meaning a part of a town inhabited entirely by Jews. *See* Jewry.

Ghi or **GHEE** (Hind. from *ghar*, to drip). Clarified butter used in the East not only for food but also medicinally and in religious ceremonies. The butter is heated and skimmed or strained till it becomes a semi-solid oil which may be kept for years.

Ghibellines. Italian political faction. It originated in Germany, the story being that in a fight near Weinsberg in 1140, between the German king Conrad III, one of the Hohenstaufen family, and the ruler of Bavaria, Welf, the troop of the latter called out as a rallying cry Welf, to which the others replied with Waiblingen, the name of Conrad's castle. Welf became Guelph, and Waiblingen became Ghibelline. *See* Florence; Guelphs and Ghibellines.

Ghiberti, LORENZO (1378-1455). Italian artist. Born at Florence, he early adopted the trade of goldsmith. His chief work is seen in the golden doors of the baptistery in Florence which consist of a series of unequalled bas-reliefs. One door, representing the sacrifice of Isaac, was begun in 1403 and finished in 1424; the second occupied Ghiberti until 1447. His assistants included Donatello and Paolo Uccello. Many madonnas, small sculptural compositions, and goldsmith's articles are attributed to Ghiberti. As an architect he engaged in competitions for the design of the Duomo. His *Commentarii* describes works of art in a number of Italian cities. He died at Florence, Dec. 1, 1455. *See* Door, and *ill.*

Lorenzo Ghiberti, Italian sculptor
From an old print

Ghika, ION (1817-97). Rumanian diplomatist. Grandson of Scarlat Ghika, prince of Wallachia, he early developed strong revolutionary principles which necessitated his living in obscurity. He became professor of mathematics at Jassy university, and from 1853 to 1859 he was bey of Samos. He had long been agitating for the union of Moldavia and Wallachia, and when this took place in 1859

Ghika returned to Bukarest and became the first prime minister. He was Rumanian ambassador in London, 1881-89. Died May 7, 1897.

Ghilan OR **GHILAN**. Province of Persia. Lying between the Elburz Mts. and the Caspian, it has an area of 4,673 sq. m. It is bounded W. by Azerbaijan, S. by Khamseh and Kazvin, and E. by Manzan-deran. Though suffering from inundations, its soil is fertile, producing wheat, barley, and fruit, and it has a trade in silks. Its chief town is Resht.

Ghilzai. Afghan tribe between Kandahar and Kabul. They are Pushtu-speaking Muslims, claiming Turkish descent, and they rank in military prowess with the dominant Durani, but are distinguished by their commercial enterprise. They furnish the camel-caravans of Povindah merchants who have for centuries traded between India and Turkistan.

Ghirlandaio, DOMENICO (1449-94). Italian painter. Born at Florence, his name was Domenico Tommaso Corrado Bigordi, the adopted sobriquet indicating that he was a maker of garlands. Apprenticed to a goldsmith, he also studied painting under Alessio Baldovinetti (*q.v.*). Between 1480 and his death, Jan. 11, 1494, he produced many important works in tempera and fresco, and in mosaic. Among his most notable paintings are S. Jerome and The Last Supper, 1480, in Florence; the fresco of S. Peter and S. Andrew in the Sistine Chapel, 1483, Rome; Adoration of the Magi, 1488, Florence; the Tornabuoni frescoes, 1490, in S. Maria Novella, Florence; The Visitation, 1491, in the Louvre; and the moving por-

trait of an Old Man and his Grandson, sometimes called The Bottle Nose, also in the Louvre.

His mosaic of the Annunciata, in Florence cathedral, is justly celebrated. In spite of a hardness in his colour effects, Ghirlandaio must be placed among the greatest painters of his century. For a short time Michelangelo was one of his pupils. A son, Ridolfo (1483-1560), was also a painter of ability. *Pron.* Gear-lan-di-yo (hard g).

Ghost. Spirit of a dead person manifesting itself in some form perceptible to the senses of the living. Some measure of belief in such posthumous manifestations has been held in all times and by all peoples. The ghost is frequently associated with some crime in which the person has been concerned either as perpetrator or as victim, and is generally said to appear about the hour of midnight and to disappear at cockcrow.

Sometimes these apparitions are described as sheeted ghosts, implying an appearance in their shrouds, and sometimes as appearing in the habit in which they lived, implying spiritual replicas of material things, as in Hamlet. Ghost is also a familiar term for one who furnishes material to or actually writes in the name of an author better known. *See* Psychological Research; Survival.

Ghost Moth (*Hepialus humuli*). Common British moth. The male has shining white wings with red-

Ghost Moth. Female, left, and male, right

dish fringes, the female yellowish wings with brown spots and streaks. The under surface of the wings in both sexes is brown. This moth is often seen at dusk, when its peculiar flight causes the white upper side of the wings to appear and disappear, whence its name.

Ghosts. Drama in three acts by Ibsen. In this, the psychological study of a mother (Mrs. Alving) and son (Oswald), Ibsen dealt with the evils of hereditary syphilis—a subject which started a battle of the critics throughout Europe. His conclusion would appear to be that a crime against society is more serious than a crime against love. Written in 1881, Ghosts was translated by William Archer, and first performed in England by the Independent Theatre at the Royalty Theatre, London, March 13, 1891. Long banned, it received a first

licensed performance at the Haymarket Theatre, 1914. Notable revivals included those at the Everyman, 1925; Windham's, 1928; Arts, 1935; Vandeville, 1937; Duke of York's, 1943.

Ghost Train. Name given to an engineers' maintenance train operating on busy rly. lines at night, particularly on the London Underground. Empty trains run over electrified lines at night in frosty weather, to prevent ice accumulating on the "live" rail, are also referred to as ghost trains.

Ghost Train, THE. Comedy "thriller" by Arnold Ridley. Produced at the St. Martin's Theatre, Nov. 25, 1925, this play, the scene of which is laid in the waiting-room of a country station, ran for 655 performances, being chiefly notable for its climax in which the noise of a passing train was reproduced by orchestral effects. It was revived in 1929 and 1934. Various film versions were produced, one featuring Jack Hulbert in 1931, one with Arthur Askey in 1941.

Ghoul (Arab. *ghūl*). Monster of Oriental legend supposed to haunt burial places and devour the corpses of the dead. Hence the word is figuratively used of anyone who revels in gruesome matters. *Pron.* Gool.

Ghur. Town of Afghanistan, 120 m. S.E. of Herat. It was in the 12th century the capital of a powerful empire. *See* Ghazni.

Ghurian OR **GARIAN**. Ancient town of Libya, N. Africa. It is 74 m. S. of Tripoli, with which it is connected by rly. Ghurian is built on a hill, and possesses a commanding castle and the residences of the Troglodytes or cave-dwellers.

Giacomelli, HECTOR (1820-1904). French painter. Born in Paris, he early showed talent in draughtsmanship, and studied especially the drawing of birds, flowers, and insects, for the dainty pictures by which he became famous. His illustrations to Michel's L'Oiseau, 1867, and L'Insecte, 1876, were justly popular.

Giacosa, GIUSEPPE (1847-1906). Italian novelist and dramatist. He was born at Collettero-Parella, in Piedmont. Classed among the romantic realists of the period, he wrote all forms of drama, in both prose and verse, the best known of his works being Tristi Amori, 1888; Dritti dell'anima, a comedy, 1894; La Signora di Challant; and Il più Forte, 1904. He was editor of the monthly Lettura.

Giannini, GIOVANNI. Italian politician. In 1944 he founded in Milan the political satirical weekly

Ghirlandaio. This Italian painter's Portrait of an Old Man and his Grandson, now in the Louvre, Paris

L'Uomo Qualunque, The Common Man, from which sprang the Uomo Qualunque movement. Of fascist tendency, the party won 30 seats in the general election of 1946, but had disappeared as an entity by 1948, when Giannini himself failed to secure election.

Giant. Abnormally tall human being. The Greek word *gigas* denoted primarily manlike beings of monstrous size, either wholly mythical, such as Briareus, or reminiscent of traditional oversized races, such as Polyphemus. Similar O.T. traditions attach to the Anakim and Rephaim, tall non-Semitic peoples who occupied Palestine before the Israelite immigration. Og, king of Bashan, and Goliath of Gath, who according to Josephus was 8 ft. 9 ins. high, were of Rephaite blood.

European folklore is much concerned with stories of giants such as Blunderbore and Grim. It attributed to their activities such natural formations as the Giant's Causeway and the Giant's Kettle, with megalithic structures such as Dutch Hunnel-bedden.

Classical and medieval tradition have been brought to the touchstone of fact by measured records of giants in modern times. The tallest races, pre-eminently the Patagonians and the Galloway Scots, who are normally 5 ft. 10 ins., seldom reach 6 ft. 4 ins. The conventional limit of spectacular giantism is 7 ft. The Royal College of Surgeons in London possesses the skeleton, 7 ft. 9 ins. long, of O'Brien Charles Byrne, the 18th century Irish giant. His contemporary Patrick Cottar, whose skeleton was exhumed at Bristol in 1909, was shown to have been 7 ft. 10 ins.; the skeleton of Cornelius MacGrath, now in Dublin, is 7 ft. 9 ins. long. The tallest authentic measurement was the 9 ft. 3 ins. of the Russian Machnov; the same height was attributed to John Middleton, of Hale, Lancs, introduced to James I in 1620. See Dwarf; consult also Giants and Dwarfs, E. J. Wood, 1868.

Giant Panda. Animal discovered by Père David of the Lazarist Missionary Society in the bamboo jungles of W. China in the winter of 1868-69. The London Zoo's first specimen (a female named Ming) arrived in the 1930s and died 1944. Another, called Lien Ho (Unity), was exhibited from 1946 till its death in 1950 when it was found to be a male. Their appearance and behaviour took the public fancy, and models and pictures were made. The giant

Giant Panda. Specimen of this animal captured in Tibet and sent to an American zoo

panda is white, with black paws, a black saddle, black ears, and a black patch round each eye.

The use of the name panda for the animal is most questionable. There is a well-known genus, *Ailuropus*, containing the species *A. fulgens*, which is reddish in colour, a little like a fox with a very bushy tail and special paws. It lives in the Himalayas and has long been known as a panda. This animal has woolly soles to its paws and its five digits are rather forward so that none is at all opposable. As the new discovery was similar in some details, the name panda was used with the prefix Giant. The generic name *Ailuropoda* was coined for it, with the specific name *melanoleuca*, black-and-white.

Though the bearlike appearance of the giant panda is at once obvious, zoologists now agree that it is not a bear, and the peculiarity of its paws is taken by many to place it not far from the true panda. The giant panda has developed a most odd modification of the

palm of its forepaw. There is a pad of flesh on to which all the digits are folded back when its food, the bamboo cane, is grasped. This enables the creature to hold the cane so as to give an impression that it is using a thumb, while the thumb is actually lying with the fingers round the cane. A scent pad, protected by the tail and probably of sexual significance, is found in the giant panda as in the true panda; it is not found in the bears. The giant panda is a vegetarian, can climb, sleeps in trees as well as in caves, is about half the size of a grizzly bear, is very hardy, and lives above the winter snow line in the Himalayas, Upper Burma, and the Chinese provinces of Yunnan and Szechwan.

Paul G. Espinasse

Giant's Causeway. Promontory of columnar basalt lava of the Tertiary age on the N. coast of co. Antrim, N. Ireland. It consists of some 40,000 closely packed polygonal pillars, the pentagonal and hexagonal formations largely predominating. The causeway is 2½ m. N. of Bushmills and is divided by "whin dykes" into three natural platforms known as the Little Causeway, the Middle or Honeycomb Causeway, and the Grand Causeway. The pillars, 15 to 20 ins. diam., each consist of several joints, concave and convex at the extremities, which fit perfectly into one another. The peculiar formation of the columns is ascribed to the cooling and cracking of the lava. It is seen similarly at Fingal's Cave, Hebrides.

The neighbouring cliffs exhibit several remarkable features, such as the Wishing Chair, Lady's Fan, Giant's Loom, and Giant's Organ. with pillars like organ pipes.

Giant's Causeway. Remarkable formation of basalt rock columns on the north coast of co. Antrim, Northern Ireland

Giant's Kettle. Large pothole found in the rock beds of former glaciers. A stream on the surface of the glacier descends a crevasse, wearing out a cavity or shaft, at the base of which the Giant's Kettle is formed by the gyration of stones brought by the stream. These holes are often very deep.

Giant's Ring. Name applied to a prehistoric monument in N. Ireland, 5 m. S.W. of Belfast, on the co. Down side of the river Lagan. It consists of a circular vallum measuring $\frac{1}{2}$ mile in circumference, and averaging 15 ft. in height. Almost in the centre of the flat enclosure is a cromlech, or Druids' altar. The ancient name of this monument, and all traditions relating to it, are lost in antiquity. In 1917 it was found that under the cromlech the incinerated remains of apparently one human being had been buried in the soil without enclosure in an urn; the bones had been so much burned and decayed by age that no conclusions could be arrived at as to sex or age. The monument is evidently the tomb of an exalted personage of the late Stone age, possibly 2000 B.C. Near by many sepulchral remains have been found, and are believed to be mostly of the early Bronze age.

Giant Star. Star of great intrinsic brightness. Their luminosity, and also their mass, are about the same whether they are blue stars such as Spica at a temperature of 40,000° F. or red stars such as Betelgeux at only 5,000° F.; but the red giants make up for their low temperature by their enormous radiating surface. See Star.

Giao-Chi. Ancient people of Tibeto-Chinese stock in Indo-China. The name in Chinese means forked toes. This physical character, recorded in early Chinese annals, may have resulted from the riding stirrup being grasped between the first and second toes. When they migrated southward across Tongking, their ethnic fusion with Chams and others produced the Annamese type and culture, a mixture of Mongoloid and Indonesian elements.

Giaour. Term applied by the Turks to all non-Mahomedans, especially Christians and particularly to Indian-born Portuguese. It does not necessarily imply contempt. The word, the English form of which is adapted from Italian *giaurro*, is said to be a corruption of Arabic *Kyafir*, unbeliever. Byron's poem *The Giaour* appeared in 1813. *Pron.* jowr.

Giarre. Town of Sicily, in the prov. of Catania. It stands on the E. slope of Mt. Etna, 8 m. N. of Acireale and 40 m. by rly. S.W. of Messina, a junction for the rly. running W. One mile E. of the town is Riposto, its port, whence it exports the wine for which it is celebrated.

Giaveno. Town of Italy, in the prov. of Turin. It stands on the river Sangone, at an alt. of 1,660 ft., 17 m. by rly. W.S.W. of Turin, with which it is also connected by tramway. It has cotton and jute spinning mills and paper factories, while there is trade in coal, wood, fruit, potatoes, and wine.

Gibara OR **JIBARA.** Seaport of Cuba. On the N. coast, it is 80 m. N. of Santiago de Cuba, with which it has rly. connexion. It has a sheltered harbour protected by an old fort, and is the port for a large district producing maize, sugar, bananas, coconuts, to tobacco, coffee, and timber. Pop. 8,165.

Gibb, SIR ALEXANDER (b. 1872). Scottish engineer. Born at Broughty Ferry, Feb. 12, 1872, he was educated at Rugby and University College, London. Taught by Wolfe Barry and H. M. Brunel, he was consulting engineer for works in the U.K., Europe, India, China, Persia, Canada, Australia, and S. America. He was civil engineer-in-chief at the Admiralty, 1918-19, and consulting civil engineer to the ministry of Transport, 1921; advised the Canadian government on the administration of its national docks, and was consulting engineer for the Singapore naval base and the new dock at Sydney. Gibb was knighted in 1918 and awarded the silver jubilee medal in 1935. He published a book on Telford, 1935.

Gibbet (Fr. *gibet*, crooked stick). Type of gallows having a projecting bar, and used principally for hanging executed malefactors in chains as a warning to passers-by, hence the term "to gibbet." Gibbets were at one time very common, and were usually erected at the scene of a crime. See Gallows; Hanging.

Gibbon (*Hyllobates*). Smallest of the anthropoid or man-like apes. Rarely more than 3 ft. high, it is readily distinguished from the other anthropoids—the gorilla, the chimpanzee, and the orangutan—by its small

Gibbon. Specimen of the Silver Gibbon
Gambier Bolton, F.Z.S.

slender build, its remarkably long arms, and by small naked callosities on the buttocks. It is the only anthropoid that walks on its hind legs without difficulty, either balancing itself by holding its long arms outstretched or by clasping its hands behind the neck.

There are several species, all of them found in Malaya and the surrounding countries. In colour they vary from black to grey, and some individuals tend to become lighter as they grow older. They live in the trees, and are by far the most agile of the anthropoids, leaping through the air with such speed as to catch birds on the wing. Their food consists of fruit and young shoots, insects, and the eggs and nestlings of birds. In the forests they are extremely noisy, uttering mournful cries in the morning and evening. In captivity they are gentle and easily tamed, and have been known to change colour. See Monkey.

Gibbon, EDWARD (1737-94). English historian. The eldest son of an M.P. in the time of Walpole, he was born at Putney, April 27, 1737. Both his grandfathers were merchants in London, and he was brought up in surroundings of comfort and ease. At seven he had a private tutor, at nine he went to a school at Kingston, and at eleven to Westminster, but he owed much to an aunt, Catherine

Gibbon
After
Sir Joshua Reynolds

Porten, who took charge of him after his mother's death in 1747.

In 1752, after two years spent under tutors, for his health was not equal to the regular life of Westminster, Gibbon went to Oxford, entering Magdalen College; but he did not trouble to turn his abilities into the conventional channels, occupied himself mainly with gaieties, and pronounced his period of residence wholly unprofitable. In 1753 he joined the Roman Church. His angered father took him away from Oxford and sent him to Lausanne, where for five years he lived with a Calvinist pastor and read widely and steadily. In 1758 he returned to England, and lived for a time at his father's house at Buriton. He took a commission in the Hampshire Militia, which involved periodical drilling, and was colonel when he retired in 1770. In 1761 he published in French his first book, *An Essay on the Study of Literature*. In 1763 he set out upon a tour of Europe. In Rome, on Oct. 15, 1764, the idea of the *Decline and Fall* came to him.

In 1765 Gibbon returned home from Italy, kept his great idea constantly in mind, but did not actually begin work on it until, after his father's death in 1770, he moved from Buriton to London.

When in Feb., 1776, the first volume of the *Decline and Fall* was published, it was an instant and complete success, and he continued, pausing only in 1779 to reply, in a *Vindication*, to those who had criticised chapters 15 and 16 on Christianity. In 1774 he had been returned to the house of commons for Liskeard, and in 1780 he was returned for Lymington. In 1783, having resigned his seat, he joined a Swiss friend, Georges Deyverdun, at Lausanne, and there he lived until 1793. The *Decline and Fall* was finished June 27, 1787, and, as he tells in a great passage of his autobiography: "A sober melancholy was spread over my mind by the idea that . . . whatever might be the fate of my History, the life of the historian must be short and precarious." The last three volumes were published in 1788.

Again in England, Gibbon spent some time in Sussex with his friend Lord Sheffield, but he was in London for an operation when he died Jan. 16, 1794. His remains were buried at Fletching, Sussex. He was never married. At Lausanne, in 1757, he became engaged to Susan Curchod, afterwards the wife of Necker; but his father forbade the match, and, as he says, "I sighed as a lover, I obeyed as a

son." His delightful autobiography occupied his last years.

Gibbon may be described as the greatest of modern historians. Ranke, and probably Acton, knew more; Ranke and Lecky wrote more; but when the qualities of the ideal historian are estimated, Gibbon excels them all. To knowledge, industry, and judgement he added an English style which can be compared only with that of Burke, and a power of generalisation that amounts to genius. His acquaintance with the literature of his subject was amazing even when his years of steady reading are remembered. On the other hand, it must be said that the latter part of his history has certain faults; it is a sketch, unequal to the earlier part in knowledge, accuracy, and a sense of proportion, while later research has shown his point of view in one or two instances to be distinctly wrong.

The standard edition of the *Decline and Fall* is by J. B. Bury, 7 vols., 1900-13. There are *Lives* by J. M. Robertson, 1925; G. M. Young, 1932; R. B. Mowat, 1936; D. M. Low, 1937.

Gibbons, GRINLING (1648-1720). English carver and sculptor. Born at Rotterdam, April 4, 1648, of Dutch parentage, he practised his art in England, whither

Grinling Gibbons. Carving, with detail of game, birds, and fruit, in the western recess of the State ante-room, Windsor Castle, 1677-78. This room was originally the "King's Eating Room."

Grinling Gibbons,

Wren for Gibbons, whose carved decorations in S. Paul's (the choir stalls) and other Wren churches are particularly noteworthy.

Other fine works are at Blenheim Palace, Chatsworth, Petworth, Belton House (Grantham), Gattton. There is a throne carved by him at Canterbury. He carved foliage, fruit, and floral designs with extraordinary delicacy, and produced also several statues of merit, including those of Charles II at Chelsea Hospital and the Royal Exchange, and one of James II, now outside the National Gallery. He died Aug. 3, 1720, and is buried in S. Paul's, Covent Garden. See James II illus.

Gibbons, JAMES (1834-1921). American cardinal. Born July 23, 1834, at Baltimore, he entered the R.C. priesthood in 1861, and in 1872 was appointed bishop of Baltimore. In 1877 he became archbishop of Baltimore and primate of the U.S.A. *James Cardinal Gibbons.* and was

made cardinal by Leo XIII in 1886. His chief work, *The Faith of Our Fathers*, 1871, had a wide circulation in Great Britain and America. He was prominent in the foundation of the Catholic university of America at Washington, 1884. He died March 24, 1921.

Gibbons, ORLANDO (1583-1625). English composer, born at Cambridge, Dec. 25, 1583; most distinguished of three brothers, all musicians, sons of William Gibbons, one of the town musicians

or waits. First a chorister at King's College, Cambridge, he made his reputation by composing a fantasia. In 1604 he was appointed organist of the Chapel Royal,

London, and in 1623 of Westminster Abbey. His compositions, which include church music, madrigals, and instrumental music, place him amongst the greatest of early English composers. He died of apoplexy at Canterbury, June 5, 1624, whither he had gone to produce his music for the wedding reception of Henrietta Maria by Charles I. His son Christopher (1615-76) was successively organist of Winchester Cathedral and Westminster Abbey.

Gibbs, JAMES (1682-1754). A British architect. Born at Aberdeen, Dec. 23, 1682, he studied at Rome under Carolo Fontana. Coming to London in 1709, he designed and built S. Mary-le-Strand, 1714-22, and added the steeple to Wren's church of S. Clement Danes, 1719. The church of S. Martin-in-the-Fields, his masterpiece, was built during 1722-26, and other noted works were the Radcliffe Library, Oxford, 1737-47; S. Peter's, Vere Street, 1721; and All Hallows', Derby, 1723-25. The friend and disciple of Wren, Gibbs was slavishly faithful to the classic models, but his buildings

Gibraltar. Map of the Rock and harbour from the Spanish Lines to Europa Point

are finely proportioned. He died at Aberdeen, Aug. 5, 1754.

Gibbs, SIR PHILIP HAMILTON (b. 1877). British author. Born May 1, 1877, he became a journalist in 1902, holding editorial appointments on the Daily Mail, the Daily Chronicle, and the short-lived Liberal newspaper the Tribune (*q.v.*). In 1912 he was war correspondent with the Bulgarian army, and won fame during the First Great War as correspondent with the French and Belgian armies, 1914-15, and the British army, 1915-18. For this work Gibbs was knighted in 1920. He edited the Review of Reviews, 1921-22. He published memoirs, contemporary history (with special reference to the emotions of war-time), and novels; among the last, *The Street of Adventure*, based on his experiences in Fleet Street, was most notable. Later came *The Middle of the Road*, 1922; *Heirs Apparent*, 1923; *The Wings of Adventure*, 1930; *This Nettle Danger*, 1939; *Sons of the Others*, 1940; *The Long Alert*, 1941. An Autobiography, *The Pageant of the Years*, appeared in 1946.

Sir Philip Gibbs
British author

Gibeah (Heb., hill). Name of several places in the O.T. The most important was Gibeah of Benjamin, or Gibeah of Saul, which stood a little N. of Jerusalem, and was the home of Saul. The site is now marked by an artificial mound.

Gibeon. Ancient Hivite city, now known as El-Jib. It is 5 m. N.W. of Jerusalem. Here Joshua overcame five kings of the Amorites; and here later the great fight took place between the followers of David and those of Ishbosheth.

Gibeon. Township of the S.W. Africa protectorate. It is situated in the valley of the Fish River a few miles from the main North-South rly., and is the centre of an agricultural district. Pop. 3,500.

Gibraltar (anc. Calpē). Town and rock fortress at the S. extremity of Spain, a British possession. The rock juts out into the Mediterranean as an attenuated peninsula, ending in Europa Point. The town is

Gibraltar arms

Orlando Gibbons,
English composer
From an old print

divided into two sections—the North Town and the South Town. The North Town is the meaner part of Gibraltar, with narrow and crooked streets. In 1947 the upper portion of the fortress was turned into a public park.

The principal buildings are the Anglican cathedral of the Holy Trinity, built in Moorish style, and

wind, or Levanter. The town is of great importance as a coaling station. The harbour, of 260 acres, can accommodate the Mediterranean fleet. The Rock of Gibraltar and Mount Abyla on the African coast were known to the ancients as the Pillars of Hercules.

Gibraltar ranks as a crown colony and is administered by a

the fortress of Gibraltar was the base for naval and air operations controlling shipping through the Straits and along trade routes to S. America, W. Africa, and the Cape. On the loss of the French naval bases, it became the sole Allied W. Mediterranean base.

Shortly before and during the war the fortifications were strengthened, new heavy and A.A. batteries being installed. Extensive tunnelling accommodated underground emplacements, hospitals, barracks, and stores. The racecourse was converted into an aerodrome. In July, 1940, some 15,000 women and children were taken off, the majority going to England.

In September the fortress was raided by some 50 (Vichy) French aircraft, as a reprisal for the Allied assault on Dakar, and two powder magazines were exploded. In Oct., Italian midget submarines attacked the harbour without doing any damage. The people began to return in 1944. Pop., est. 19,232.

Gibraltar, Strength of. Military operations conducted by the

consecrated in 1832; the church of the Sacred Heart of Jesus; the castle, built by the Moors, and the governor's residence.

Gibraltar is connected with the mainland by an isthmus, 3 m. long and 1 m. broad. Between the British Lines and the Spanish Lines is a tract of neutral uninhabited ground. Just S. of the British Lines are rifle ranges, a racecourse, and cemeteries. The mole on Gibraltar Bay affords secure anchorage for the largest vessels. The haven is adequately sheltered from the dangerous E.

governor, an executive council (inaugurated 1922), and a legislative council (established 1949). This last, presided over by the governor, has three ex officio, five elected, and two nominated members.

During the Second Great War

Gibraltar. 1. General view of the town. 2. The Rock, showing the road to Spain. 3. View from above Europa Point, looking north, showing the fortifications and the harbour

British, the Spaniards, and others. Several sieges of this dominant rock are recorded before the appearance of the British in 1704. It was taken by the Moors in 711, and they were deprived of it by the Castilians in 1309. The Moors soon recovered it and held it against several attempts made by the Christians. The latter, however, recovered it in 1462, and the next sieges were due to the desire of one Spaniard to oust another.

In 1704 a British and Dutch fleet under Sir George Rooke, with an army of 30,000 men on board, was sent against Cadiz. At the last minute Gibraltar was substituted for Cadiz, and on July 22 the fleet appeared in the bay. Some marines were landed and the place was bombarded for six hours; at the end of that time the garrison,

under 500 men, offered to surrender. Gibraltar thus became British, July 24 (O.S.), 1704. It cost 61 men killed and 252 wounded.

In the autumn the Spaniards, aided by their French allies, began an attempt to recover the fortress. This siege lasted until April, 1705, and was marked by a daring attempt to surprise the place, and by several naval encounters. In 1736 the Spaniards tried again, but with equal unsuccess, and then came the siege of 1779-83.

Gibraltar at this time was defended by Sir G. A. Eliott, afterwards Lord Heathfield. The French and Spanish fleet got into the bay and the blockade began. The fortress was assailed also by land, and extensive siege works were constructed. A good deal of damage was done by the besiegers, while British ships from time to time succeeded in attacking the enemy. The garrison was in great difficulties when, in June, 1780, Rodney got provisions through.

Again provisions ran short, but in April, 1781, a British fleet arrived with supplies. A terrific bombardment was tried, but the defenders maintained position and in Nov. partially destroyed the siege works by a sortie. The final attack was made in Sept., 1782. An army of 40,000 men was collected, while off the bay was a strong French and Spanish fleet. Floating batteries were built, and from sea and land a continuous and heavy bombardment was maintained, to which Eliott replied with red-hot shot. On the 13th the attack was pressed desperately, but the battering ships at length were set on fire and great loss was inflicted upon the attacking force. On Feb. 6, 1783, the siege was raised. Consult *History of the Siege of Gibraltar*, J. Drinkwater, 1905.

Gibraltar, STRAIT OF. Channel separating the S. of Spain from the N. of Africa, and leading from the Atlantic to the Mediterranean. It has a surface current, which flows from the Atlantic, and an underlying current, which flows from

Gibraltar. Map of the strait which separates Europe from North Africa

the Mediterranean. At its narrowest point the strait is nearly 9 m. wide; its length from E. to W. is about 35 m.

Gibraltar Fever. Endemic or epidemic disease caused by a micro-organism, conveyed by goat's milk. See *Undulant Fever*.

Gibson, CHARLES DANA (1867-1944). American draughtsman and painter. Born at Roxbury, Mass., Sept. 14, 1867, he studied in New York and Paris. He began as a draughtsman in black and white for periodicals and magazines, and made a great hit by introducing to illustrated literature his own type of female beauty, which

Chas. Dana Gibson, American artist

became specifically named "The Gibson Girl." Later he took up portraiture. Among his books may be mentioned *London*, 1896; *Pictures of People*, 1896; *The Education of Mr. Pipp*, 1899; *The Americans*, 1900; *The Social Ladder*, 1902. In 1920 he became proprietor of *Life*. Died Dec. 23, 1944.

Gibson, MARGARET DUNLOP (d. 1920). British scholar. The younger twin daughter of John Smith, of Irvine, Ayrshire, in 1883 she married the Rev. James Gibson, translator of Cervantes' poetry. Both she and her sister, Mrs. Agnes Lewis, paid a number of visits to Syria and Palestine. In 1892, when at the convent on Mt. Sinai, they photographed the Syriac palimpsest of the Gospels (Codex Sinaiticus), and in 1896 brought to England the first leaf of the Hebrew Ecclesiastics. They presented the site for Westminster Theological College at Cambridge. Mrs. Gibson wrote *How the Codex was Found*, *Studia Sinaitica*, *Apocrypha Arabica*, *Didascalia Apostolorum*, and *Commentaries on Acts*. She died Jan. 11, 1920.

Gibson, WILFRID WILSON (b. 1878). English poet, born Oct. 2, 1878. His earliest published work was *Wilyn the Harper*, 1900, and at frequent intervals he issued collections of poems, a comprehensive one in 1926. Later volumes were *Islands*, 1932; *The Alert*, 1941; *Challenge*, 1942; *The Outpost*, 1944. Gibson is content with traditional forms and diction. His best-known lyric is *Lament, beginning*

Who are we left, how shall we look again

Happily on the sun or feel the rain.
Gibson Gallery. Hall in Burlington House, Piccadilly, London. The exhibits comprise the original sketches and casts of the chief

Charles Dana Gibson. An illustration from *The Education of Mr. Pipp*. The nouveau riche, taken to a concert by his wife and daughters, typical Gibson girls, fails to take any friendly interest in the great composers

works of a Welsh sculptor, John Gibson (1790–1866), and examples of his marble sculpture bequeathed to the Royal Academy. Gibson was elected A.R.A. in 1833 and R.A. in 1838 but worked for many years in Rome. He was an advocate of the ancient Greek practice of introducing colour into sculpture.

Gichtel, JOHANN GEORG (1638–1710). German mystic. Born at Ratisbon (Regensburg), March 14, 1638, he studied theology and Oriental languages at Strasbourg. For some years he practised as a lawyer, and in 1665 was banished for attacking the Lutheran doctrine of justification by faith. Three years later he founded the celibate sect of Angelic Brethren, who aimed at a life of angelic purity. He died Jan. 21, 1710.

Giddiness or **VERTIGO** (Lat. *vertere*, to turn). Sensation of lack of balance, which may be associated with reeling or staggering. Giddiness may be experienced in normal health after rapid rotation of the body as in dancing; at stepping on an insecure surface; or on looking down from a height.

A common pathological cause is some disorder such as wax in the external ear, or some condition of the middle ear. Giddiness is a constant symptom of many affections of the brain, like cerebral haemorrhage, tumours, and thickening of the cerebral arteries. Cardiac inadequacy, causing poor blood supply to the brain, is an obvious cause. Excess of alcohol or tobacco may produce giddiness. Local conditions of the eye form yet another group of causes. The aura, the premonitory indication of an epileptic fit, frequently takes the form of giddiness.

Gide, ANDRÉ PAUL GUILAUME (b. 1869). French novelist, essayist, and dramatist. Born in

André Gide,
French novelist.

Paris, Nov. 21, 1869, he was educated at the École Alsacienne and Lycée Henri IV there. His first work, *Les Cahiers d'André Walter*, 1891, was published anonymously; it was followed by *Le Voyage d'Orien*, 1893, *Paludes*, 1895, and *Les Nourritures Terrestres*, 1897. These studies were in advance of their time for psychological subtlety. In his novel *L'Immoraliste*, 1902, Gide established his reputation as a writer of unusual power and originality.

His work has been described as the epic of deferred adolescence. An amoralist, advocating a highly charged, unafraid attitude towards life, he was influenced by Nietzsche and Dostoevsky, and he became a leader for writers of the 1920s. *La Porte Étroite*, 1909; *Les Caves du Vatican*, 1914; *La Symphonie Pastorale*, 1919; *Si le Grain ne Meurt*, 1921; *Les Faux-Monnayeurs*, 1925, took their place in French literature with the works of Proust and Romain.

Gide's plays include *Saul*, 1903; *Betsabe*, 1912; *Oedipe*, 1931. His translations ranged over Shakespeare, Tagore, Conrad, Whitman, Blake, and Pushkin. A member of the French Academy, he won the Nobel prize for literature in 1947. Vols. 1 and 2 of the *Gide Journals* were pub. 1948, Vol. 3, 1949.

Gideon. Hebrew judge and warrior. The son of Joash, he appears to have been born at Ophrah in Manasseh. Called by God to deliver Israel from the Midianites, he overthrew the altars and groves of Baal. By an ingenious night alarm he threw the Midianite army into confusion and routed it. He refused the throne, but judged Israel for about 40 years, and is said to have had 70 sons. The obscure and partly inconsistent O.T. account of him (Judges 6–8) probably consists of two or more traditions unskillfully combined by a late editor.

Gielgud (ARTHUR), JOHN (b. 1904). British actor and theatrical producer. Son of Frank Gielgud and Kate Terry Lewis, and nephew of Ellen Terry, he was born April 14, 1904, educated at Westminster, and studied at the R.A.D.A. He played his first part as the Herald in *Henry V* at the Old Vic, 1921, joined J. B. Fagan's repertory in 1924, and succeeded Noel Coward in *The Vortex*, 1925. Three years later came his début in New York. Triumphant Shakespearean seasons at the Old Vic, 1929–30, made him the most-talked-of young actor, as *Prospero* and *King Lear* especially, and in 1934 he scored an even greater success as *Hamlet* in his own production at the New Theatre.

Some of Gielgud's most elegant and thoughtful performances were as John Worthing in *The Importance of Being Earnest*; *Inigo Jollifant* in *The Good Companions*; *Richard II* in *Richard of Bordeaux*; *Valentine* in *Love for Love*; *Joseph Surface* in *The School for Scandal*; *Trigorin* in *The Seagull*; and (his favourite part) *Vershinin* in *The Three*

Sisters. As a producer he was happiest with comedy, e.g. *Con-*

grave, Wilde, and Maugham, in seasons at the Haymarket Theatre, 1943–46. He visited the U.S.A. with a production of *The Importance of Being Earnest* in 1947. An autobiography, *Early Stages* appeared in 1938.

His brother, Val Henry Gielgud, was born April 28, 1900, and educated at Rugby and Trinity College, Oxford. Joining the B.B.C. in 1928, he became next year its director of drama. He wrote radio plays, film scenarios, and novels.

Gien. Town of France, in the dept. of Loiret. It stands on the right bank of the Loire, 40 m. E.S.E. of Orleans. An old place, its interest is mainly antiquarian. It has some old houses, a 15th century bridge across the Loire, and a château, now used as a palais de justice. In the town there is a gigantic statue of the valiant Gallic chief Vercingetorix.

Gierke, OTTO FRIEDRICH (1841–1921). German jurist. Born at Stettin, Jan. 11, 1841, Gierke studied at Heidelberg and Berlin, and afterwards lectured on law. He became professor of German law at Breslau in 1872, in 1884 was transferred to Heidelberg, and in 1887 to Berlin. Of Gierke's writings the most important is *German Society Law* (*Genossenschaftsrecht*), 1887. In this and other books he developed the idea that groups within the state, guilds and the like, have their own bodies of law, their own personality, and rights. Gierke died Oct. 10, 1921.

Giesebrecht, WILHELM VON (1814–89). German historian. Born in Berlin, March 5, 1814, he became one of Ranke's pupils, and before 1840 published his first historical work, a monograph on Otto II. In 1857 he was made professor of history at Königsberg, and in 1862 at Munich, where he died Dec. 17, 1889. Giesebrecht's main contribution to history is his unfinished *History of the Empire* (*Kaiserzeit*), 1881–90, a study of the medieval empire to the time of Frederick I; it is an exact piece of scholarship. His other works include a translation of the *History of Gregory of Tours*, 1851.

Giesecking, WALTER WILHELM (b. 1895). German pianist. Born at Lyons, France, Nov. 5, 1895, he

John Gielgud,
British actor

began to play the piano at the age of four, but received no regular musical training until 1911 when

Walter Gieseck,
German pianist

he studied with Leimer at Hanover. He gave his first concerts just before the First Great War, and after 1920 toured Europe and the U.S.A., first appearing in England in 1923. Among his compositions were a quintet and a sonatina for flute and piano, 1937.

Giessen. Town in West Germany, in the *Land* of Hesse. It is situated on the river Lahn, 34 m. N. of Frankfurt. A town since 1248, Hessian since 1265, Giessen is famous for its university, founded in 1605, which had international importance as the working place of Liebig, professor of chemistry, 1824-52. Attached to it and its impressive new buildings, clinics, laboratories, and library (574,000 vols. and MSS.), is a botanic garden founded 1609. The town has fine old timber-frame houses of the 14th-16th centuries, a gabled town hall, two 16th century palaces, an armoury, and in the vicinity five old castles, four in ruins. Tobacco, machinery, iron, and rubber industries existed before the Second Great War. Pop. 35,913.

Gifford, WILLIAM (1756-1826). British writer and controversialist. Son of a glazier, he was born at Ashburton, Devon. Left an orphan at 12, he became first a cabin boy on a coasting steamer, and then apprentice to a shoemaker. Devoting his spare time to the study of mathematics and verse writing, he attracted the notice of a surgeon named Cookesley, who raised a fund on his be-

William Gifford,
British writer
After Hoppner

half; with this he was sent to Exeter College, Oxford, after which he travelled on the Continent.

On his return Gifford published in 1794 and 1795 two satires, *The Baviad*, a paraphrase of the first satire of Persius, which castigated the Della Cruscans (*q.v.*), and *The Maeviad*. He edited *The Anti-Jacobin*, 1797-98, so much to the satisfaction of the Tories that he was given two government appointments worth together £900 a year. His *Epistle to Peter Pindar* (Dr. Walcot), 1800, was followed by his *Autobiography* and a verse translation of Juvenal, which, with that of Persius, 1821, remains unrivalled in vigour.

As editor of *The Quarterly Review*, 1809-24, he bitterly attacked Keats, Hazlitt, and what was known as the Cockney School of Poetry. He edited the dramatic works of Massinger, 1805-13, Ben Jonson, 1816, and Ford, 1827.

Giessen, Germany. The Liebig Museum, a building used as a laboratory by Justus von Liebig, 1824-52

He died Dec. 31, 1826, and was buried in Westminster Abbey. *Consult* Life, R. B. Clark, 1931.

Gifford Lectures. Course of lectures on natural theology, in connexion with the universities of Edinburgh, Glasgow, Aberdeen, and St. Andrews. It was founded by Lord Gifford (1820-87), Scottish judge and philanthropist, who left £80,000 between the Scottish universities. The lecturers have included W. James, A. J. Balfour, Sir J. G. Frazer, W. R. Inge, Bergson, and Andrew Lang.

Gift. In English law, the promise to make a gift, except by deed, is not enforceable. But once the gift is completed, it is

irrevocable unless it has been obtained by duress, fraud, or undue influence. A gift is complete only when every legal step has been taken to pass the property to the donee. For example, "I give you my watch, or this freehold house" means nothing in law unless the watch is handed over or the freehold conveyed by deed.

Gifu. Town of Japan, on the island of Honshu. It is the capital of the Gifu prefecture, 70 m. E.N.E. of Kyoto. Silk and paper goods are industries. Pop. 172,340.

Gig. Word suggesting lightness and speed applied to a two-

Gig of British admiral, manned by naval officers

wheeled vehicle drawn by one horse. It is also used of a clinker-built racing boat, and of a narrow ship's boat propelled either by oars or by sails. *See* Carriage.

Gigantes. In Greek mythology, a race of giants who sprang from the blood of Uranus as it fell to the earth when he was mutilated by Cronos. The chief of the Gigantes were Alcioneus, Enceladus, and Porphyreon. They warred with Zeus and, ultimately defeated with the help of Hercules, some were buried under volcanoes. This legend, however, seems to confound the Gigantes with the Titans (*q.v.*).

Giggleswick. Parish and village of the W. Riding of Yorkshire, England. It stands on the Ribble, 14 m. N.W. of Skipton, and has a rly. station, but is nearer Settle station. Near are stone and slate quarries. It is known for its large public school; founded in 1512, this received a charter from Edward VI in 1553. The school has five houses with accommodation for over 200 boys. A total eclipse of the sun was observed here on June 29, 1927, by the party of the Astronomer Royal. Pop. 786.

Gigli, BEN-

IAMINO (b.

1890). Italian

singer. Born

March 20,

1890, at Reca-

nati, Marches,

he was educa-

ted there, and

studied under

Rosati at the

Rome conser-

Beniamino Gigli,
Italian singer

vatoire, making his début at Rovigo in La Gioconda, 1914. He created the tenor part in Mascagni's Lodoletta and Puccini's La Rondine in Italy and S. America. A leading singer in Italian opera at the Metropolitan, New York, he first came to Covent Garden in 1930, scoring a triumph with his lyrical singing in Tosca and Martha, and being hailed as Caruso's successor. He made several successful concert tours in the U.K. *Pron.* Zheelyee.

Gijón (anc. *Gigia*). Seaport of Spain, in the prov. of Oviedo. It stands on the Bay of Biscay, 11 m. N.N.E. of Oviedo, at the terminus of various Asturian rlys., about midway between the ports of Bilbao and Corunna. It has a commodious harbour, with quays, arsenal, a curious 15th century church, palace, and the Jovellanos Institute with a fine art collection. The town retains its medieval walls.

Among the exports are minerals, fish, nuts, fruit, butter, and cheese, while glass, liqueurs, tobacco, soap, chocolate, and tinned goods are manufactured. The Moors rebuilt the fortifications with stones from the Roman city. Gijón repelled the Normans in 844, was burnt down in 1395, but is now a prosperous town and popular seaside resort. In the Spanish civil war of 1936-39 it was the last government stronghold on the northern (Asturian) front to fall, Oct. 21, 1937; but Asturian miners maintained further resistance near by. Pop. 102,817.

Gila. River of the U.S.A. Rising in New Mexico on the slopes of the Sierra Madre, it flows S. and W. through Arizona, and enters the Colorado at Yuma near the Mexican border. For upwards of half its course of about 480 m. it passes through mountainous country, and precipitous cañons.

Gila Monster (*Heloderma suspectum*). Popular name for the heloderm, the only venomous lizard known. It is common in Texas and Mexico, and lurks in ruins where it feeds upon frogs, eggs, and insects. Its bite is not fatal to man, though injurious.

Gilbert. River of Queensland, Australia. It rises near the Gregory Range, about 20 m. S. of Gilberton, and flows N.W. to the Gulf of Carpentaria after a course of 230 m.

Gilbert. Group of small islands and atolls in the Pacific Ocean. They lie on the equator, between long. 171° and 177° E., S.E. of the Marshall Islands. The chief are Butaritari, Makin, Abaian, Mara-kei, Tarawa, Maiana, Kuria, Abemama, Ananuka, Tapiteuea, No-

nouti, Nikunau, Onotoa, Beru, Tamana, and Arorae. Total area, 166 sq. m. Eighteen islands are inhabited; they yield pandanus fruit and coconuts, and export copra and phosphates. Pop. 28,124, chiefly Micronesians.

Proclaimed a protectorate in 1892, the islands were annexed by Great Britain at the request of the natives, Nov. 10, 1915, and with other groups make up the Gilbert and Ellice Islands colony.

Early in 1941 the Japanese occupied most of the Gilbert Islands, establishing air and naval bases on Makin and Tarawa. On Aug. 17 a small force of U.S. marines landed on Makin and destroyed the Japanese seaplane base. Following a prolonged bombardment, U.S. marines invaded Makin and Tarawa on Nov. 20, 1943. Makin was captured with little loss, but Tarawa proved a costly victory, for out of 4,500 men, 1,026 were killed and 2,557 wounded in the 76-hour battle. The Japanese garrison of 5,000 was annihilated. This occupation provided a stepping stone to the recapture of the Marshall Islands.

Gilbert (c. 1110-89). English saint and founder of the Gilbertines (*g.v.*) He was born at Sempringham, Lincs, of which he became rector, and where he founded in 1135 the only monastic order of English origin, for both sexes. He was imprisoned on a false charge of sending help to Becket in exile. He died at Sempringham, and was canonised by Pope Innocent III.

Gilbert, Sir Alfred (1854-1934). British sculptor. Born in London, Aug. 12, 1854, he studied at Heatherley's, and the Beaux Arts, Paris. In 1882 he first exhibited his Kiss of Victory at the Royal Academy, where Icarus followed in 1884. Gilbert's best-known work was the Shaftesbury memorial fountain (Eros) at Piccadilly Circus, a work that by reason of its position became famous throughout the world. Other well-known sculptures included the Alexandra memorial at St. James's; statue of John Bright at Westminster, and of Queen Victoria at Winchester; the duke of Clarence memorial at Windsor; and many busts. But Gilbert rated his designs as a goldsmith more highly than his sculpture. Elected R.A., in 1892,

Sir Alfred Gilbert. The most famous work of this British sculptor, the aluminium figure, now known as Eros, surmounting the Shaftesbury memorial, Piccadilly Circus, London

he retired in 1909, having been professor of sculpture from 1900. Knighted in 1932, he died Nov. 4, 1934. *Consult* Alfred Gilbert, I. McAllister, 1929.

Gilbert, Sir Humphrey (c. 1539-83). English navigator. Born at Dartmouth, stepbrother of

Sir Humphrey Gilbert, English navigator

Raleigh, he was educated at Eton and Oxford, studying navigation and mathematics. In 1563 he fought against the French at Havre and in 1566 took part in the operations in Ireland, being given command of the prov. of Munster in 1569. Knighted in 1570 and M.P. for Plymouth in 1571, he was sent the following year to the Netherlands, where he failed against the Spaniards.

Gilbert then mostly resided in Limehouse until 1583, when with two vessels he sailed to Newfoundland, landed at St. John's, and founded the first English colony in America. He insisted on settling out on the return voyage aboard the smaller of his two vessels, the Squirrel, a frigate of only 10 tons. The little craft foundered off the Azores with all hands, Sept. 9, 1583. The story, told by the commander of the Golden Hind, has become immortal through Gilbert's encouragement of his company with the words, "We are as near to Heaven by sea as by land." *Consult* Life, D. B. Chidsey, 1932.

Sir Alfred Gilbert, British sculptor
Elliott & Fry

Gilbert, Sir John (1817-97). British painter and illustrator. Born at Blackheath, July 21, 1817,

he entered a city office, but after two years he abandoned business for art. He was almost entirely self-taught. From 1836 onwards he exhibited at the British Institution, Royal Academy, and other galleries, although between 1851 and 1867 he showed at the Academy a solitary picture (1867). His real *métier* was the illustration of books and periodicals. His drawings (829 in all) for Howard Staunton's edition of Shakespeare (1856-60) became deservedly famous, and a complete set of the proofs found an appropriate home in the print-room of the British Museum. Sir Walter Scott and Cervantes he also illustrated with extreme felicity, and for nearly thirty years he was the mainstay of *The Illustrated London News*.

In 1852 he became associate, and in 1854 full, member of the Royal Society of Painters in Water Colour, being elected its president in 1871, when he received a knighthood. He was elected A.R.A. in 1872, and R.A. in 1876. His preference of subjects was still governed by his old relish for literature and history, among his best works in oils being *King Charles Leaving Westminster Hall* (1872), *Naseby* (1873), *Richard II Resigning the Crown to Bolingbroke* (1876), and *The Doge and Senators of Venice*. Sir John was well represented in the Guildhall Gallery, London. He died at Blackheath, Oct. 5, 1897.

Gilbert, Sir Joseph Henry (1817-1901). British chemist. Born at Hull, Aug. 1, 1817, he studied chemistry in London and under Liebig at Giessen. From 1843 until his death, Dec. 13, 1901, he was director of Rothamsted Laboratory in collaboration with Sir J. B. Lawes. He was elected F.R.S. in 1860, and was knighted in 1893, on the jubilee of the Rothamsted experiments, which covered a large field of research in agricultural science. He was also professor of rural economy at Oxford, 1884-90.

Gilbert, Marie Dolores Eliza Rosanna (1818-61). Irish dancer, better known by her stage name of *Lola Montez* (*q.v.*).

John Gilbert

Gilbert, Sir William Schwenk (1836-1911). British playwright. Born in London, Nov. 18, 1836, he was educated at London university. From 1857 he was a clerk in the education department of the privy council office, and in 1863 was called to the bar. After 1860 he contributed articles and drawings to *Fun*, in which his *Bab Ballads*, 1869 and 1873, appeared, and he started his career as dramatist by writing half a dozen burlesques, including a travesty of Tennyson's *The Princess*. These were followed by three fairy plays, *The Palace of Truth*, 1870, *The Wicked World*, 1873, and *Broken Hearts*, 1875; a classical romance, *Pygmalion and Galatea*, 1871; and two farcical comedies, *Tom Cobb*, 1875, and *Engaged*, 1877. He also wrote plays of serious interest, such as *Dan'l Druce*, 1876; *Grethchen*, 1879; *Comedy and Tragedy*, 1884; and *Brantingham Hall*, 1888.

The remarkable series of comic operas, in the production of which he as librettist was associated with Arthur Sullivan as composer and Richard D'Oyly Carte as theatrical manager, started in 1875, and the partnership endured, with lapses, until 1896 (see *Gilbert and Sullivan*). To the wit and finish of his dialogue and lyrics, the urbanity of his satire, and his exploitation of the humours of topsy-turveydom, which added the word *Gilbertian* to the language, much of the original success of the operas was due. Gilbert, who was knighted in 1907, was drowned in his private open-air swimming pool while going to the aid of a lady guest in difficulties, May 29, 1911.

Gilbert and Sullivan. Term in general use to define the output of one of the most remarkable partnerships in the history of creative art, that of W. S. Gilbert (*v.s.*) and Arthur Sullivan (*q.v.*) in the series of comic operas first produced under the management of Richard D'Oyly Carte between 1875 and 1896. Gilbert wrote the libretti, Sullivan composed the music, and in spite of fundamental differences in temperament leading to frequent disagreement and more than once to open quarrel, each inspired the other to greater achievement than was possible to each separately (though

neither would have agreed to this, particularly Sullivan, who had high ambitions as a serious composer and chafed at the popularity of his most delightful melodies). The full Gilbert and Sullivan repertory is as follows:

<i>Gaiety Theatre</i>	
<i>Thespis</i>	1871
(an early collaboration of historical interest only.)	
<i>Royalty Theatre</i>	
<i>Trial by Jury</i>	1875
<i>Opéra Comique</i>	
<i>The Sorcerer</i>	1877
<i>H.M.S. Pinafore, or The Lass that Loved a Sailor</i>	1878
<i>The Pirates of Penzance, or The Slave of Duty</i>	1880
<i>Patience, or Bunthorne's Bride</i>	1881
<i>Savoy Theatre</i>	
<i>Iolanthe, or The Peer and the Peri</i>	1882
<i>Princess Ida, or Castle Adamant</i>	1885
<i>The Mikado, or The Town of Titipu</i>	1885
<i>Ruddigore, or The Witch's Curse</i>	1887
<i>The Yeomen of the Guard, or The Merryman and his Maid</i>	1888
<i>The Gondoliers, or The King of Barataria</i>	1889
<i>Utopia, Limited, or The Flowers of Progress</i>	1893
<i>The Grand Duke, or The Statutory Duel</i>	1896

Of these, *The Mikado*, the first production of which ran for 672 performances, remains generally the most popular. The original run of *H.M.S. Pinafore* was 700 performances; of *Patience*, 578; of *The Gondoliers*, 554; of *The Yeomen of the Guard*, 423. Composer and librettist alike were most satisfied with *The Yeomen of the Guard*. *The Grand Duke*, greatly inferior to the rest, was played only 123 times and has never been revived. The operas are sometimes called the *Savoy operas*, and sometimes (because the D'Oyly Carte family still holds the copyright) the *D'Oyly Carte operas*. Their popularity waxes and wanes. During the early years of the 20th century it is fair to say that they were more popular in the provinces than in London, but notable revivals in the West End in 1919-20 contributed to a new lease of vigorous life throughout the 1920s. Amateur operatic companies have always remained faithful to Gilbert and Sullivan. But many critics tire of the highly stylised and mechanical stage actions which were first insisted upon by Gilbert, from which no departure is allowed, thus turning what should be spontaneous fun into something like a ritual. A film version of *The Mikado* (1939) was an experiment that would bear repetition. On the other hand, the true lover of Gilbert and Sullivan would not willingly dispense with the least of the tradi-

Sir W. S. Gilbert,
British dramatist
Russell

tional gestures or "business." The criticism that the style of humour is more suited to the suburban drawing-room than to the stage may have some sound basis but is not necessarily detrimental, except perhaps to the stage. The fact remains that the public still flocks in its thousands to see, hear, and enjoy Gilbert and Sullivan, whatever the vagaries of fashionable criticism may have to say. *Consult* G. and S., A. H. Godwin, 1926; G. and S., Hesketh Pearson, 1937.

Gordon Stowell

Gilbert Blane Medal. Naval prize. It was founded in 1829 by Sir Gilbert Blane, a member of

Gilbert Blane Medal. Reverse and obverse sides of the naval prize medal

the board for sick and wounded seamen, to encourage the study of medicine in the navy. It consists of a gold medal presented biennially to each of the two medical officers who produce the most approved daily journals of their practice whilst in charge of a ship of war in the Royal Navy.

Gilbertines. English monastic order. It was founded by S. Gilbert of Sempringham (*q.v.*) about 1135. The order included both men and women, who lived in double monasteries having no communication. The men followed the Augustinian rule and the women the Cistercian. The habit was black, covered with a white cloak. S. Gilbert established 13 houses, containing some 700 canons and 1,500 nuns. The superior was called the master or prior general. *See* Abbey.

Gilbey, Sir Walter (1831-1914). British wine merchant. He was born at Bishop's Stortford, May 2, 1831, and entered the office of an estate agent. On his return from the Crimean War he founded with his brother Alfred the firm of W. and A. Gilbey, wine merchants. In 1893 Walter was made a baronet, and the title passed to his son on his death, Nov. 12, 1914.

Sir (Henry) Walter Gilbey (1859-1945), born Oct. 1, 1859, and educated at Harrow, took his

father's place in the sporting world. He was president of the London cart horse parade and of the Royal Agricultural Society. Always particular about his own clothes and affecting a bowler hat with a specially flaired brim, he condemned sartorial slackness in the public, particularly in those who rode in Rotten Row. He died April 11, 1945, being succeeded in the baronetcy by his grandson.

Gil Blas, DE SANTILLANE. French novel, by Le Sage (*q.v.*). This masterpiece of picaresque literature was written over a period, the first two parts appearing in 1715, the third in 1724, and the fourth in 1735. Le Sage adopted the Spanish picaresque romance of the 16th-17th centuries. He was accused by Voltaire and others of having borrowed incidents and characters from Espinel's Marcos de Obregon (1618), but he adhered closely to the spirit of the Spanish scene and character.

Gilboa (bubbling fountain). Chain of hills beside the plain of Esdraelon, Palestine. Saul and his sons were slain in battle here.

Gildas (c. 516-570). British historian. His work, *Liber Querulus de Excidio Britanniae*, or Lament over the Destruction of Britain, traces the history of Britain from the Roman invasion to the writer's own time, and has slight literary and doubtful historical value, but is without a contemporary. He is known also as a Breton saint, two monasteries having been founded in his honour in Brittany.

Gilding. The application of a thin layer of gold alloy as a decorative treatment. It is widely used for sign-writing on wood and glass fascias and on shop windows and commercial motor bodies; also in architectural decoration as a finish for wood and plaster mouldings on walls and ceilings of an ornate character. Gilded mouldings and figures were a feature of late French Renaissance decoration.

In sign-writing, the lettering is first painted in size slightly stained with yellow chrome, or with a special writers' size. When the size is almost dry the lettering is gilded by pressing on gold leaf transfers. On completion the gilding is lightly polished with a wad of cotton wool. If the lettering is outlined or shaded in oil paint, this is done after gilding. When the sign or ground is varnished, this should be done before gilding, as gold is more durable

and withstands weather better than varnish.

Wood letters are first prepared by washing, glass papering, and one-coat french polishing. They are then treated with oil gold size and when nearly dry are gilded. This is best done on the bench. Mouldings and picture frames are treated similarly.

Gilead. Mt. district in Palestine E. of the Jordan (now in Transjordan). In it the tribe of Gad appears to have settled. Elijah was the most notable of its sons. *See* Balm.

Giles (Lat. *Aegidius*). Patron saint of lepers and beggars. He is said to have been born at Athens at the end of the 7th century, and to have emigrated to France, where he became a hermit near Nîmes. He founded an abbey, which was called by his name.

Giles, ERNEST (1839-97). British explorer. A Bristol boy, he went to Australia at an early age,

Ernest Giles, British explorer

and between 1872 and 1882 made explorations into the interior. In the first of these he started from about 134° E. long., 25° S. lat., and proceeded N.W. as far as Lake Amadeus. In 1873 he journeyed from the Alberga River and followed the 27th parallel to 126° E. long.

His most successful journey was in 1874, when, at the end of Sept., with a well-equipped party and numerous camels, he left Fowler's Bay, and after many vicissitudes reached Perth on Nov. 13.

In 1876 he again traversed the continent. Leaving Pia Springs, in 27° 7' S. lat., 116° 45' E. long., on April 10, and travelling to the 23rd parallel, he made a general N.E. course, crossing the headwaters of the Murchison, passing Mt. Gould, and tracing the Ashburton river to its source. He reached Peake Station Aug. 23. Towards the end of 1882 he explored the country W. of the Peake. Giles wrote *Geographic Travels in Central Australia*, 1875; *Australia Twice Traversed*, 1889.

Giles, HERBERT ALLEN (1845-1935). British scholar. Born Dec. 8, 1845, he was educated at Charterhouse, and joined the China consular service in 1867. He was vice-consul at Pagoda Island, 1880, and Shanghai, 1883, and consul at

Tamsui, 1885, and Ningpo, 1891. Resigning in 1893, he became professor of Chinese at Cambridge, 1897-1932, and was first lecturer on Chinese on the Dean Lung Foundation, Columbia university. In addition to his *Longinus*, 1870, he was the author of every kind of work on the language, literature, art, and religion of China, including a *History of Chinese Literature*, 1901; *The Civilization of China*, 1911; *Confucianism and Its Rivals*, 1915; *Introduction to Chinese Art*, 2nd ed. 1918. He compiled a *Chinese-English dictionary*, 2nd ed. 1912. He died Feb. 13, 1935.

His 4th son, Lionel Giles (b. Dec. 29, 1875), was educated at Liège, Feldkirch (Austria), Aberdeen university, and Wadham College, Oxford. He was a keeper of Oriental printed books and manuscripts at the British Museum, retiring in 1940. He published many books on China and translations from the Chinese, including the *Sayings of Lao Tzu*, 1904; the *Sayings of Confucius*, 1907; *Taoist Teachings*, 1912; *The Book of Mencius*, 1942.

Gilfillan, GEORGE (1813-78). Scottish author. Born at Comrie, Perthshire, Jan. 30, 1813, son of a secession minister, he was educated at Glasgow university. In 1836 he became minister of School Wynd Church, Dundee, where he remained till his death, Aug. 13, 1878.

George Gilfillan

Between 1845 and 1854 he published three series of critical estimates entitled *A Gallery of Literary Portraits*. He wrote *Lives of Scott*, 1870, and *Burns*, 1878.

Gilgal (Heb., stone-circle). A name given in the O.T. to various places. At one, near Jericho, a place of sacrifice in the days of Samuel, Saul gathered his people against the Philistines. At Gilgal Samuel hewed in pieces Agag the Amalekite.

Gilgamesh. Hero of a Babylonian epic, by some identified as Nimrod (*q.v.*). In the twelve books of the epic, corresponding more or less closely to the months of the year, his adventures are set forth; he is a man of mighty strength, a great hunter, and, as ruler of Erech, so evil that the people pray to the gods against him. Gilgamesh incurs the enmity of the goddess Ishtar; he journeys to the land of the dead, and the account

of that journey gives occasion for narrating the Babylonian story of the Flood. The story of Gilgamesh

Gilgamesh, the Babylonian Hercules, strangling a lion
From a sculpture in the Louvre, Paris

has remarkable parallels with that of Hercules. Consult *The Religions of Ancient Egypt and Babylonia*, A. H. Sayce, 1902.

Gilgit. District, town, and river of Kashmir. Lying on the S. slopes of the Hindu Kush, the dist. includes the valleys of Gilgit, Chitral, Swat, and Ladak. Area, 25,000 sq. m. The town stands at an elevation of 4,900 ft. above the level of the sea, 125 m. N.W. of Srinagar. It was a British agency 1889-1947. Pop. 76,526.

Gilia. Genus of annual herbs of the family Polemoniaceae, natives of the warm, but not tropical, regions of America. They have abundant flowers, funnel or salver shape, blue, rose, yellow, purple, white, etc.

Gill. Organ of respiration in animals that habitually live in water and do not rise to the surface to inhale air. They are found in fishes, crustaceans, many molluscs, the larval stages of batrachians and some insects, and in many aquatic forms of life. They are so constructed as to present the largest possible surface con-

taining capillary blood-vessels to the water in order that the contained oxygen may be brought into contact with the blood. Gills may vary in their structure from simple slits in the body wall to more or less elaborate plates, filaments, and leaf-like organs. The gills in fish and many other animals are situated at the sides of the head or neck, but in some crustaceans they are found on the limbs; certain echinoderms carry them on the tentacles. No vertebrates higher than fishes and batrachians breathe with gills in the adult stage, but gill clefts are present in an early stage of the development of the embryo. The gills of insects (*e.g.* May flies) whose larvae pass most of their lives in water are called tracheal gills, from the fact that they are permeated by fine air tubes. See *Fish*.

Gill. In engineering, the flat plate or fin fitted to the tubes of a radiator or water-cooler in order to facilitate the dissipation of heat.

Gill. Dry and liquid measure of capacity used in Great Britain and the U.S.A. The gill quantity has always been in some doubt. Generally, the measure equals a quarter of a pint, but the word has been used in Scotland and N. England for half a pint, and in certain other districts for one pint. Gill is derived from the late Latin *gillo*, a mine vessel. *Pron.* Jill.

Gill. Lough or lake of Eire. It is mainly in co. Sligo and partly in co. Leitrim; length 5 m., extreme breadth 2 m. It is navigable by small steamers. W. B. Yeats lived on an island of Lough Gill, which he made famous as Innisfree.

Gill (ARTHUR), ERIC ROWTON (1882-1940). British sculptor and designer. Born at Brighton, Feb. 22, 1882, he studied architecture

Eric Gill. At work on his carved relief, Christ giving sight to Bartimaeus, for Moorfields Eye Hospital, London

under Caroš but did not practise. Eric Gill's designs include the Stations of the Cross for Westminster Cathedral (see Art, illus. p. 664) and for the R.C. church at Bradford; the First Great War memorial for Leeds university; and the sculptured group on S. Thomas's Church, Hanwell. He executed the stone figures of Prospero and Ariel on the B.B.C. building, Langham Place, and the figure of the North Wind and its companion piece on the London Transport building, Broadway, Westminster. Examples of his sculpture are in the Tate Gallery and the Victoria and Albert Museum. His work is notable for a Giotto-like simplicity of design and boldness of execution. His Gill Sans type was perhaps the finest evolved in 100 years; a 3-vol. N.T. hand-set by him in this type was published in 1934. He designed the lettering used by W. H. Smith & Sons. The author of provocative essays on art and its relation to other subjects, he died Nov. 17, 1940.

Gill, Sir David (1843-1914). British astronomer. He was born at Aberdeen, June 12, 1843, and educated at Aberdeen university. On taking charge of Lord Lindsay's observatory he went out to Mauritius and observed the transit of Venus. In 1877, having determined at Ascension Island the solar parallax by a study of the movements of Mars, he received the gold medal of the Royal Astronomical Society. In 1882 he took fresh measurements of the transit of Venus, and photographed the great comet of that year. As H.M. astronomer at the Cape of Good Hope, 1879-1907, Gill carried out his greatest work, the magnificent catalogue of the stars of the southern hemisphere. This catalogue, comprising nearly half a million stars, was completed in 1900. He was created K.C.B. in 1900, and died Aug. 27, 1914.

Gill, MacDonald (1884-1947). British architect and designer. The younger brother of Eric Gill was born at Brighton, educated at The Royal Naval Academy, Bognor, and the Central school of arts and crafts, and became an architect. In 1913 he designed a well-known map of London for the Underground; later cartographical pieces for the L.M.S. rly. and the Empire Marketing Board were outstandingly successful. His mural decorations ornament Lincoln Cathedral, the Guildhall, Cambridge, and the Scott Polar Institute, and he worked as

designer to the Imperial War Graves Commission. He died at Chelsea, Jan. 14, 1947.

Gillespie, Sir Robert Rollo (1766-1814). British soldier. The son of a landowner in co. Down, he

Sir Robert Rollo Gillespie, British soldier

was born at Comber therein, Jan. 21, 1766. He obtained a commission in the army in 1783. In 1787 he killed a man in a duel and was tried for wilful murder, but the result was a verdict in his favour. In 1794 in San Domingo he fought as a volunteer for the French against the rebels. Gillespie's reputation rests upon his services in India, whither he sailed in 1805. He was made commandant of Arcot, from which he made his ride to Vellore, July 10, 1806. Hoisted up by the rope, he entered the fort and inspired the defenders to hold it until help arrived.

In 1811 Gillespie held a command in a force sent to Java, and led the attack on Batavia, but was involved in a serious quarrel with Sir Stamford Raffles, the governor. He was serving in a war against Nepal when he was killed leading a desperate rush on the fort of Kalunga, Oct. 31, 1814. Before this news reached England Gillespie was knighted.

Gillette, King Camp (1855-1932). American inventor, born Jan. 5, 1855. He became world-famous as the inventor of a safety razor, and was president of the Gillette Safety Razor Co., 1901-31. He was the author of Human Drift, 1894; Gillette's Social Redemption and Gillette's Industrial Solution, both 1900; The People's Corporation, 1924. He died July 10, 1932.

Gillie. Old name for a Highland manservant. It is now used to denote one who assists his master on deerstalking and fishing expeditions in the Scottish Highlands. See Deer-stalking.

Gillies, Sir Harold Delf (b. 1882). New Zealand surgeon. Born June 17, 1882, at Dunedin, he was educated at Wanganui College, Cambridge university, and S. Bartholomew's Hospital. One of the foremost plastic surgeons, as evidenced by his book, Plastic Surgery of the Face, 1920, he became consultant in that subject to the ministry of Pensions, the R.A.F., and the army in Great Britain, and civil consultant to the

Admiralty, besides holding a number of hospital appointments. He was knighted in 1930. He played amateur golf for England v. Scotland, 1908, 1925, 1926.

Gillingham. Market town of Dorset, England. It stands on the Stour, 23 m. W.S.W. of Salisbury, and has a railway station. The National Stud was moved to Giltown Stud, Gillingham, from Tully, co. Kildare, Eire, 1944. The chief building is the church of S. Mary, the Virgin. Market day, Monday, Pop. 3,274.

Gillingham. Mun. and parl. bor. of Kent, England. It stands on the Medway to the E. of Chatham, being 36 m. E.S.E. from London by railway. It has a fine Perpendicular church, parts of the building dating back to Norman times. It was made a borough in 1903, and includes the districts of Brompton and New Brompton. The centre of a fruit growing district, its industries include the making of bricks and cement, while many of the inhabitants work in the dockyards of Chatham. The corporation provides parks, recreation grounds, and cemeteries. One member is returned to parliament; the borough was until 1948 a division of Rochester. Gillingham existed in Anglo-Saxon times. It received its charter as a market town in the time of Edward III. The R.N. Barracks, Chatham, and a major part of Chatham dockyard are located within the borough. Pop. 60,983.

Gillingham. Village of Norfolk, England, 1½ m. N.W. of Beccles. The church of S. Mary, pure early Norman, is divided into Galilee, tower space, nave, chancel, and apse. In the village also stands the tower only of the former All Saints church.

Gillott, Joseph (1799-1873). British penmaker. Born at Sheffield, Oct. 11, 1799, he served his

Joseph Gillott, British penmaker

time as a cutter. In 1821 he moved to Birmingham, where in 1830 he began experimenting in steel nib making. His first improvement was the introduction of side slits in addition to the centre slit, which made the nib more pliable. His next improvement was to cross-grind the point. So far all his work had been performed in secrecy, the finished nibs being sold to a stationer at the price

of a shilling each. In 1859 he opened a large factory, and the business soon became one of the largest of its kind. Gillot made a fortune, much of which was spent on a collection of pictures, which at his death was sold for £170,000. Died at Edgbaston, Jan. 5, 1873.

Gillow, ROBERT (d. 1773). English furniture maker and designer. Gillow set up a cabinet-making business at Lancaster about 1730, and opened a London house in 1761. The business was greatly developed by his sons, Richard, Robert, and Thomas, whose high standards of craftsmanship were worthy of the designs made for them, among others by George Hepplewhite, and from about 1790 to 1800 by Thomas Sheraton. Gillow and Barton, as the firm became, were credited with the introduction of the extra-leaves dining-table, and were the leading furniture makers of the 18th century in England.

Gillray, JAMES (1757-1815). A British caricaturist. Born probably at Chelsea, of Scottish or Irish descent, he was apprenticed to a letter-engraver. Later he attended the R. A. Schools and studied engraving under W. W. Ryland and Bartolozzi. His aptitude for caricature, at first confined to social foibles, early displayed itself anonymously, but in 1779 his plate of Paddy on Horseback, published under his own name, announced his entrance into the political arena.

From this date until he died, virtually demented, in London on June 1, 1815, he produced no fewer than 1,500 pieces, mostly caustic. He spared no one. He assailed George III and his queen as ruthlessly as William Pitt, Charles James Fox, and other leaders, and the public vociferously applauded all. His pictures of social manners and customs are invaluable to the historian. See Caricature illus. p. 1770.

Gillyflower. Name originally applied to carnation (*Dianthus caryophyllus*), but now used chiefly for stocks (*Malhiola*) and wallflower (*Cheiranthus*). It is a corruption of Fr. *girasole*, which is derived from Gr. *karyophyllon*, nut-leaf, clove-tree, in reference to the clove-like smell. See Stock; Wallflower.

Gilman, DANIEL COIT (1831-1908). American educationist. Born at Norwich, Conn., July 6, 1831, he was educated at Yale, New Haven, and Berlin universities. He became librarian and, in 1856, professor of physical and political geography at Yale; he was president of the university of California, 1872-75. He helped to found Johns Hopkins university, Baltimore, and was first president, 1875-1901. Among other posts he held that of executive officer of the geological survey of Maryland.

His books include *University Problems*, 1898; *James Monroe in His Relations to the Public Service* (1776-1826), 1883; *The Launching of a University*, 1906. He edited De-Tocqueville's *Democracy in America*, and was one of the general editors of the *New International Encyclopaedia*, 1902-4. He died Oct. 13, 1908. *Consult Life*, F. Franklin, 1910.

Gilman, HAROLD JOHN WILDE (1876-1919). English painter. He was born at Road, Somerset, Feb. 11, 1876, and studied at the Slade school, London. Influenced at first by Sickert, he later became a follower of Van Gogh and a pure colourist; in choice of subject he adhered to still life and interiors reminiscent of the Dutch masters. As the virtual originator of the Camden Town Group, 1911, and as first president of the London Group, 1914, he had considerable influence on 20th century English painting. He died Feb. 12, 1919.

Gilmour, SIR JOHN (1876-1940). British politician. He was born May 27, 1876, and educated at Trinity College, Glenalmond; Edinburgh university; and Trinity Hall, Cambridge. Having served in the S. African War, Gilmour entered parliament in 1910 as Unionist member for E. Renfrewshire. He succeeded his father as the 2nd baronet in 1920. Secretary for Scotland, 1924-29, he was minister of Agriculture in the National government formed in 1931, and Home secretary, 1932-35. Appointed minister of Shipping, Oct., 1939, he died suddenly March 30, 1940. He was created G.C.V.O. in 1935.

Gilolo. Alternative name for Halmahera (*q.v.*), island in the Malaccas.

Gilpin, BERNARD (1517-83). English divine and philanthropist, known as the apostle of the North. Born at Kentmere, Westmorland, he was educated at Queen's College, Oxford and ordained 1542. He studied at Paris and Louvain, and became archdeacon of Durham

and rector of Houghton-le-Spring, where he died March 4, 1583. Here he founded a grammar school, and became famed for his beneficence. He was offered the bishopric of Carlisle, but declined it. He spent his later years in journeying about the district, preaching and relieving distress.

Gilpin, JOHN. The hero of the mock ballad, *The Diverting History of John Gilpin*, by William Cowper. It describes how Gilpin, linen-draper and train-band captain, but a poor horseman, attempted to follow his wife and family to Edmonton on horseback, but was carried on to Ware, whence, with equally diverting adventures, he was carried back to London. The poem was based on an anecdote of a Mr. Beyer, of Paternoster Row, told to the poet by Lady Austen.

Gilsonite. A lustrous, black asphaltite, named after an American, S. H. Gilson. It has a specific gravity of 1.03 to 1.09, a softening point between 250° F. and 500° F., and a high dielectric strength. The mineral content is less than 1 p.c. Gilsonite occurs in veins which vary in thickness up to several feet, and is found in E. Utah and W. Colo., U.S.A. It is a valuable raw material for the varnish and japan industry and is also used as a thermoplastic. Smaller quantities are used in the electrical industry, in the manufacturing of some printing inks, and for impregnating belting and other materials.

Giltspur Street. A London thoroughfare running N. from the Old Bailey to W. Smithfield. An approach to the old jousting ground at Smithfield, hence its name, it contained, 1791-1855, a computer, or debtors' prison, at the S.E. corner. On the same side are parts of the G.P.O. and S. Bartholomew's Hospital, with, in the yard of the former, and below the surface, a bastion of the old Roman wall.

Gilyak. Primitive tribe of palaesiac stock in N. Sakhalin and on the lower Amur, E. Siberia. Short and round-headed, they display a sparse-bearded Tungus type and a bushy-bearded Ainu type. They occupy in the winter pit-huts and in the summer pile-houses. They are skiful boatmen, hunt with bow and arrow, and subsist mainly on salmon and sturgeon. Their animism includes a bear-festival.

Gimbals. Arrangement of rings and pivots to allow relative motion of the pivoted member in two planes at right angles. Gim-

James Gillray,
British artist

bals are used for the support of a mariner's compass so that this instrument may keep its level

Gimbals, device of brass rings for keeping a mariner's compass horizontal

position despite the rolling or pitching of the ship. A simple form of this arrangement is often seen in the toy gyroscope, while gimbals are used in a perfected form in the gyro-compass.

Gimcrack Club. Racing club. Founded in 1767, its name commemorates that of a famous race-horse. It holds an annual dinner at York, the rule being that the guest of the evening shall be the owner of the horse that wins the Gimcrack Stakes, a race run every Aug. at York.

Gimli. In Norse mythology, a great hall. It was of wonderful brightness, and the idea was that it would remain after the destruction of the world, to be for ever the home of the good.

Gimmel Ring. Two or more separable hooks which when linked together form a single finger ring. They were formerly popular as betrothal rings and ornamented with a device of two clasped hands or two hearts.

Gimp (Fr. *guimpe*, nun's wimple). Lace trimming stiffened with cords covered with silk or worsted. It is sometimes enriched with gold or silver, and usually of a rather open design.

Gin. Colourless or slightly tinged spirit flavoured with juniper berries and other aromatic herbs. It is distilled in a patent still, the grain used being maize, to which a little barley malt is added. The gin rectifier, as a rule, buys the neutral spirit, and then rectifies it. Sometimes it is rectified twice, and then naturally commands a higher price. It is flavoured by distillation with juniper berries, although occasionally essential oil of juniper is added to the rectified product. Each gin rectifier has his own recipes for flavouring, and very often in addition to juniper, almonds, cardamoms, cassia, orris-root, coriander seeds, or other aromatic flavourings are used. London gin is known all over the world, and another variety which

has a large sale is Plymouth gin, made, as the name implies, at Plymouth. The kind known as Old Tom is simply ordinary gin sweetened with cane sugar or sugar syrup. Gin as sold retail in the U.K. is usually of a strength of 30 degrees under proof. If sold below 35 degrees under proof the strength must be noted on the label. The formula, "contains — p.c. proof spirit," is sufficient to fulfil the requirements of the Act governing the sale of spirits. "Geneva," sometimes called hollands, hollands geneva, or schnapps, is simply Dutch gin. The name is derived from the Dutch word *jenever*, which means both juniper and gin. Geneva is principally made in Schiedam, Holland, on much the same lines as English gin. See Distilling.

Ginger (*Zingiber officinale*). Perennial herb of the family

Ginger. Horizontal rootstock with flowering shoots

Scitamineae. It is a native of the E. Indies. It has a horizontal rootstock, which forms the ginger of commerce. The leaves are narrow, lance-shaped, up to 1 ft. long. The yellow and blue flowers are clustered in a dense oval spike, on a tall, leafless stem. Preserved ginger consists of the young rootstocks preserved in syrup. The ordinary form, used as a spice, is the year-old rootstock, either skinned or unskinned. Ginger was used by the Greeks and Romans, and in India from remote antiquity.

Ginger Ale. Aerated beverage flavoured with ginger, acidulated with citric or other vegetable acid, and coloured with caramel. It is manufactured in the same way as soda-water, except that before water saturated with carbonic acid

is forced into the bottle, a small quantity of syrup flavouring is placed in it. This syrup contains citric acid, caramel, ginger ale essence, and sugar. The ginger ale essence, officially styled by the ministry of Food "unsweetened gingerale essence," is a compound of ginger, lemon, vanilla, and cinnamon, each manufacturer having his special proportions of ingredients, upon which the flavour of the product depends. Ginger ale is a clear, effervescing liquid, popular both as a temperance beverage and a dilutant for spirits.

Ginger Beer. Beverage flavoured with ginger and lemon, and produced by fermentation. If of normal gravity and containing not more than 2 p.c. of proof spirit, it is not regarded as "beer," or an "intoxicating liquor," and may be sold without an excise licence. As ginger beer is a cloudy liquid it is usually bottled in stone or earthenware bottles. The clear variety in glass bottles, entirely free of alcohol, is an acrated water, flavoured with soluble essence of ginger, and scarcely distinguishable from ginger ale.

Gingerbread. Cake flavoured with ginger. The chief ingredients are flour, butter or lard, eggs, and treacle. More elaborate recipes add candied peel, sweet almonds, cinnamon, etc. Gingerbread was made six centuries ago with rye flour, honey, and various spices, besides ginger. At one time small gingerbread figures of people and animals were sold by bakers, the figure decorated with gold paper being regarded by the children as the king of the others—hence the phrase "that takes the gilt off the gingerbread." Many towns have been noted for gingerbread fairs, at which small gingerbread cakes, known in East Anglia as "brown buttons," were sold.

Ginger Wine. Winc, not necessarily alcoholic, prepared from ginger, lemons, raisins, and sugar. More frequently nowadays it is prepared from the manufactured product known as "unsweetened gingerale essence." See Ginger Ale.

Gingham (Malay *ging-gang*, striped). Cotton or linen fabric woven from white or coloured yarn often in stripes, checks, or other designs, used for dresses, umbrellas, etc. Gingham was introduced into Europe from India. The patterns, though sometimes resembling those on calico, are woven in, not printed as on calico. Gingham is manufactured chiefly at Glasgow and Manchester, and in the U.S.A. Earlston, in Berwick-

shire, is still famous for its gingham. An umbrella, especially a large clumsy one, is sometimes colloquially called a gingham because umbrellas were formerly covered with that material.

Gingivitis. Inflammation of the gums. This can arise from pressure of an ill-fitting dental plate, or from vitamin shortage weakening the resistance of the tissues against germs. Stagnant food mixed with pus organisms may lie between the tooth and the gum, forming eventually a pocket of pus which loosens the tooth; this is known as pyorrhoea. Air swallowing, with excessive salivation, may ensue, and this pus absorbed and swallowed—especially at night when there is no disturbance of its activities by food and no secretion of gastric juices to destroy it—is a frequent factor in cases of rheumatism, anaemia, and ulcerated conditions of the intestine. The prevention of gingivitis lies in oral hygiene (the gums as well as the teeth should be brushed), chewing crisp foods, and eating foods rich in vitamins. Cure lies in the use of penicillin, antiseptics, and in massage of the gums. In bad cases teeth must be removed.

Ginkel, GODART VAN (1630–1703). Dutch soldier. Son of a Dutch nobleman, he entered the army and saw service in the wars against France. In 1688, being then known as an able soldier, he crossed to England with William of Orange, under whom he also served at the battle of the Boyne. When the king returned to England, Ginkel was left in command in Ireland, where he captured Ballymore and Athlone. He was responsible for the English victory at Aughrim and for the captures of Galway and Limerick that ended the war. He continued his military career in the Low Countries, and, in spite of his age, led the Dutch in Marlborough's army in 1702. He died at Utrecht, Feb. 11, 1703. In 1691 Ginkel was made earl of Athlone, a title held by his descendants until 1844.

Ginning. Separation of cotton fibre from cotton seed by the gin (a corruption of engine). Bowing was the original process, the seed being struck by the string of a wooden bow. Roller gins with parallel fluted rollers were in use before 1793, when Eli Whitney's invention of the saw-gin ushered in a new era in the cotton trade.

Ginsberg, MORRIS (b. 1889). British philosopher and sociologist. Born May 14, 1889, he was

educated at University College, London, becoming lecturer in philosophy there, 1914–23. In 1929 he was appointed Martin White professor of Sociology at the London School of Economics. He became joint editor of *The Sociological Review*. Among his publications are *The Psychology of Society*, 1921; *Sociology*, 1934.

Ginsburg, CHRISTIAN DAVID (1831–1914). Polish Hebrew scholar. He was born at Warsaw and educated at the Rabbinical School, and later in England, where he made his home. He was a member of the O.T. revision committee and published a number of important works on the Hebrew scriptures, as well as contributions to encyclopedias and dictionaries. It was owing to him that the MSS. offered by Shapira to the British Museum were discovered to be forged. He died March 7, 1914.

Ginseng (*Panax ginseng*). Plant of the family Araliaceae. A native of N. Asia, it has com-

Ginseng. Leaves and flowers of the medicinal herb

pound leaves and greenish flowers in umbels. The name is Chinese, and signifies Wonder of the World, the physicians believing that the root restores lost animal functions, removes fatigue, and rejuvenates the old. See Araliaceae.

Gioberti, VINCENTO (1801–52). Italian philosopher and politician. He was born at Turin, April 5, 1801, where he became professor of theology. Exiled for his independent opinions, he withdrew to Paris. The events of 1848 brought him back to Turin, where he held various political offices. He afterwards returned to Paris, where he died Oct. 26, 1852. Gioberti, who may be called a Platonic idealist, endeavoured to reconcile the claims of science and religion.

His most important works were *Introduzione allo Studio della Filosofia* (Introduction to the Study of Philosophy), *Del Rinnovamento civile d'Italia* (the Civil

Renewal of Italy), and *Il Gesuita Moderno* (the modern Jesuit). Although he was a Catholic, his works, which were strictly orthodox, were placed upon the Index.

Gioja del Colle. Town of Italy, in the prov. of Bari. A junction on the Taranto line, it stands at an alt. of 1,180 ft. above sea level, 37 m. by rly. N. of Taranto. It trades in grain, wine, and oil. Pop. 21,852.

Giono, JEAN (b. 1895). French novelist. Winner of the Bretona prize in 1929 with his first novel *Colline*, Giono continued to produce distinguished work; *Le Serpent d'Étoiles* Regain won the Northcliffe prize. *Le Chant du Monde* was translated as *Song of the World*, and *Lanceurs de Graines* as *Harvest*. A pacifist, he was interned at the beginning of the Second Great War, but was released during the German occupation of France.

Giordani, PIETRO (1774–1848). Italian author. Born at Piacenza, Jan. 1, 1774, he became a Benedictine monk, but in 1800 left the order and became secretary to the Accademia at Bologna. The publication of his *Panegirico all'Imperatore Napoleone* was sufficient to warrant his disgrace at the reaction of 1815, and he was the object of continual persecution until his death at Parma, Sept. 1, 1848. He wrote some of the best prose of his period, and his essays and eulogies have become classics.

Giordano, LUCA (1632–1705). Italian painter. Born in Naples, he studied under Giuseppe Ribera,

and afterwards went to Rome and Venice. He painted in a free and animated manner, his composition was harmonious, his imaginative gifts were considerable, and his foreshortening daring and correct. He was summoned to Madrid in 1692 by Charles II to embellish the Escorial.

His nickname of *Fa Presto* was derived from his father's constant injunction to hurry up (Luca, *fa presto*—Luke, make haste). His best work is to be found in the Escorial, especially his decoration of the staircase, representing the Battle of St. Quentin. He was represented in most of the leading collections on the Continent, his Commerce and Navigation (Florence) being characteristic.

Luca Giordano, Italian painter From an etching

Giorgione. *The Storm*, a characteristic landscape with figures by this master of the Venetian school. The original is in the Giovanelli Gallery, Venice

Giorgione, GIORGIO (1477-1510). Venetian painter. Little is known of Giorgione, but he is reputed to have been born at Castelfranco and to have become the pupil of Bellini. It is probable that he worked with Titian in painting frescoes in the Fondaco dei Tedeschi at Venice. Many works attributed to him have been disputed. The famous *Concert Champêtre*, in the Louvre, was the subject of a protracted argument, but is now generally considered to be by Giorgione. Other authentic works include *The Sleeping Venus* (formerly Dresden Gallery), *The Storm* (Giovanelli

Gallery, Venice), *The Three Philosophers* (Vienna), probably finished by Sebastiano del Piombo. *The Concert*, in the Pitti Palace, Florence, has also borne

Giorgio Giorgione, Venetian painter. Self-portrait

the name of Giorgione.

One of the most important masters of the Venetian school, Giorgione drew direct from nature, and in his landscapes he reveals a profound feeling for light and shadow, rain and storm, thus breaking away from the stylised composition of the primitives. It is supposed that he died of the plague in 1510.

Giotto di Bondone (c. 1266-1337). Italian painter. The father of the Italian Renaissance, as he is considered to be, was born at

Colle, near Florence. It is probable that he was the son of Francesco Bondone di Vespignano, a well-to-do landed proprietor; that he was apprenticed to the wool trade; that he was in the habit of stopping at Cimabue's studio in Florence on the way to his work, and by this means called the master's attention to his genius.

Possibly Giotto may have become a pupil of Cimabue, but the naturalistic bent of his art from the first suggests that he owed more to the sculptor brothers, the Pisani, than to any painter, and more to first-hand study of nature than to any master. About 1298 his technical proficiency must have been achieved, for it was then that he designed the mosaic of the Navicella and painted the famous Stefaneschi altar-piece for S. Peter's, Rome. The former is now in the portico of S. Peter's, and most of

Francis's life in S. Croce Church, Florence, were executed considerably later.

One of his last works was the design made for the beautiful campanile of Florence cathedral.

These are the most notable extant examples of an art that broke away from the conventions of contemporary Byzantinism and opened the door to naturalism in form and colour. Giotto died at Florence, Jan. 8, 1337. See Italy: Art; consult also Lives, F. M. Perkin, 1902; B. de Sélincourt, 1905.

Giovinazzo. Seaport of Italy, in the prov. of Bari, the ancient Natilium. It stands on the N. shore of the Adriatic, 12 m. by rly. N.W. of Bari. A walled town, it possesses a 13th century cathedral and a fortified castle. Building stone is quarried in the neighbourhood, brandy is distilled, fishing-nets are manufactured, and fruits of many kinds and wine of excellent quality are produced.

Giotto di Bondone, Italian painter. From a print

Giotto di Bondone. *The Ascension*, one of the famous series of frescoes painted in 1305 in the chapel of the Annunziata dell' Arena, Padua

the latter—a triptych, with the central panel representing Christ Enthroned—in the Sagrestia dei Canonici. The more widely known frescoes of the Life of S. Francis in the Franciscan Church of Assisi were painted shortly after, and in 1303 he was commissioned by Enrico Scrovegno to decorate the chapel of the Annunziata dell' Arena at Padua with frescoes of the History of the Virgin and Son. The mutilated frescoes of S.

After the fascists obtained power, however, they discouraged the use of the word freedom, and the following official words still retaining the first two lines of the original poem, were set to the popular refrain:

Giovinazza, giovinazza,
Primavera di bellezza,
Non si piega e non si spezza
Perchè eterna Iddio la fa
(Youth, youth, springtime of beauty, neither bends nor breaks because God makes it eternal).

They were by Federico Valerio Ratti. Throughout the regime Giovinezza was played compulsorily after the national anthem on all official occasions.

Gippsland. Province of Victoria, Australia. Its area is 16,700 sq. m. Rugged and mountainous, it was formerly heavily timbered with giant eucalyptus trees; large areas have been cleared and settled. Its coastal lake district consists of lagoons and sandy dunes. It is a rich agricultural area, dairying being a principal occupation. Silver, lead, copper, tungsten, molybdenite, platinum, osmiridium, and gold are found, and there are big deposits of bauxite. Coal is mined at Wonthaggi, where the state mine yields about 230,000 tons per annum. The great lignite (brown coal) deposits in N. Gippsland have been developed at Yallourn, where the state electricity commission operates a generating and briquetting plant. The principal towns are Wonthaggi, Sale, Bairnsdale, and Yallourn. It was named after Sir George Gipps (1791-1847), governor of N.S.W., 1838-46.

Giraffe (Arab. *zarāf*). Member of the even-toed ungulate or hoofed mammals, remarkable for the great length of its legs and neck. The body is comparatively short, the fore-quarters standing much higher than the hind ones, and the tawny pelt is handsomely marked with a network of light lines, the pattern varying considerably in local races. The long, narrow head is surmounted by a pair of short horns, or bony cores, covered by the skin. The tongue is remarkably long and is used to grasp the twigs and leaves of trees. Owing to the great length of the fore legs, the giraffe can only reach the ground with its mouth by straddling its legs widely apart. It has seldom been seen to graze.

Giraffes are found only in Central and S. Africa, chiefly in desert regions, where they have to subsist for long periods without drinking. There is probably only one species, divided into several local races or varieties. The animals are wary and timid, but when at bay can deliver formidable kicks with their long legs. Their gait when running is peculiar and clumsy, but they cover the ground at great speed. The flesh is eaten by the natives, and is of excellent quality.

Giraffe Vehicle. Vehicle designed for the invasion of France during the Second Great War. Giraffes could be driven ashore from landing craft on to the beach,

Giraffe. Male specimen of the Central African giraffe
Gambier Bolton, F.Z.S.

the engine being raised over 7 ft. above ground. The chassis was that of a standard four-wheel drive truck with the cab, engine, and gear-box mounted on an upper frame, power being transmitted by a simple chain drive to the transfer box and thence to the road wheels in the normal way.

Giraldus Cambrensis (c. 1150 -c. 1222). Welsh historian. Born in Wales (Cambria) about 1150, he was given the name of Gerald, hence his name Giraldus Cambrensis. His father was William de Barri, and he is sometimes called Gerald de Barri. He studied in Paris, and entered the Church, becoming an archdeacon owing to the influence of his uncle, the bishop of St. Davids. He visited Ireland with Prince John, but most of his time was passed in clerical and political work in Wales. In 1198 he was chosen bishop of St. Davids, but the opposition of the archbishop of Canterbury prevented him from enjoying the dignity, although he tried hard to obtain the Pope's consent. His failure to obtain the bishopric, to which he had been elected once

before, was probably due to his independent spirit. He died probably in 1222. Giraldus wrote several works, two being on Ireland, one the story of its conquest by the English; he also wrote *Itinerarium Cambrense*. All have been published in the *Rolls series*, 8 vols., 1861-69. Consult Gerald the Welshman, H. Owen, new ed. 1904.

Girandole (Lat. *gyrus*, circle). Wall candelabra, or candle branches, attached to a mirror. They were used during the *Directoire*, *Empire*, and *Georgian periods*.

Girardin, ÉMILE DE (1806-81). French journalist and politician. Born at Paris, June 22, 1806, he early devoted himself to journalism for the masses, and in *La Presse*, 1836, inaugurated the cheap popular newspaper in France. To its columns his first wife, Delphine de Girardin (1804-55), contributed a brilliant series of sketches published under the title *Lettres Parisiennes* (1843). She was also the author of several romances and plays. As a politician Émile de Girardin first supported the Conservatives, but later became a Republican. He

also wrote some indifferent plays and a novel, *Émile*, 1827. He died at Paris, April 27, 1881.

Girardot. Town of Colombia, S. America, in the dept. of Cundinamarca. Connected by rly. with Bogota, the capital (102 m.), it is famous for its semi-annual cattle fairs. Coffee and hides are the principal export. Pop. 25,455.

Girasol (Ital. *girasole*, from *girare*, to turn, *sole*, sun). Gem which reflects bright red or yellow light apparently coming from its interior. The most remarkable form is the fire opal, which gives bright hyacinth, yellow, or fire-red reflections; the finest examples have been found at Zimapan, Mexico, and in the Faroe Islands. A sapphire, presenting a radiate flamboyant interior, and known as star sapphire or asteriated sapphire, found in India, has also the property of a girasol. At one time girasols were highly esteemed. They can be imitated artificially with facility. See Opal.

Giraud, HENRI HONORÉ (1879-1949). French soldier. Born in Paris, Jan. 19, 1879 he

Henri H. Giraud,
French soldier

went to St. Cyr military academy and the École Supérieure de Guerre. Captured by the Germans in the First Great War, he escaped and returned to the front. In the Second Great War, Giraud commanded the French 7th army, and was captured by the Germans May 21, 1940, while trying to pull together the broken 9th army, after the German breakthrough at Sedan. He was interned in Königstein prison, but escaped in April, 1942, to Vichy France. The Americans believed Giraud could rally the French forces in N. Africa to the Allies, and the following November he was brought across the Mediterranean by British submarine and appointed c.-in.-c. by Darlan (q.v.). After Darlan's assassination, Dec. 24, Giraud succeeded him as high commissioner of French N. and W. Africa. He failed, however, to win sufficient support from the French. Roosevelt and Churchill arranged meetings between him and de Gaulle (q.v.), which resulted in June, 1943, in the formation of the committee of national liberation under their joint presidency. In Nov., as a result of the committee's decision

to separate political and military authority, Giraud ceased to be joint president, but remained

constructed of riveted or welded steelwork or of reinforced concrete. Cast iron is no longer used

Girders. 1. Steel plate girder. 2. Precast reinforced concrete beam girder. 3. Trussed steel girder. 4. Hogback steel girder. 5. Warren girder (outline). 6. Reinforced concrete bowstring girder

c.-in.-c. until the post was abolished in 1944. He then refused that of inspector-gen. and was placed on the retired list. He was awarded the Médaille Militaire on the eve of his death, March 11, 1949, and was buried in Les Invalides.

Giraudoux, HIPPOLYTE JEAN (1882-1944). French novelist and dramatist. Born at Bellac, Haute Vienne, France, Oct. 29, 1882, he was educated at the École Normale, Paris. He entered the diplomatic service, then wrote novels (e.g. *Suzanne et le Pacifique*) and plays distinguished for satirical wit. Among his best known comedies are *Siegfried et le Limousin*, *Intermezzo*, *Supplément au Voyage de Cook*. His *Amphitryon 38* was translated into English and performed with success in London and New York. In Paris his *Tessa*, an adaptation of Margaret Kennedy's *Constant Nymph*, attracted considerable attention. He was decorated with the Legion of Honour in 1936. He died in Paris, Jan. 31, 1944.

Girder. Built up beam or framework (not a rolled steel beam), constructed to take superimposed loadings and to transmit them to supporting walls, piers, or columns. Girders are usually

constructed of riveted or welded steelwork or of reinforced concrete. Cast iron is no longer used on account of difficulties in casting large units, and wrought iron on account of high cost relative to strength. For spans up to about 40 ft., reinforced concrete beam girders (rectangular or T section) are usually most economical; they can be precast or cast in place. Where a number of similar beams are required, higher strength in relation to weight can be secured by prestressing the reinforcement before the beam is cast. For larger spans, reinforced concrete girders are usually of the bow-string type, in which the upper member is in pure compression. In simply supported steel plate and steel frame girders, the upper flange is in compression and the lower flange is in tension; while shear stresses are resisted by the web plate (stiffened by angles or tees) on plate girders, and by tensile and compressive forces in the diagonal framing in framed girders. In continuous beams the compression and tension forces are reversed over the intermediate supports. Girders are used as the main beams in large steel-framed buildings, as crane or gantry beams in industrial engineering, and as the main members of bridges carrying roads and railways. See Bridge; Concrete; Engineering; Frame; Steel.

Girdle. Belt worn round the waist. Possibly the origin of all clothing, being worn by primitive man to carry weapons, it was later used to draw in loose outer garments, to keep up breeches or petticoats, or to carry weapons or other articles. From these practical uses an article of apparel developed that

Girdle. Example, 1460, from a brass in S. Stephen's Church, Norwich

lent itself to rich decoration by armourer, broiderer, and goldsmith, and led to the formation of the Girdlers' Company (q.v.).

The use of the girdle as an obvious convenience for carrying sword or dagger is very ancient. *Cingulum deponere*, to lay down the belt, was the Roman phrase for leaving military service; and in the days of chivalry his girdle was an elaborate part of the knight's equipment, heavily bossed and fastened with enamelled or jewelled buckles. In the 15th and 16th centuries civilian extravagance brought the girdle within the purview of the sumptuary laws. After the 16th century it gradually disappeared and now survives only in a few distinctively national costumes and makes ephemeral reappearances at the caprice of fashion. See Baldric; Costume.

Girdlers' Company. London city livery company. Originally a fraternity of girdle makers of

Girdlers' Company arms

S. Laurence, it was incorporated in 1448 and united with the Pinners and Wire-drawers in 1568. The hall, 39, Basinghall Street, E.C., burnt with the archives in 1666, was rebuilt in 1681-82, restored and altered in 1878-79, but destroyed in the German air raid Dec. 29, 1940. The address is now 16, St. Andrew Street, E.C.4. Consult Historical Account of the . . . Girdlers, W. D. Smythe, 1905.

Giresun. Town and vilayet of Turkey. The town is on the Black Sea, some 80 m. W. of Trabzon, and exports timber and hides. Lucullus introduced the cherry into Italy from this place when it was the Greek colony of Kerasos. The vilayet has a pop. of 284,147.

Girga. Town, prov., and dist. of Egypt. The town is on the W. bank of the Nile, 313 m. S. of Cairo by rly. The prov. has an area of 576 sq. m. and a pop. of 1,118,402. The Nag' Hammadi barrage, completed 1930, ensures full supplies of water to the prov.

Girgenti. Alternative name for province and city of Sicily, also called Agrigento (q.v.).

Giriama OR GIRYAMA. Tract of country S. of the Sabaki river in the British colony of Kenya. It extends inland for 40 m. behind the coastal fringe, over a length of 55 m., having water communication with Kalifi Bay. It is occupied by the Wagiriama, a Bantu-

speaking agricultural people allied to the Kikuyu and Pokomo. Their graded system of initiation, under tribal elders, is directed by a paramount council called Hyenas. The S. pastureland has been adversely affected by Masai raids. Cereal produce of the central region is now of great economic importance.

Girl Guides. Association for the promotion of good citizenship through individual character training, and to help girls to develop physically, mentally, and spiritually. The girl guide movement, founded by the 1st Lord Baden-Powell and developed by his sister, Agnes Baden-Powell, is international. Starting in Great Britain in 1909, as a counterpart to the Boy Scout movement, it spread to the Dominions and foreign countries, and by 1939 32 countries were members of the world association. Beginning as brownies (7½ to 11 years), girls become guides (11 to 16), and rangers (16 to 21). On enrolment a guide promises to do her duty to God and the king; to help others, and to obey the guide law, which enjoins honour, loyalty, helpfulness, friendliness, courtesy, cheerfulness in difficulties, thrift, and cleanliness of life. The maximum strength of a guide company is 36. Camping, hiking, and woodcraft are included in the training. The Princess Royal is president of the Girl Guides Association, whose imperial headquarters is 17-19, Buckingham Palace Rd., London, S.W.1. Lady Baden-Powell is chief guide. Princess Elizabeth became chief ranger in 1946.

Girls' Friendly Society. Body of girls and women who accept the Christian faith. Founded in 1875, it is a Church organization, established in parishes. Its aim is to unite girls and women in a fellowship of prayer, service, and purity of life. Girls may join as candidates at the age of seven, as prentices at 11, and as members after 12. It has a commendation system by which members are put in touch with the church, as well as the local branch of their society, when they are away from home. It runs a number of hostels, holiday homes, and camps. Associates, or leaders of the society, must be members of the Church of England; members may belong to any Christian denomination. The head office is Townsend House, Greycoat Place, London, S.W.1.

Girls' Life Brigade. Organization to provide girls with character and physical training and recreation. Founded in 1902 by the National Sunday School Union, it numbered over 50,000 by 1945. A first condition of membership is loyalty to church and Sunday school. Bible and missionary study are emphasised. Girls are admitted from the age of six. It organizes camping, swimming, rambling, cycling, and the study of first aid, hygiene, home-nursing, household management, child welfare, arts and crafts, literature, and music. Prospective officers take a short postal training course before receiving commissions. Its headquarters is at 8, Upper Belgrave Street, London, S.W.1.

Girnar. Sacred hill of India, in Kathiawar, Bombay, 10 m. E. of Junagarh town. There are numerous Jain temples on the hill, which is one of the sacred places of the Jains—a bare, black rock of granite. In one place about sixteen temples are grouped together. The hill has five principal peaks, the highest being Gorakhneth, 3,666 ft. above sea level.

Girón OR JIRÓN. Town of Colombia, S. America, in the prov. of Santander. It stands on the river Lebrija, 10 m. S.W. of Bucaramanga, with manufactures of tobacco. There are gold mines in the surrounding districts. The town was founded by Jesuits in 1631. Pop. 6,202.

Girl Guides. Left to right: a ranger, a patrol leader, and a brownie

Gironde. Map of the French department on the Bay of Biscay, showing the estuary of the Dordogne and Garonne rivers

Gironde, LA. River estuary of France. It is formed by the union of the Garonne and the Dordogne, and is about 50 m. from there to its mouth in the Bay of Biscay. Its width varies from 2 m. to 6 m., and in spite of certain obstructions, large vessels can pass up it to Bordeaux. At its mouth is the Tower of Cordouan, a lighthouse standing on an island.

After the Allied landing in S. France on Aug. 15, 1944, the Germans retreated from the S.W. before the F.F.I. as their forces in the Rhône valley were pushed N. by the U.S. 7th army. The F.F.I. liberated Bordeaux on Aug. 31, but, in pursuance of their policy of preventing Allied use of French ports, the strong German garrison retreated to the mouth of the Gironde estuary, where they were contained by the F.F.I. until in April, 1945, troops of the French 1st army under General de Laminat were sent to attack them. More than 1,000 U.S. aircraft carried out a preliminary bombardment on troop concentrations and fortifications, and on April 15 a French naval force with Canadian and British support bombarded the coastal batteries on both sides of the estuary, while U.S. aircraft made another bombing attack, using liquid fire bombs for the first time in Europe. Later the same day French infantry and armour broke into the German lines on both banks of the river.

about the Gironde estuary, fronting the Bay of Biscay on the W., and this western section forms part of the district called the Landes, being a low and sandy plain containing several lakes and the bay or basin of Arcachon. The eastern part of the dept. is undulating and the soil very fertile. Cereals are grown, but the chief industry is the cultivation of the vine, and there are vineyards almost everywhere. From here come the varieties of wine known, from the districts in which they are grown, as Graves, Médoc, Sauterne, and others. The climate and soil are also favourable for fruit-growing generally, while many cattle are reared. Bordeaux is the capital of the department, which is divided into six arrondissements. Other towns are

Next day they captured Royan, which was found completely destroyed. All German resistance N. of the estuary ended on April 18. In the southern sector, the main German defence line was pierced on April 19; Pointe de Grave fell on the 21st, and the enemy was eliminated from the area on May 1 with the capture of the I. of Oléron just to the N. of the estuary. See Europe, Western: Its Liberation.

Gironde. Largest department of France. With an area of 4,140 sq. m., it lies

Blaye, Arcachon, Libourne, Pauillac, and St. Macaire. Pop. 858,381.

Girondins OR GIRONDISTS. Name given to one of the political parties of the French Revolution. It was given because several of its early members had represented the dept. of Gironde in the legislative assembly. Brissot (*q.v.*) was their leader; hence they were sometimes called Brissotins. Others were Condorcet, Barbaroux, and Vergniaud, while Madame Roland was a great influence in the party.

The Girondins originated in a schism in the Jacobin Club, first appearing in 1791. They were then the more moderate section of the Republican party, and in March, 1792, being the largest group in the assembly, Louis entrusted them with the control of affairs, and they declared war on Austria. Although both parties were in favour of destroying the monarchy, the struggle between the Girondins and the other Jacobins called the Mountain came to a head in the National Convention, in which the former were about 180 strong. Robespierre, Marat, and Danton were attacked by the Girondin orators, who, however, lost their support in the country, and fell from power by a *coup d'état* in June, 1793. Twenty-two of them were arrested, while others fled to the country and stirred up rebellion. After a trial, a travesty of justice, 21 of them were executed, Oct. 31, 1793, and others later. After the fall of Robespierre a few of them returned to the Convention. See French Revolution.

Girtin, THOMAS (1775-1802). English water-colour painter. Born in Southwark, Feb. 18, 1775, he received lessons from Edward Dayes (1763-1804), and frequently accompanied J. M. W. Turner to sketch on the Thames side. He was the founder of the modern school of painters in water colours.

He died of consumption, in the Strand, London, Nov. 9, 1802.

Turner said, "Had Tom Girtin lived I should have starved," and Ruskin allows that Turner "owed more to his teaching and companionship than to his own genius in the first years of his life." Girtin's broad, simple manner, his

Thomas Girtin. Kirkstall Abbey, Yorks: one of this great water-colour painter's finest works, now in the Victoria and Albert Museum, S. Kensington

After J. O'Neil

pure, deep, harmonious colouring, his handling of masses, his mastery of aerial effects, and his sense of tone and feeling entitle him to a foremost place in the English school. Most of his best works—such as the White House, Chelsea, and Battersea Reach—are in private hands, but he is adequately represented at the British Museum. *Consult Life, L. Binyon, 1900.*

Girton College. College for the higher education of women, since 1948 part of the university of Cambridge. Founded in a house at Hitchin, Oct. 16, 1869, removed to Cambridge, Oct., 1873; obtained a royal charter, 1924; and a coat of arms, 1928. The founders included Miss Emily Davies and Mme. Bodichon. The college buildings, providing accommodation for resident fellows and students, are situated in the parish of Girton, on

Girton College arms

Girton College. Main entrance to the building which was begun in 1873 to the designs of Alfred Waterhouse, R.A.

the outskirts of Cambridge, and the college derives its name from Girton village. Titles of degrees having been conferred by the university on students at Girton from 1921, they became eligible for full university degrees from 1948. *Consult As I Remember, 1896-1916, E. E. C. Jones, 1922.*

Girvan. Police burgh and seaside resort of Ayrshire, Scotland. At the mouth of the Girvan in Ayrshire, it is 63 m. S.W. of Glasgow and 21 m. S.W. of Ayr, and has a railway station. The chief industry is fishing. The town has a harbour. It is visited in the holiday season, and there are a golf course, tennis courts, and other attractions. The river after which it is named has a course of 35 m., and flows through the vale of Girvan from its starting point in a loch called Girvan Eye. Pop. 5,292.

Gisborne. Port of North Island, New Zealand, in Cook co. It stands on Poverty Bay, and has daily steamer communication with Napier. A fine town, the centre of a rich pastoral and agricultural district, it has freezing works, and exports wool and mutton. Here Captain Cook first landed in New Zealand in 1769. Pop. 16,984.

Gish. Name of two American actresses, the sisters Lillian (born Oct. 14, 1896, at Springfield, Ohio) and Dorothy (born March 11, 1898, at Massillon, Ohio). They both appeared in child parts on the stage, and were introduced to films in 1912 by Mary Pickford. They appeared with the Biograph Company in many of D. W. Griffith's pioneer films, acting together in *The Unseen Enemy*, *Hearts of the World*, *The Orphans of the Storm* (their best-known picture), and in *Romola*. Lillian also acted in Griffith's *The Birth of a Nation*, *Intolerance*, *Broken Blossoms*, *Way Down East*, and *The White*

Sister; and Dorothy in *Tiptoes*, *London*, *Nell Gwynn*, and *Mme. Pompadour*. With the coming of talking films, both sisters returned to the stage.

Gissing, GEORGE ROBERT (1857-1903). British novelist. He was born at Wakefield, Nov. 22, 1857, and educated at Owen's College, Manchester. After spending some months in America he returned to Europe in 1877, and in 1878 published a Werther-like romance called *Workers in the Dawn*, the result of some months of study at Jena. In 1882 he became tutor to Frederic Harrison's sons, and subsequently brought out three novels, *The Unclassed*, 1884; *Demos*, 1886; and *Thyrza*, 1887; all concerned with the suffering of sensitive souls in sordid environment.

More able, but equally joyless, novels were *The Nether World*, *New Grub Street*, *Born in Exile*, and *The Odd Women*. A scholar of

Girvan, Ayrshire. The town and parish church from the harbour

George Robert Gissing

Gisborne. A general view of this port of North Island, New Zealand

parts and a man of sound critical judgement. Gissing's charming personal qualities and tastes are revealed in his monograph on Charles Dickens, 1898; in *By the Ionian Sea*, 1901; in *The Private Papers of Henry Ryecroft*, 1903, a semi-autobiographical volume; and the posthumous *Veranilda*, 1904. He died at St. Jean de Luz, Dec. 28, 1903. His *Letters*, edited by his son, were published in 1931. *Consult* George Gissing: *A Critical Study*, F. A. Swinnerton, 1912.

Giurgevo or **GRURGIV**. Town and river port of Rumania, in Wallachia. It stands on the Danube, facing Rustchuk, 38 m. S.S.W. of Bukarest, of which it is the port. Exports normally include timber, grain, petroleum, and salt. Formerly fortified, it was founded by Genoese colonists in early medieval times. It has figured prominently during the wars of the Russians and Turks. Pop. 30,348.

Giusti, **GRUSEPPA** (1809-50). Italian poet. Born at Monsummano, near Florence, May 12, 1809, he early won recognition for his brilliant work in political satire, which previously had been little cultivated in Italian literature. Owing to their revolutionary sentiments his poems were not printed until after 1848, but they were freely circulated in manuscript. He displayed his power as lyric satirist successively in *La Ghigliottina a Vapore*, 1833; *Il Dies Irae*, 1835 (on the death of the emperor Francis II); *Lo Stivale*, 1836; *Il Brindisi di Girella*, 1840; *Il Papato del Prete* (Pero), 1845; *Il Gingilino*, 1845 (describing the corruption of Florentine society); and *Una Messa in Sant' Ambrogio*, 1847.

The use he made of idiomatic Tuscan heightens the effect of his work to his countrymen, but renders it more difficult to foreign readers. In 1848 Giusti became a member of the Tuscan chamber of deputies, and died at Florence two years later, May 31, 1850. Several of his poems are rendered into English in *Modern Italian Poets*, W. D. Howells, 1887.

Givenchy. Village of France, in the dept. of Pas-de-Calais. Sometimes known as Givenchy-lez-la-Bassée, it is 2 m. W. of La Bassée and 1 m. S.E. of Festubert. It was the scene of a considerable battle, Dec. 16-22, 1914, during the First Great War. To assist the French, then heavily engaged at Arras, the Allied forces—Indian under Lieut.-Gen. Sir James Willcocks and French under Gen. Foch—near Givenchy were ordered to create a diversion. They attacked, without

success, and a German breakthrough seemed imminent when fresh troops under Haig were moved up, recovered part of Givenchy which had been lost, and restored the position at Festubert. There was more fierce fighting here in 1915; and in April, 1918, the Germans made some determined but unsuccessful attempts to capture Givenchy during their abortive drive to the Channel ports.

Givet. Town of France, in the dept. of Ardennes. It stands on both sides of the Meuse, close to the Belgian frontier. It has a number of small industries, including tan-

Givet, France. Looking down upon the Meuse from the ramparts of the old citadel

ning, and is a river port; but its interest is mainly historical, as it was once a famous fortress. Of its fortifications the only remaining building is the citadel, the others having been pulled down in 1892. This stands on a rock, and as it was founded by the emperor Charles V, is known as Charlemont. There are a town hall, several churches, and a stone bridge across the river. Givet was in the Spanish Netherlands until it became French about 1680. Pop. 6,000.

Givors. Town of France, in the dept. of Rhône. It lies about 14 m. S. of Lyons, with a station on the Paris-Lyons-Mediterranean line, on the right bank of the Rhône at the confluence with the river Gier. The town's chief industries are metal working and glass-bottle manufactures, and there is considerable trade in silk and coal. Pop. 13,205.

Gizeh, **GHIZEH** or **GIZA**. Prov. of Lower Egypt. It contains the districts of Ayat, Es Saff, Embaba, and Gizeh. Area, 409 sq. m. Pop. 685,331.

Gizeh, **GHIZEH**, or **GIZA**. Town of Egypt. It stands on the left bank of the Nile, opposite the island of Roda, just above Cairo. Here is the palace of Gizeh, erected

by the khedive Ismail. In the neighbourhood are the Pyramids. Pop. 37,779. See *Egyptian Art*, colour plate.

Gizzard (Lat. *gigéria*, poultry entrails). Term used in comparative anatomy for that portion of the alimentary canal which is specially designed for grinding food. Hence it is usually found in such animals as swallow food whole without mastication. The domestic fowl swallows particles of gravel to help the action of the muscular walls of its gizzard. Many crustaceans and insects possess gizzards.

Glace Bay. Town of Cape Breton Island, Nova Scotia, and Canada's most easterly port. A station on the Sydney and Louisburg rly., it is 10 m. from Sydney, with which it is also connected by electric rly. Centre of the richest coal mining area of the dominion, it lies in a good farming district and has deep-sea fisheries. It has a wireless station. Pop. 25,147.

Glacial Acetic Acid. Clear, colourless liquid or crystals, with a pungent odour, containing 99 p.c. of acetic acid (*q.v.*). Aromatic acetic acid or aromatic vinegar contains about 74 p.c. of glacial acetic acid, together with odorants, and is used as a restorative and stimulant in cases of fainting. The pure acid is sometimes applied to corns and warts.

Glacial Period. Name given to one of the great stages of development in the earth's history. It is the earlier of the two subdivisions of quaternary time, when the N. hemisphere was extensively covered by glaciers. See *Ice Age*.

Glacier (Fr.). Moving mass of ice. The edge of the permanent snow, the snow-line, varies in elevation from sea level in Antarctica to 2,500 ft. in Alaska, 8,500 ft. on the Alps, and 16,000 ft. on the S. side of the Himalayas.

As the snow above the permanent snow-line accumulates, the underlying portions, adjacent to the rock, slowly change into ice; when the mass of ice and snow is sufficiently thick it begins to move down the slopes. When the moving mass follows a definite path down a mountain valley, it is a glacier.

The physical changes which occur when ice moves under pressure have not been precisely determined. Owing to irregularities in the rock contour, deep cracks or crevasses occur in the upper glacier layers; they are sometimes hidden by a thin snow bridge, and are a source of ever-present danger to mountaineers. In its passage downwards, a glacier accumulates large quantities of rocks. Some of these sink into the mass of ice; others are moved to the margins of the glacier because the middle moves more rapidly than the sides. The débris of the edge is known as lateral moraines.

The snout of a glacier occurs where the temperature melts the ice as fast as it is brought down; in many cases the snout advances or retreats during different periods. From the snout a turbid, milky-looking torrent rushes down the valley, and when the snout retreats it leaves rock débris, which forms a terminal moraine.

Four Types of Glacier

Glaciers have been classified into four types: (1) valley glaciers; (2) piedmont glaciers; (3) ice caps; (4) continental glaciers. Valley glaciers occur in the Alps, where, e.g., the Aletsch is 10 m. long and 1 m. wide; in the Caucasus, Andes, Himalayas, and among the coast mts. of Alaska, where the Muir glacier is 35 m. long and from 6 to 10 m. wide. Alpine glaciers terminate on land, but the Alaskan glaciers reach the sea, and portions break off and float away as icebergs. The rate of movement of some valley glaciers has been measured; the Mer de Glace in France moved during the warm season from 1 ft. to 1½ ft. a day along the margin, and about 2 ft. daily in the middle; the Muir glacier moved 7 ft. daily in the middle. The rate varies with the season, and from year to year.

Piedmont glaciers occur when a valley glacier pushes out on to a nearly level area at the base of the mountains. The Malaspina piedmont glacier, fed by numerous valley glaciers, is 70 m. by 25 m.

Ice caps occur in Iceland; the largest is at Vatna Jökull. In this case the ice moves very little, owing to the level character of the rock contours. Extensive ice caps are called continental glaciers, or ice sheets. Greenland and Antarctica are both covered with ice formations of this type. The great depth of the ice sheet causes outward movement, and in Antarctica the great ice barrier, an ice cliff margin to the Ross Sea, is 500

Glacier. The upper névé from which the Grindelwald, Switzerland, glacier is fed, and an ice fall due to the glacier being broken up as it pours down the slopes. In the background is the Schreckhorn.

m. in length, and rises sheer from the water to heights from 30 ft. to nearly 300 ft. The Greenland continental glacier is steadily pushing seawards, the tongues of ice project into the water, in some cases with a front 60 m. in width. These tongues move 5 to 75 ft. per day, and are constantly losing great blocks, which feed the never-ending stream of bergs in the N. Atlantic.

The various signs left by retreating glaciers—terminal moraines, layers of glacier silt (till or boulder clay), isolated rock fragments, rounded rocks (*roches moutonnées*), striations upon rock faces, etc.—are so common in Britain N. of the Thames, and in Europe N. of Bohemia, that it is concluded that most of Europe has been covered at least once by a continental glacier of Antarctic magnitude. See Finsteraarhorn; Geology; Ice Age; consult also *Glaciers of the Alps*, J. Tyndall, 1896; *Characteristics of Existing Glaciers*, W. H. Hobbs, 1911; *Natural History of Ice and Snow*, A. E. H. Tutton, 1927; *Climatic Accidents in Landscape Making*, C. A. Cotton, 1942.

Glacis (Fr. *glace*, ice). Artificial slope in front of a fortification. In permanent fortresses the glacis were frequently built at a considerable gradient, so that the attackers had to proceed up them slowly under the defenders' fire. The glacis was introduced into fortifications in the 16th century owing to the increasing power of artillery. It is mentioned in *The British Grenadiers*, the words of which date from about 1690.

Gladbach. Name of two German towns. The more important, formerly München-Gladbach, was

united with Rheydt and Odenkirchen in 1933 as Gladbach-Rheydt. It is 15 m. W. of Düsseldorf. Developed around a Benedictine abbey whose church was built in 972, and stood until the Second Great War, Gladbach became in the 18th–19th centuries a centre of the German textile industry, with about 400 separate plants. There were also iron, metal, machinery, electrical, and printing works, and clothing manufactures. Gladbach was the seat of Germany's main R.C. charity and educational organizations, and had a baroque town hall (1663), museum, theatre, and concert hall, but suffered heavy damage in the Second Great War, before which its pop. was 127,115.

Bergisch-Gladbach, 8 m. N.E. of Cologne, is a health resort, with sanatoria, schools, and special industries concerned with paper, ceramics, gypsum, iron, machinery, bicycles, wire netting, leather goods. Pop. 20,121.

Gladiator (Lat. *gladius*, sword).

Term applied among the ancient Romans to a professional fighter who fought with others or with wild beasts. Such combats, a common feature of funeral ceremonies among the Etruscans, were doubtless a reminiscence of human sacrifice. The custom was introduced into Rome in 264 B.C., and gladiatorial combats in amphitheatres became a recognized amusement, attaining the zenith of popularity under the Empire. Gladiators were recruited from prisoners of war, criminals, and volunteers, the latter chiefly young men in financial difficulties. Schools existed for training them, and the wealthy man of fashion took the same pride in maintaining

a school that his modern counterpart takes in a racing stable.

There were several different classes of gladiators, such as the *bestiarius*, who fought with wild beasts, and the *retiarius*, who was armed with a trident and a net (*retē*) in the meshes of which he endeavoured to entangle his opponent. Other gladiators were the *mirrillo*, whose helmet was adorned with the figure of a fish, and was usually opposed by the *Thraex*, wearing a Thracian equipment, a round shield and a short

Gladiolus. Flowers and leaves of the garden variety

sword; the *andabata*, who fought on horseback and wore a helmet which entirely covered the face; the *laquearius*, who carried a lasso to catch his adversary. A gladiatorial display in the amphitheatre began with a procession of gladiators. As the procession passed the Emperor's seat, the gladiators cried *Ave Caesar, morituri te salutant* (Hail, Caesar, those about to die salute thee). When one combatant was overcome but not killed by another, the spectators, by turning their thumbs up (or against the breast) or down, determined the fate of the beaten gladiator. The exact significance of the action is disputed. Lytton's *Last Days of Pompeii* and Henryk Sienkiewicz's *Quo Vadis?* contain striking descriptions of gladiatorial combats. See *Amphitheatre*.

Gladiator. Type of fighter aircraft produced by the Gloster Aircraft Co., Ltd. (Hawker Siddeley group). Last of the biplanes, the Gladiator was armed with four machine-guns, and, powered by a 850 h.p. Bristol Mercury engine, had a maximum speed of 250

m.p.h. and exceptional manoeuvrability. The wing span was only 32 ft. 3 ins.

The Gladiator twice made history against overwhelming odds. In the short-lived but desperate defence of Norway in April, 1940, a squadron was flown off the carrier *Furious* and established a base on a frozen lake near Aandalsnes. (See *North-West Europe, Campaign in*.) When Italy attacked Malta in June, the only available fighters were three Sea Gladiators, still crated. These were made serviceable, and as *Faith*, *Hope*, and *Charity* staved off air attacks until the arrival of Hurricanes.

Gladiolus (Lat., little sword). Beautiful flowering bulbs of the family Iridaceae. Most are natives of S. Africa, though some Turkish species were introduced in 1596. They flower from June to Oct., bearing a number of blossoms on stiff, almost upright, spikes. The corms should be planted in spring-time, about 4 ins. deep in ordinary rich soil, with a dash of silver sand at the base of each bulb.

It is advisable to dig them up after flowering, in late autumn, and keep them in a cool, dry place until the following spring. For show purposes they may be forced by potting up in Nov., in a temperature averaging 60°. They are propagated from seeds sown in pans in Feb., or by bulblets separated from the parent corm and planted out of doors in early spring.

Gladkov, FEDOR VASILIEVICH (b. 1893). Russian novelist. A schoolteacher in Siberia, 1902-05, he was exiled to Lena on account of his Communist activities, 1906-10. From 1911 he taught at Novorossiisk and in the Kuban, and after the Revolution of 1917 took an active part in the civil war. As a leading novelist, he became a member of the union of Soviet writers, and was awarded the Orders of Lenin and of the Red Banner in 1943. His novels include *Exile*, 1908; *Old Secret*, 1923; *Towards the Light*; *Cement Power*.

Gladstone. Town of Queensland, Australia. It stands on the fine natural harbour of Port Curtis, 354 m. N.N.W. of Brisbane. It is the outlet of a number of mining areas producing gold, silver, and manganese, and is in a rich pastoral district. Pop. 5,200.

Gladstone, HERBERT JOHN GLADSTONE, VISCOUNT (1854-1930). British politician. Born Jan. 7, 1854, youngest son of W. E. Gladstone, he was educated at Eton and University College, Oxford. Having been a history

lecturer at Keble College, in 1880 he was returned to parliament for West Leeds, and became private secretary to the premier. From 1881 he was a lord of the treasury, and in 1886 financial secretary to the War office.

During 1892-94 he was under-secretary for home affairs, and in 1894-95 first commissioner of works. In 1899, during the Liberal split, Gladstone undertook the thankless office of chief whip, and was rewarded in 1905 by being made home secretary. In 1909 he was chosen governor-general of S. Africa, and made a viscount. He remained there until the outbreak of the First Great War, during which he was an active worker on behalf of the Belgian refugees.

A defence of his father's policy, *After Thirty Years*, was written in 1928. Following certain defamatory statements about his father made in a book, Gladstone then figured as defendant in a memorable libel action forced by him upon the author. The finding in Gladstone's favour demonstrated for the first time that the dead could not be vilified with impunity. He died childless, March 6, 1930.

Gladstone, WILLIAM EWART (1809-98). British statesman. Born at 62, Rodney St., Liverpool, Dec. 29, 1809, he was the youngest son of Sir John Gladstone, Bart., M.P. (1764-1851). The family was a Lanarkshire one, but Sir John had made a fortune in Liverpool. William spent his early years mainly at Seaforth, and in 1821 went to Eton, where he remained until 1827. In 1828 he entered Christ Church, Oxford. He gained a double first class degree.

He first turned his attention to the Church. But his father had resolved to make him a politician, and a Tory seat was easily found for him at Newark. In Jan., 1833, he took his seat in the first reformed parliament. In 1834 he was appointed by Peel a junior lord of the treasury, and in 1835 under-secretary for the Colonies, but in a few weeks his party was out of office.

In 1841, when the Tories returned to power, Gladstone was made vice-president of the board of trade. He became acting president in 1843, entering a cabinet for the first time. In 1845 he left

W. Gladstone
Russell

office because he disliked the additional public grant to the R.C. college at Maynooth, but at the end of the year he returned to become secretary for war and the colonies. In July, 1846, the ministry resigned. In 1847 Gladstone was returned for the university of Oxford; but his political position was not very clear, as he was not completely committed to the Peelites, but had broken with the Toryism of his youth. In 1851 he wrote from Italy his letters denouncing the Bourbon king of Naples.

At the Exchequer

On Dec. 2, 1852, Gladstone joined the ministry of Lord Aberdeen as chancellor of the exchequer. Changes in the direction of simplicity proposed in his first budget marked him out as a great financier. Then came the Crimean War, the resignation of Aberdeen, and in Feb., 1855, that of Gladstone. While in opposition he acted as high commissioner for the Ionian Islands. In 1859 the Conservative ministry was defeated. Gladstone returned to the exchequer for seven years. He abolished the paper duty, and reduced income tax to fourpence in the £.

In 1865 he succeeded Palmerston as leader of the house of commons, Russell becoming prime minister, and he was in charge of the rejected reform bill of 1866. The Russell ministry then resigned, and in 1867 Gladstone led the Liberals. About the same time Disraeli succeeded Derby, and the two great rivals became the chief figures on the political stage. The general election of 1868 was fought largely on the issue, pushed to the front by Gladstone, of the disestablishment of the Irish Church. The Liberals were returned to power, Gladstone becoming prime minister for six years. This was a notable reforming administration, but its leader's relations with the Queen lacked cordiality.

Hawarden Castle, Flintshire, for 60 years the residence of W. E. Gladstone

Defeated in 1874, Gladstone decided to retire from political life, and was succeeded as Liberal leader by Lord Hartington, but he kept his seat in the house of commons, and events, or his own undoubted love of power, soon called him again to the front. The Turkish possessions in the Balkans became the scene of savage fighting, and with the fervour of a crusader Gladstone carried on a campaign against Turkish misrule and cruelty. He did not actually resume the party leadership, but when the general election of 1880 came he was the protagonist of the opposition to the Conservative policy, and his speeches in the

From a photograph by London Stereoscopic Co., taken in 1888

famous Midlothian campaign were mainly responsible for the Liberal victory. He then became M.P. for Midlothian, retaining that seat until his final retirement in 1895.

Gladstone, now at the height of his influence, took office a second time, being chancellor of the exchequer as well as first lord of the treasury until 1882. There were difficulties in Ireland and in Egypt, which were not helped by the constant dissensions in the cabinet.

The Phoenix Park murders, and the death of Gordon, weakened the position of the ministry, but it held on until 1885. Then came a general election, at which neither party gained a clear majority, and Gladstone's sudden declaration in favour of home rule for Ireland.

In Feb., 1886, the Conservative ministry was beaten and Gladstone took office for the

third time as premier, but the defection of some of his party led to the defeat of his Home Rule bill and to another election, in which he was defeated. The election of 1892 returned him to power by a small majority. The house of lords rejected Gladstone's second Home Rule bill, but it was the size of the navy estimates that led to his resignation in March, 1894. He retained his seat until 1895. He appeared in public in Sept., 1896, to denounce the Armenian massacres. He died at Hawarden, May 19, 1898, and was buried in Westminster Abbey.

In 1839 Gladstone married Catherine, sister and heiress of Sir Stephen Glynne, 9th baronet. Through this marriage the castle and estates of Hawarden passed into the Gladstone family.

After a life spent either in strenuous labour or in recreations scarcely less laborious, including the felling of trees, Gladstone could walk to the summit of Snowdon when he had turned eighty; and, when blindness and deafness had disabled him, the stethoscope found nothing amiss in heart or lungs.

An Estimate

By common consent Gladstone, popularly spoken of in his own lifetime as the G.O.M., or Grand Old Man, ranks as one of the great orators of the 19th century, and perhaps its greatest parliamentarian. A clear and beautiful voice, a generous flow of language, and above all a burning belief in the cause he was at the moment advocating, account for his power to sway the multitude. He was also great as a finance minister, where his lucidity of expression, grasp of detail, and capacity for work found full play. As premier he was hardly so successful. His vehement nature was not fitted for calm and calculated action, and his imperiousness made it difficult for others to work with him.

Gladwyn (*Iris foetidissima*), FOETID IRIS, or ROAST-BEEF PLANT. Perennial herb of the family Iridaceae. It is a native of W. Europe. The rootstock is thick and creeping, the leaves 2 ft. long, sword-shaped, erect, and dark green, the flowers dull blue-purple,

Gladwyn or Gladden. Fruit and inset, flower of *Iris foetidissima*

with darker veins, about 3 ins. across. The club-shaped capsule splits into three spreading sections, late in autumn, disclosing the bright orange, round seeds, which make the plant more conspicuous than when in flower.

Glaisher, JAMES (1809-1903). British meteorologist. Born in London, April 7, 1809, he was employed on the Irish ordnance survey, and in 1833 received an appointment at Cambridge observatory. For over 30 years from 1836 he was head of the meteorological department at Greenwich. He founded the (Royal) Meteorological

James Glaisher,
British aeronaut
Elliott & Fry

Society in 1850, and 16 years later helped to found the (Royal) Aeronautical Society. In a balloon ascent, Sept. 5, 1862, Glaisher and H. T. Coxwell reached a height of 28,000 ft. Glaisher wrote *Meteorology of England*, 1860; *Travels in the Air*, 1870; *Crystals of Snow*, 1872. Elected F.R.S., he died Feb. 7, 1903.

Glamis. Village and parish of Angus co., Scotland. It stands on Glamis Burn, 6 m. W.S.W. of Fortar, and has a railway station. In the village there is a sculptured stone, said to be a memorial of Malcolm II. Near the village is Glamis Castle, a seat of the earl of Strathmore. The present building, dating mainly from the 17th century, is in the Scottish baronial style, with parts of a much older building. Glamis is steeped in history and legend. Here Macbeth is said to have lived and Malcolm II to have been slain.

Queen Elizabeth, consort of King George VI, and their younger daughter Margaret were born at the castle. Pop. 985. *Pron.* Glahms.

Glamorganshire. County of S. Wales. It lies along the Bristol Channel, its other boundaries being the counties of Carmarthen, Brecknock, and Monmouth. Owing to the development of the rich coalfields, it has become one of the great industrial centres of the country and contains more than half the pop. of Wales. The chief mining area is in the valleys that run down to the sea around Cardiff, while there is another industrial area around Swansea. Between Rhymney and Neath is the agricultural region known as the vale of Glamorgan. The Gower peninsula in the W. is in some respects

vale of Neath, with its series of waterfalls. Cardiff, Swansea, and Merthyr Tydfil are the largest towns. Coalmining has developed enormously since about 1850; older industries are the tinplating and smelting which made Swansea and Merthyr Tydfil.

Agriculture is carried on especially in the vale of Glamorgan, where the soil is rich. The county, known to the Welsh as Morganwg, was conquered by the Normans in the 11th and 12th centuries, and several castles were built here as defences against the Welsh from the N. Monasteries were founded at Neath, Margam,

Glamorganshire
arms

Glamorgan. Map of the county in which are situated the principal coalfields of South Wales

quite apart from the rest of the co.; on it are Worms Head and the Mumbles Head. Swansea Bay and Burry Inlet are the chief openings.

The chief rivers are the Taff, Tawe, Neath, Cynon, Ogwr, Rhonda, Rhymney, all short and flowing S. In the N. of the co. are mts., a continuation of those in Brecknockshire, the highest point being nearly 2,000 ft. high. There is some beautiful scenery, especially in the

and elsewhere, and Glamorganshire, smaller than it is today—for Gower was outside it—was a co. palatine. Cowbridge, Kenfig, Llantrisant, Neath, and Aberavon became chartered towns. The earls of Gloucester and then other baronial families were lords of Glamorgan, and in the time of Edward VI the title was given to William Herbert, who afterwards became earl of Pembroke.

Ruined castles include Caerphilly, Oystermouth, Llanblethian, Penarth, and Swansea. Cardiff, St. Donats, Dunraven, and Penrice have been restored, and are now inhabited. Ewenny has a fine church and ruins of an abbey. The co. is in the dioceses of Llandaff and of Swansea and Brecon. Seven members of parliament are elected, not counting

Glamis Castle. Angus seat of the earl of Strathmore, and birthplace of Queen Elizabeth, consort of George VI, and Princess Margaret

nine of the boroughs. Area, 813 sq. m. Pop. 1,225,717.

Gland (Lat. *glans*, acorn). Term describing (1) masses of tissue connected with the lymphatic system, such as are found in the neck, which prevent the spread of infection; (2) organs of the body which pour out by means of a duct (e.g. the pancreas), or directly into the blood stream, substances necessary for maintaining bodily health. (See Endocrinology.)

Ductless glands pour their secretion direct into the blood stream without using any conduit. Among them are the pituitary, thyroid, adrenals, testes, and ovaries. Some important glands have a dual performance: thus, the liver secretes bile, but makes other glandular contributions to the organism with no definite conduction; the pancreas, while pouring out a digestive juice through a duct, contributes to the blood stream a secretion from its substance insulin, which travels by no discernible route, but enables the muscles to burn and use glucose. Much research has been done on the interaction of the ductless glands.

Glanders. Infectious disease occurring principally in the horse and occasionally transmitted to man. Affecting the nose in the form of nodules, it is known as glanders; invading the subcutaneous tissues, it is known as farcy. The organism is the glanders bacillus, which gains entry through any abrasion of the skin, or of the nasal mucous membrane. The disease is characterised by profuse discharge from the nose, fever, general constitutional disturbance, and nodules, vague in distribution, under the skin.

The disease is often difficult to diagnose. The answer lies essentially with bacteriology. Any localised condition demands drastic treatment by knife and drug, while the general condition demands treatment for any generalised septicaemia.

Glanvill, RANULF DE (d. 1190). English lawyer. Born at Stratford, Suffolk, he entered the service of Henry II. In 1163 he was sheriff of Yorkshire, and he was afterwards sheriff of Lancashire. In 1176 he was made a judge and from 1180 to 1189 was chief justiciar of England. Richard I deprived him of his office and put him in prison, but he is said to have been on crusade at Acre when he died. Glanvill is known by his Treatise concerning the laws and customs of the English kingdom; this is a unique and invaluable account of

the subject, first published in 1554. He was also Henry's chief helper in the judicial reforms carried out in this reign.

Glärnisch. Mt. range of Switzerland. In the canton of Glarus, it trends S.W. from the town of Glarus, and has several imposing peaks. The Vorder-Glärnisch, 7,848 ft. in height, is difficult and laborious of ascent. Other peaks are the Ruchen-Glärnisch (9,557 ft.) and the Bächistock (9,582 ft.).

Glarus. Canton of E. Switzerland. It is bounded on the N. and E. by the Wallen See and St. Gall, S. by Grisons, W. by Uri and Schwyz. Area, 264 sq. m. It slopes N. from Mt. Tödi, on which is the source of the Linth. There are several lakes, mineral springs, and fine waterfalls, besides the bold rocky group of the Glärnisch.

An Alpine canton, it has a climate somewhat severe, and only about one-fifth of the surface is arable. The inhabitants are mostly German-speaking, and mainly Protestants, while the chief industries are connected with textiles, cattle raising, and slate quarrying. A speciality is the curious green cheese known as Schabzieger.

Glarus is the chief town. The canton joined the Swiss Confederation in 1352. Pop. 34,771.

Glarus (Romansch, *Claruna*; Fr. *Glaris*). Town of Switzerland, capital of the canton of Glarus. It stands on the river Linth, overlooked by the imposing Vorder-Glärnisch, 43 m. by rly. S.E. of Zürich. A serious conflagration in 1861 destroyed nearly all the town, which was founded at the end of the 5th century by S. Fridolin, an Irish monk, and was settled by Germanic tribes. Zwingli (q.v.) was parish priest here for 10 years. The chief occupation is the manufacture of textiles. Pop. 5,269.

Glas, JOHN (1695-1773). Scottish divine. He was born at Auchtermuchty, Sept. 21, 1695, and became minister of Tealing, near Dundee, in 1719. Here he founded a sect which became known as the Glassites (q.v.). For this he was deposed in 1730, but this decree was revoked in 1739 and Glas preached in Dundee until his death, Nov. 2, 1773, though not holding office. His son-in-law, Robert Sandeman (q.v.), carried his ideas further, giving his name to the sect of the Sandemanians.

GLASGOW: SCOTLAND'S LARGEST CITY

Sir Patrick Dollan, Lord Provost of Glasgow, 1938-41

A noted citizen and lover of the city of Glasgow here tells the story of its rise and explains its importance, not alone to Scotland but to Great Britain and the world. See also Clyde: Clydebank

Glasgow is world-renowned. The then bishop of Glasgow obtained the burgh charter from James II, in 1175; but the rise of the city to eminence has been rapid, and has happened since the Act of Union, 1707. At that time the pop. was only 12,000.

Glasgow arms

It was 202,426 by 1831, when only 33 of the citizens had the right to vote. The Reform Act of 1832, making Glasgow a parl. and mun. burgh, accelerated the progress of the capital of Clydeside. In 1947 the city had some 1,075,700 inhabitants; Greater Glasgow had 2,000,000, or two-fifths of the pop. of Scotland. Few cities have increased in size so quickly. It has three important main line railway stations, Central, St. Enoch, and Queen Street, and is the natural centre for rail, road, and steamship communications with the W. Highlands and Islands. Before the Second Great War there were direct steamer services to the

U.S.A., Canada, India, and New Zealand. The city's municipal transport system which comprises electric tramcar and motor bus services, and the 6½ m. subway rly., carried over 14 million passengers more than a million miles weekly in 1945, and is claimed to be the best and cheapest in the world. Apart from London, Glasgow is the only city in the U.K. with an electric underground rly.

The development of industry made Glasgow a melting pot for the Highlands and Islands, and incomers from the N.E. coast, from the S., and from Ireland. Social and industrial conditions became deplorable. Housing was lamentable. Disease was rampant and mortality excessive. All that has been gradually changed. Infant mortality had fallen by 1946 to 67 per 1,000, the lowest in Glasgow's history; average mortality to 13·8 per 1,000. Some districts are as healthy as New Zealand, Denmark, or any other specially favoured country. Before the national health service came into force, the city spent over £2,000,000 every year on health, and still

Glasgow. Map of the district showing the towns which have grown up around this important centre of commerce and manufacture

regards this as a sound investment. The saving in life compared with 100 years ago is 25,000 lives per annum. The difference between now and 50 years ago is 11,490.

Glasgow owns municipal properties to the value of £114,000,000. It is the richest of all local authorities, except London, in real estate. The town council's building plan after the Second Great War envisaged an expenditure of over £100,000,000 on housing in 15 years, in addition to huge sums for schools, hospitals, bridges, and other public works.

Thrift in the City

Some 560,000 of Glasgow's citizens have over £92,000,000 in the Savings Bank, the most powerful thrift organization in the world. It is estimated that the aggregate savings of working and middle-class folk in savings banks, co-operative societies, friendly societies, and allied associations is in the region of £200,000,000. This is exclusive of the possessions and investments of the so-called industrial, property-owning, and capitalist classes. Everybody in Glasgow is, in effect, a property owner and capitalist of sorts.

Glasgow is the only city in the British Commonwealth with an award for citizenship, the S. Mungo prize, bestowed triennially on the citizen who, in the opinion of the trustees, has done most for the good of the city by making it more beautiful, healthier, or more honoured. Three awards have been made. The prize was endowed by a shopkeeper who, remaining anony-

mous, wished to use his surplus wealth for the advantage of the city in which he had worked and lived over 70 years.

Educational Facilities

The university charter was granted by Pope Nicholas V in 1450-51, and the university now has accommodation for 5,000 students in the various faculties. There are also technical, domestic and commercial colleges, the Anderson medical college, the school of art, and other specialised cultural institutions. Glasgow men helped to start universities in London, Montreal, and Princeton, U.S.A., while Professor John Anderson was the pioneer of the mechanics' institutes and polytechnics since established in all parts of Great Britain. There is no racial or religious bar to educational progress on Clydeside. The corporation spends over £3,000,000 a year on education, and almost £30,000,000 yearly on all the civic services. But the cost to the householder is not prohibitive. A man and wife with three children living in a house rented at £30 a year pay 5s. 8d. a week in rates, or 10d. a day. This works out at 2d. per head, which must be a world record for cheapness in public services.

Glasgow's public art galleries and museums with their contents, and the books in the libraries (not included in the valuation of £114,000,000 for municipal properties) are easily worth £3,500,000. They are owned by the municipality, and surpass in value the

artistic and cultural possessions of any other city in the British Commonwealth.

Religious toleration has been a characteristic of Glasgow since in 543 S. Kentigern (Mungo) raised the standard of Christianity and founded Glasgow on the banks of the Molindinar river, a tributary of the Clyde. A cathedral dedicated in 1136 was burned down c. 1189. The first section of the present building was dedicated in 1197. It and S. Magnus alone of the pre-Reformation cathedrals on the Scottish mainland escaped destruction during the Reformation disorders of the 16th century. It was saved by the merchants and tradesmen when it was threatened by a mob. It is the chief centre of the Church of Scotland, and is still used for regular services, and for special services connected with the city and the nation.

The churches of Glasgow are now better attended than they were in the beginning of the 19th century. All denominations seem to have achieved harmony and understanding, and cooperate on the education committee and in many other directions. The habits of the people have improved; in 1928 there were 1,519 premises licensed for the sale of alcoholic liquors, and 8,373 prosecutions for drunkenness; in 1946 the comparative figures were 1,353 and 2,340.

An Industrial Community

But it is as an industrial community that Glasgow is best known. Its citizens like to call it the industrial capital of Great Britain. For more than a century it has been celebrated for its heavy industries—iron, steel, ship-building, engineering, and the making of locomotives, boilers, cranes, bridges, and machinery. Ships built there include the Empress of Britain and H.M.S. Hood, both sunk during the Second Great War, the Queen Mary and the Queen Elizabeth, H.M.S.S. Duke of York, Vanguard, and Implacable. Scottish shipyards in 1946 had an aggregate output of 379,515 tons of mercantile shipping, and carried out repair and conversion work on merchant ships of a gross tonnage of 4,623,454 tons. The Clyde navigation trust, which has spent over £12,000,000 on the docks and waterways in proof of its confidence in the future of ship-building and shipping has planned a long-term programme of extensions and improvements to cost over £7,000,000; and shipbuilders have taken leases of new lands in

1. Glasgow cathedral dating from 12th to 13th century.
2. Argyle Street, chief shopping thoroughfare. 3. City art gallery, seen from Kelvingrove Park. 4. Glasgow University buildings, designed by Gilbert Scott, 1868.

5. Broomielaw Bridge over the Clyde, opened 1899.

GLASGOW: VIEWS OF SCOTLAND'S GREAT INDUSTRIAL METROPOLIS

perpetuity or for 60 years. In 1947 the shipbuilders had contracts to keep them all busy for four years.

At least 40 p.c. of all the shipping built in Great Britain in a normal year is launched on the Clyde; and Clyde-built marine engines, boilers, electrical equipment, and locomotives are sent to all parts of the world. Glasgow locomen build locomotives for India and for Africa; Babcock and Wilcox boilers and electric power plant are designed for nearly every country in the world.

Lord Kelvin's Record

The city's engineers are also skilled in the lighter industries. Several firms are famous for the optical and other instruments they make for the Royal navy and the merchant navy, the R.A.F., and the army. This is what might be expected in a city where Lord Kelvin registered 50 patents for telephonic, cable, and electric communications. His influence and name are still respected in two of the largest companies which fulfil orders for all kinds of scientific instruments and apparatus from every country on the globe.

The Singer manufacturing company started to manufacture sewing machines in Bridgeton in the E. end of Glasgow, and later built larger factories in Clydebank out-with the city boundary. Here 90 p.c. of all British sewing

machines are made for the home and export markets. Glasgow also makes carpets of all kinds, the E. end having the largest carpet factory in Great Britain. Carpets for the coronation and other national ceremonies have been made here. Scores of new factories for lighter industries employ men and women formerly considered heavy handed. These new industries include the making of radio receiving sets, vacuum cleaners, clocks, typewriters, refrigerators, restaurant equipment, ventilators for houses, shops, and factories, electric lamps, cycles, chemicals, motor vehicles, photographic equipment, atomic research and other scientific apparatus, dry batteries, motor tires, clothing, laundry plant, books and paper, tobacco, and cigarettes. There is hardly anything wanted at home or abroad that Glasgow is not prepared to make.

Manufacture for Export

The workers of the city also excel in the making of coalmining machinery, pumps, and valves, while its textile machines are of such high quality that some producers can sell as easily in the U.S.A. as in Great Britain. The city also produces fully 50 p.c. of all the manufactured bread, biscuits, and cakes consumed in Scotland, and in normal times exports special food products to the Dominions, the colonies, and the U.S.A. It has

the oldest brewery in Scotland, which before the Second Great War exported more beer than any other brewery in Great Britain. Huge quantities of whisky are blended and bonded in Glasgow, which is also the chief centre for shipping supplies to the U.S.A. and other overseas buyers.

Iron and Steel Plants

Immediately after the Second Great War, plans for Glasgow included the modernisation of its iron and steel plants, at an estimated cost of £29,000,000; the building by the government of a £20,000,000 integrated plant for iron and steel at Bishopton; the construction of a giant graving dock to take the biggest ships afloat at a probable cost of over £20,000,000; the driving of a vehicular and pedestrian tunnel under the Clyde between Scotstoun and Linthouse, estimated to take 10 years to complete and to cost £15,000,000 to £20,000,000.

Glasgow has been interested in flying since Percy Pilcher experimented with gliders there and at Dumbarton in the 1890s. A Scottish aviation company was started at Barrhead near Glasgow in 1911 with a capital of £10,000, but the aerodrome and the first two machines were burnt out the following year. During the First Great War over 2,200 engines were built by Glasgow firms, one of which, William Beardmore & Co., also

Glasgow. Plan of the central portion of the city, showing the principal buildings, railway stations and docks, as well as Kelvingrove Park and the inner suburbs

designed and constructed R 34, the airship which made the first double Atlantic voyage in 1919. The industry, however, lapsed until the Rolls Royce co., operating a government factory at Hillington, started production in 1940. Between 1940 and 1945 almost 24,000 new engines were built, and 30,000 others converted, at Hillington.

Glasgow airport, which is at Renfrew, 6½ m. from Glasgow, was the first civil airport in Scotland. In 1945 there were ten routes based on it; in that year they flew 29,573 passengers a total of 2,321,607 miles. During the Second Great War thousands of aircraft were assembled and flown or transported from there to all war zones. Over 1,500 mechanics were employed at Renfrew by the American Lockheed Co. repairing and reconditioning U.S. bombers; more than 40,000 men, women, and youths were employed on air work in Glasgow.

Sport and Recreation

Glasgow has six first league football grounds capable of accommodating a total of over 400,000 spectators. Hampden, the largest ground in the world, has held 150,000 persons, but the number is now restricted to 135,000; Ibrox, the next largest, has held 117,000, Celtic Park can hold 80,000. There are also about 200 other pitches for junior and juvenile footballers.

There are over 120 cinemas and 50 dance halls. Jazz has its devotees, but the classical concerts of the Scottish orchestra and the Glasgow choral union also draw many listeners.

Theatres and music halls have declined in number, though they attract big audiences. The Princess's theatre, once famous for pantomime, now specialises, as the Citizen's theatre, in modern drama with a preference for the Scottish brand. Unity theatre caters for those who want left-wing plays. But pantomime in winter and variety in summer are the most popular stage performances for Glaswegians. Pantomimes run to full houses for 20 weeks, summer variety shows often continue for a four months' season.

The original university buildings, situated near High Street, have been supplanted by the modern buildings at Gilmorehill, designed by Sir Gilbert Scott and completed in 1870. These overlook Kelvingrove park, in which the Western infirmary, the Anderson college, and the art gallery are situated. The university includes

the Hunterian museum and the Bute hall, two of the cultural "show places" in the city. The art gallery, damaged during the 1941 air raids, was opened in 1901 as part of an international exhibition, and cost £250,000. Kelvin hall is, after Olympia, London, the largest exhibition centre in Great Britain.

Historic buildings include, besides the cathedral, Provand's lordship, said to be the oldest house in the city. Built and occupied by Bishop Muirhead in 1474, it is at the top of High St., the main thoroughfare in pre-Reformation times. At the S. end of High St. is the Tolbooth or town house, the seat of civic government, which occupied a site midway between the cathedral and the river Clyde.

Modern public buildings include the city chambers, the royal technical college, the merchants' house, the stock exchange, and the royal exchange, all within walking distance of each other in the commercial and civic centre of the city. Farther W., near the university, is the Mitchell library, much used by students; it contains one of the best collections of Robert Burns publications in the world.

Plan of the City

The city, planned and laid out with the river as its S. boundary, was commended before the industrial revolution for its excellent houses, beautiful gardens, and lovely river walks. The streets then all radiated from the cathedral and the town house with High St., Gallowgate, Saltmarket, and Trongate as the chief promenades. Now, with over 1,000 miles of streets lined with residential tenements and commercial buildings, Glasgow has become one of the most congested towns in Europe.

Argyle St. is the busiest and most popular shopping thoroughfare, and runs almost from the E. to the W. boundary of the city. It is part of what was once the main road from the Firth of Clyde to the Firth of Forth. Sauchiehall St., running almost E. to W. from the royal infirmary to the art gallery, is a favourite shopping rendezvous for those who prefer Paris styles and Bond St. prices. Great Western Road, praised by John Ruskin as one of the finest avenues in Great Britain, leads almost from the west centre of the city to the Loch Lomond Boulevard, constructed after the First Great War. This by-passes Clydebank and Dumbarton, direct to Balloch, and is a busy motor route, summer or winter. A magnificent

panorama of the firth of Clyde can be seen from the Boulevard above Clydebank and Old Kilpatrick.

The Glasgow-Edinburgh road, 100 ft. wide, was constructed 1924-26 at a cost of £2,400,000. There are also "excellent roads to the N., S., and W. Almost any part of Scotland can be reached by road from Glasgow within a few hours.

Bibliography. Glasgow Memorials, R. Renwick, 1908; History of the University of Glasgow, 1451-1909, J. Coutts, 1909; Medieval Glasgow, J. Primrose, 1913; History of Glasgow, G. Eyre-Todd, 1931; The Second City, Walkley, 1946.

Glasgow, ELLEN (1874-1945). American novelist. Ellen Anderson Gholson, born at Richmond, Va., April 22, 1874, took the name Glasgow in regard to her Scottish ancestry. She published her first novel, *The Descendant*, in 1897, and her other books included *Phases of an Inferior Planet*, 1898; *The Romance of a Plain Man*, 1909; *One Man in His Time*, 1922; *Barren Ground*, 1925; *The Romantic Comedians*, 1927; *The Sheltered Life*, 1932. Often describing life in Virginia, she drew powerful portraits of Southern characters. In 1943 she published *A Certain Measure*: an Interpretation of Prose Fiction. She was awarded the Pulitzer prize in 1941. She died at Richmond, Va., Nov. 21, 1945.

Glasgow Bank Frauds. The failure of the City of Glasgow Bank. Oct. 2, 1878, resulted in losses of over six millions sterling. Every shareholder was responsible to the extent of his fortune. More than half the whole number had less than £500 of stock, and only 88 stockholders held amounts of £2,000 and upwards. But among these was the bank itself, which held no less than £153,536.

The manager and several directors were tried at Edinburgh, Feb., 1879, on charges of falsehood, fraud, and theft, convicted on certain counts, and sentenced to terms of imprisonment varying from eight to 18 months.

Glasgow Herald, THE. Scottish independent newspaper, started by John Mennons, Jan. 27, 1783, as a weekly, under the title of *The Glasgow Advertiser*. It was published later twice a week as *The Glasgow Advertiser and Evening Intelligencer*, the old title was resumed in 1794, altered to *The Herald and Advertiser* in 1802, and finally to *The Glasgow Herald* in 1805. From a tri-weekly it became a daily on Jan. 3, 1859.

Mennons's successors in the editorship included Samuel Hunter,

George Outram, James Pagan, who instituted modern methods of reporting, William Jack, Dr. J. H. Stoddart, Dr. Charles Russell, Dr. William Wallace, F. Harcourt Kitchin, Sir Robert Bruce. Allied papers are The Evening Times, 1876, and The Bulletin, 1915. The proprietary firm, George Outram & Co., was converted into a public limited liability company in 1920.

Glasgow Rangers. Scottish football club, described under its correct title Rangers.

Glasgow School. Name associated from 1886 with a group of painters living in Glasgow. Its members included Sir David Cameron, J. E. Christie, Joseph Crawhall, junr., Sir James Guthrie, E. A. Hornel, Sir John Lavery, Harrington Mann, James Peterson, Alexander Roche, R. Macaulay Stevenson, and E. A. Walton. Consult The Glasgow School of Painting, D. Martin, 1902.

Glasgow University. Founded in 1450 by William Turnbull, bishop of Glasgow. It found a home in the High Street; various Scottish sovereigns made gifts of land and property, and there it remained for about four centuries. In 1860 a new site was bought on Gil-

Glasgow University arms

morehill, where a magnificent pile of buildings was erected in the Early English style. They include library, museum, classrooms, etc., with houses for some professors. Sir G. G. Scott was the architect, and the buildings were opened in 1870, having cost £500,000. Parts of them, Bute Hall and Randolph Hall, were given by the benefactors after whom they are named. New buildings have been erected for scientific and medical departments.

The university has a chancellor and also a lord rector. Its working head is the principal and it has faculties in arts, divinity, law, medicine, science, and engineering. In the 19th century it received many additional benefactions, and it has many scholarships and bursaries, including the Snell exhibition to Oxford. Women equally with men are admitted to degrees. Affiliated is the Royal Technical College, which provides courses for degrees in applied science. The university was at the height of its fame in the 18th century, when Adam Smith, Sir William Hamilton, John Wilson, and other noted Scotsmen were educated here, as

were a number of Englishmen. Before 1950 it united with the other Scottish universities to send three members to parliament.

Glashtin. Mythical horse in Isle of Man folklore. It lived in the water, but frequently disported itself on the land with the native ponies. When the Manx ponies became crossed with horses from other countries the glashtin ceased to visit them.

Glaspell, SUSAN (1882-1948). American novelist and dramatist. Born at Davenport, Iowa, July 1,

1882, she was educated at Drake university and the university of Chicago, and became a reporter at Des Moines. Her plays included *Bernice*, 1920; *Inheritors*, 1921; *The Verge*, 1921; *Alison's House*, 1930, which gained the Pulitzer prize. Among her novels are *The Glory of the Conquered*, 1909; *Fidelity*, 1915; *The Road to the Temple*, 1926; *The Morning is Near Us*, 1940. She also wrote a biography of her first husband, G. C. Cook (d. 1923). She died July 27, 1948.

GLASS AND GLASSMAKING

Ivor B. N. Evans, member of the Assoc. of British Science Writers

The origins and development of glass from the earliest times are here described. See also articles on special kinds of glass, e.g. Irish Glass; Optical Glass; Stained Glass; Venetian Glass. See also Chemistry; Glass-like Plastics

Glasses are substances which, when quickly cooled from the molten state, become solid without devitrification, i.e., the formation of very small crystals. Most commercial glasses are a mixture of silicates; but certain glasses contain no silica, being made on a small scale for special purposes. The ingredients used in varying proportions are usually sand (silica) together with one or more of the following: soda ash, potash, magnesia, calcium and sodium phosphates and borates (for heat resisting glasses). High silica glass, used for laboratory ware, contains 80 p.c. silica, sheet glass 71 p.c.; optical flint glass, which has one-third the hardness of sheet glass, contains 40 p.c.

The Softening Temperature

Glasses soften from 400° C. upwards; but have no definite melting point, so the point at which a thread 9 ins. long and 0.6 mm. diam. lengthens under its own weight at the rate of 1 mm. per min. in a furnace is taken as the softening temperature, which varies from 610° C. for lead glass, to 780° C. for high silica glass. The density varies from specific gravity 2.2 for borosilicate glass to 5.2 for very dense lead glass.

Glass will stand almost infinite compression, but breaks under tension; the surface containing, so to speak, the strength. Cutting with a diamond or cutting wheel reduces the strength, so that the glass breaks easily along the line of the cut.

Glass is today indispensable in the house, in decoration, buildings, engineering, scientific research, radio, television, food, drink, and chemical manufacture and in electrical engineering.

The earliest glass known is a few pieces found in Egypt and attributed to Syria at about 5,500 B.C. Sidon and Damascus are believed to have been the world's original glass manufacturing centres, or "glassfields," the craft being introduced into Egypt about 2000 B.C. When Tamerlane sacked Damascus in 1400 A.D. the Syrian glass makers dispersed. This ancient glass was not transparent; it was coloured or opaque. In the 15th century B.C., the Egyptians developed glass-blowing, and the blown glass ware of the Greek and Roman period resulted.

Early Egyptian Methods

About 1370 B.C. the Egyptians fused crushed quartz pebbles and wood ash alkali in earthenware pans, coloured the "metal" (molten glass) with green or blue frit. When cold the pan was chipped away, and the pieces, about 4 ins. to 5 ins. across and $\frac{1}{4}$ in. to 1 in. thick, had the froth chipped off, leaving, for the first time, clear, coloured glass. The plate was heated again to the pasty state, folded and rolled with a metal bar to produce a cane of pencil diameter, which was heated and drawn to a cane about $\frac{1}{4}$ in. diam. The hot cane was then wound round a copper mandril in the shape of a wide-mouthed vase, and the whole rolled hot until the surface was smooth. On cooling, the copper mandril contracted and was withdrawn to leave the glass vase. Decorative beads were in demand. About 1200 B.C. pressed and moulded glass articles were made.

In the 3rd century B.C. blown bottles and vessels were in common use at Sidon, where the Syrians first developed window or crown glass in the 1st century A.D. The

Glass and Glassmaking. 1. Drawing a tube. The skilled tube drawer, on right, has started to walk backwards from his mate, and the tube is just becoming visible. 2. Drawing out thermometer tubing—almost completed: the length is approximately 40 yards and the bore is maintained throughout. 3. A skilled blower with a "gathering" of molten glass which will become a cathode ray bulb for radar

Alexandrians had a trade with Rome in cut and engraved glass.

Roman glass was roughly 69 p.c. silica, 17 p.c. soda, 11 p.c. lime, and 3 p.c. magnesia alumina and iron oxide. Enamelled glassware originated with the Syrians of the 1st century A.D. The Roman Empire spread glass-making to many European centres, nor did glassmaking disappear at the fall of Rome; Syrians were settled in the Seine-Rhine areas until the 7th century A.D.

About the 10th century A.D., a glassmaking industry was started at Venice as a closed guild with severe penalties for divulgence of its secrets. It required three generations to make a master-craftsman; but all changes were by rule of thumb, for not until the 18th and 19th centuries was glass studied scientifically.

Venetian Muranese Glass

Crown glass is made by blowing a large bubble, attaching a "punty," or iron rod, to the pole opposite the blow-pipe, which is then removed, and spinning until the blow-hole opens out to become the periphery of a disk about 24 ins. diam. The Seine-Rhine glassfields and Normandy specialised in this, the latter supplying most of Britain's glass, particularly for the British schools of glass-painting. The Venetians' Muranese glass became famous throughout the medieval world as did their beads, spectacle lenses, ships' lanterns, and, after 1317 A.D., mirrors. The guild of mirrormakers was formed in 1569.

Plate glass, which is flat glass, with both sides polished so that they are parallel to each other, was made in France in the 17th century by casting glass into metal frames and rolling the surface, then grinding and polishing it when it was cold and annealed. This method used 2,000 lb. of glass per cast, and took 10 days to anneal.

Cylinders Forty Feet Long

The German method of blowing a long cylinder, 15 ins. or more in diam., cutting off the ends and then opening out to a plate in a furnace, invented before the 11th century, continued to be used for small quantities of special glasses into the 20th century. Cylinders up to 40 ft. long were blown mechanically at the end of the 19th century in the U.S.A.

The families of glassmakers, following receding forests for their fuel, spread to Bohemia and all over Europe. In France they enjoyed a high status until their spirit of religious independence caused their persecution, and they emigrated to England in Elizabeth's time. In the 13th century glassmakers at Dyers Cross had made glass for Westminster Abbey, the glazier's company had been formed in 1328 and a Royal charter granted to the glassfield at Chiddingfold; but, until the French glassmakers arrived English glass was inferior and most requirements were imported. In 1587 some Venetians in London invented lead glass.

In 1617 Sir Robert Mansell (d. 1653) obtained the glass monopoly,

becoming, by his granting of licences to Stourbridge and elsewhere, the father of the English industry. By 1696 there were 90 glasshouses, using sea-coal, in England and Wales. They manufactured crystal, flint, green bottle, window, and plate glass. London had 26 houses.

Casting of plate was introduced into England in 1773, crown glass by John Boles between 1678 and 1691. Plate glass manufacture and experimental development were restricted by a heavy excise tax and the development of lenses by an excise regulation forbidding crown glass to be manufactured thicker than $\frac{1}{4}$ in. Taxes and restrictions were repealed in 1845, but so also were the import duties, and cheap foreign glass closed many small British works.

Ordinary Sheet Glass

With the assistance of the Frenchman, Georges Bontemps, Robert Lucas Chance introduced the manufacture of ordinary sheet glass into England in 1832. By that time British flint glass (lead-sand potash) was world-famous for its brilliancy as cut table-ware, being manufactured at London, Stourbridge, Whittington, and Waterford, Ireland. The cutting process was introduced from Bohemia. In 1839 James Chance produced his patent plate, the thinnest produced to date, by grinding the sheets on slates coated with leather and felt. In 1841, James Hartley, at Pilkingtons, Sunderland, manufactured thin, cast sheet glass to any size

and down to $\frac{1}{8}$ -in. thick; it had a fluted pattern impressed upon it.

In 1851 Chances supplied the $1\frac{1}{2}$ million square feet of glass for the Crystal Palace. They next developed cathedral glass, which has one side impressed with an irregular pattern, and figured glass, with deeper, regular patterns, by feeding the glass into marked rollers and producing the figured sheet with both sides brilliant.

The 1,000 tons capacity tank furnace was also developed, being about 30 ft. by 120 ft. by 5 ft., with fireclay walls and a roof of silica brick, to the Siemens regenerative design. The ingredients

free. The edge-bowl method developed by the Pittsburgh plate glass company consists of merely the cooled, slotted ends of the Fourcault slit or débiteuse, which cools the edges and maintains the width of the glass. The composition of sheet and plate glass is, ordinarily, similar: 72-73 p.c. silica, 13-14 p.c. lime, 0.5-1.5 p.c. alumina, 14-15 p.c. soda.

The grinding and polishing of cast plate glass, begun in 1688 when the glass had to be cast at least 50 p.c. thicker than the final product, steadily evolved until a method was developed in which the glass was embedded in plaster of Paris on rotating steel tables 30 to 40 ft. in diam. The grinder of iron shod disks was first fed with sand and water, then fine sand or emery, and the perfectly flat,

glass is now made by the continuous tank method.

Both Ford and Pilkingtons developed a method for continuous grinding and polishing. The sheet, after leaving the rollers, was put through an annealing lehr and was then cut up. The rough sheets were laid on tables, whose ends met at a level, flush joint, which slid on guides under motor-driven grinders and polishers. Some plants were 800 ft. long, and licences to operate the Pilkington method on glass up to 15 ft. wide were granted to the U.S.A., France, and Belgium. By this method very thin sheets of ground plate glass could be made, and laminated "safety" glass, in which a sheet of gelatine was sandwiched between two thin plates and the perimeter sealed, became universally available for motor cars.

Glass is coloured by the addition of cobalt for blue, chrome for yellow-green, manganese for violet, nickel for green, and so forth. The colouring ingredients either form transparent silicates or become so finely divided that the particles scatter the light, allowing only certain colours to be transmitted in the process.

Wired Glass

Wired glass, where electrically welded mesh is embedded in continuous sheet glass, was developed by Pilkington Bros. in 1898. Spun "glass silk," or fibreglass, was first manufactured by Chances in 1930, the molten glass being forced through fine, heated dies. Woven in tapes, it provides a very thin insulation, unaffected by climate or insects, for the wires in radar sets. In mats, quilts, or blankets, it is used to insulate heat, for filters, cinema screens, tire fabrics, tablecloths, etc.

Toughened or tempered glass, armourplate, is a French invention. Unless glass is annealed, the internal stresses become so great that they overcome the surface strength and the glass cracks. In armourplate the two surfaces of a sheet are cooled quickly by blasts of air, with the result that the compressive forces of the "skins" are far greater than expanding internal forces. The breaking strength of such glass is 50 to 300 p.c. greater than that of ordinary glass. When broken by a scratch or projectile it falls into fragments, free of cutting edges.

Opal glass, which the Egyptians discovered about 300 A.D., is clear glass with millions of small particles of glass of another refractive index per c.c. It gives a sea-mist

Glass and Glassmaking. Placing a "gathering" into the "glory hole" to be warmed up. When warm enough, the glass will be stretched, slit, flattened, and made into a square sheet. Right: a partly shaped fruit dish, on the punty iron, is being sheared

are introduced at one end and the molten glass comes out at the other, the highest temperature, with the glass at about 1,600° C. and watery to allow bubbles to escape to the surface, being one-third of the way across.

The cut cylinder method and casting from ladles have been displaced by semi-continuous and continuous processes. Fourcault, in Belgium, in 1904, patented his method of drawing a stream of glass through a fireclay slot floating on molten pasty glass, and achieved complete success in 1913. The sheet, drawn up by water-cooled rollers, passes into the annealing tower at the rate of 120 ft. per hr. On reaching the top the sheet is cut at convenient lengths. Unfortunately, glass crystals gradually form on the slot, scratching the sheet with "music lines."

In the Colburn or Libby-Owens process patented in 1905, two small rollers maintain the width of the vertically drawn sheet, which is then re-heated and drawn horizontally over a roller into the annealing lehr. The surface is spoilt by the bending, but is dirt

smooth silky texture obtained was washed with rouge and water. The sheet was then relaid with the polished side on cloth and the operation was repeated. The Bicherox process substituted for the casting table two rollers fed with glass poured from a pot on to a smooth sheet behind the feed rollers; the glass sheet emerging being cut by a descending knife when it reached the end of the delivery table. The sheet was annealed and then polished. Glass made in this way does not cockle on cooling as does cast glass, and less glass has to be removed by grinding and polishing to secure parallel surfaces.

The motor car has created an enormous demand for plate glass. The Ford process discharges a continuous sheet, from one end of a continually supplied furnace, into two rollers. At first the sheet produced was only the width of a windscreen, but after 1923 Pilkingtons introduced modifications by which high-grade sheets of glass 100 ins. wide could be produced by this method. Most plate

effect produced by adding phosphates and fluorides to the metal. Flashed glasses are clear glasses thinly coated with coloured glass.

Glass tumblers and electric lamp and valve globes are blown on multiple automatic machines, whose plungers pick up a measured amount of glass from a tank and blow it into a globe, given its final, exact shape in a mould. Other machines place molten glass in a mould and bring down a plunger producing a pressed article, such as thick tumblers, heat-resisting oven-ware, lens and prism blanks, which are afterwards ground to their precise forms. Britain now leads in the manufacture of the highest quality lenses for cameras and for lighthouses. In fact, most of the coasts of the world are lit by lighthouses fitted with British lenses. Hollow glass bricks are made in two halves by pressing, the two parts being sealed together in the annealing lehr. These thick glasses are of borosilicate to withstand temperature changes without undue expansion.

Twin Plate Glass

Twin plate, a British invention of the Second Great War years, is produced by introducing the ribbon of plate glass continuously, without cutting, into the grinders and polishers, which act on both sides simultaneously. One furnace can produce 160 sq. ft. of glass per min. continuously, day and night, all the year round.

Stourbridge produces beautiful blown glass vessels, while glasses have been developed to transmit or to screen ultra-violet radiation, to deter flies, to absorb the heat rays from the sun, thus keeping a room's air and inhabitants cool, and for other specialised purposes.

Bibliography. Principles of Glass Making, H. J. Powell, 1883; Glass in the Old World, M. A. W. Dunlop, 1883; Irish Glass, M. S. D. Westrop, 1920; Defects in Glass, C. J. Peddie, 1927; Modern Glass, G. Janneau, 1931; English Glass, W. A. Thorpe, 1935; Glass in Architecture and Decoration, R. McGrath, A. C. Frost, H. E. Beckett, 1937; Scottish and Jacobite Glass, A. Fleming, 1938; A Key to Pottery and Glass, B. Rackham, 1940; Handbook of the Glass Industry, S. R. Scholes, 1941; American Glass, H. and G. S. McKearin, 1941; Glass and Glazing, D. M. J. Davidson, 1946.

Glassites. A Scottish sect, founded by John Glas. He taught that all Church establishments were unscriptural, and that each congregation should be self-governing and have the power to appoint its own ministers. The publication of his views in The Testimony

of the King of Martyrs, 1727, led to his suspension by the synod of Angus, and in 1730 he was deposed from the ministry. He founded several congregations, better known as Sandemanians, after one of the more conspicuous elders, Robert Sandeman, son-in-law of Glas. The sect adopted the practices of community of goods and abstinence from certain foods.

Glass-like Plastics OR ORGANIC GLASSES. Those plastics which have the primary characteristic of glass—transparency. The search for a non-breakable glass has been the incentive behind much work on plastics. Glass-like plastics are in the main derivatives of the hypothetical vinyl radical, and include polystyrene and its derivatives, certain vinyl polymers, polymethyl methacrylate, allyl polymers, and some ketone condensation resins.

Except for the allyl polymers, these are thermio-softening, and can be manipulated in sheet or rod form by the application of moderate heat. They have reasonable resistance to shock except at very low temperatures, and are of low specific gravity, being mostly slightly denser than water. In sheet form they are used for aircraft screens and generally where protection and good vision must be combined. Rods of polymethyl methacrylate, with their remarkable transparency, are wanted for surgical instruments. Other uses of glass-like plastics are in television apparatus and the production of lenses for industrial and ophthalmic purposes.

Glass Paper. Sheets of paper coated with powdered glass for use as an abrasive. Glue or some other adhesive is applied to the paper, which is then sprinkled with a layer of the abrasive material in a determined thickness and closely controlled grade of fineness. Glass cloth is a similar, more durable material in which the backing is a fine twill. Glass paper or cloth is used for finishing and smoothing woodwork, rubbing down painted surfaces, etc. To prevent the dust which would arise from rubbing down paintwork dry (and which might be harmful to the worker), glass-paper is made with a water-resistant adhesive so that it can be used on the previously wetted surface of the paintwork.

The name is applied somewhat loosely to materials in which the abrasive is a substance other than glass. Sand paper is coated with sharp sand in various grades,

made and used as glass paper. Other natural and artificial grits are employed, some of the carborundum class. Emery paper and cloth, coated with emery powder, are used for finishing metal surfaces.

Glass-sand. Sand suitable for the manufacture of glass. Most sands contain a high percentage of quartz, together with other constituents, commonly feldspar and lesser amounts of other minerals; but high-grade glass requires sand having a silica percentage of nearly 100. The sand should be of fine to medium grain, and individual grains should be angular. There should be no iron oxide to form a yellow coating on the grains. Some impure sands are still suitable for bottle glass. The purest glass-sands come from Fontainebleau and Lippe, where they carry only 0.02 p.c. of impurities. Good British varieties are obtained from the Lower Greensand formation of Cretaceous age in Kent, Surrey, Bucks, and Beds.

Glass Sellers' Company. London city livery company.

Glass Sellers' Company arms

Incorporated in 1664, it has one trust, the John Abbott scholarship of £50 tenable by a scholar of the City of London School at Oxford or Cambridge. The offices are 32, Victoria St., London, S.W.1.

Glass Snake (*Ophisaurus*). The popular but erroneous name for the *Sheltopusik*, a genus of

Glass Snake, a legless lizard, over a yard in length

lizards found in Hungary, Greece, Russia, S. Asia, and N. America. It is snake-like in form, the limbs being absent or rudimentary, and the body covered with scales. It is perfectly harmless, and feeds on mice and snails. See Lizard.

Glasswort (*Salicornia europaea*) OR MARSH SAMPHIRE. Annual leafless herb of the family Chenopodiaceae. A native of Europe, N. Africa, W. Asia, and N. America, it has juicy, jointed stems and branches, joints spindle-shaped. The minute flowers are in pairs, sunk in a pit in the joints of the branches, and have no petals. Glasswort grows in salt marshes, and was so

Glasswort or Marsh Samphire. A leafless herb with fleshy branches

called from having been burnt formerly to obtain soda from its ashes (*Barilla*) for use in glass-making. Its joints are pickled as a substitute for real samphire (*Crithmum*). See *Chenopodiaceae*.

Glastonbury. A borough and market town of Somerset, England. It stands on the Brue, $5\frac{1}{2}$ m. S.W. of Wells, has a railway station on the old Somerset and Dorset line. It is chiefly famous for its abbey ruins, remains of a great monastic house, belonging to the Benedictines, which flourished here until the Reformation. The most complete of the ruins is that of S. Joseph's Chapel, really the Lady Chapel, and they show that the abbey church must have been one of the largest and noblest in England. Near to it is the abbot's kitchen, an octagonal building, and some distance away is his barn. In the town is the abbot's justice room. The abbey was one of the richest in England and its buildings covered 40 acres.

The chief buildings of the town are the Perpendicular churches of S. John the Baptist and S. Benedict. The George Inn was a house for pilgrims. There is a museum with prehistoric exhibits.

At the beginning of the 7th century the Benedictines founded a monastery. It was replaced by one which Dunstan, as abbot here, restored and enlarged in the 10th century. This was destroyed by fire in 1184, whereupon a finer one was erected, which lasted until the dissolution of the monasteries. Until 1907 the ruins were in private hands, after which they were transferred to the diocese of Bath and Wells. Tradition ascribed the foundation to Joseph of Arimathea, who, it is said, built a church here and planted the thorn which bloomed once a year on Christmas Day. It was long a place of pilgrimage. The town, which grew up around the abbey,

was given municipal privileges in 1706. Market day, Tues. Pop. 4,515. See *Abbey illus.*

The Glastonbury lake-villages are two late Celtic settlements of the crannog (*q.v.*) type. Discovered by Arthur Bulleid in 1892, the principal one was formed upon the fringes of a morass by pile-surrounded brushwood fascines. Beneath peat mounds 90 wattle-and-daub round huts, 18 ft. to 35 ft. across, were traced within $3\frac{1}{2}$ acres. The stratified floors, successively remade and rehearthened as the foundations subsided, indicate 150 years of village life before the Roman occupation. The rarity of weapons—7 out of 109 iron objects—betokens a peaceful settlement with several local industries. A settlement discovered in 1908 at Meare, 2 m. away, contained similar remains.

Glatz. Town and former fortress of Silesia. In Polish hands since 1945, it is on the river Neisse, near the Czech frontier, 58 m. by rly. S.S.W. of Breslau. It has a reputed 14th century church and other old buildings and monuments, a bridge of the 14th century, and a town hall and museum. The lofty keep of its old castle stands on a 1,200-ft. hill, into whose rocks the former citadel was cut. A German township from 1275, Glatz belonged until 1742 to the Bohemian crown. Late in the Second Great War it fell to Russian troops. It makes machines, furniture, shoes, and cigars. Pop. 18,900.

Glauber, JOHANN RUDOLPH (1604–68). A German alchemist. Born at Karlstadt, afterwards living at Strasbourg, Basel, Frankfurt-on-Main, and Cologne, he died in poverty in Amsterdam. His name is perpetuated in Glauber's salt, which he discovered and lauded as a medicine.

Glauber's Salt. Sodium sulphate, $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$, colourless crystals soluble in water. The dose is 30 to 120 grains for repeated administration; $\frac{1}{2}$ to $\frac{1}{4}$ oz. for single administration. It is often a useful purgative in conditions resulting from sluggish liver. It is named after its discoverer (*v.s.*).

Glauchau. Town of Germany, in Saxony. Situated on the right bank of the Mulde, 8 m. N.N.E. of Zwickau, and due W. of Chemnitz, it is a textile and tool manufacturing centre, and has two castles preserved from the 16th century. Pop. 31,199.

Glaucoma (Gr. *glaukos*, bluish green). Disease of the eye characterised by an increase of tension or

pressure of the fluids within the eyeball. In chronic glaucoma, gradually increasing dimness of vision is usually the first symptom, and in some cases rainbow colours are seen round the margins of lights. In acute glaucoma, pain in the eyeball, often radiating over one side of the head, is a symptom, and vision is affected.

Hardness of the eyeball is an important diagnostic sign. Glaucoma is very serious, and if not promptly treated may lead rapidly to permanent blindness. The general principle of treatment is to remove a portion of the iris so as to allow some of the compressed fluid to filter into the anterior chamber of the eye. See *Blindness*; *Eye*.

Glauconite. Dull green mineral, essentially a hydrous silicate of iron and potassium, composition variable. It occurs in colloidal, amorphous, and crystalline form in certain rocks of nearly all geological ages; it is abundant in the "green sand" of the Chalk formation and in ocean sediments near the continental shores.

Glauconophane (Gr. *glaukos*, bluish green; *phainesthai*, to appear). Member of the monoclinic amphibole group of minerals. Essentially a silicate of sodium, aluminium, and iron, with some magnesium, it is of variable composition. It occurs as vitreous to pearly crystals or masses with a grey-blue colour in metamorphic rocks, such as schist, eclogite, marble, etc. Comparatively rare, it is usually associated with quartz, epidote, pyroxene, etc.

Glaucois. Name of three personages in Greek mythology. They are the builder of the Argo, the ship of the Argonauts (*q.v.*), ultimately a sea-god; the father of Bellerophon; and a Lycian hero slain by Ajax.

Glaucois. Genus of opisthobranch gastropod molluscs, found floating on the surface of the Atlantic and Pacific oceans. They resemble green slugs with six heavily fringed lobes on the body. Glaucois, or Wonders of the Shore, is the title of a book by Charles Kingsley, 1855. See *Gastropoda*.

Glaze. Layer of pure or mixed transparent colour thinly applied to an oil painting to improve its tone, to impart mellowness, to protect the surface, and to facilitate its being cleaned without risk of injury. The old masters achieved some of their most subtle colour effects by means of their glazes painted over a solid monochrome basis. This was one of the traditional methods of the great

schools, contrasting with the "direct" method, i.e. the direct application of solid colour to the canvas, adopted by such painters as Hals or (later) Raeburn, and in general use by the end of the 19th century.

Glaze also plays an important part in the manufacture of pottery and porcelain. At the stage known as the biscuit state, the ware is dipped in glaze, which either gives it a finished appearance, or, in decorated porcelain, forms the ground on which the painting is applied. See Tiles.

Glazebrook, Sir Richard Tetley (1854-1935). British physicist. Born at Liverpool, Sept. 18,

Sir R. Glazebrook,
British physicist
Russell

1854, he was educated at Dulwich, Liverpool College (later the university), and Trinity, Cambridge. Demonstrator at the Cavendish Laboratory from 1880, he became assistant director in 1890. He served a year as principal of University College, Liverpool, but in 1899 became first director of the National Physical Laboratory, a position from which he retired in 1919. During 1920-23 he was director of aeronautics at the Imperial College of Technology. He was chairman of the Aeronautical Research Committee 1909-33. One of the most distinguished physicists of his generation, he was chiefly concerned with optics and electricity. He issued textbooks on heat, light, mechanics, and electricity; was the author of *Science and Industry*, 1917, and edited the *Dictionary of Applied Physics*. Knighted in 1917, he was awarded a Hughes medal in 1909, and Royal medal in 1931. He died Dec. 15, 1935.

Glazed Frost. Transparent smooth coating of ice, in contrast to hoar frost and rime which are white and opaque, on roads, trees, buildings, etc. It is caused chiefly by the freezing rain as it falls on the ground or objects the temperature of which is below freezing point. Clear ice can also be formed with the sudden arrival of a warm, damp wind; moisture in the air then condenses on the still cold surfaces, where it becomes solid. When sharp frost sets in after a partial thaw, melting snow or ice freezes again, giving roads the appearance of glazed frost. True glazed frost, however, is infre-

quent in the U.K. and more common on the Continent. In the eastern U.S.A. it is formed by a southerly wind blowing from the sea over frozen land.

Severe ice storms can produce rapidly heavy accumulations of ice, which besides interrupting transport interfere with communications by bringing down telegraph wires and poles. In the great storm of Jan. 26-27, 1940,

Frames are usually rebated (Fig. 1), but sometimes they are grooved, to receive the edges of the glass. Glass may be fixed in a simple frame or in a frame divided by glazing bars. The latter are rebated to provide a means of fixing the glass edges, just as the frame is.

The glass may be fixed by puttying and sprigging; beading; or covering the edges with metal

strip. In windows and glazed doors puttying is usually adopted. The sprigs are small metal tacks driven into the edges of frames and glazing bars to secure the glass while the putty is applied, but

Glazing: 1. Wood glazing bar with putty. 2. Wood glazing bar with lead cover. 3. Steel lead sheathed puttyless bar. 4. Reinforced concrete puttyless bar

which affected large areas from Hampshire N. to Warwickshire and W. to Gloucester, it was estimated that in one instance a weight of 11 tons of ice formed on the wires between a pair of telegraph poles. On high ground the short-circuiting of insulators of overhead power cables may cause breakdown in electrical supply.

Although a risk of glazed frost can be forecast, it is difficult to be certain that it will actually occur. For instance, if a warm S.W. stream of air from the Atlantic brings rain into a region of hard frost, glazing will almost certainly occur on the ground; but glazing on overhead wires requires an air temperature below 32 F. Rain falling through such a freezing layer near the ground may arrive in a supercooled state, freezing on the first object it touches, or it may freeze before then into pellets of ice which will fall to the ground.

Glaziers' Company. London city livery co. It was recorded at Guildhall in 1328, incorporated in 1638, and granted a charter by James II in 1685. This was annulled by parliament in 1690, so that the operative charter is that of 1638. The offices are at 1, Garden Court, The Temple, E.C.4.

Glazing. The setting of panes of glass in a suitable frame.

before fixing the glass in this way the rebates are given a thinly spread backing of putty. The glass is then pressed on to this putty seating, the sprigs are driven in, and the front putty is applied and smoothed off with a special knife. Linseed oil putty is used for wood frames and metallic putty for metal frames. The putty should be painted before it sets hard.

Beaded glazing means fixing a wood or metal beading with small screws to secure the glass in the frame or glazing bars. Narrow strips of washleather are bent round the edges of the glass to act as a cushion. Puttyless glazing bars with metal strip covering to secure the glass are widely used in roof glazing, lantern lights, and glazed walls; they are of wood, steel, and reinforced concrete. The wood bar shown in Fig. 2 has a lead capping turned down to cover the glass edges. The condensation grooves drain away moisture running down the underside of the glass. Metal glazing bars are usually of inverted tee section, protected against corrosion by lead sheathing or galvanising. A seating for the glass is formed in either lead or asbestos cord (Fig. 3). Reinforced concrete glazing bars

are pre-cast under pressure in steel moulds. The capping is of copper held to the bars by brass or copper screws, nuts, and washers. The bars are grooved for asbestos cord seating (Fig. 4).

In all kinds of glazing the pane should be slightly less in size than the opening, so that shrinkage and expansion and contraction cannot crack the glass. Puttyless glazing has the advantage of allowing the glass to be easily renewed if broken, and protected metal and concrete bars do not need painting, as they are rot- and rust-proof.

Glazing. In photography this process consists in squeegeeing a wet print on to a highly finished surface, e.g. a sheet of polished plate glass, stainless steel, chromium, etc. When dry, the print is stripped from the plate, having attained a high gloss. Where quantities of prints are concerned, glazing is carried out in machines incorporating polished rotating drums.

Glazounov, ALEXANDER CONSTANTINOVICH (1865-1936). Russian composer. The son of a publisher in St. Petersburg (Leningrad), he was born Aug. 10, 1865, received a musical education, and was advanced by Balakirev and Rimsky-Korsakov. A symphony composed at 16 revealed his masterly approach to orchestral technique. Glazounov first conducted at the Paris exhibition of 1889, became a professor at St. Petersburg conservatoire in 1900, and was director from 1906 until the Revolution of 1917. He died March 21, 1936.

Of all Russian composers Glazounov was the most susceptible to Western influence, notably that of Brahms, with whose symphonies his No. 6 in C minor (he wrote eight) will bear comparison. He excels at theme and variations, e.g. in this symphony and the set for piano, op. 72. The melancholy in his violin concerto and piano concerto is far more restrained than that of Tchaikovsky, and he can rise to a strain of mysticism. A more Oriental note is sounded in the symphonic poem *Stenka Razin*, and his ballet music, *The Seasons*, and *Raymonda*, is full of colour.

Gleaning OR LEASING. Gathering what is left after harvest, usually corn, but sometimes grapes or other produce. By the Mosaic law the farmer was expressly commanded to leave the gleanings of his fields and vineyards for the poor and the stranger, and was forbidden even to "wholly reap the

corners" of the fields; and from remote times the poor have been almost universally allowed to glean.

In England the public are not legally entitled to glean, but are seldom turned off. In some districts gleaning is done by the farmer's and harvesters' families.

Glebe (Lat. *gleba*, clod, land). Term in ecclesiastical law for land belonging to a benefice. It was formerly held to be essential that each parish should possess a house and glebe land for the support of the parson. The glebe might be farmed by the parson, or, subject to certain restrictions, let on lease in consideration of an annual rental, or in certain circumstances sold or exchanged. Legislation has enabled parishes to get rid of what was often a source of loss rather than of income. See *Tithe*.

Glee. English vocal concerted work in three or more parts. It is for solo voices, unaccompanied and usually male, the style being non-contrapuntal. The word is derived from the Anglo-Saxon "gligg," music, and has little connexion with gleeful. Standard glee writers are Webbe, Battishill, Callcott, Cooke, Attwood, Horsley, Mornington, Danby, Stevens, Spofforth, Storace, Savile, Este, Paxton, Arnold, Mazzinghi, Shield, and Ford.

Gleichenia. Genus of ferns of the family *Gleicheniaceae*. Natives of the tropics, they have creeping

Gleichenia. Feather-shaped fronds of *Gleichenia acutifolia*

rhizomes, and the leafy portion of the frond is forked, the two divisions being then subdivided after the manner of a feather.

Gleiwitz (Pol. Gliwice). The second city and chief industrial centre of the former German province of Upper Silesia. It is on the river Klodnitz and a canal, 16 m. W.S.W. of Beuthen. Founded as a German township in 1276, Prussian from 1742, Gleiwitz grew with the development of coal mining and heavy industry from 20,000 inhabitants

in 1890 to 117,666 in 1939. It has two 16th century churches. The mines and big industrial plants were not without parks and pleasant suburbs between them; but as a rly. and air junction Gleiwitz suffered heavily from Allied bombing before being captured by Koniev's 1st Ukrainian army, Jan. 25, 1945. It came under Polish admin. 1945. Pop. est. 88,000.

Glen. Narrow valley through which a river flows, or one between two hills. The word is of Celtic origin; hence the frequency of the word in place-names in Scotland and Ireland. The Gaelic form is *gleann*, valley.

Glen Affric. This Scottish glen is mentioned, together with the river and lake of the same name, under Affric.

Glenalmond. Glen or valley of the Almond river, Perthshire, Scotland. It is about 20 m. long,

and the most beautiful portion of it is called Sma' Glen. On the right bank of the Almond stands Trinity College, the first school in Scotland to be modelled (1841) after the English public schools. The buildings include a chapel, laboratories, engineering shops, gymnasium, library, etc. In the glen is the reputed grave of Ossian.

Glencairn, EARL OF. Scottish title borne by the family of Cunningham from 1488 to 1796. The first earl was Alexander Cunningham, a lord of parliament, killed when fighting for James III against some rebels in 1488. Alexander, the 5th earl (d. 1574), was concerned in the troubles of Scotland under Mary Stuart; at times he was with the reformers and at others with the queen. William, the 9th earl (d. 1664), was responsible for the rising in Scotland in favour of Charles II which is named after him. He led this in 1653, but it soon collapsed and he was imprisoned; later he became lord chancellor of Scotland. The 14th earl, James, who died childless in 1791, is known as the friend of Burns, who wrote a Lament on his death (beginning The wind blew hollow frae the hills). His brother, the 15th earl, died childless in 1796, and the title became extinct.

Glencoe. Glen in Argyllshire, Scotland. It extends for 10 m. W. from Buchaille Etive to Loch

Glencoe. The rugged Argylshire glen in which the Macdonalds were massacred in 1692

Leven, an E. arm of Loch Linnhe. It lies among magnificent mountain scenery with peaks rising to 3,800 ft. The motor road A82, completed 1934, is remarkable both scenically and as engineering. The locality is the scene of exciting episodes in Stevenson's *Kidnapped*.

The glen is noted for the massacre which took place on Feb. 13, 1692. After the suppression of Dundee's Jacobite insurrection of 1689, many Scottish clans remained disaffected, and the Scottish government, chiefly controlled by Lord Stair, his son, and Lord Melville, proclaimed an amnesty to all who should take an oath of allegiance by Dec. 31, 1691. The chief of the MacIans of Glencoe (a branch of the Macdonalds) put off doing so till the last moment and, there being no magistrate at Fort William when he went to take the oath, was compelled to proceed to Inveraray, with the result that the oath was not taken till Jan. 6. His old enemy, the master of Stair, took advantage of this, obtaining an order from William III for the extirpation of the Macdonalds as dangerous irreconcilables.

The order was carried out by the Campbells, also the inveterate enemies of the Macdonalds. Arriving in the glen as friends, they were given hospitality by the unsuspecting inhabitants. In the night they rose and treacherously murdered their hosts, while many Macdonalds who escaped actual massacre perished in the mountains. It is averred that William signed the order without reading it. *Consult* Massacre of Glencoe, G. Gilliland, 1912; Massacre of Glencoe, J. Buchan, 1933.

Glencoe. Village of Natal, S. Africa. It is 231 m. N.N.W. of Durban by rly., on the main line to Johannesburg and branch line to Vryheid and Ermelo. Its altitude is 4,303 ft. Near here the opening operations of the South African War took place in 1899.

and dies, furniture, medical goods, pottery, and tiles. Originally part of the first Spanish land grant in California, it began its existence about 1880 with the breaking-up of ranches. It was incorporated in 1906. Here are the Little Church of the Flowers and the Wee Kirk o' Heather and an academy maintained by Seventh Day Adventists. Pop. 82,582.

Glendalough. Valley of Eire, in co. Wicklow. It is 8 m. N.W. of Rathdrum, a station on the Eire

Glendalough, Ireland. The glen and old city, with the ancient Round Tower

state rlys., and is famous for its beauty and its eccles. ruins. The glen, 2 m. long, is enclosed by mts. which in places reach over 2,000 ft. It is traversed by the Glencalo, which in it forms two lakes. Glendalough as a town was the seat of a bishop from the 6th century to the 13th, after which, having been plundered, it fell into decay. The ruins are known as the Seven Churches, these being the cathedral, Our Lady's Church, S. Kevin's Kitchen (the most complete), the ivy church, the priory, and two others. Most were founded by S. Kevin. There are also a fine round tower and a cross.

Glendower, H.M.S. A naval training station of the Second Great War established near Pwllheli, Carnarvonshire, Wales. The station was closed down in July, 1946, and its ensign laid up in Bangor cathedral. The site was converted into a holiday camp.

Glendale. City of California, U.S.A. in Los Angeles co., at the S. end of the San Fernando Valley. Situated 6 m. from the heart of Los Angeles, it is served by rlys. and an airport. A centre of aircraft industry during the Second Great War, it manufactures aeroplanes and engines, tools

Glendower, OWEN (c. 1359-c. 1416). Welsh patriot. Also known as Owen ap Gruffydd, he claimed descent from the old Welsh princes. He studied law at Westminster, fought for Richard II against the Scots in 1385, and entered the service of Henry of Lancaster. After Henry IV's accession he became the champion of Welsh independence, assuming the title of prince of Wales and summoning a Welsh parliament, and spent the rest of his life in resistance against English domination.

He thrice defeated the English, aided the rebellions of Hotspur and Mortimer, and in 1404 made an offensive alliance with France against England. In 1408-09 he suffered serious reverses at Prince Henry's hands. The date and manner of his death are uncertain. The hero of many Welsh legends, Owen also figures in Shakespeare's *Henry IV.* *Consult* O. G. and the Last Struggle for Welsh Independence, A. G. Bradley, 1901; Owen Glendower, J. E. Lloyd, 1931.

Gleneagles. Locality in Perthshire, Scotland. It has a rly. junction 17 m. N.E. of Perth and a fine hotel, and became in the 1920s a fashionable resort for golfers. Pop. 486.

Glenelg. River of Victoria, Australia. It drains the S.W. corner of that state from the Grampians and debouches at the head of Discovery Bay at Nelson, near the South Australian border. Its length is 260 m.; it is

un navigable and in dry seasons its bed is bare through evaporation.

Glenelg. Seaport and watering-place of S. Australia. It stands on Holdfast Bay, 6 m. by rly. S.W. of Adelaide. S. Australia was proclaimed a British colony here, 1836.

Glenelg, CHARLES GRANT, BARON (1778-1866). British statesman. Born at Kidderpore, Bengal, Oct. 26, 1778, and educated at Magdalene College, Cambridge, he was called to the bar, and entered parliament in 1811 as member for the Inverness and Fortrose burghs. Made a lord of the treasury in 1813, a privy councillor and Irish secretary in 1819, he became vice-president

Charles Grant, 1st Baron Glenelg After J. Slater

in 1823 and president in 1827 of the board of trade, and of the board of control in 1830. In 1835 he was raised to the peerage and made colonial secretary, but was forced to resign in 1839 on account of his vacillating Canadian policy. He died childless at Cannes, April 23, 1866. His title was taken from his estate in Scotland.

Glenesk. ALGERNON BORTHWICK, BARON (1830-1908). British journalist. Born at Cambridge,

Algernon Borthwick,
1st Baron Glenesk
Haines

Dec. 27, 1830, eldest son of the editor of the *Morning Post*, he was Paris correspondent of that paper in 1850, and succeeded to the editorship in 1852 and the proprietorship

in 1876. He suggested the formation of the Primrose League, 1883, and was Conservative M.P. for S. Kensington, 1885-95. Knighted, 1880, he was created a baronet in 1887, and raised to the peerage as Baron Glenesk, 1895, when he handed over the control of the *Morning Post* to his son Oliver (d. 1905). By his death, Nov. 24, 1908, the title became extinct.

Glenfinnan. Glen and hamlet of Inverness-shire, Scotland. The hamlet stands at the head of Loch Shiel, 18 m. W. of Fort William. A monument, erected in 1815, marks the spot where Prince Charles Edward unfurled his banner in 1745.

Glenariff. Village and pleasure resort of co. Cork, Eire. It stands on Glenariff Harbour, an arm of Bantry Bay, 11 m. N.W. of Bantry, and is a noted beauty spot with almost tropical vegetation.

Glenarry. Glen of Inverness-shire, Scotland. It is formed by the Garry, and lies between lochs Quoich and Garry. It was the home of the Macdonalds, and gives its name to the Highland cap worn by kilted and other Scottish regiments.

This must not be confused with Glen Garry in Perthshire, part of the main road A9 between Perth and Inverness and traversed by a main railway line.

Glen Innes. Chief town in the rich New England plateau of New South Wales, in Gough co. It is 423 m. N. of Sydney by rly., on the

main line to Queensland. It is the chief tin-mining centre of the state, and bismuth, wolfram, and molybdenite are also found. Pop. 5,352.

Glenlivet or **GLENLIVAT.** Valley of Banffshire, Scotland. It is the glen of the little river Livet, a tributary of the Avon, and is chiefly celebrated for its whisky. It is also the name of a parish, 6 m. S.E. of Ballindalloch.

Glen Lyon. Longest of the Scottish glens. In Perthshire, it extends some 30 m. from Invermeran in the W. to a point near Aberfeldy

in the E. The river Lyon, a tributary of the Tay, is narrow and rocky and the mountain prospect severe. This was the scene of a clan fight between Stewarts and Macgregors; Campbell of Glen Lyon organized the massacre of Glencoe (q.v.).

Glenmore. Valley of Inverness-shire, Scotland. About 60 m. long, it extends from the Moray Firth to the head of Loch Linnhe, i.e. right across the country. It is thus called also the Great Glen of Scotland. In it are the Caledonian Canal and lochs Ness, Dochfour, Oich, and Lochy. There are other glens of this name in Scotland, one being in Perthshire.

Glen Moriston. Valley of Inverness-shire, Scotland. From Invermoriston on Loch Ness it runs 18 m. W.S.W. to Loch Clunie. At the eastern end there are birch and fir woods; near Torgylo, waterfalls; but the scenery at the W. end is wild.

Glen Orchy. Valley of Argyllshire, Scotland, joining Dalmally, near Loch Awe and Bridge of Orchy. 12 m. N.E. One of the loneliest and most beautiful glens, it was formerly a Macgregor possession, but passed to the Campbells.

Glenroy, looking across the glen to the three parallel roads or terraces

Glenroy. Valley of Inverness-shire, Scotland. About 14 m. long, running N. from Glen Spean, it is remarkable for three parallel roads which extend in terraces on both sides of the glen. They are generally thought to be the margins of lakes formed during the glacial period by the melting of the ice which filled the tributary valleys. The river Roy traverses the glen.

Glens Falls. City of New York, U.S.A., in Warren co. On the left bank of the Hudson, where it unites with the Champlain Canal, it is 55 m. N. of Troy, and is served by rly. and an airport. In the neighbourhood are limestone and marble quarries, and brick and cement works, and the city has plants producing pulp, newsprint, wallpaper, boxes, lace, toys, and pigments. It is named after falls on the Hudson river. Settled in 1763, Glens Falls, a village in 1837, became a city in 1908. This "dark and bloody ground" of Fenimore

Cooper saw fighting in the 18th century wars. Pop. 18,836.

Glenshee. A valley of Perthshire, Scotland. It is the valley of the Shee Water, which joins the Ardlie at Bridge of Cally; length 13 m. From the Spittal of Glenshee runs the highest motor road in the U.K. (2,199 ft.) over the Cairnwell to Braemar.

Glenarry bonnet

Glenarry, Inverness-shire. View of the glen at the mouth of the river

Glenshiel. Valley of Ross and Cromarty, Scotland. Its length is about 10 m. from Loch Duich, E.S.E. to Clunie Bridge, and its average breadth is 4 m. It was formerly part of the Seaforth country, and in 1719, during the small Jacobite rising, there was a fight in the pass between the Seaforths and the English. This place inspired Dr. Johnson with the idea of writing his *Journey to the Western Isles*. Glenshiel is also the name of a parish, which includes Letterfeearn.

Glentilt. Valley of Perthshire. It runs for about 15 m. S.W. from the border of Aberdeenshire to Blair Atholl, being straight and of uniform steepness. The Tilt runs through it, hence its name. On both sides are peaks of the Grampians over 3,500 ft. high.

Glider. A heavier-than-air aircraft without an engine; the term usually embraces the sailplane,

The Germans first exploited the aircraft towed glider—then a surprise in military tactics—in the invasion of the Low Countries in May, 1940; they used it again in Crete (see Crete in the Second Great War), and during the N. Africa campaigns. These gliders which were towed singly or in pairs, threes, or in line behind a Junkers transport (itself a troop-carrier), were simply, almost crudely, constructed of wood. They carried ten or so fully-armed shock troops, and were usually regarded as "expendable."

The glider and its tug were easy targets for fighter aircraft unless the force using them had superiority in the air. When the Allies invaded Europe on June 6, 1944, they had complete air superiority, and a huge armada of gliders formed, with the airborne parachutists, the spearhead of the liberating forces. British Airspeed

power of manoeuvre; the sailplane is often a masterpiece of engineering capable of taking advantage of "thermals," cloud formations, or other up-currents, and thus of soaring for remarkable distances. A well-built sailplane, which has a best gliding angle of about 1 in 25, has a finely tapered wing of great span, and a thin fuselage approaching a perfect streamlined form. Most gliders have a single skid as a landing gear, the larger transport gliders also taking off with a wheeled undercarriage which can be discarded in flight.

There are several methods of launching: by release from a rubber-cord catapult, by car tow, by high-speed winch, by utilising rocket propulsion, or from an aeroplane which has towed the glider into the air. Dunstable Downs, Long Mynd in Shropshire, and, in Germany, the Wasserkuppe are typical hill ridges used as launching sites by gliding clubs.

From April 1, 1949, the registration of gliders was made com-

Glider. Two types of British-built machine. Above, low-wing sailplane, which has a span of 82 ft. and a possible speed up to 130 m.p.h. Right, high-wing type used widely for instructing pilots

which is capable of continuous flight and of rising above its starting-point. Before the invention of a suitable power plant, the early pioneers, such as Lilienthal and the Wright brothers, experimented with gliders and solved many of the problems of flight.

The glider later suffered an eclipse, until the period between the First and Second Great Wars, when the sport of gliding was developed, especially in Germany (where the training of a military air force was then forbidden). High-performance sailplanes of German design were introduced into other countries, and the gliding clubs of Great Britain were largely equipped with original or adapted German craft.

Many new uses were found for engineless aircraft during the Second Great War. Pre-service training of potential pilots on primary gliders was a feature of several air forces; the Air Training Corps (*q.v.*) use gliders as an introduction to the R.A.F. Research with scale models provided data for wing sections, etc.; the troop-carrying glider, towed singly or in series behind a powered aircraft, was also developed.

Horsas, lifting a load of three tons, tank-carrying G.A.L. Hamilcars, and the smaller American-built Waco Hadrians were used successfully. The battle of Arnhem (*q.v.*), the crossing of the Rhine, in which over 1,300 gliders were towed to the battlefield, and the second Chindit expedition in Burma were other outstanding Allied glider-borne actions. (See also Airborne Forces; D-Day; Europe, Western: Its Liberation; Glider Pilot Regiment.)

After the war enthusiasts again took up gliding as a sport, in Britain under the British Gliding Association (offices, Londonderry House, Park Lane, London, W.1). Gliding equipment—some of it still of German origin—fell into four distinct classes: primary gliders, secondary gliders, two-seat gliders, and sailplanes. The primary is an open-framework training craft to accustom the pupil to the sensations of gliding flight, and to the use of the controls; the secondary is of better airflow design, and gives the pilot more

pulsory and certificates of airworthiness issued by the ministry of civil aviation. The Royal Aero Club grants to pilots certificates of proficiency in six classes: A, for which a flight of 30 secs. duration must be supported by proof of previous experience, etc.; B; C; and Silver, Gold, and Diamond C badges. Separate flights of 500 m. distance and 5,000 metres alt. qualify for the last.

Noteworthy records include: (distance) Miss O. Klepikova (U.S.S.R.), Moscow to Stalingrad, 465 m. in a straight line, July, 1939; (duration) G. Marchand (France), 40 hrs. 51 mins., March, 1949; (altitude) J. Robinson (U.S.A.), 33,497 ft., July, 1949. In Gt. Britain P. A. Wills in a German-designed sailplane, Weihe, flew from Hatfield to near Falmouth, 232 m., May, 1949; and above Long Mynd (Shropshire)

reached 15,247 ft., June, 1946. *Consult* Sailplanes: Their Design. Construction and Pilotage, C. H. Latimer-Needham, 1939; Flight Without Power, L. B. Barringer, 1942; Soaring Flight, T. Horsley, 1944; Gliding and Advanced Soaring, A. C. Douglas, 1947.

Glider Bomb. Radio-controlled bomb introduced by the Germans in 1943. It was a rocket-assisted glider with a war head of high-explosive. Carried under the fuselage of a Heinkel 177 and released from a great height, the bombs were guided to their target by radio-control from the parent aircraft. The glider bomb was used mainly against shipping; on Sept. 9, 1943, one sank the battleship *Roma* while it was on its way with the rest of the Italian fleet to surrender at Malta. *See* Bomb.

Glider Pilot Regiment. British army unit formed in Feb. 1942. The regiment consists of volunteers selected from the army. It provides pilots and co-pilots for the gliders of an airborne force, and for administrative purposes forms part of the Army Air Corps (*q.v.*). Members of the regiment are trained not only to fly gliders but also as assault infantry; after the gliders have landed and discharged their troops the pilots act as section-leaders. Each glider carries a section, and the sections are organized into squadrons.

Glider pilots are trained by R.A.F. instructors, first learning to fly light-powered aircraft, then graduating to gliders. Training is continued at R.A.F. conversion units, where the pilots learn to fly service gliders. Operational ground and air training are completed in the service squadrons of the regiment. The Glider Pilot Regiment served in N. Africa, Sicily, Italy, and N.W. Europe. It suffered such heavy casualties at the battle of Arnhem (*q.v.*) that over 1,000 R.A.F. pilots had to be drafted into its ranks to bring it up to strength for the Rhine crossing. *See* Rhine, Crossing of.

Glinka, MICHAEL IVANOVICH (1803-57). A Russian composer. Born at Novospasskoi, Smolensk, June 2, 1803, he grew up in the country under the influence of folk music. He took lessons from Field in St. Petersburg, met Donizetti and Bellini in Italy, and studied composition in Berlin, returning to Russia in 1834. His opera *A Life for the Tsar*, was an immediate success in 1836. This

was followed by *Russian and Ludmilla*, 1842, a work based on Pushkin's poem—musically superior but less popular. These operas, nationalist in spirit, are regarded as bringing to birth the school of Russian music. Glinka also wrote songs and pieces for the pianoforte. He died in Berlin, Feb. 15, 1857.

Gliwice. Polish form of Gleiwitz (*q.v.*), city of Upper Silesia.

Globe (Lat. *globus*). Spherical body, the whole of the surface of which is equidistant from the centre. The word is used in the singular to signify the earth. A sphere on the surface of which is drawn a map or representation of the earth or heavens is termed a terrestrial or celestial globe respectively. *See* Earth.

Globe Amaranth (*Gomphrena globosa*). Annual herb of the family Amaranaceae. A native of India, it has downy, opposite, oblong leaves. The flower-heads are globular, about 1 in. across and dark red.

Globe Artichoke. Perennial plant supposed to be a cultivated variety of the cardoon (*q.v.*).

Globe Fish. The lesser spotted variety with distended body

Globe Fish (*Chilomycterus antennatus*). Marine fish of the Tetrodontidae family. They are found in the tropic seas, and have the power of distending their bodies with air till they assume a more or less globular appearance. At other times they have the usual shape of a round-bodied fish. The largest species are about 2 ft. in length, and most are beautifully coloured.

Globe-flower. Leaves and flowers of this European herb

Globe-flower (*Trollius europaeus*). Perennial herb of the family Ranunculaceae. It is a native of Europe. The leaves are round in general outline, but divided into

five toothed lobes. The fine yellow flowers are globular, and their rich appearance is due to the numerous sepals, which are petal-like, while the true petals are small and narrow. The plant favours moist situations on high ground, and in the Scottish highlands is known as the luckengowan.

Globe Theatre, the old London playhouse associated with Shakespeare. From an engraving c. 1612

Globe Theatre, THE. Famous London playhouse, built on the Bankside, Southwark, in 1599, by the Burbages, Shakespeare, and four other actors. A circular building—the “wooden O” referred to in *King Henry the Fifth*—it held 1,200 spectators, and was partly open to the sky. Shakespeare acted and had shares in this theatre. It was destroyed by fire, June 29, 1613. Its successor opened June 30, 1614, lasted until April 15, 1644. It has been conclusively shown that the playhouse of Shakespeare's time was on the S. side of Park Street, Southwark, and the position of the frontage has been located to within a foot. A reconstruction was made for the film of *Henry V* in 1944. (*See* Bankside; The Globe Playhouse, J. Adams, 1943).

The third London playhouse of this name stood in Newcastle St., Strand, 1868-1902; here ran Charley's Aunt, 1893, and The Gay Lord Quex, 1899. Hicks's Theatre (built by Seymour Hicks), opened in Shaftesbury Avenue, Dec. 27, 1906, and, renamed The Globe in 1909, became a leading West End playhouse. Its many successful comedies included The Glad Eye, 1912; French Leave, 1920; Our Betters, 1923; The Truth Game, 1928; Call it a Day, 1935; Robert's Wife, 1937; While the Sun Shines, 1943.

Globe-thistle (*Echinops*). Genus of biennial and perennial herbs. Of the family Compositae, they are natives of Europe and W. Asia. Their long, strongly lobed and

spiny leaves give them a resemblance to thistles. The flowerheads are gathered into large globular masses, each standing on a long stalk. The flowers are white or blue. The best known species is the S. European *E. vitro*.

Globigerina. Genus of Foraminifera. They are minute protozoa, mainly marine, which secrete shells. In the perforate group these shells are hard and glossy and are pierced by a vast number of little holes, through which the body protoplasm flows out in thread-like streams, called pseudopodia, for the purposes of loco-

Globe-thistle. Leaves and flowerheads of the *Echinops*

Glochidium. Name given to the larval stage of the fresh-water mussel (*Anodonta cygnaea*) in the belief that it was a distinct species parasitic upon *Anodonta*. This mussel retains its eggs until they hatch, and the glochidia which result from them are found at first attached to the gills of their parent. They are cast out in the outgoing current of water from the gills of the parent, and attach themselves to the fins of sticklebacks and other fishes, and are thus distributed to other parts of the pond or stream. The shell develops, and the young mussels then drop to the bottom.

Glockenspiel (Ger., play of bells). Musical instrument, consisting of a series of tuned steel bars played upon either with two hammers or with a pianoforte keyboard. Formerly a row of bells was employed, hence the name. A notable use of the glockenspiel was by Wagner in the scores of *Die Meistersinger* and the *Ring cycle*.

Glockner, Gross. Twin-peaked mountain of the Noric Alps, Austria. It lies between Tirol, Salzburg, and Carinthia, and is the loftiest summit of the Hohe-Tauern range. Its two peaks are named Grossglockner (12,455 ft.) and Kleinglockner (12,350 ft.). The former height was ascended for the first time in 1800 by Prince Salm-Reifferscheid. The Pasterze glacier is fed by the Glockner

snows. In 1935 the Gross Glockner motor road was opened. This connects N. Austria with Carinthia and Tirol, being 22 m. long and rising to 8,100 ft.

Glogau (Pol. Glogow). A town and former fortress of Silesia. Lying on the left bank of the Oder, 60 m. N.W. of Breslau, it is a rly.

junction and was a district capital and garrison town of Germany. From c. 1250, when it received German urban privileges, it was the bone of contention between rival princes. Remarkable buildings were a 12th century cathedral, churches of the 14th and 18th centuries, a palace (later town hall), theatre, and college all of the 18th century. It had a famous printing plant, clock, hat and metal works, sugar and starch factories, and shipyards. As a river port it had more than 250,000 tons turnover per year. Glogau was taken by Marshal Koniev's 1st Ukrainian army, April 1, 1945, and its German population (28,229) was expelled after it came under Polish administration in 1945.

Gloppen. River of Norway, the principal stream of the country. It rises in the Dovrefeld at an alt. of 2,338 ft., issuing from Lake Aursund. Flowing in a generally S. direction for 350 m., it falls into the Skagerak at Frederikstad. Timber from the Osterdal region, the richest wood district in Norway, is floated down stream to Frederikstad. The drainage area of its basin is 15,925 sq. m., and its largest tributary is the Vorma.

Gloriana. Titular character of Spenser's allegorical poem, *The Faerie Queene*. Introduced in canto i, 3, as "That greatest Glorious Queene of Faeryland," she personifies both Glory and Queen Elizabeth, to whom the work is dedicated and who also figures in it as Belphebe.

Gloriosa. A small genus of bulbous herbs of the family Liliaceae. Natives of tropical Asia and Africa, their branching stems bear lance-shaped leaves in pairs or whorls. These leaves have slender extended tips which act as tendrils, enabling the plants to climb. The rich orange and red flowers are reversed, their six undulated segments turning upwards, whilst the stamens and pistils spread out below.

Glorious. A British aircraft carrier of the Second Great War, sunk in action with German battleships *Scharnhorst* and *Gneisenau* on June 8, 1940, while covering the evacuation of Norway by British troops. Built in 1915 as a shallow draught cruiser to operate in the Baltic, and converted into a carrier in 1930 at a cost of £2,025,000, *Glorious* displaced 22,500 tons on a length of 786 ft., and had a speed of 30.5 knots. She carried 48 aircraft, sixteen 4.7-in. guns, and a number of smaller weapons.

Globigerina. Minute foraminiferous protozoa in globigerina ooze

motion and for seizing food. *Globigerina* abound in the sea, where their shells falling to the bottom form the globigerina ooze which constitutes such a considerable part of the bed of the ocean. See Foraminifera.

Globularia. A small genus of perennial herbs and shrubs, of the family Globulariaceae. Natives of the Mediterranean region, they have leathery, lance-shaped leaves, and numerous small flowers gathered into flattish heads. *G. vulgaris* and *G. nudicaulis*, with blue flowers, are frequently grown in gardens, and *G. alypum*, a shrubby species, in the greenhouse. They are sometimes known as ball-flowers.

Globulins. Class of protein substances which occur in both the plant

Globularia alypum, a shrubby greenhouse species

Glory OR BROCKEN SPECTRE. Name given to the series of coloured rings sometimes seen to be surrounding the shadow, on mist or cloud, of the observer. This phenomenon is quite common in hilly country, but is associated particularly with the Brocken (q.v.), Saxony.

Gloss (Lat. [from Gr. *glossa*, tongue], obscure word). Note or remark in the margin of a book or between the lines, to explain words likely to be of doubtful meaning to the reader: employed by copyists of old MSS. A collection of glosses forms a glossary, which is usually placed at the end of a book.

Glossina. This genus of flies, which transmit the parasites that cause sleeping sickness, is described in this work as Tsetse Fly.

Glossitis (Gr. *glōssa*, tongue). Inflammation of the tongue. Acute glossitis may arise from injuries, or from the bites or stings of insects; it is occasionally seen in acute fevers. The tongue becomes swollen and painful and there is interference with speech, swallowing, and respiration. Chronic glossitis is associated with various forms of anaemia, with pellagra, and with syphilis. Treatment depends upon the cause. See Tongue.

Glossodia (Gr. *glōssa*, tongue). Small genus of terrestrial orchids. Natives of Australia, they have egg-shaped tuberous roots and a solitary lance-shaped or oblong leaf. The flowering stem does not exceed 1 ft. in height, bearing one, two, or three blue or purple flowers, sometimes speckled with white. These are of more regular form than in most orchids. At the base of the lip is a long, tongue-like appendage which has suggested the name of the genus.

Glossop. A mun. borough and market town of Derbyshire, England. It is 13 m. E. of Manchester, and has a railway station. Its chief industry is the manufacture of cotton. There are also dyeworks, bleachworks, paper mills, calico printing, and food canning. The chief church is All Saints, and there are three fine R.C. churches. Hadfield is part of the borough, much of which is built on land belonging to the Howards. Glossop Hall is a building in the French style. Glossop is on the edge of the Peak district, being in the parl. div. of High Peak, and near it is Longendale, with the Etheridge flowing through. It was made a borough in 1866. Market days, Fri. and Sat. Pop. 17,900.

Glosso-pharyngeal Nerve. Ninth cranial nerve. It is the nerve of sensation to the upper part of the throat and tonsils; of taste to the back and posterior two-thirds of the side of the tongue; and of motion to the stylo-pharyngeal muscle; and middle constrictor of the pharynx.

Glottis (Gr.). Chink between the true vocal cords. It alters in size and shape with the degree of tenseness in the cords which also determines the pitch of the note emitted in speaking or singing. Spasm of the glottis occurs in whooping cough, croup, and sometimes in tetanus.

Gloucester. City, co. of itself, parl. and mun. bor., port, and co. town of Gloucestershire, England. It stands on the left bank of the Severn, 114 m. W. and N. of London; it is served by two railways and by the Berkeley Canal (16½ m.), which connects the docks with those at Sharpness in the Severn estuary.

An abbey was established here in 681, and in 1022 a Benedictine monastery was founded, the church of which, following the dissolution of the monasteries by Henry VIII, became the cathedral in 1541, when Gloucester was constituted a separate see. Substantially Norman, the cathedral is a magnificent edifice, and contains

unique fan tracery, the canopied shrine of Edward II, the shrine of Osric, king of Northumbria, other fine monuments, and beautiful stained glass.

Other buildings include the 12th century church of S. Mary de Crypt, the episcopal palace, the guildhall, the prison, the King's School, and other educational institutions. The centre of the city is the Cross, the intersection of four main streets known as Eastgate, Northgate, Westgate, and Southgate.

Remains of the ancient walls exist, and there are memorials to Hooper the martyr, and Raikes, the founder of Sunday schools. There is a fine public park in which is a chalybeate spring, discovered in 1814. Gloucester has engineering and other works for the manufacture of aircraft, railway carriages, engines, agricultural implements, machinery, oil and feeding cake, chemicals and essences, and factories for making matches, pins, carpets, rugs, toys, and in war time munitions. One member is returned to parliament. Market day, Sat. Pop. est. 61,000.

Gloucester is one of the most historic of English cities. Com-

Gloucester arms

Gloucester. The cathedral from the south-east. In the foreground is the 15th century Lady Chapel

Frith

manding the passage of the Severn, it was probably the British *Caer Glow*, and the Roman *Glevum*. In Anglo-Saxon times it was also a fortified place, and occasionally the residence of kings. It was one of the three places at which William the Conqueror wore his crown. Several parliaments were held here; and in every civil war, down to the one between Charles I and his foes, its possession was coveted.

Gloucester. A city of Massachusetts, U.S.A., in Essex co. On the S. of Cape Ann peninsula, facing the N. side of Massachusetts Bay, it lies 32 m. N.E. of Boston by rly. A port of entry and a popular summer resort, it has one of the finest harbours on the coast, and is the cod, halibut, and mackerel fishing centre of the U.S.A.

Its fishing fleets, manned largely by men of Portuguese, Italian, and Scandinavian descent, range the Atlantic as far as Iceland and Greenland. Their hardy and adventurous lives have provided literary material, e.g. in Kipling's *Captains Courageous*. A bronze statue was set up in 1923 to commemorate the thousands of fishermen who have lost their lives at sea. *Norman's Woe*, 2 m. from Gloucester, is the sunken rock of Longfellow's *The Wreck of the Hesperus*. Pop. 24,046.

Gloucester, EARLAND DUKE OF. English titles. Like other counties, Gloucester had its earls in Norman times, one of these being Robert, a natural son of Henry I. The great family of Clare secured the title about 1218, and retained it until Earl Gilbert was killed at Bannockburn in 1314. In 1385 Thomas of Woodstock, a younger son of Edward III, was made duke of Gloucester, and after he had forfeited the title in 1397 it was held by two other well-known men: Henry IV's son Humphrey, and he who became Richard III. Later dukes of Gloucester were Henry, a son of Charles I; William (d. 1700), the eldest son of Queen Anne; and George III's brother, William Henry, created duke in 1764. He died in 1805, when his only son, William Frederick, known as *Silly Billy*, became duke. He married his cousin, Mary, daughter of George III, and when he died, childless, in 1834, the title again became extinct. It was revived for Prince Henry, son of George V, in 1928.

Gloucester, HENRY WILLIAM FREDERICK ALBERT, DUKE OF (b. 1900). British prince. Third son of King George V, he was born at

York Cottage, Sandringham, March 31, 1900. His health at first being delicate, he attended a

H.R.H. the Duke of Gloucester, brother of King George VI, with the Duchess of Gloucester

private school at Broadstairs, but later went to Eton, adopted a military career, and was commissioned in the 10th Royal Hussars. In 1921 he was created K.G., and in 1925 became a privy councillor and was one of four counsellors of state deputed to act for the king when he was abroad.

A duke from 1928, he went to Japan to invest the emperor with the Order of the Garter, 1929, and in 1930 was present at the coronation of the emperor of Abyssinia. His marriage to Lady Alice Montagu-Douglas-Scott (b. Dec. 25, 1901), daughter of the duke of Buccleuch, took place on Nov. 6, 1935, in the private chapel of Buckingham Palace. In 1937 the duke was promoted major-general, but soon relinquished his army career to assist his brother, King George VI, by undertaking official engagements. He was appointed A.D.C. to the King and colonel-in-chief of several regiments.

At the outbreak of the Second Great War, the duke became chief liaison officer to the B.E.F. in France, and on Aug. 12, 1940, was made chief liaison officer, G.H.Q., Home Forces. In 1942 he made a tour of British forces in the Middle East and India. On Nov. 15, 1943, it was announced that at the request of the Commonwealth government the duke had been nominated first royal governor-general of Australia; but as senior regent he was unable to leave Great Britain to take up his appointment until 1944, when Princess Elizabeth had come of age. His governorship was limited to two years, and he returned to Great Britain in Jan., 1947, so as to act as counsellor of state during the King's absence in S. Africa.

The sons of the duke and duchess of Gloucester were Prince William Henry Andrew Frederick, born Dec. 18, 1941; Prince Richard Alexander Walter George, born Aug. 26, 1944.

Gloucester, HUMPHREY, DUKE OF (1391-1447). English prince, youngest son of Henry IV and Mary de Bohun. Created duke by his brother Henry V, he was wounded at Agincourt, captured Cherbourg, and fought at Rouen. He acted as regent during the king's absence in France, 1420-21, and was protector of the realm with limited powers during the minority of Henry VI. Humphrey's impulsiveness led to quarrels with the Beaufort faction, and his opposition to Henry's French marriage brought the enmity of Suffolk. Under arrest on a charge of treason, he died at Bury St. Edmunds, Feb. 23, 1447, and was buried at St. Albans.

Humphrey was not unlike a prince of the Italian Renaissance. He patronised men of learning and gave its first library to Oxford university. The common people loved the "good duke" and the traditional estimate was handed on by Shakespeare in *King Henry the Sixth*. A promenade in S. Paul's cathedral was long known as Duke Humphrey's Walk, from the erroneous notion that it contained his tomb; and the phrase "dinner with Duke Humphrey" (i.e. no dinner) was an allusion to the beggars who loitered there. Consult *Life*, K. H. Vickers, 1907.

Gloucester, THOMAS OF WOODSTOCK, DUKE OF (1355-97). English prince. The youngest son of Edward III was born at Woodstock, Jan. 7, 1355. A rich wife was found for him in the heiress of the Bohuns, and he was made constable of England and earl of Buckingham. Thomas's public life almost covered the reign of his nephew, Richard II. Having fought in France, he received a dukedom in 1385 and was

Humphrey, Duke of Gloucester
From a portrait

Thomas of Woodstock, Duke of Gloucester
From a portrait

the leader of those who put a check upon the arbitrary deeds of Richard in 1386. As leader of the lords appellant in 1388, he crushed his enemies ruthlessly, and for a short time was the real ruler of England.

Richard regained authority in 1389, but kept on good terms with the duke until 1396. Differences arising between them, Richard himself arrested Gloucester at Pleshey, his Essex castle, in July, 1397, and a little later his end came; most probably he was executed at Calais in Sept. His son was not allowed to inherit his titles or estates.

Gloucester Cheese. Hard whole-milk cheese, made between autumn and Christmas, and of a rich red colour. It is the ideal substitute for the original Welsh cheese of a rarebit. The term Double Gloucester refers to its size. A foreign expert has dismissed this cheese as "similar to Cheddar," but another ranks it "for richness and delicacy of flavour with the great blue cheeses."

Gloucestershire. Western co. of England. Its area is 1,257 sq.

m., and it is 64 m. from N.E. to S.W. Very irregular in shape, it falls into three parts. In the W., lying between the Severn and the Wye is the Forest of Dean; the centre district is that of the Severn valley; the E. that of the Cotswolds. The chief rivers are the Severn, which flows right through and forms the estuary which makes it a maritime county; Wye, Upper and Lower Avon, and Thames, which rises here. Smaller streams are the Frome, Coln, Leach, and Leadon. The chief range of hills is the Cotswolds, famous rather for the quiet beauty of their stone villages than for their height, although some points exceed 1,000 ft.

Gloucestershire is mainly an agricultural county, although coal is mined in the Forest of Dean. The Severn valley is noted for its rich pasture land, while here much wheat is grown. Cheese is made, cattle are reared, apples and pears are grown for making cider and perry. Sheep are plentiful on the Cotswolds. Cloth is manufactured, several of the small towns, especially Stroud, being noted for broadcloth.

Gloucester is the county town, but Bristol is much the largest. Cirencester and Tewkesbury are noted for their architectural and historical associations.

Cheltenham is a watering-place and educational centre. A feature of the county is the picturesque market towns, e.g. Minchinhampton, Northleach, Nailsworth, Tetbury, Chipping Campden, Winchcomb.

The co. is served by the Thames and Severn canal. It sends four members to parliament, and its boroughs another eight. It is a hunting county. Its cricketers have included the Grace brothers, G. L. Jessop, and W. R. Hammond. It is in the Oxford circuit and in the dioceses of Gloucester and Bristol. Pop. 786,000.

LITERARY ASSOCIATIONS. Robert of Gloucester was a 13th century rhyming chronicler. Another chronicler of a century later was Richard of Cirencester. William Tyndale, first English translator of the Bible, belonged to a Gloucestershire family. A bishop of Bristol was Joseph Butler, author of *The Analogy of Religion*. William Warburton, critic and friend of Pope, was bishop of Gloucester. Notable writers born at Bristol include Grocyn, the water poet, John Taylor, Chatterton, and Southey. John Keble was born at Fairford; Hannah More at Stapleton. Daniel and Samuel Lysons were natives of the county.

Cirencester House, formerly known as Oakley Park, was frequently visited by Swift and Pope. At Amberley, Dinah Maria Craik wrote *John Halifax, Gentleman*, scenes in which are based on life at Tewkesbury. Shakespeare lays scenes of Richard II and Henry IV, part 2, in this co. Shelley, T. E. Brown, Newbolt, Drinkwater, and Flecker have used Gloucestershire as a background to their poetry. The *Victoria History* of the co. appeared in 1907; the *King's England* vol. in 1938; the *Land of Britain* vol. in 1942.

Gloucestershire Regiment. A regiment of the British army raised in 1694 as the 28th Foot. It served under Marlborough at Ramillies in 1706 and was at Fontenoy in 1745. It went to America and the West Indies and fought with distinction at Guadeloupe (1759), Quebec (1759), Martinique (1762), and St. Lucia (1778).

Gloucestershire arms

Gloucestershire. Map of this West of England county, showing the head of the Severn estuary

Gloucester Regiment badge

At the battle of Alexandria in 1801 the regiment was attacked by Napoleon's Invincible Legion both front and rear, but, fighting back to back, defeated the enemy with heavy loss. To commemorate the victory it was permitted the unique distinction of wearing a badge at the back of the cap as well as on the front, which earned it the nickname of "The Fore and Afts." The regiment repeated its exploit in the First Great War when surrounded by Prussian guards at Ypres.

Battle Honours of the Regiment

In the Peninsular War the 28th gained fourteen battle honours, distinguishing itself at Talavera and Salamanca, and fought at Waterloo. It served in the Sikh War and the Indian Mutiny, and in the Crimea, fought at Alma, Inkerman, and Sevastopol.

In 1881 the 28th was amalgamated with the 61st Foot and given its present county title. The Gloucesters served throughout the Boer War, and were at the defence of Ladysmith and the relief of Kimberley. Twenty-four battalions were raised for service in the First Great War, and amongst the battle honours won were: Mons; Ypres, 1914, 1915, 1917; Somme, 1916, 1918; Lys; Selle; Vittorio Veneto; Doiran, 1917; Sari Bair; Bagdad.

Two battalions were with the B.E.F. in France in the Second Great War. The 2nd Battalion had been so hard pressed that only one officer and nine men were left to be taken off from Dunkirk. The 1st Gloucesters were in Rangoon at the outbreak of war and served throughout the Burma campaign; they were later joined by the 10th battalion. The 2nd Gloucesters were largely responsible for the capture of Havre in 1944 and on April 13, 1945, were the first British troops to enter Arnhem. The 4th Gloucesters acted as a searchlight regiment. The regimental depot is at Bristol.

Glove. Close-fitting garment covering the hand. The custom of wearing gloves goes back to immemorial times. Xenophon refers to their use by the Persians. They were familiar to the Romans, who, however, generally despised their use, and were worn by the Anglo-Saxons in the 7th century. In those days there was a separate division only for the thumb. A glove with two thumbs, so that it

may be used for either hand, is still worn in Iceland. In the 13th century gloves made of linen and reaching to the elbow began to be worn for ornament, as well as for warmth or protection.

Leather gauntlet gloves were used for hawking, and knights in full armour had gloves with metal entirely covering the back of the hand and overlapping the fingers. These were made flexible in the centre. Gloves were part of the imperial insignia in the Middle Ages, and are still worn ceremonially by the pope and the R.C. hierarchy. In the gorgeous dress of the 15th, 16th, and 17th centuries gloves, perfumed, jewelled, or richly embroidered on the back, and decorated with fringed gauntlets, made their appearance. Queen Elizabeth was especially fond of these costly articles, and some of her gloves are still extant.

The three rows of stitchery seen on the back of modern gloves are said to be a survival of these embroidered backs, though it is more probable that formerly the stitching of the fingers was extended to make the hand look long and slim. Modern forms of gloves include rubber ones worn for anti-septic reasons by surgeons, and for protective purposes by electricians, etc., and padded gloves for boxing, cricket, fives, and other sports and games.

Symbolic Meanings of Gloves

Gloves have had their symbolic meanings. Thus it was the custom to wear gloves in the hat as the favour of a mistress, the memorial of a friend, and as a mark to be challenged by an enemy; and a glove was thrown down as a challenge to an enemy, who accepted battle by picking it up.

Gloves are believed to have been first made in England on a large scale by the monks of Bath. In the 14th century a guild of glovers came into existence in London, and the trade of making them was already a profitable calling. The prices of ordinary sheep-leather gloves were then fixed at 14d. per pair, whilst the best gloves fetched 2d. a pair.

By 1190 the glove-makers of France had formed themselves into a company with S. Anne as their patron, while in Scotland the glove-makers of Perth were a chartered corporation in 1165. In England the glovers obtained a charter of their company in 1638.

In considering the glove trade, it is well to have a clear idea of the meaning of names applied to gloves of various qualities. The

name Cape, one of the first to be met with, was originally used to designate a glove from the Cape of Good Hope. The skin is large, heavy, and rather tight-grained. Latterly, however, the soft, pliable glove usually made from sheep and lamb skins tanned and dressed by the "nappa" method has become commercially known as Cape. What was once a name for a glove made from a single type of skin is now the designation of a glove made from leather of a particular tannage. The best types of these skins come from the district of Kazan and the Volga area in Russia. Others come from Spain, Turkey, Rumania, Bulgaria, Yugoslavia, and to a smaller extent from other sources. The skins with the finest grades of wool are normally inferior for glove-making to those with hairy, wiry wool.

Dressing and Colouring

Lamb glove and Cape glove, when advanced to the stage of tanning known as "in the white," are virtually identical, except that the skins that make Capes are heavier and larger. It is in the finishing and colouring processes that the distinction occurs. The dressing and colouring which complete the tannage of Capes is done by the "drum" or "dipped" process, and the skin is coloured all the way through; whereas leather for the so-called lamb glove has the colour "brushed" on the grain surface only, leaving the flesh side or the inside of the glove white. The nappa tannage is an alum process, and besides there is a chrome tannage which has the merit of being washable in water of any temperature up to boiling point.

After much experiment a tannage was perfected for the skin of the Arabian haired sheep, resulting in the production of the strong, soft, and velvet-like finished Mocha glove. The Mocha sheep is a distinct type, not a species resulting from cross-breeding between the Mocha goat and the woolled sheep, as is frequently supposed. No other glove passes through so many processes in tanning and dressing as the Mocha, and while the appearance of the finished leather somewhat resembles suède, it is in fact very different in character. Mocha is "friezed," not "suèded." The finished or outer side surface of the gloves is on the grain, not the flesh side of the leather. The friezing process removes the grain, leaving much of the strength of the outer skin. The name suède is applied to a glove of leather when subjected to the suèding process.

Glove. Processes in glove manufacture. 1. Stretching the skins in readiness for the puncher. 2. Punching the skins into shape. 3. The stitching room. 4. Finishing off and laying out the gloves on steam heated shapes

The chamois and the doeskin of commerce are both sheepskins, or parts of sheepskins, tanned and dressed as chamois or doeskins. Dealers and merchants in sheepskins find it advantageous to split the skins edgewise, thus providing two thinner skins. The upper part with the grain surface is termed a "skiver," and the lower a "flesher," and it is from these flesher sheepskins that the leathers known as chamois and doeskin are produced.

Process of Manufacture

All gloves are subjected practically to the same process. After they have been stamped out the sewing process is carried out by machines. The first machine invented for glove sewing was put on the market about 1875. In the quality and finish of the cloth from which gloves are made British makers have made rapid progress. The "suèdèd" cloth, a fabric so finished as to give it the velvety feel and appearance of suèdèd leather, and the "Duplex" cloth, which is made by sticking together two single cloths by processes more or less secret, were before 1914 almost a German monopoly, but machinery was evolved which allowed of British products equal to any German fabrics. *Consult* Gloves Past and Present, W. M. Smith, 1917.

A. T. E. Binstead

Glover, TERROT REAVELEY (1869-1943). A British scholar. Born at Bristol, July 23, 1869, he was educated at its grammar school and St. John's College, Cambridge. Professor of Latin at Queen's university, Kingston, Ont., 1896-1901, he returned to Cambridge, where he became a leading personality at the university and was public orator, 1920-39. A fine interpreter of the classics both as writer and as lecturer, he wrote *Life and Letters in the 4th Century*, 1901; *Studies in Virgil*, 1904; *From Pericles to Philip*, 1917; *Democracy in the Ancient World*, 1927; *Greek Byways*, 1932; *The Ancient World*, 1935; *The Challenge of the Greeks*, 1942. He died May 26, 1943.

Glovers' Company, THE London city livery company. First mentioned in 1349, incorporated with the Leather-sellers in 1502, it was separately incorporated by letters patent in 1638. The site of the old hall, in Beech Lane, E.C., is covered by warehouses. Offices: 116, Cannon St., E.C.4.

Glovers' Company arms

Gloversville. City of New York, U.S.A., in Fulton co. on the Erie Canal, 54 m. N.W. of

Albany, it is in the foothills of the Adirondacks, and is served by rly. and barge canal. Fulton co. is the chief centre of glove making in the U.S.A., the industry dating from 1760 when Perthshire settlers arrived. Gloversville also makes silk and knitted goods and wooden products. It became a city in 1890. Pop. 23,329.

Glow-worm. Name given to the female of the beetle *Lampyrus noctiluca*. It is common in many parts of Great Britain and throughout central and southern Europe. While the male possesses large elytra and has the usual appearance of a beetle, the female is wingless and grublike in form, resembling a larva rather than a perfect insect. The creature derives her name from the presence of luminous spots on the abdomen, which betray her whereabouts to the male. See Beetle.

Gloxinia. Hot-house plants of the family Gesneriaceae. They are natives of Central Asia and India, and were introduced into Great Britain in 1739. They reach an average height of 1 ft. and have elongated, bell-shaped blossoms of every possible shade and colour. They may be raised from seed planted in March in an ordinary

greenhouse, or from the tubers potted up early in the year. Gloxinias need watering freely

Gloxinia. Foliage and flowers of *G. sinningia*

until they flower, but when the foliage withers, water should be gradually diminished in supply until the tubers are quite dry. There are about six species in cultivation; hybrids are innumerable.

Glubb, JOHN BAGOT (b. 1897). British soldier. Educated at Cheltenham and the R.M.A., Woolwich, he was commissioned in the Royal Engineers in 1915 and served in France. In 1920 he went to Iraq. Transferred to Transjordan, 1930, Glubb was desert

John B. Glubb, British soldier

control officer in the Arab Legion, of which he assumed command in 1939. During the Iraqi rebellion of 1941, he commanded the legion at Habbaniyah.

The legion fought in the Syria campaign and in the Arab-Jewish war of 1948. "Glubb Pasha" was promoted brigadier in 1943 and made C.M.G. in 1946. He wrote *Story of the Arab Legion*, 1948.

Glucinum. Variant name of the chemical element beryllium (*q.v.*).

Gluck, CHRISTOPH WILLIBALD von (1714-87). German composer. Born at Weidenwang, Bavaria, July 2, 1714, son of a gamekeeper, he studied music at Prague and later at Milan. After producing from 1741 a number of operas of the conventional type, he realized the need of drastic reforms and introduced these into his works. *Orfeo ed Euridice*, 1762, is a landmark in the history of opera, and shows his ideas of making the relation of the music to the poetry more harmonious, resembling that between the arrangement of light and shade in drawing.

The more mature opera *Alceste* followed in 1767. *Iphigénie en*

Aulide (Paris, 1774) was the occasion of a struggle between two musical schools in which Gluck's party was victorious over the followers of Piccinni. His success was consolidated by *Armide*, 1777, and *Iphigénie en Taured*, 1779. Gluck was at one time music master to Marie Antoinette. For long he resided in Vienna and received from the emperor the title of Ritter von. He died there, Nov. 15, 1787. A Life by M. Cooper appeared in 1935. *Pron.* Glook.

Gluconic Acid ($C_6H_{12}O_7$). Colourless crystalline substance, soluble in water and alcohol, produced by bacterial, chemical, or electrochemical oxidation of glucose. The calcium salt is used in medicine to counter deficiency of this element in the blood.

Glucose. Carbohydrate of the monosaccharide class, belonging, with fructose and galactose, to the hexose group. The vegetable kingdom can synthesise glucose from carbon dioxide and water—a proceeding which depends on solar energy (photosynthesis) which is translated by chlorophyll (or allied pigments) into chemical energy.

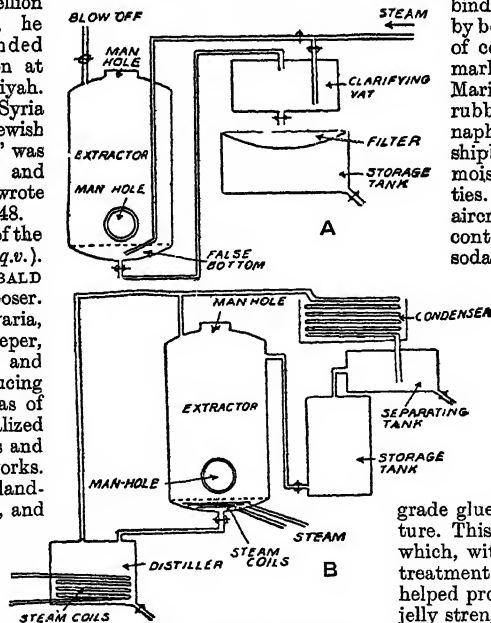

Man does not synthesise hexose in this way: he depends on plant life to do it for him. The human liver can produce glucose from proteins or fats, but these have already been produced by plant or animal life. More complex carbohydrates taken in by the body are metabolised to the hexose level. The breakdown of glucose in the presence of phosphorus in the tissues gives the energy for every bodily action. The nervous system utilises glucose alone of all energy-giving substances. Stored in the liver, it is released into the blood, coma and death resulting if the proportion is sensibly varied. Glucose metabolism goes awry if the level of the B group of vitamins is lowered beyond a certain point. Glucose is the form of sugar present in the blood in diabetes and glycosuria.

Glycosides. Class of substances occurring in the vegetable kingdom, which yield glucose (dextrose) on fermentation or by the action of dilute acids. *See* Glycosides.

Glue. Impure form of gelatine. It is a by-product of industries dealing with skins, bones, and animal tissue, and arises by the action of steam on the insoluble protein matter found in such materials. Skin glue is stronger than bone glue, but both are used for wood working, abrasive paper, gummed paper, and in book-binding.

Fish glue is prepared by boiling the skin and tissue of cod, etc., and is usually marketed as a viscous liquid. Marine glue is a solution of rubber and shellac in naphtha or benzene used in shipbuilding because of its moisture-resisting properties. Casein glue, used for aircraft work, is a powder containing casein, lime, and soda; its great advantage lies in the fact that it can be used at ordinary temperatures. Some synthetic glues made from resins set by heating, not by cooling as with animal glue.

During the First Great War there was a demand for high-grade glue in aeroplane manufacture. This led to systematic study, which, with careful selection and treatment of the raw material, helped production of glues of high jelly strength. The British Standards Institution published in 1927 agreed methods for testing glues, the methods being the result of

Glue. A, plant for extracting and clarifying glue; B, plant for degreasing bones

collaboration between chemists, manufacturers, and users.

Glutin is the main constituent of glue prepared from skins, and chondrin when bone tissue is used. Skins are washed, soaked in milk of lime, and neutralised before boiling with water; this leads to a purer glue of higher jelly strength. Bones, chiefly the head, ribs, and shoulder blades of cattle and horses, are thoroughly sorted, cracked in a suitable mill, and treated with benzol or a petroleum fraction for the extraction of bone fat. The cleansed bones are steam-heated in vertical boilers for the extraction of the glue and the latter after purification is dried to the familiar cake.

Glue is derived from substances containing large molecules, such as those in proteins, starch, resins, and rubber. By dispersal in water the molecules are partly broken down, and the dissolved units, being of graded molecular size, can penetrate into surfaces of various porosities. The liquor has a low surface tension but a high viscosity temperature coefficient. On cooling, the glue liquor sets to a jelly, which in turn loses water reversibly to form a solid tough film. The tensile strength of this film depends on the purity and degree of hydrolysis of the original protein from which the glue was derived, as also on the final moisture condition of the joint. Microscopic examination of a good glue joint shows a continuous film between the two wood surfaces and that this film penetrates into the pores, producing the desired adhesive effect.

H. M. Langton, B.Sc., F.R.I.C.

Glukhov. A town of the Ukraine S.S.R. in the prov. of Chernigov. It is 130 m. E.N.E. of Chernigov. There are rope and brick works, breweries, and distilleries. Glukhov was once the residence of the hetman of the Little Russian Cossacks. The centre of a Russian counter-attack in Sept., 1941, Glukhov was taken by the Germans in Oct. during their advance on Kursk. It remained in German hands until Aug. 30, 1943, when it was recaptured by the Russians in their first re-entry of the N. Ukraine.

Gluteal Muscles. Three muscles, *Glutens maximus, medius, and minimus*, which form the fleshy mass of the buttock (Gr. *gloutos*, rump). Their principal action is to extend the thigh or straighten the body after stooping. They also help to move the thigh outwards, and rotate the leg outwards.

Gluten. Tough, elastic substance, consisting principally of protein, obtained from wheat flour by washing it with water. The two principal ingredients of gluten are the proteins gliadin and glutenin, as a result of which wheaten flour forms dough. Gliadin, soft and sticky, is obtained from gluten by treatment with alcohol; glutenin, insoluble in water and alcohol, can be obtained from dough with dilute alkali. Bread and biscuits made from gluten are eaten by diabetics who must avoid starch.

Glutton or Wolverine (*Gulo luscus*). Carnivorous mammal of the weasel group, found in the

Glutton or wolverine, a species of weasel
W. S. Herridge, F.Z.S.

northern districts of Europe, Asia, and N. America. It does not now occur in Great Britain, but its fossil remains are not uncommon. It is nearly 3 ft. in length, has dark brown fur, and a short, bushy tail. Of heavy build, it walks with something of the action of a bear, is found in forests, is nocturnal in habit, and devours any animal it can catch. It is particularly expert in digging rabbits out of their burrows.

Glycas, MICHAEL (fl. 12th century). A Byzantine historian. Probably a native of Sicily or Corycra, he was the author of a general history of the world from the earliest times down to 1118, the end of the reign of Alexius I Comnenus. The work is written in a simpler style than most of the Byzantine histories.

Glycerine, GLYCERIN, OR GLYCEROL [$C_3H_5(OH)_3$]. Thick colourless liquid with a syrupy taste, obtained by the decomposition of fats and oils in the process of making soap and candles. It was discovered by Scheele in 1779 as a by-product in the manufacture of lead plaster. Chevreul and Braconnet in 1817 showed that glycerine is a component to the extent of 9 to 11 p.c. of all fats and oils. The discovery of nitroglycerine by Nobel in 1863 increased the demand for glycerine and caused it to be manufactured on a large scale.

Glycerine is produced to a small extent in the fermentation of sugar, but the chief sources are the waste products of the soap and candle maker. When fats and oils are saponified with a caustic alkali, the fatty acids combine with the soda or potash, and glycerine is formed as a by-product. This "sweet-water," as it is called, is afterwards purified and concentrated. The candle-maker requires only the harder portion of fats, and to obtain this heats the fats with lime or magnesia, either in open vessels or in an autoclave, glycerine being again obtained as the by-product.

Other methods of obtaining glycerine from fats are by the acid saponification process, Twitchell's process, and the use of a ferment obtained from castor oil seeds. The by-products are subsequently purified either by distilling the crude glycerine with superheated steam at ordinary pressure or in a vacuum apparatus. Colour is removed by treating the glycerine with animal charcoal and water by evaporation. Glycerine can be obtained by chlorinating the hydrocarbon propylene, a by-product in the cracking of petroleum, to form allyl chloride. This is combined with hypochlorous acid and the product, when hydrolysed, yields glycerine. Much distilled glycerine is used to make high explosives such as dynamite, blasting gelatine, and cordite. It is required to pass special tests before it can safely be used for the manufacture of explosives. The purest glycerine is employed for medicinal purposes. The substance is used in filling gas-meters and hydraulic jacks, for giving body to light wines, in liqueurs, and in the manufacture of copying inks, shoe polishes, printers' rollers, copying graphs, and toilet preparations.

Glycocoll, GLYUIN, OR AMINO-ACETIC ACID ($C_2H_5NO_2$). Discovered by Braconnet in 1820, and prepared by boiling glue with sulphuric acid or caustic potash. It can be made by mixing chloracetic acid and ammonia solution, or by boiling hippuric acid with strong hydrochloric acid. It forms colourless crystals. Glycocoll has a sweet taste, and its solution is coloured deep red by iron chloride and deep blue by copper salts.

Glycogen. Name given to the form in which glucose is stored in the body. It is a carbohydrate related to dextrin. First discovered (by Claude Bernard) in the liver, it was later found in small quantities

in other organs of the body. It is readily converted back into glucose by enzymes in the liver and muscles. During exertion the glycogen in the muscles is rapidly consumed; it is replenished during rest; consequently the concentration varies (0.1 to 1 p.c.). Glycogenolysis is the destruction of glycogen in animal tissues, including the final splitting and oxidation of glucose. See Glucose.

Glycol or ETHYLENE GLYCOL ($C_2H_4O_2$). Colourless liquid with a sweet taste, discovered by Wurtz in 1859. It can be prepared by boiling potassium carbonate with ethylene bromide and water, the product being distilled and fractionated. Made from the ethylene of natural gas, glycol is used as an anti-freeze solution in motor-car radiators, and as a cooling agent in aircraft engines. As it has a higher boiling point than water, a smaller radiator scoop can be fitted. The Rolls-Royce Merlin was the first engine to use glycol for cooling. It replaces glycerine in many of its applications.

Glycosides. Class of substances occurring in the vegetable kingdom which yield a sugar and one or more other products when hydrolysed by acids. Glycosides in which the sugar constituent is glucose are called glucosides (*g.v.*). Among the glycosides are several used in medicine, e.g. digitalin and digitoxin obtained from foxglove (*Digitalis purpurea*); jalapin from *Convolvulus orizabensis* and *C. scammonia*; and strophanthin from strophanthus seeds. The group of drugs which owe their action to what are termed the cardiac glycosides includes digitalis, strophanthus, and squill.

Glycosmis (Gr. *glykys*, sweet; *osmē*, smell). Small genus of trees and shrubs of the family Rutaceae. They are natives of tropical Asia and Australia. The leaves are divided into three or more leaflets, and the small white flowers are fragrant. The fruits are small edible berries, those of *G. citrifolia* being esteemed by the Chinese for their delicious flavour.

Glycosuria (Gr. *glykys*, sweet; *ouron*, urine). Condition characterised by the presence of glucose in the urine. It may be temporary, in which case it is due to the intake of too much sugar, or to overaction of the adrenal glands in times of emotion or physical exertion. Sugar may be present in the urine when the blood-sugar content is normal, a harmless diabetes not demanding treatment. Chronic glycosuria characterises *diabetes*

mellitus (see Diabetes), and is the result of the failure of the muscles to burn or utilise sugar, which is therefore excreted by the kidneys.

Glyn, ELINOR (1864-1943). A British novelist. The daughter of Douglas Sutherland, of Toronto, and wife of Clayton Glyn, she was born in Jersey, Oct. 17, 1864. She achieved a popular success with her first book, *The Visits of Elizabeth*, 1900. Later publications include *Reflections of Ambrosine*, 1902; *The Vicissitudes of Evangeline*, 1905; *Three Weeks*, 1907; *His Hour*, 1910; *The Career of Katherine Bush*, 1916; *Man and Maid*, 1925; *It*, 1927; *The Flirt and the Flapper*, 1930; *Romantic Adventure* (her autobiography), 1936. During the 1920s she went to Hollywood, where she advised directors of the still silent films on the production of love scenes. She died in London, Sept. 23, 1943.

Glyndebourne. Opera house at Glynde, Sussex, England. Opened in 1934, this theatre was

combined with natural resins such as colophony or copals, and with fatty acid or drying oil-modified oxygen convertible resins. By 1920 it was found that both oil and resin-modified alkyds are compatible with nitro-cellulose, yielding surface coatings which show both increased adhesion and gloss retention. This led to wide use of the alkyds for motor car finishes. Increase in the demand for these materials has correspondingly increased the demand for naphthalene, formerly a coal-based product, but now also obtained from petroleum by aromaticisation. The bulk of current alkyd production goes into synthetic finishes; by American statistics this was over 245,000,000 lb. in 1944.

Glyptic Arts. Pertaining to carving, more especially to the art of engraving gems. The chief classes of engraved gems are: intaglios, which have the design sunk below the surface; cameos, which have the design carved in

Glyndebourne. The private opera house attached to the owner's residence near the downland village of Glynde, Sussex

built by John Christie and named after its owner's country house to which it is attached. Here in agreeable conditions the operas of Mozart, Verdi, and Donizetti were performed during summer. The theatre, with one of the largest and best equipped stages in Europe, had seating for 600. A restaurant was attached. The productions were under the direction of Carl Ebert, with Fritz Busch as conductor. During the Second Great War the theatre was closed. It reopened in 1946 with the first performance of Benjamin Britten's *Rape of Lucretia*, presenting the same composer's Albert Herring the following year.

Glyptal Resins. Condensation products of polyhydric alcohols, notably glycerol and glycols, with polybasic acids such as phthalic and maleic, now more generally referred to as alkyds. They belong in the main to the thermo-hardening family of plastics, and may be

relief; and scarabs, the backs of which have a beetle carved in relief, while their bases have a design in intaglio.

Engraved gems have come down from ancient Greece, from the Cretan and Mycenaean epoch. The stones used included amethysts, cat's-eyes, beryls, garnets, and jasper. Malachite was used for seals; onyx and sardonyx for cameos. A carved jewel of this kind was treasured as a talisman in the ancient world. The influence of sculpture is often apparent in the engraved gems of 5th century Greece. Two intaglios in the British Museum have subjects recalling the caryatids of the Erechtheum and figures from the Parthenon frieze. Designs also depicted mythological scenes, and sphinxes and lions copied from scarabs. Under the Romans the glyptic arts fell into decay, but they flourished again during the Middle Ages in Byzantium.

Glyptodon (Gr. *glyptos*, carved; *odous*, tooth). Genus of extinct armadilloes, whose fossil remains have been found in the post-tertiary deposits of S. America. Some of these fossils represent an animal 9 ft. in length. The armoured carapace, instead of being in bands as in existing armadilloes, permitting the animal to roll up hedgehog fashion, was solid and continuous like the carapace of a tortoise. The head, feet, and tail emerged from under this dome, but the head was protected by a bony cap, and the tail covered by tubercled bony rings. The carapace was beautifully sculptured in small rosette patterns. The name was suggested by the deep ridges and grooves into which the surface of the molar teeth are moulded. See Fossil.

G-Men. Popular name for the agents of the Federal Bureau of Investigation in the U.S.A. (G standing for government). This bureau, founded in 1908, is charged with the investigation of violations of federal, as distinct from state, laws. Its widespread activities are mainly the result of its reorganization in 1924, when J. Edgar Hoover was appointed director. One feature is its laboratory, occupying a whole floor in the department of justice, where a staff of 400 carries out examinations of documents, firearms, explosives, etc. The collection of fingerprints has grown to more than 100,000,000. Candidates must be between 25 and 40 years of age, and must either be graduates of a law school or have had three years of public accounting practice after graduation at a school of accountancy. They are then sent to the F.B.I. training school at Quantico, Va. No G-man is known to the public by name.

Gmünd or **SCHWÄBISCH-GMÜND.** Town of Germany, in Württemberg. It stands in the valley of the Rems, 29 m. E. of Stuttgart. Formerly a free imperial city, it has still complete walls and towers, and some interesting churches, including that of the Holy Cross (14th century) and the pilgrimage church of S. Salvatore, with two chapels hewn out of the rock. Gmünd is noted for its gold and silver ware, optical instruments, watch and tool making, etc. Pop. 22,430.

Gmunden. Town and pleasure resort of Upper Austria. In the Salzkammergut, it stands at a height of 1,400 ft. where the Traun leaves the Traunsee, 38 m. E.N.E. of Salzburg. The Traunstein rises sheer from the margin of the lake

Glyptodon. Skeleton of *G. clavipes* from the Pampa formation of Buenos Aires
British Museum

to a height of 5,550 ft. Gmunden is a centre for hill and lake excursions. In addition to a Gothic church, theatre, and museum there is a kursaal. Cumberland castle was the seat of the Hanoverian dynasty after Prussia annexed Hanover in 1866. Pop. 8,200.

Gnat. Popular name for certain small dipterous (two-winged) insects of the Culicidae family. Some 29 species occur in Great Britain. The larval stage is passed in water, and the adult insects are most abundant in marshy districts. Blood-sucking in habit, they are also known as mosquitoes (*q.v.*).

Gnathostomata (Greek). Animals with truly jawed mouths. All vertebrates except the cyclostomes (lampreys, *q.v.*, and their allies) belong to this group.

Gneisenau. Name given to two German warships. During the First Great War the battle cruiser Gneisenau was flagship of Admiral von Spee's China squadron, which included her sister ship Scharnhorst and the light cruisers Leipzig, Dresden, and Nürnberg. On Nov. 1, 1914, this German squadron met and defeated Cradock's squadron off Coronel, but on Dec. 8, von Spee's ships were themselves caught and all but one destroyed by Sturdee's battle cruisers off the Falklands. (See Coronel: Falkland Islands, Battle of.)

In 1938 a second Gneisenau was completed for the German navy. A battleship displacing 35,100 tons with a length of 741 ft. and beam of 98 ft., she had a speed of 29 knots. She mounted a main armament of nine 11-in. guns and a secondary battery of 12 5.9-in. guns, as well as 14 4.1-in. and 16 37-mm. A.A. guns. She carried four aircraft and had two catapults for launching them.

Early in 1941 the Gneisenau, in company with a new Scharnhorst, was operating against Allied shipping in the Atlantic. After sinking some 20 merchant vessels, both vessels put into Brest for refit, where they were joined a few months later by the Prinz Eugen (*q.v.*). There on March 30 the R.A.F. made the first of a total of 3,299 bomber attacks on these warships. The severity and persistence of the raids compelled the German admiralty to move them to a safer anchorage.

Escorted by a large number of destroyers, E-boats, and mine-sweepers, and protected by a strong umbrella of fighter aircraft, the three German warships slipped out of Brest early on Feb. 12, 1942. Bad visibility, technical breakdowns in the British air patrols, and the jamming of the R.D.F. screen by the Germans, enabled the German squadron to escape detection until it had nearly reached Cap Gris Nez, where at 10.42 a.m. the Gneisenau and Scharnhorst were identified by two Hurricanes.

These aircraft raised the alarm, and at 12.30 p.m. six Swordfish torpedo-carriers under Lt.-Comdr. Esmonde of the Fleet Air Arm went in to attack the squadron; all were shot down. Aircraft of Coastal, Bomber, and Fighter Commands took up the attack; eight M.T.B.s and six destroyers attempted to intercept the squadron; and at night magnetic mines were laid ahead of the enemy ships in the mouth of the Elbe. Both the Gneisenau and the Scharnhorst were damaged by these mines. The former reached Kiel, where she was subjected to further bombing attacks. She was then moved to Gdynia, where she lay until that port was captured by the Russians, March 28, 1945. They dismantled, reconditioned, and commissioned her as a floating battery.

Gneisenau, AUGUST WILHELM ANTON NETHARDT, COUNT VON (1760-1831). German soldier. The son of a soldier, he was born Oct. 27, 1760, and was educated at the university of Erfurt. He served first in the Austrian army. With a German contingent he was in America in the British service during the war of independence, and then he entered the army of

A. von Gneisenau, German soldier

Prussia. There he won promotion, and when, in 1806, Prussia again took up arms against France, he was known as a capable officer.

He helped to reorganize the Prussian army, and in the war of liberation served Blücher as chief of staff. He was responsible for the plan of campaign of 1814, and for that of the battles around Waterloo, and to him was due the ruthless pursuit of the French. In 1818 he was made governor of Berlin and a member of the Prussian council of state. In 1830 he was appointed to command an army on the frontier of Poland, where he died of cholera, Aug. 24, 1831. The standard life is by G. H. Pertz and H. Delbrück, 1864-80.

Gneiss (German). Coarse textured, crystalline rock. Strongly banded or foliated, it is somewhat like a streaky granite in appearance. It is composed of quartz, ferromagnesian minerals (e.g. biotite-mica, or hornblende), and, usually, feldspar. It is coarser than schist, and the dark and light coloured minerals are in distinct separable bands or lenticles. Gneisses are commonly distinguished from one another by some prominent, easily recognizable mineral which they contain (e.g., biotite-gneiss, hornblende-gneiss, sillimanite-gneiss). Gneisses in which eye-like lenses or individual crystals of feldspar or aggregates of quartz and feldspar occur are called augen-gneisses (Ger. *Auge*, eye).

Some gneisses are produced by flow movements or the rhythmic settling of heavy crystals in igneous rocks when they were still fluid; others are the result of recrystallisation of stratified rocks under conditions of intense metamorphism, i.e. high temperature and pressure. Many gneisses are the product of impregnation or permeation of older solid rocks by solutions or even igneous rock in a highly fluid condition derived from depth in the earth's crust, and travelling along planes of weakness in the rocks. These fluids react chemically with the pre-existing material, causing a general softening of the whole mass which can then yield plastically to earth movements. On final solidification the rock crystallises in a more or less banded condition resulting from the movement or from initial differences in composition.

Gneist, HEINRICH RUDOLF HERMANN FRIEDRICH VON (1816-95). German jurist. Born at Berlin, Aug. 13, 1816, the son of a judge, he was educated at Eisleben and the university of Berlin. He be-

came a lawyer, but the study rather than the practice of law attracted him, and in 1844 he was made professor at Berlin.

From 1858 to 1893 he was a member of the landtag of Prussia; in 1868 he was elected to the diet of the North German Confederation, and from 1870 to 1884 he was a member of the Reichstag. In all he was an active member of the National Liberal party, and was active also as an advocate of legal reforms. During 1875-77 he was a judge of the supreme court of Prussia, and for a time was tutor to the future emperor William II. Ennobled by Frederick III in 1888, he died July 22, 1895. His works on England include *The English Parliament*, 1886, and *History of the English Constitution*, 1886.

Gniezno or GNESEN. Town of Poland. It is 31 m. N.E. of Poznań on the rly. to Toruń. Poland's kings were crowned here, down to

Gniezno. View of the town and cathedral across the river Wrzemia

1320. It became the seat of an archbishop in 1000. The cathedral, founded in the 9th century, and largely rebuilt at the close of the 18th century, contains the tomb of S. Adalbert (q.v.) and bronze doors dating from the 12th century. The archiepiscopal palace is also noteworthy. There are manufactures of sugar, leather, and machinery, and a trade in dairy products, also breweries, flour, and mills for other products. In the part of Poland occupied by Germany in Sept., 1939, it was freed by the Russians Jan. 22, 1945. Pop. 26,000.

Gnome. Small legendary being in the folk-tales of many peoples, supposed to dwell in the earth and guard the treasures hidden there. Gnomes, dwarfs, and elves become almost inextricably interlinked in the folk-tales, though the elves are generally smaller, more fairy-like creatures, while the gnomes or earthmen are more akin to the black dwarfs of North European folklore. See Folklore.

Gnome (Gr. *gnōmē*). Maxim, aphorism, or reflection summing up or stating concisely a general

truth. The Greek Gnostic poets were those who wrote sententious didactic verses, and included Solon, Theognis, and Phocylides.

Gnome-et-Rhône. An aero-engine works at Limoges, France. Built in 1939 as one of the four main factories for the French air force, it became of increasing importance to German war economy as the Allies air attacks on Germany grew. On the night of Feb. 8-9, 1944, the R.A.F. attacked this works, using for the first time 12,000-lb. "factory buster" blast bombs; 20 bays out of 48 were entirely destroyed. The works was nationalised in 1945.

The name of Gnome is a notable one in the aero-engine industry. The 50 h.p. Gnome of 1909 was the first successful engine of the rotary air-cooled type (see Aero-engines illus., p. 119); later the firm manufactured a large number of radial engines, including British designs under licence.

Gnomon. Vertical pillar of which the shadow cast on a horizontal surface was used by the ancients for astronomical observations of latitude, azimuth, and time. The term is now applied to the inclined style of a sundial.

Gnomonic Projection. System of cartography. In a map drawn on this projection, all great circles are drawn as straight lines radiating from a particular point selected according to the purpose for which the map is required. A gnomonic chart or map is produced by projecting a spherical map of the world on to a plane, which touches the globe at one point. When this tangential point is located at the site of a radio direction finding station, the chart can be used to lay off in straight lines the true bearings of distant transmitting stations as observed on a ship's or aircraft's direction finder. See Chart; Direction Finding; Mercator.

Gnosicism (Gr. *gnosikos*, knowing). Term usually applied to the heresy with which were concerned sects that sprang up in the 1st century A.D., the members of

which claimed mystical knowledge denied to the world. The name was adopted first by the Ophites.

Gnosticism existed before Christianity. Originating in the East, it embodied attempts to formulate a cosmic philosophy or theory of the universe, and a quest for a world religion. An example of syncretism, *i.e.* the blending of opposite and conflicting ideas into a harmonious whole, its sources were Zoroastrianism, Buddhism, and accretions from Judaism, Mithraism, and the mythologies of Babylon, Egypt, and Platonism.

While, broadly speaking, Gnosticism was a form of dualism—mind and matter; light and darkness; good and evil—it embodied not one but protean forms of thought. It is characterised by association with the idea of emanation, a theory of creation which postulates One Supreme Being from whom lesser beings or aeons have emanated as light emanates from the sun. From the fall of one of these lesser beings into the outer void arose a Demiurge, regarded as the embodiment of evil, from which redemption is possible only for two of the three classes into which Gnosticism divided mankind, by reunion with the Infinite—a state comparable with the Buddhistic nirvana. A Gnostic's view of Jesus Christ is given in the apocryphal epistle of Barnabas (*q.v.*).

Gnosticism assumed a new form after the rise of Christianity; and gained a strong foothold in the 2nd century. Information about the leading Gnostics and their writings is largely derived from the anti-heretical treatises of the Christian Fathers—Irenaeus, Tertullian, Hippolytus, Epiphanius, Ignatius, and Justin Martyr; from the Pistis Sophia, a 3rd century Coptic work.

Gnostics interpreted the Scriptures for their own purpose; and one result was the formulation by the Catholic Church of its standards of orthodoxy. Gnosticism died out in the 6th century, but was reflected in Manichaeism, an attempt to fuse Zoroastrianism, Gnosticism, and Christianity; in Paulicianism; in the beliefs of the Cathari and Albigenses; and in Rosicrucianism.

The reputed founder of post-Christian Gnosticism was Simon Magus (*see* Acts 8), the supposed author of a work called The Great Revelation, of which only fragments remain. It had two prominent schools; one in Alexandria, of which Basilides, Valentinus, and Carpocrates were leaders, and one in Syria, of which Saturninus and Cerdo were among the teachers. The last leader of note was Marcion, who conceived three primal forces; the good God, as revealed by Jesus Christ; evil matter, under the rule of the devil; and the Demiurge, newly identified with the Yahveh of the Jews.

These sects wavered between extremes of asceticism and sensual immorality; and included, in addition to those named after their leaders, the ascetic Encratites or Continentes, and the serpent worshipping Ophites or Naaseni. One influence that worked against Gnosticism, by means of a rival theory of the universe, was Neoplatonism (*q.v.*). An important branch of study in connexion with the heresy is concerned with its elaborate and mythical symbolism, secret terminology, and use of inscribed talismans and amulets. The supposed Scriptural references to Gnosticism, *e.g.* John 1; 1 Tim. 1, v. 4; 2 Tim. 2, v. 18; Tit. 3, v. 9, are debatable. *See* Abraxas; Docetism; Ophites; Valentinians.

Bibliography. Gnostic Heresies of the 1st and 2nd Centuries, H. L. Mansel, ed. J. B. Lightfoot, 1875; The Gnostics and Their Remains, C. W. King, 2nd ed. 1887; Fragments of a Faith Forgotten, G. R. S. Mead, 1900; Esoteric Teaching of The Gnostics, F. Swiney, 1909; numerous works in German, and the writings of the Fathers. Gnostic Story of Jesus Christ, G. T. Sadler, 1919; Gnostic Fragments, E. Buonaiuti, 1934; Gnosis in Christian Scripture, W. Kingsland, 1937.

Gnu, OR WILDE-BEEST. Large antelope, differing from all others in having a heavy head and neck

which somewhat suggest the appearance of a small bison. There are two genera: *Connuchaetes*, the white-tailed, and *Gorgon*, the brindled, both natives of Africa. The horns curve downwards and then upwards. The muzzle is remarkably wide, the neck has an erect mane, and the tail has long, thick hair almost like that of a horse. The animal stands rather more than 4 feet high at the

Goa. The church of Bom Jesus, completed 1603, in which is buried S. Francis Xavier, the apostle of the Indies

shoulder, lives in the open country, and is generally found in company with the zebra. *See* Antelope.

Goa. Portuguese colony on the W. coast of India. Bounded by the Bombay presidency, its area is 1,537 sq. m., a little over a third of which is under cultivation, producing rice, spices, copra, coconuts, pepper, and betel nuts. Some 500 salt works produced 26,000 tons of salt in 1939. The trade is chiefly transit. New Goa, the capital of Portuguese possessions in India since 1843, includes Panjim. Except for some of its churches, still in excellent preservation, Old Goa, once the wealthiest city in India, is now a city of ruins. Here, in the church of Bom Jesus, is buried S. Francis Xavier. The colony has belonged to Portugal since its capture by Albuquerque in 1510. Pop. of settlement, 624,177 (1940).

Goajira. Territory of Colombia, S. America. A peninsula jutting into the Caribbean Sea, on the N.W. shore of the Gulf of Maracaibo, it is low-lying and sandy on the coast, with the Oca Mts., a N.E. extension of the Andes, inland. Area, 4,730 sq. m. Puerto Estrella is the capital. The native Indians, virile and independent, are as yet little influenced by civilization. Claimed by both Venezuela and Colombia, it was given to the latter republic after arbitration in 1891. Pop. 53,409.

Goalanda OR GOALUNDO. Village and subdivision of E. Bengal. Pakistan in the Faridpur district. Goalanda village is 151 m. N.E. of Calcutta, and is the terminus of

Gnu. White-tailed variety. The animal is found only in Africa
Gambier Bolton, F.Z.S.

the Eastern Bengal Rly. and an important steamer station.

Goalpara. District, sub-division, and town of India, in W. Assam. It lies to the S. of Bhutan, and, although fertile, is very unhealthy. The town is the capital of the district, and stands on the river Brahmaputra, 80 m. N.E. of Rangpur. Pop. (district) 1,014,285; (subdivision) 298,361; (town) 56,418.

Goat. A genus of the group Bovidae, which includes also oxen, sheep, and antelopes. The goats

The true wild goat is a native of Persia, Asia Minor, and some of the Mediterranean islands, and it is from this species that the domesticated goat has descended. The varied form of the horns in domesticated varieties suggests their mixed origin. Its domestication dates from prehistoric days, for its remains have been found in the Swiss lake dwellings, and it was well established in the earliest Egyptian period. Among domesticated breeds may be specially mentioned the Cashmere and

Angora goats, noted for their very valuable silky hair. (See Cashmere Goat.)

GOATKEEPING. Goats are kept in large numbers in many countries, both for the sake of their hides and hair, and also as a source of dairy products. Their value is not fully realized in Great

Britain, although a British and an Irish goat society have both done valuable work. To cottagers and smallholders the goat is of particular value as a milk producer. It is hardy, easy to keep, and thrives on a miscellaneous diet.

Goats' milk is relatively rich in butter-fat and casein, its percentage composition being: water, 85.71; casein, 3.20; albumin, 1.09; milk-sugar, 4.46; fat, 4.78; ash, 0.76. Goats are almost free from tuberculosis, and infants fed on their milk not only thrive but run no risk of contracting this disease. If perfect cleanliness is maintained, especially by careful washing of the udders before milking, the unpopular "goaty" flavour is absent. Butter made from goats' milk is white and does not look attractive. Goat cheeses are much esteemed. A goat is not worth keeping unless it yields at least 2 quarts per day at kidding, an amount that is often greatly exceeded. To secure good results a suitable breed, i.e. one bred from milk-giving strains, must be selected. The Toggenburg is most esteemed, after which come the Anglo-Swiss and Anglo-Nubian cross-bred varieties.

The best time for mating is Sept. to March, but by using the foreign breeds or crosses with them, kidding can be arranged for any time, and a winter supply of milk ensured. Kids not required for addition to the herd are killed at birth, especially the males. Except for a little corn, summer feeding (May to August) costs hardly anything, the animals being put out on rough grazing. Tethering, though usual, is not good for the animals; but if not tethered they must be confined by strong, high fencing, as they are very destructive. At other times the grass available must be supplemented by a miscellaneous ration, which may include hay, roots, offals, cake, and various scraps, such as potato-peelings, garden refuse, and acorns. Water and salt must be provided. A few animals can be housed during winter in any available building, but a herd should be accommodated in a suitably constructed goat-house. See The Book of the Goat, H. S. H. Pegler, 5th ed. 1917.

Goat Fell. Mountain of the Isle of Arran, Scotland. It lies 1½ m. N.W. of Brodick. Composed of granite, it is of volcanic origin. It is 2,866 ft. high.

Goat Moth. Large moth of the genus *Cossus*, found in most parts of Great Britain. The fore wings, often over 3 ins. in expanse, are pale grey clouded with brown, with a kind of network of fine brown lines. The hind wings are grey, with very fine reticulations. The caterpillar is flesh colour, with reddish brown patches, and is almost hairless. When it is alarmed it gives out a strong and offensive goat-like smell, from which the moth derives its name. It lives in the wood of willow, ash, and elm trees, eating out long burrows often large enough for a finger to

Goat Moth. Specimen of *Cossus ligniperda*

go in. It takes three years to come to maturity, and does great damage to the timber, the destruction of the tree being by no means unusual. It is about 3 ins. long.

Goat's-beard (*Tragopogon pratensis*). Perennial herb of the family Compositae. A native of Europe and N. and W. Asia, it has a tap-root with milky juice, and the slender, alternate leaves, 5 to 9 ins. long, clasp the stem at their bases, which are dilated, especially in the upper leaves,

Goat. 1. Toggenburg. 2. Nubian. 3. Anglo-Nubian. 4. Irish

are placed between sheep and antelopes, and it is difficult to distinguish them from sheep. Certain species of wild sheep approach goats very closely in structure and appearance.

Goats differ from sheep in the bony structure of the skull, and the horns are placed close together immediately above the eyes. The males are usually bearded, and have a strong odour. They lack the glands on the hind feet, and have callosities on the knees. While they live in herds, they associate less intimately and are of more independent disposition than sheep. The flesh of the kid is excellent, but that of the adult is apt to be tough and rank.

The goat in its wild state inhabits the Eastern hemisphere exclusively, the so-called Rocky Mountain goat of N. America not being a true goat, but belonging to a genus approaching the antelopes. It is widely spread in S. Europe and Asia, but in Africa occurs wild only in Egypt and Abyssinia. So far as is known, the wild goat has never inhabited the British Islands, the so-called wild goats of some parts of Scotland and the Achill Islands being domesticated goats that have taken to a feral life. Only about ten species of wild goat are recognized by naturalists, and of these three or four are known by the name ibex (*q.v.*).

and taper to a long point. The solitary flower head is yellow, with 7 or 8 slender bracts. The head opens about 4 a.m. and closes as soon as pollinated. whence the popular name John-go-to-bed-at noon. The

Goat's-beard. Left, the growing herb; right, puff or head of fruit

fruits form a "clock" like those of the dandelion, but larger and more beautiful, the parachute of each fruit having its arms feathered. The salsify (*T. porrifolius*), grown as an esculent root, belongs to the same genus. Its flowers are purple.

Goat's Rue (*Galega officinalis*). A perennial herb of the family Leguminosae. A native of S. Europe, it has a stout, creeping rootstock, and the compound leaves consist of about 15 lance-shaped leaflets. The leafy stems are about 2 ft. high, with a flowering branch at the base of each of the upper leaves. The pea-like flowers are blue, but there is a variety with pure white flowers. It was formerly made into a cordial for administration in fevers and convulsions, and has been grown for forage.

Goat's Rue. Flowers and leaves of this S. European herb

Goatsucker (*Caprimulgus europaeus*). Alternative name for the nightjar (*q.v.*).

Gob. Waste material used in coal mines for filling up stalls. In the pillar and stall system of coal mining, large openings or stalls are left in the coal face, separated from one another by a wall of coal which is left standing. When all

the coal has been got from a stall it is filled with any refuse or waste material that may be at hand. Material so employed is called by the miner gob, or goaf, though the latter term is more generally reserved for the stall itself from which the coal has been removed, the plural "goaves" being the form generally used. This use of

the term gob has doubtless arisen from the similarity between the appearance of the opening into a stall and a huge mouth, the word being vulgarly used in many parts of the country for a mouth or mouthful. Gob corresponds to the attle or deads of the metal miner.

Göbbels. Alternative spelling of the surname of the German politician Josef Goebbels (*q.v.*).

Gobelin, JEAN (d. 1476). French dyer. A native of Reims, he founded in 1450 a dyeworks and cloth factory on the banks of the Bièvre, in St. Marcel, a suburb of Paris. The firm was renowned

especially for scarlet wool, but probably the works would never have enjoyed more than a local reputation had not Henry IV, about 1603, purchased from the Gobelin family part of the land adjoining the dye-house. Here tapestry sheds were erected for Marc de Comans and François de la Planche, two expert designers, but the establishment was still called by its old name, which gradually became attached to the new products.

Gobelin. Tapestry named from Jean Gobelin. In 1667 Louis XIV consolidated the royal Parisian tapestry workshops at the Hôtel de Gobelins. Le Brun and other eminent artists provided magnificent designs such as The History of the King. Suspended in 1694, work was resumed in 1697. Smaller tapestries, portières of the Gods, etc., were made under Louis XV, but prosperity returned with the beautiful designs of Boucher. The Revolution crippled the industry, but later the designs of Baudry brought success. From 1826 carpets also were made. Modern tapestries from designs by Galland adorn the Comédie Française, others by Toudouze are in the Palais de Justice, Rennes. Many replicas of ancient works have been executed at the Gobelins workshops. See Tapestry.

Gobelin. Example of a piece of tapestry depicting a scene from the adventures of Don Quixote, entitled Don Quixote led by Folly, from a cartoon drawn by C.A. Coypel (1694-1752)

Gobi OR SHAMO. Desert of Central Asia, mainly in Mongolia, China. "Gobi" means desert, "Sha-mo," sand desert. The fractured tableland of Mongolia terminates on the N. at a scarped edge overlooking Siberia; from this edge the land rises towards the Inshan and Khingan Mts., of which the E. and S.E. slopes form an escarpment facing the valley of the Hwang-ho. The average level of the plateau is 4,000 ft.

The climate is one of great extremes, and is almost rainless, with the result that there are no large rivers. Nomad Mongols and Kalmacks are the only inhabitants; they find sustenance for their camels, horses, and sheep at the water-holes. Vast expanses of sand-dunes are marked by a silence undisturbed by any form of life. The desert is crossed by caravan routes; and in 1917 a summer motor-car service from Kalgan to Urga (1,160 m., 4-6 days) was inaugurated.

Westward the desert area narrows and leads between the Tianshan and Kuen-lun ranges to the Tarim basin, which forms the basin of internal drainage of Lob Nor; this is the Chinese province of Sin Kiang, Eastern Turkistan, where the scanty rainfall ameliorates the harsher desert conditions of the east. In the dim geological past, the Gobi, known to the Chinese as Shamo, was covered by the eastern portion of a great sea, of which the Caspian and Mediterranean are relics. To the N.E. was the ancient continent of Angaraland, and to the S. that of Gondwanaland. The tilting of the plateau and the rise of the Kuen-lun ranges, including the Khingan Mts., are a more recent development. *See Asia; Desert. Consult* Across the Gobi Desert, S. Hedin, 1935; The Gobi Desert, M. Cable and F. French, 1943.

Goblets, THE. Pair-oared boat race rowed annually at Henley-on-Thames. It was inaugurated in 1845, and its full title is The Silver Goblets; the Nickalls Challenge Cup is also presented to the winning pair. *See Henley Royal Regatta.*

Goblin (Gr. *kobālos*; late Lat. *jobelinus*; Ger. *Kobold*). Mischievous or evil being. The word is supposed to derive from the Gr. *kobālos*, a sprite, a rogue, and to be the same as the Ger. *Kobold*, spirit or demon of the mine; another origin suggested is that of the Gobelinus or demon which S. Taurinus drove from a temple in Normandy; while yet another, and

somewhat ridiculous, derivation has made elf and goblin to be but Gueff and Ghibelline in a new form. Goblin has come to be applicable nowadays to any frightening phantasm. *See Folklore.*

Goby (*Gobiops*). Large genus of fishes. Several species occur round the British coasts, especially in rocky neighbourhoods. Small in size, the pelvic fins are modified to form a sucker by which they can attach themselves to rocks. The freckled goby (*G. minutus*) is often found at a considerable distance up the Thames, and constructs a curious little nest in the sand for its eggs.

Goch. Town of Germany on the Niers, near the Dutch border. In the Middle Ages, it was part

of the duchy of Cleves, and a centre of the linen trade. An important road junction with a number of factories, it was reduced to ruins during the Second Great War, when it was a German key position in the Reichswald. After it had been bombed from the air and shelled by artillery, Scottish infantry attached to the Canadian 1st army made a silent assault on it in the night of Feb. 18-19, 1945, capturing the garrison commander, Col. Paul Matussek, and his staff in bed, and securing two-thirds of the town. Snipers continued to hold out tenaciously, however, until with the help of Welsh troops the town was cleared on the 21st. Of the pre-war pop. of 14,000, only a handful remained.

GOD : THE SUPREME BEING

Rev. H. L. Goudge, D.D., Regius Prof. of Divinity, Oxford, 1923-1939

Cognate articles in this work are those on Heaven; Jesus Christ; Trinity. See also Buddhism; Christianity; Deism; Mahomedanism; Monotheism; Theism; Theology, etc.

For the best theists today the word God stands for the one ultimate personal ground of all existence, the source of the order and beauty of the universe, and of those ideals of truth, beauty, and goodness which have led man thus far upon his upward way.

Religion, says Schleiermacher, is the feeling of absolute dependence, the immediate consciousness of all that is finite as existing in and through the Infinite, of all that is temporal as existing in and through the Eternal. God is thus revealed in and through the experience of man, and, the higher and fuller the experience, the higher and fuller is the revelation attained. Christians believe that Christ is God's highest means of revelation, but not His only means. The knowledge of God is attained by many paths. Thus, though man is a religious being, and is almost always found believing in a God or gods, his conceptions of God vary greatly, and the highest conception reached has a long history behind it. No adequate definition of God can be given, since God by His very greatness can be but imperfectly known.

The God of Israel

The Christian view of God is the result of a long process, which the Bible enables us to trace. The people of Israel, from whom Christ came, began with a conception of God differing little from that current in kindred tribes. They thought of their God at first as peculiar to themselves rather than

as the God of the universe, and they learned to know Him in their own national experience. His revelation of Himself had been in facts, rather than in words. He was a "living God," Who by wondrous means had lifted them out of slavery, brought them to their own land, protected them when they obeyed Him, and punished them when they disobeyed. But from very early days their conception of God was a moral conception as the conceptions of the tribes around them were not. God had shown Himself in their experience to be a God of truth, and righteousness and love (*cf. Exodus 24, vv. 6, 7*), and He asked righteousness and love from them in their dealings one with another. In the best of the Hebrews it was God's character which was the primary fact about Him, rather than His power or knowledge. This moral conception of God was deepened and enlarged by the teaching of the long line of prophets in Israel's history.

This people, long before the coming of Christ, had learned that their God was "the God of the whole earth" (*cf. Isaiah 54, v. 5*), but the moral conception held its ground. It is still the character of God and the nature of His purpose which occupy the foreground in the consciousness of Christians. In the life and death of Christ for men, in all that He has done and is doing for them, the power and wisdom of God are clearly revealed, but His righteousness and love are revealed more clearly still.

The great words "God is love" are the summary expression of what God has been found in Christ to be. To this righteous love all other "attributes" of God are subordinate. His eternity and omnipresence are the eternity and omnipresence of love and holiness, His omnipotence and omniscience instruments which serve them. The vast additions made in modern days to our knowledge of nature and of history have indeed widened our conception of God's methods and purposes. Art has taught us to find a new revelation of Him in all sublimity and beauty; but the revelation of God's character and of the nature of His purpose stands where Christ has left it.

Authority and Acceptance

This conception of God comes to us at first, like other truth, upon the authority of others, but it needs to be verified by each man for himself by consideration of the experience on which it rests and by the effort to share it. The so-called "proofs" of God's existence are simply the ways in which He makes Himself known. Man's discovery of God and God's revelation of Himself to the individual and to the race are two sides of the same process.

But the need of seeking after God must be recognized. God's revelation does not force itself upon us. There must be the desire and the effort to know, and such a moral sympathy with the character of God as will render the revelation possible. So it is that Christ says, "Blessed are the pure in heart; for they shall see God" (Matthew 5, v. 8), and again "If any man willet to do God's will, he shall know of the teaching, whether it be of God, or whether I speak from Myself" (John 7, v. 17). Belief in God has difficulties to overcome, and only those who are morally faithful to the light of conscience are likely to overcome them.

Why, firstly, do we find the ultimate ground of all that exists in a personal Being? The reason lies deep in our own nature. Man is conscious of himself as the cause of his own actions, and of the changes which they bring about in the world. Soon he becomes conscious of his fellow men, as acting with a will and purpose resembling his own. Thus, he inevitably explains the changes which he sees in the world by will and purpose, and, as he comes to recognize the unity of the world, by the will and purpose of the one God. No higher explanation is open to him, since personality is the highest fact he knows. At first he may regard God simply as a magnified man, but,

as he rises above this, he does not cease to believe that God is living and personal. Though the nature of God in its fullness must transcend our understanding, He cannot be lower in the scale of being than ourselves. Though He may be more than personal, He cannot be less. The world demands an explanation; and our minds can rest only in the thought of a Being with will and intelligence as the cause and ground of all that experience reveals to us.

Secondly, the world which we seek to explain is a world of order and of beauty, a world which everywhere exhibits the adaptation of means to ends, and in which each end when attained serves as a means to higher ends beyond. Though there may seem to be waste in nature and disorder in history, there can be no doubt that both nature and history are eloquent witnesses to God's wisdom and power, and in some degree to the benevolence of His purpose. But the world has issued in living beings, and in the case of man, in beings who recognize the difference between right and wrong, and the obligation, be the cost what it may, to choose the higher of the courses open to them. This again brings a revelation of God.

Though conscience, like reason, has been a gradual growth in close connexion with man's environment, a true explanation of the world must take account of it. Man himself is the "roof and crown of things," and no explanation of the world can be true which ignores the ideals which have made him what he has at his best come to be. A world in which beauty, truth, and goodness are felt to possess an infinite value is a world which must minister to a moral purpose, and the presence of our highest ideals must be our own sharing in the thought of God. It is this which assures us that, though God is the ground of all that exists, He must not be regarded as the author of evil.

The Problem of Evil

The problem of evil is the greatest difficulty which belief in God has to surmount, but the revelation of God which conscience brings shows us how to regard it. Evil is no part of the creation; it arises from the misuse of what is good by the freewill of man. The possibility of evil is a necessity, if good is to be freely chosen. A world in which evil choice was impossible would be a world without struggle or sacrifice; the existence of moral evil in the world, like the existence of pain, with which it is intimately connected, has a place to fill in the development of human souls, and

this is the highest purpose of God which we are able to trace. It is in conflict with evil that the righteousness and love characteristic of God are developed also in men. In all these ways, quite apart from the special revelation which the Bible records, God may be known by men who open their eyes to the light.

But though these paths of knowledge are open to all, they require a certain character for their appreciation. It is the man who himself acts with the most intelligent purpose who will appreciate best the intelligent purpose revealed in nature and in history, and the man most faithful to his ideals who will best see the character of God revealed in them. So it is that, though the best non-Christian philosophy has reached results very similar to the Christian view of God, its influence outside Christendom has been but slight. Just because the acceptance of moral evil has so largely blinded us, some higher revelation of God is required.

God and the Christ

The character of these new paths to knowledge has been already seen. They are not altogether different from the universal proofs, but rather the same proofs brought more closely home to us. The history of Israel and of the Church witnesses to God as all history witnesses to Him, but more clearly; the ideals of the prophets witness as all ideals witness, but more fully.

The wisdom and power of God shine out more clearly in Christ than anywhere else, and the character of God in a way absolutely unique, while sin and pain, the great hindrances to faith, though not fully explained, are illuminated by the Cross. God is seen taking them upon Himself, and making them the path to the highest good. Moreover, Christ, as no one else, has led men to seek after God, and enabled them to be sure that they have found Him. The crowning proof of God's existence and character is the multitude of those who have come to know God, and who trace to this knowledge all that is best in themselves and most fruitful in their life and activity.

Godalming. Mun. bor. and market town of Surrey, England. It stands on the Wey, 35 m. S.W.

Godalming arms

The town has a technical and art school. It has still some half-timbered houses of the 17th century. The chief industries are tanning and knitting; there is a trade in malt and corn. Bargate stone is quarried in the neighbourhood. The place, which is mentioned in Domesday Book, became a borough in 1574. It was long a centre of the cloth manufacture. Pop. 14,500.

Near Godalming is Charterhouse School. This was founded in London by Thomas Sutton, in 1626, his foundation being for a hospital and a free grammar school. In 1872 the school was removed to its present site, commodious buildings, in the Gothic style, being erected thereon. The buildings include chapel, laboratories, library, etc. There are 11 houses with accommodation for about 600 boys, and scholarships to the school. Boys may also receive grants according to need, to enable them to continue their education at a university, etc. See Charterhouse.

Godavari. River of S. India, 900 m. in length, flowing across the Deccan, from the W. Ghats to the Bay of Bengal. One of the most sacred rivers of India, it is a great resort of pilgrims. The chief tributaries are the Pranhita and the Manjera. It gives its name to a rice-producing coastal dist. of Madras (area, 8,756 sq. m.; pop. 3,541,951).

Goddard, RAYNER GODDARD, BARON. Lord chief justice of England from 1946. See N.V.

Godsberg or **BAD GODESBERG.** Town and spa of Germany, on the left bank of the Rhine 4 m. S.E. of Bonn. In 1949 it became the seat of the federal president and other high officials of the Bonn government. The ruins of an old castle, destroyed in 1583, overlook the town, which, sheltered by mountains, has

a mild climate. Pop. (pre-war) 25,000.

Godsberg was the scene of the second meeting between Neville Chamberlain and Hitler during the international crisis of Sept., 1938 (see Munich Crisis).

During the Second Great War the town was captured by the U.S. 1st army, March 8, 1945.

Godetia (*Oenothera*). Section of the evening primrose genus, part of the family Onagraceae. They are natives of the warm parts of America. Evening primroses all have yellow flowers, and do not open in sunshine; but the godetias have white, rosy, or purple flowers which do. They are annual herbs.

Godfather and Godmother. Sponsors for an infant presented

for baptism, but two are usually required. Godparents were formerly called Gossips, from God and sib, kindred, i.e. relations in God. See Baptism.

Godfrey (c. 1061-1100). Count of Bouillon and crusading leader. The son of Eustace, count of Boulogne, he was made count of Bouillon and later duke of part of Lorraine by his master, the emperor Henry IV. In 1096 he offered himself for service as a crusader and was one of the leaders of the host that marched across Europe to Constantinople and the Holy Land. In 1099 he had an honourable part in the successful siege of Jerusalem, and he was chosen its king, but refused the title, although he undertook the duties of ruler. He remained there, beating off attacks, especially when at Ascalon in 1099 he crushed the Saracens, and to some extent enlarging his authority until his death in July, 1100.

Godfrey's fame became legendary in the medieval romances; he was the hero of two notable French *chansons de geste*, and of a legend which has close resemblances to that of Lohengrin.

Godfrey, CHARLES (1790-1863). British musical conductor. Born at Kingston-on-Thames, Nov. 22, 1790, Godfrey entered the band of the Coldstream Guards as bassoon player, and in 1828-63 was bandmaster. He founded Jullien's Journal, the first English publication devoted to military music, was appointed musician in ordinary to the king, 1831, and died Dec. 12, 1863. Several of his sons and grandsons followed the same calling. The eldest son, Daniel, or more commonly Dan (1831-1903), was bandmaster of the Grenadier Guards, 1856-96, and then had a band of his own. He died June 30, 1903. Another son, Adolphus Frederick (1837-82), succeeded his father as bandmaster of the Coldstream Guards.

Charles (1839-1919), the third son, was bandmaster of the Royal Scots Fusiliers and then of the Royal Horse Guards from 1859 to 1904, and professor of military music at the Royal College of Music and the Guildhall School of Music.

Daniel's son Dan, born June 20, 1868, in London, became a conductor of opera and symphony concerts throughout England, and

Godalming, Surrey. Buildings of the Charterhouse School, which moved here from London in 1872
Frith

for baptism, required as an assurance that the child will be brought up in the Christian faith. Their duty is to answer the interrogatories put to them at the font, and afterwards to see that the child is instructed according to the promises made in his name and in due time brought to the bishop for confirmation.

The custom derives from the primitive church, when guarantors of the character of persons brought for baptism were an obviously necessary precaution. Parents were commonly the sponsors, as being the natural and proper guardians, and the 29th Canon, of 1604, forbidding their admission to the office, was intended simply to provide additional security for the religious training of the infant. In the Anglican Church, three sponsors are required, two of them of the same sex as the child; in the Roman Catholic Church one

Sir Dan Godfrey,
British musical
conductor

music for military bands. He died July 20, 1939.

Godfrey, Sir Edmundbury (1621-78). An English politician. Member of a Kentish family and educated at Westminster and Oxford, he became a woodmonger in London and justice of the peace for Westminster, and was knighted, 1666, for his services during the plague. Before him, Sept. 6, 1678, Titus Oates first swore the particulars of the notorious Popish "plot." On Oct. 12 Godfrey was missing, and five days later his body was found at Primrose Hill.

He was almost certainly murdered, perhaps at the instigation of Jesuits, but by whom has never been established. Three men were hanged on the evidence of an informer whose perjury was afterwards confessed and established.

Godhra. Town and subdivision of Bombay, India, in the W. part of Panch Mahals dist. The area of the division is 585 sq. m. Godhra town has an important timber trade. Pop. 41,986.

Godin, Jean Baptiste André (1817-88). French socialist. Born at Esqueheries, Jan. 26, 1817, he became an employee in the iron-works there. In 1840 he set up in business for himself, and made a considerable fortune. He introduced profit-sharing into his business which, after it had been transferred to Guise, he turned into a cooperative association. He also erected dwellings, called familistères, for the workers, and in other ways showed himself a genuine believer in the socialist ideas he had learned from Fourier. Godin was a member of the National Assembly, 1871-76. He died Jan. 15, 1888. He wrote much on socialism and industrial problems. See Profit-Sharing; consult also Twenty-Eight Years of Co-Partnership at Guise, A. Williams, 1908.

from 1893 to 1934 was director of music to the corporation of Bournemouth. He was knighted in 1922. He published many arrangements of

Sir Edmundbury
Godfrey,
English politician

Godiva, Lady. Wife of the 11th century Leofric of Mercia. According to legend, Leofric made harsh exactions on his people of Coventry; consequently his wife begged for their removal, which he promised to grant if she rode naked through the town. Lady Godiva accepted the terms. The people of Coventry kept close within doors, their windows shuttered, during the ride; all save a certain tailor, who, peering through a chink, was struck blind, and has ever since been known as Peeping Tom. The legend was commemorated at Coventry fair from 1678 to 1826 by a Godiva procession that has been revived intermittently in more recent years, and it is the subject of a well-known poem by Tennyson.

Godmanchester. Mun. bor. and parish of Huntingdonshire, England. It stands on the Ouse, $\frac{1}{2}$ m. S. of Huntingdon, and has a railway station. The town occupies the site of the Roman station of Durolopon. Mentioned in Domesday, in 1213 it received a charter from King John, and was incorporated in 1605 as a borough; it is now governed by a mayor and corporation. The church of S. Mary is a fine 14th century Perpendicular building; the tower and spire were rebuilt in 1623. There are several fine timbered houses of the 17th century, and a grammar school founded in 1567. The curfew is still rung. The chief industry is agriculture. Pop. (1931) 1,993.

Godolphin, Sidney Godolphin, 1st Earl of (1645-1712). English politician. Of good family,

1st Earl of Godolphin,
English politician
After Kneller

he came somehow to the notice of Charles II, to whose household he was attached during his exile. In 1668 he entered the house of commons as M.P. for Helston, but it was not until 1679 that he became prominent in affairs of the state. Having by then made a certain reputation as a student of finance, he became a member of the treasury board and one of the king's chief advisers, the little group being called the chits. In 1684 he was made a secretary of state, and a little later first lord of the treasury.

In 1690, after a brief absence, Godolphin returned to the treasury, but he was not loyal to William, and his secret intrigues with

James II, in which he was associated with Marlborough, led to his resignation in 1696. In 1700, however, he was again in office. In 1702 he was made lord treasurer, and he remained in power until 1710, when he shared the fate of his great associate, being dismissed from office in Aug., 1710. During these eight years he was mainly responsible for directing the country's affairs. In 1706 he was made an earl. He died, Sept. 15, 1712.

Godoy, Manuel (1767-1851). A Spanish statesman. Born at Badajoz, Feb. 12, 1767, Godoy became an official of the court, a royal favourite, and was made duke of Alcudia. During 1792-97 he was chief minister of Spain, being responsible for the declaration of war on France and the humiliating peace of Basel, 1795. He was again premier in 1801 and also general of the Spanish forces, which he led into Portugal, this time being in alliance with France. He was victorious, but the defeat of the Spanish fleet at Trafalgar added to the number of his public enemies, and he narrowly escaped death during an insurrection in 1808. His public career was over, and he lived in Rome and Paris almost forgotten until his death, Oct. 7, 1851. Godoy's Memoirs, dealing with the reign of his patron Charles IV, were published in English in 1836.

Gods. For details of various pagan deities, e.g. those of ancient Greece, Rome, Scandinavia, see Mythology.

God Save the King. British national anthem. The origin and authorship of words and music are unknown. The earliest extant version of both together appeared in The Gentleman's Magazine, Oct., 1745, following upon the singing of the anthem (to an arrangement by Dr. Arne) at Drury Lane Theatre the previous month as a loyal retort to the proclamation of the Young Pretender at Edinburgh. In a slightly differing form it was concurrently sung at Covent Garden Theatre. But it is stated that Latin words were sung to the tune as early as 1688, and were preserved as a Jacobite hymn. The tune was possibly an adaptation by Dr. John Bull (1562-1628), first Gresham professor of music, of a traditional air.

Haydn's admiration of the anthem inspired him to compose his own Emperor's Hymn as a national anthem for Austria. Beethoven, Weber, Brahms, and other composers have introduced

God Save the King. Facsimile of the opening bars in Dr. Arne's arrangement as sung at Drury Lane Theatre, 1745

the tune into works of their own. The same tune is used as a setting for patriotic words in many countries besides the British. In the U.S.A., under the name America, it is used for the song My Country, 'tis of Thee.

The present British words (*not* by Henry Carey, as often stated) are little more than an undistinguished sequence of loyal clichés. The second verse, which prays for the confusion of the king's enemies, has sometimes offended religious susceptibilities, but suggested alternative versions have not proved popular.

Within the British Empire the anthem is usually played or sung on any public appearance of the king, also at the close (or, increasingly, the opening) of a public entertainment. British people customarily stand while it is played, men and women of the services standing at attention. An Army order of 1933 gave precise regulations for the playing of the anthem by military bands. See Galliard; National Anthem. *Consult* God Save the King: its History and Romance, P. A. Scholes, 1942.

Godthaab (Dan., Good Hope). Oldest settlement in, and chief town of, the southern inspectorate of Greenland. On the S.W. shore, on a bay in Davis Strait, in lat. 64° 10' N., it has a harbour, government offices, and a seminary for Eskimo catechists. The first Danish colony in Greenland, it was founded by Hans Egede in 1721. Pop. 1,000.

Godwin or **GODWINE** (d. 1053). English earl. Little is known of him before the time of Canute, when he became one of the English earls. In 1020 he was earl of the West Saxons, and for fifteen years he appears to have been one of the Danish king's chief supporters. He forwarded the selection of Hardicanute as king in 1035, as in 1042 he did that of Edward the Confessor. His daughter was married to the latter king, and, with his

sons also in high positions, he was the most powerful man in the kingdom. In 1051, however, there was a serious quarrel between the earl and the king. The details are uncertain, but Godwin and his sons were exiled. In 1053, however, he returned and was restored to his estates and dignities. He died April 15, 1053. Godwin, whose name is perpetuated in the Goodwin Sands, is regarded as the protagonist of the English against the growing influence of the Normans. Harold II was one of his sons; others were Sweyn, Tostig, Gurth, and Leofwine.

Godwin, MARY WOLLSTONECRAFT (1759-97). English writer, and advocate of women's rights.

Born at Hoxton, London, April 27, 1759, daughter of Edward John Wollstonecraft, she lived at Epping and Beverley, Yorkshire. Here she received the principal part of her education.

Mary Wollstonecraft Godwin, British feminist After Opie

tion. She left an un congenial home in 1778, and became companion to a Mrs. Dawson, at Bath. In 1783, with a Miss Blood, she opened a school at Islington, later removed to Newington Green. She was for a year governess in the family of Lord Kingsborough, but in 1787 was offered the chance to adopt a literary career by the London publisher, Johnson, who, in 1786, had given her 10gs. for a pamphlet entitled: *Thoughts on the Education of Daughters*. She contributed regularly to *The Analytical Review*; translated Salzmann's *Elements of Morality*; in 1791 published her *Vindication of the Rights of Men*, an answer to Burke's *Reflections on the French Revolution*; and in 1792 issued her *Vindication of the Rights of*

Woman, her most famous work, dedicated to Talleyrand.

In Paris, where she witnessed the Terror and collected materials for her unfinished work on the Revolution, 1794, she met Gilbert Imlay, and bore him a daughter, Fanny, 1794 (who committed suicide in 1816). She tried to drown herself from Putney Bridge as a result of Imlay's desertion; married William Godwin (*v.i.*), March 29, 1797; and on Aug. 30 in the same year bore him a daughter, Mary, who became the second wife of the poet Shelley. She died Sept. 10, 1797. *Consult* Memoir, W. Godwin, 1798; *Life*, Mrs. E. R. Pennell, 1885; *Love Letters of Mary Wollstonecraft to Gilbert Imlay*, intro. R. Ingpen, 1908; *Mary Wollstonecraft*, M. Linford, 1924.

Godwin, WILLIAM (1756-1836). English political writer and novelist. Born at Wisbech, Cambridgeshire, March 3, 1756, for some years he was a dissenting minister. In 1785 he became a freethinker and a republican, and in 1793 obtained considerable reputation by the publication of his *Enquiry concerning Political Justice*, a gospel of the purest anarchism. In 1794 he brought out *The Adventures of*

William Godwin
After J. Northcote, R.A.

Caleb Williams, a novel of extraordinary power, wherein he presented Falkland, the first of his self-torturing and unfortunate heroes. On these two books his contemporary fame was based; he is remembered by posterity principally as the father-in-law of Shelley. He died April 7, 1836. *Consult* Shelley, Godwin and their Circle, H. N. Brailsford, 1913; *Lives*, F. K. Brown, 1926, G. Woodcock, 1947.

Godwin-Austen. Lofty mt. of Central Asia, the second highest known peak in the world (28,278 ft.). It is situated on the N.E. frontier of Kashmir, and is the culminating point of the Mustagh or Karakoram range. Designated on the India survey maps as "K 2," it was also called Dapsang, and in 1888 received its present name after Lt.-Col. H. H. Godwin-Austen, of the Trigonometrical Survey of India.

Godwit (*Limosa*). Genus of wading birds belonging to the snipe group. Two species, the bartailed (*L. lapponica*) and the black-tailed (*L. limosa*) godwits, occur in Great Britain as birds of passage, though they appear to breed there no longer. They have long

Godwit. The black-tailed variety, *Limosa limosa*

legs and beaks, the plumage barred with white and brown, and are usually found about shores and estuaries.

Goebbels, PAUL JOSEF (1897-1945). German Nazi leader. He was born Oct. 29, 1897, at Rheydt, an industrial town on the Rhine. His father, a clerk, died when Goebbels was a boy, and his mother, a staunch R.C., was aided in his education by a church charity and by a Jewish philanthropist.

He proved a brilliant scholar, though his dwarfish figure and club foot had a warping effect on his mind. He studied literature under Dr. Gundolf, a German teacher of Jewish origin, and might have made a successful career for himself as a writer. He chose instead to devote himself to National Socialism. Though not one of the earliest members of the party, his perverted invention and resourcefulness, and his gift for persuading simpler minds and turning doubt into enthusiasm were quickly rewarded. In 1926 Hitler appointed him *Gauleiter* for Berlin, where he immediately started an evening paper, *Der Angriff*, devoted to the overthrow of the Weimar republic. This met with such success, despite its unscrupulous methods, that in

1929 he was put in charge of Nazi party propaganda.

After Hitler's accession to power Goebbels created a ministry of propaganda, and was generally recognized as the intellectual leader of the Nazis. Throughout the Second Great War his articles and speeches, an inextricable mixture of lies and distortion with a minimum

Josef Goebbels, German Nazi leader

of actual fact, did much to sustain German resistance and stimulate German morale. His craving for applause, no less than awareness of the fate in store for a prisoner numbered among the most guilty of war criminals, helps to explain his melodramatic death. He seems to have survived Hitler, whose body, it was believed, he helped to carry to its improvised funeral pyre. He took his own life, as well as the lives of his wife and seven children, shortly before the fall of Berlin to the Russians on May 2, 1945.

Goeben. German battle cruiser, built 1911. She became notable early in the First Great War by her escape into Turkish waters from the British Mediterranean fleet in company with the *Breslau* (q.v.), Aug. 6, 1914, and her subsequent operations while leading the Turkish fleet in the Dardanelles. On Jan. 20, 1918, the two ships, emerging from the Dardanelles to attack British ships in the Aegean area, were driven into minefields. The *Breslau* sank and the *Goeben* suffered much damage, which was increased by bombs from British aircraft while she was under repair. After the armistice the British fleet, on entering the Sea of Marmara, found her completely crippled at Ismid and took her over.

Goering, HERMANN WILHELM (1893-1946). German airman and Nazi leader. Born Jan. 12, 1893, at Rosenheim in Bavaria, the son of Judge Goering, a former commissioner for S.W. Africa, he served during the First Great War in the famous *Richt-hofen* squadron (q.v.), winning the order *Pour le Mérite*. When imperial Germany

Hermann Goering, German Nazi leader

collapsed in 1918 he conceived a violent hatred for the socialism that replaced it and went to Sweden as a civil air pilot.

On his return to Germany in 1922 he met Hitler and offered him his services. He was one of the first 12 Nazi deputies elected to the Reichstag in 1928, founded the S.A. (brown shirt storm troops), and by his ruthlessness and organizing ability was probably more responsible than anyone else for the consolidation of the Nazis in power in 1933. He created the Gestapo (q.v.) and the concentration camps, used the Reichstag fire (q.v.) as a pretext for destroying his political opponents, and was behind the "Röehm Putsch" (q.v.) (June, 1934) which wiped out dissident members of the Nazi party itself.

As Reich minister for air from 1933, he organized the Luftwaffe for war (using it experimentally in the Spanish civil war, 1936-39). Promoted air chief marshal, 1935, he became director of the Four Year Plan, 1936, field marshal, 1938, and when war started was made head of the Reich defence council. Hitler's designated successor from Sept., 1939, he fell out of favour in the last months of the war, was deprived of his offices and of the succession, and expelled from the Nazi party.

He was captured by U.S. troops near Salzburg on May 8, 1945. Brought to trial before the international military tribunal at Nuremberg in Nov., 1945, he made, March 13-15, 1946, an unexpectedly dignified statement in his own defence. Found guilty on all four counts in the charge—conspiracy to wage aggressive war, crimes against peace, war crimes, and crimes against humanity—he was, on Oct. 1, condemned to death by hanging. He escaped this fate by committing suicide by poison on the night of Oct. 15, 2½ hours before the time set for his execution.

Goes or TER GOES. Town of the island of S. Beveland, Netherlands, in the prov. of Zeeland. It is situated in the N. part of the island, of which it is the chief town, 20 m. W.N.W. of Bergen-op-Zoom. It has a lofty Gothic church, consecrated in 1423, and remnants of the château of Ostende, once the residence of the Countess Jaqueline of Bavaria. The town hall contains fine pictures by Flemish artists. Goes suffered some damage during the Second Great War, being liberated by British forces, Oct. 29, 1944, in the course of the operations to force the Schelde estuary.

An important weekly fair is held at which the quaint costumes of the surrounding districts may be seen.

Goethals, GEORGE WASHINGTON (1858-1928). American soldier and engineer. Born at Brooklyn and educated at the military academy of West Point, he specialised in military engineering, and did good service in that branch in the Spanish-American War of 1898. He was also employed on weir and harbour work. In 1907 Goethals was given charge of the construction of the Panama

Canal, a task demanding not only technical skill but high administrative qualities, which he fulfilled with admirable success, the canal being virtually completed some six months before the scheduled date of June 1, 1915. In Dec., 1917, he was acting Q.M.G. He died Jan. 21, 1928.

G. W. Goethals, American soldier acting Q.M.G.

GOETHE: HIS CAREER AND INFLUENCE

J. G. Robertson, former Prof. of German Literature, London Univ

This article is supplemented by those on Germany: Literature; Drama; Poetry. See also the biographies of Heine; Schiller, and other German poets

Johann Wolfgang von Goethe, Germany's greatest poet, was born at Frankfort-on-Main, Aug. 28, 1749. Of good family, he received a liberal education at the hands of tutors, and studied law at the university of Leipzig and subsequently at Strasbourg. In the latter town, under the guidance of Herder, he learned to appreciate the beauties of Gothic architecture, the German Volkslied, and the greatness of Shakespeare; his genius was thereby awakened, and under the influence of his love for Friederike Brion, daughter of the pastor of a neighbouring Alsatian village, his lyric powers revealed their full strength. With Götz von Berlichingen, 1773, Goethe gave the new literary movement of Storm and Stress its first tragedy, and with Werthers Leiden, 1774, its typical novel. To this period also belongs the drama Clavigo, 1774, and other fragmentary works, including the earliest form of the drama of Faust.

Goethe and Weimar

Before settling down as an advocate in Frankfort, Goethe spent some months at Wetzlar, then the seat of the supreme German law courts. His plans for a career were, however, soon upset; at the end of 1775 he accepted an invitation to visit Karl August, duke of Saxe-Weimar, and Weimar remained his home for life. He won the duke's confidence, and before long was entrusted, as his minister, with the conduct of state affairs. These duties and the claims of social life interfered for a time with his literary work, and he published little; but under the inspiration of Charlotte von Stein, whose influence is immediately apparent in his lyrics, all the greater works of the next twenty years of his life were planned and begun.

The years 1786-88 Goethe spent in Italy, a stay which made a deep incision in his literary life; in the course of these years the dramas of Iphigenie auf Tauris, 1787, and Egmont, 1788, were completed, and Torquato Tasso, 1790, in great part written. On his return to Germany disappointment with home conditions for a time lamed his powers, and he produced little of importance; but in 1794 he came into personal contact with Schiller, and a mutually inspiring affection united the two men until the younger poet's death in 1805. In this period Goethe completed his

After J. K. Stieler

greatest novel, Wilhelm Meisters Lehrjahre, 1795-96, and, in friendly rivalry with Schiller, wrote several of his finest ballads. In 1797 he published Hermann und Dorothea, the most perfect idyll in German literature.

Goethe also threw himself zealously into scientific pursuits. Here

his discovery of a rudimentary inter-maxillary bone in man and his suggestive theory of plant-development from the basic leaf-form prepared the way for the Darwinian theory of evolution, while his studies in optics resulted in a new theory of colours. The last period of Goethe's life is comparatively uneventful. In 1788 he had found a congenial helpmate in Christiane Vulpius, who, although of all the women Goethe loved least to be regarded as his intellectual equal, inspired a lasting affection; in 1806 he made her his wife.

His principal works in this period were the first part of Faust, 1808; Die Wahlverwandtschaften, 1809, a psychological "problem" novel; Der Westöstliche Divan, 1819, a collection of poetry in an oriental mould which showed that, in spite of his years, his lyric powers were still undiminished; and Wilhelm Meisters Wanderjahre, 1821, a continuation of the earlier novel. In 1811 he commenced the publication of his autobiography, Aus meinem Leben: Dichtung und Wahrheit, which, however, was not carried beyond the year 1775, although other works, such as Die Italienische Reise, 1816, etc., may be regarded as a continuation.

In the very last year of his life he put the finishing touches to the second part of Faust, 1832. As his interest in this theme went back to the very beginnings of his literary life, and the kernel of the first part, the tragedy of Faust and Gretchen, was written in his pre-Weimar days, Faust may be said, in a very literal sense, to have accompanied Goethe all through life. He died at Weimar, March 22, 1832.

Goethe's Place in Literature

It is difficult in a brief summary to estimate Goethe's significance for his own literature and that of Europe. The most striking features in his life are the universality of his genius, the enormous range of his intellectual sympathies, and the sincerity and sanity of his judgement of men and things. He was not tempted into false paths by the materialistic tendencies of the age of rationalism into which he was born, nor did he lose himself in the maze of metaphysical subtleties of the romantic epoch.

His supreme achievement, it has been often said, was the life he lived; supreme, not on account of any exemplary morality, but rather because he saw all his experience in the light of a moral education, as so much material out of which he might build up, as he said, the pyramid of his life and personality.

Goethe. House in Weimar presented to the poet in 1792 by Karl August, duke of Saxe-Weimar
Drawn by D. Wagner, engraved by L. Schätze

His works he has himself called "fragments of a great confession," the "confession" of his own life; and this markedly subjective aspect lends them a unique interest.

But Goethe was also a great artist in poetry. It is true, his strength, unless where the lyric was concerned, did not lie in formal beauty; his dramas often overstep the limitations imposed by the theatre; his novels are lacking in proportion and sometimes tedious. But both his dramas and his novels show an almost Shakespearean power of characterisation, an insight into problems of spiritual development and emotional conflict, and contain an unrivalled wealth of wise reflection. As a lyric poet, Goethe stands alone in a literature the strength of which has in all times lain in its lyric. In the problems of philosophy, on the other hand, he took little interest; as a political thinker, he lived in too distraught an age to understand fully the questions either of his own time or of the future; as a scientist, his achievements have no present-day value. But his attitude to the problem of the conduct of life is still "modern." Goethe's life covered the most important period in the development of his country's literature, and he is its greatest personality.

Round few men of letters has so vast a literature grown up. The standard Weimar edition in 142 vols., 1887-1920, includes Works, Letters, and Diaries. Goethe's Conversations have been edited by F. Biedermann, 2nd ed. 1908-09. The first adequate biography in English was by G.H. Lewes, 1855. In German the most satisfactory Life is by A. Bielschowsky, Eng. trans. W. A. Cooper, 1905-08. There is a complete bibliography in Goedeke's *Grundriss zur Geschichte der deutschen Dichtung*, vol. iv., 1910. Consult also Life,

J. Sime, 1888; G. and the Twentieth Century, J. G. Robertson, 1912; Life, P. Hume Brown, 1920; Life, J. G. Robertson, 1927; G., the History of a Man, E. Ludwig, 1928; G., Man and Poet, H. W. Nevinson, 1931; G. and Schiller, A. M. B. Meakin, 1932.

Goethite. Iron ore, one of the most common minerals, and, after haematite, the commonest ferric oxide. Much of what was formerly called limonite, is really goethite. It generally occurs as yellowish or reddish brown masses with a fibrous structure. It is a hydrogen iron oxide (HFeO_2 , 90p.c. iron) often containing up to 5 p.c. manganese, admixed silica, and adsorbed water. Goethite is typically formed under oxidising conditions as a weathering product of ferri-ferous minerals; in bogs and springs; with limonite in gossan; in residual deposits (laterites) of igneous and other rocks. Goethite is mined in Germany, Bohemia, and France; common in the Lake Superior haematite deposits; residual after glauconitic sediments in Texas, and in residual brown iron ores in the Appalachians.

Gog and Magog. Two names in Biblical and post-Biblical literature. In Ezek. 38, v. 2, God is spoken of as opposing "Gog, the land of Magog, the prince of Rosh, Meshech and Tubal"; and in Chap. 39 a battle on the mountains of Israel is predicted in which Gog is overthrown. In the Mishnah, Gog and Magog appear as the worldly leaders of a furious assault upon the Kingdom of God. The name Gog was perhaps suggested by the Gyges

of Herodotus and the Gugu of Assyrian inscriptions.

Gog and Magog were the names given to two huge carved figures which formerly stood on octagonal pedestals at each angle of the wall at the west end of Guildhall, in the City of London. Each figure was 14 ft. 6 ins. high. They were carved, 1708, by Richard Saunders who was paid £70 for the work.

Figures of this character, but made of wickerwork and pasteboard, were at one time carried in the annual mayoral procession. According to tradition they represent Gogmagog and Corineus, who, in medieval monastic chronicles, fought the battles of the Trojan invaders against the early inhabitants of Britain. In time Corineus was forgotten and the name of his companion divided between the two. With this myth is associated the tradition that the city was founded by the invaders and that London as Troynovaunt, or New Troy, was the chief city of Albion 1,000 years before the Christian era. See Gogmagog Hills.

Gogh, VINCENT VAN (1853-1890). Dutch painter. Son of a Calvinist pastor, he was born at Groot-Zundert, N. Brabant, March 3, 1853. At 16 he became assistant at The Hague branch of Goupil Galleries under his uncle, and later worked at the London and Paris branches. Unfitted for commercial life, he became engrossed in the ideal of Christian communism, and, returning from England in 1877, went as missionary to Belgium, where he lived in the mining village of Wasmes in the Borinage. Here he began to paint, receiving instruction from Mauve at The Hague in 1880. He returned to Brabant in 1885, and to this period belongs his first important picture, *The Potato Eaters*, a study of peasants at table. The following year in Paris he met leaders of the Impressionists and

Gog and Magog, wooden figures (now destroyed) within Guildhall, London
London Stereoscopic Co.

Neo-Impressionists and was strongly influenced by their use of colour, notably by Seurat's pointillism.

In 1888 he settled at Arles, where he was joined by Gauguin. Van Gogh painted many landscapes and portraits at Arles; but, undermined by privation, and strained by exposure to the sun, his supersensitive temperament was shattered by Gauguin's overbearing personality. He had attacks of insanity, during one of which he cut off his left ear (the self-portrait mirrors this as the right ear). After being confined in an asylum at St. Rémy, he shot himself, and died July 29, 1890.

As a painter, van Gogh exemplifies the solitary genius whose art cannot be appreciated or understood by his contemporaries. His work may be divided into three stages: the early pictures of Dutch and Belgian peasants, the impressionistic phase in Paris, and the frenzied, brilliant compositions executed in Provence. The last include his famous paintings of sunflowers, flowering orchards, and rhythmic patterns of cypresses and cornfields.

Bibliography. Lives, M. Denis, 1909; T. Duet, 1916; J. Meier-Graefe, 1928; A. Bertram, 1930; P. Burra, 1934; Letters of V. van G. to his Brother, 1872-1886 (2 vols.), 1927; Lust for Life, I. Stone, 1935; Dear Theo (ed. I. Stone), 1937.

Gogmagog Hills. Range of hills in Cambridgeshire. They lie to the S.E. of Cambridge, and are a continuation of the chalk formation which runs up from the Chilterns. Their highest points are only about 220 ft. above sea level, but owing to the flatness of the country round, command extensive views. Traces of Roman earthworks exist.

Gogol, NIKOLAI VASSILIEVITCH (1809-52). Russian novelist and dramatist. Born at Sorochintsi,

Poltava, March 13, 1809, and educated at Nyejin, he went to St. Petersburg in 1828, and for a time was a clerk in a government office. After a period of indecision and unrest, he

Nikolai V. Gogol,
Russian novelist

published anonymously *Evenings at a Farmhouse near Dikanka*, 1831, a series of stories of that Little Russia in which his early life had been spent. For a short time he was professor of history at St. Petersburg.

Van Gogh. Self-portrait of this 19th century Dutch painter, after he had cut off his ear
Courtauld Collection

In 1834 Mirgorod, another volume of stories, established his fame; it contained Taras Bulba, a romance of the Cossacks, which was re-written in 1842 and, since widely translated, founded the Russian novel. In 1836 his comedy *Revizor* was produced, its satire on the conditions of the Russian life passing unnoticed in general appreciation of its humour. Regarded as the greatest Russian comedy, it was given by the Incorporated Stage Society at the Scala Theatre, London, 1906. In 1920, as *The Government Inspector*, it was produced at the Duke of York's Theatre. During 1836-48 the author lived mostly in Rome. In 1842 he published the first volume of *Dead Souls*, presenting Russian provincial life in a clear and brilliant manner, and with a rare humour. The second volume was burnt by the author, and only collected scraps have been produced. In his later years Gogol developed religious mania, and died at Moscow, worn out, it is said, by prayer and fasting, Feb. 21, 1852.

His complete works were translated into English by Constance Garnett, 1922, etc. There are Lives by L. Leger, 1914; J. Lavrin, 1926.

Gogra. River of India. With its source in Tibet, it is the great river of Oudh, United Provinces. After passing Ajodhya and Tanda, it joins the Ganges at Chapra. It exceeds 500 m. in length, is venerated by the Hindus, and is a useful waterway.

Goidels. Earlier branch of the Celtic-speaking peoples, who carried to Britain the Goidelic or C. Celtic speech. This developed into the Irish and Scottish Gaelic and the Manx dialects. The term, introduced by John Rhys in 1882, dis-

placed the earlier Gadhelic or Gaelic. The Goidels either preceded or accompanied the Bronze Age culture, with the practice of cremation. Round-headed Alpines, they mingled with the short, swarthy, long-headed pre-Aryan population. After at least six centuries this mixed race was confronted by the Brythonic invasion, whose late-Celtic speech and Iron Age culture gradually penetrated westward. See Brython; Celt.

Goil. Sea-loch of Argyllshire, Scotland. It forms a W. arm of Loch Long, and extends for 6 m. N.W. of Lochgoilhead. There are mountains on either side.

Goito. Town of Italy, in the prov. of Mantua. It stands on the Mincio, 11 m. W. of Mantua. It is chiefly notable for the battle fought here on May 30, 1848, when Charles Albert, king of Sardinia, defeated the Austrians.

Goitre (Fr. *goitre*, Lat. *guttur*, throat). An enlargement of the thyroid gland, situated in the lower part of the front of the neck. The size of a gland is no indication of its functioning capacity. Goitre falls into two main subdivisions: the secretion of the gland is diminished by excess of formation of non-glandular tissue, and the enlargement is an effort at compensation of function; or there is an enlargement of the intrinsic tissue with increased or toxic output of secretion. If the output of the gland is too small for the health of the organism, myxoedema may result with increase in weight, loss of intelligence, dropping out of hair; if too large, the result is exophthalmic goitre, characterised mainly by protruding eyeballs, quick pulse rate, tremor of the outstretched hands: this is also known as Graves's disease. Alternatively, enlargement of the gland may be due to tumour, either simple or malignant in nature.

Goitre is most common where iodine, a necessary component of the secretion of the thyroid, is scarce or absent. It is often seen in areas remote from the sea, e.g. Switzerland, Central India, Derbyshire (whence its name Derby neck). Treatment depends upon careful weighing up of the case. To provide the chemical substances lacking may achieve the cure; if surgery is indicated the operation is safe, the scar negligible. See Exophthalmic Goitre; Myxoedema.

Gojjam. District of Abyssinia. A grassy plain traversed by high mt. ranges, it lies to the S. of Lake Tana, between lat. 10° and 11° N.

Never entirely subdued by the Italians during their occupation of Abyssinia (1936-41), Gojjam became a centre of revolt in the early months of 1941, when some 1,600 Sudanese and Abyssinian troops, led by British officers, cleared much larger Italian forces from Gojjam in six weeks. See East Africa Campaign.

Goktcha OR SEVANG. Lake of Armenia S.S.R. It lies at an alt. of over 6,000 ft., 30 m. E.N.E. of Erivan, in a deep basin surrounded by rugged mts. It is about 47 m. long from N.W. to S.E., with an average breadth of 12 m., and provides good fishing.

GOLD: THE METAL AND ITS USES

F. D. L. Noakes, B.Sc., and J. Stuart Webb, B.Sc.

Treasured for its appearance, its ease of working, and its resistance to corrosion, gold has played a vital part in the development of man's history. Its distribution, methods of recovery, and uses are here described. See Exchange; Gold Standard

Pure gold is a yellow metal in the solid state, but it appears green when molten and red or purple when finely divided. The element, chemical symbol Au, falls into the first group of the Periodic Table, with silver and copper, and has one free valency electron. It has the following physical properties: atomic number, 79; atomic weight, 197.2; melting point, 1,063° C.; boiling point, 2,600° C.; crystal form, face-centred cube, with lattice constant $a=4.0779$ at 18° C.; density, 19.32, as cast, but this can be increased by hammering to 19.65, and the density of precipitated gold may be as high as 20.5; electrical resistivity, 2.44 microhms per centimetre cube at 18° C.

Gold was almost certainly the first metal to be worked by man, since it occurs more widely than any other in the native state, and its fascinating colour and great weight attracted early man, probably even before the beginnings of civilization. From very early times it has been associated with wealth, and hence with the conflicts of nations. The grains of gold, varying in shape and size, were at first merely tied together with pieces of animal fibre to form bracelets and necklaces, but before long the amenability of the metal to working into shapes by hammering became apparent, and later it was found possible to melt and cast it into moulds. Owing to the excellent resistance to corrosion of this "noble" metal, many examples of the work of early artists on

Golconda. Fortress belonging to the nizam of Hyderabad, India. Situated about 7 m. W. of Hyderabad, Golconda, now a ruined city, was the capital of a kingdom that flourished from its establishment in 1512 until its conquest and annexation by Aurangzeb in 1687. Huge mausoleums of the former kings, fast falling into decay, surround and dominate the fort, which is used by the nizam as a treasury and prison. From the fact that the diamonds brought from the rich fields at the base of the Nila Hulla mts. were cut and sold at Golconda, the name of the city has come to be associated with fabulous wealth.

copper, iron, rarely bismuth, tin, lead, zinc, platinum, palladium, iridium, rhodium.

Native gold crystallises in the isometric system, often as octahedral crystals, but more commonly as irregular grains or in wiry dendritic forms. Other properties are (1) no cleavage; (2) high specific gravity—19.3; (3) softness, malleability, ductility; (4) opaqueness, though it is translucent-green in thin foliae.

In nature gold combines only with other metals, and of these tellurium (Te) is the most common. The gold tellurides usually contain variable amounts of silver, up to 5 p.c. The most common is calaverite (Au_2Te_3 , 43.6 p.c. gold). Krennerite (Au_8Te_6 , also 43.6 p.c. gold) is rarer than calaverite or sylvanite. Sylvanite ($\text{Au}_8\text{Ag}_2\text{Te}_6$, 24.2 p.c. gold) and petzite (Ag_3AuTe_2 , 25.4 p.c. gold) are gold-silver tellurides. Gold telluride ores form important sources of gold in a certain class of deposit (see below). Occasionally gold may combine with selenium and bismuth. In a few deposits gold and mercury form a natural amalgam.

Where Gold is Found

Gold is widespread in the earth's crust. It is found in small amounts in all igneous rocks, in sea water, and in some hot springs. It is also found in sedimentary rocks formed as a result of erosion of igneous rocks. The order of concentration is 6 parts per million.

Small amounts of metallic gold are commonly present in other minerals, especially in pyrite, chalcopyrite, sphalerite, galena, and other sulphides, occasionally in sufficient amount to form an economic source of the metal. Deposits of native gold are usually in veins, the most important economically; with quartz in quartz veins; and, in small amounts, with quartz and feldspar in pegmatite dykes. The wall-rock of the veins is sometimes replaced by gold, pyrite, sericite, alunite, etc.—the particular mineral assemblage depends on the nature of the rock, the conditions at the time of formation, and the composition of the ore-forming solutions. The gold tellurides occur in similar siliceous veins.

Occasionally gold ore occurs in contact-altered sedimentary rocks adjoining an acid igneous rock. Such deposits (e.g. in Montana) are called pyrometasomatic deposits. Gold is found in notable amounts in two main types of deposit: (a) in veins of hydrothermal and

flints, knives, and other implements exist to this day in very much their original form.

The working of gold is mentioned in the Old Testament and the ancient Egyptians have left us many beautiful articles of jewelry and statuettes, dating as far back as 5,000 B.C., the First Dynasty. The Greeks later developed great skill in handling gold, and much of their early history and way of life have been learned from a study of their ornaments.

Methods of separating metallic gold from the associated rocks and minerals have been developed from very early times, and gold-working is depicted on monuments of the Fourth Dynasty (4,000 B.C.). The methods of extraction used had much in common with modern practice, and there is evidence to show that gold was refined by cupellation before 500 B.C., and was recovered by amalgamation before the Christian era. The first full description of the metallurgy of gold is to be found in Georgius Agricola's *De Re Metallica*, 1556. His illustrations show strakes, mortars, and stamps very similar to those still used in some mines.

Native Gold

Most of the world's gold is still obtained in the metallic state, i.e. native gold. On rare occasions it is almost pure (Au), but generally it contains up to 10-15 p.c. of silver (Ag). When it contains more than 20 p.c. of silver, the mineral is known as electrum. Depending on the silver content, the colour varies from gold-yellow to silver-white. Other impurities sometimes present are

related origin, connected with igneous activity; and (b) as placer deposits derived from the former by weathering processes at the surface, which remove the light minerals and leave gold and other heavy stable minerals concentrated near the outcrop of the source.

The great majority of gold lodes or veins are found within a mile of the acid intrusive rock with which they are genetically related. As a rule, hydrothermal siliceous solutions, ascending from below, favour channelways near cupolas (*q.v.*) or small stocks of the igneous mass. These solutions deposit quartz, gold, and other minerals to form the auriferous quartz veins. According to the temperature and pressure at the time of formation, the veins assume certain characteristic features, and the vein-type has a very important bearing on the life of the mine.

World's Greatest Gold Mines

The deposits formed at the highest temperatures and pressures (hypothermal deposits, *q.v.*) are composed of massive quartz with gold, pyrite, pyrrhotite, and other sulphides, occasionally some tellurides, garnet, biotite, amphibole, or tourmaline. Such deposits compose some of the greatest gold mines in the world, *e.g.* Porcupine and Kirkland Lake, Canada; Morro Velho, Brazil; Kolar, India; Kalgoorlie, Australia. Hypothermal gold deposits are characterised by persistent, deep veins, workable in places to a depth of more than 8,000 ft.

The famous Mother Lode, California, and Bendigo, Australia, deposits were formed from similar solutions under intermediate conditions. These mesothermal deposits (*q.v.*) are composed of gold in milky quartz, simple auriferous sulphides, and, locally, albite and chlorite. The vein minerals are usually massive and rarely show comb structure. Carbonates and sericite may appear in the wall-rocks.

Deposition under low temperatures and pressures (epithermal deposits, *q.v.*) is shown by delicate banding in the quartz vein, complex sulphides and sulph-arsenides, and low temperature minerals such as zeolites, lamellae calcite, etc. At places gold tellurides form the bulk of the ore. Epithermal gold deposits are frequently extraordinarily rich, but they have little depth. Examples of this type of deposit are El Oro, Mexico; Comstock, Nevada; Cripple Creek, Colorado (telluride ore).

Until recent years, placer deposits were the chief sources of the world's gold, yielding about 20 p.c. of the total metal mined. The richest values in such deposits are usually found near the bedrock, and the gold, often very pure, occurs in grains ranging from mere "colours" up to large nuggets, some weighing over 200 lb.

Famous localities include Klondike, Yukon; Ballarat, Australia; and California. Not all placer deposits occur on the surface. Some were formed during early geological times, and have since been covered by newer sedimentary or even igneous rocks such as lavas (California, and Victoria, Australia). The origin of the famous Rand gold deposits, S. Africa (*see* Witwatersrand) is still a matter of controversy. Some believe that the lodes of this, the largest mining field in the world, were originally surface placers, subsequently covered by later sediments and folded into a large synclinal basin. Such deposits are known as "fossil placers." Others maintain that the Rand deposits were formed in a similar manner to the vein deposits.

Gold placers also accumulate along sea-shores in mineralised areas, forming beach or marine placers. In such places as Nome, Alaska, wave and current action have selectively concentrated detrital gold on the present-day beaches and also in earlier "raised beaches."

How Gold is Extracted

Methods of extraction vary with the mode of occurrence of the ore, its richness, and the quality and quantity present of other constituents which influence the process. When the gold is concentrated in placer deposits, the process is simplified to a gravity concentration of the heavy particles of gold, the ore often consisting of loose particles which require little or no crushing. Various apparatus is used in washing the gravel. The pan, of the same form as that used by the old prospectors, is a flat-bottomed bowl of stiff sheet-iron, 2½ to 3½ inches deep and about 8 to 10 inches in diameter at the bottom. The sides may be riffled to help the collection of fine particles of gold. The pan is given a swirling motion, so that the water carries the gangue material over the side and leaves the heavy gold in a "tail" in the bottom of the pan. The operation looks simple, but requires practice. With the batea, which is made of wood and

conical instead of flat-bottomed, the gold is collected in the bottom of the cone. Mechanical bateas, the long tom and the Siberian trough (long troughs with riffles at suitable places to hold back the gold), and sluice boxes are all used to obtain a concentrate of gold and black sand which can be treated by amalgamation for recovery of the gold. The amalgamation is carried out in barrels or in some form of mill, the mercury-gold amalgam being collected on plates or strakes. The mercury is distilled off in a retort leaving the precious metals, and the tailings are treated with cyanide to recover any remaining gold. On the large scale, the sands are lifted from a river bed by dredgers or washed from the rock hydraulically by a very powerful jet of water, the proceeds being passed over suitable sluices.

Stamp Batteries

When the alluvial deposits have been worked out and it becomes necessary to mine the gold from the hard rock, this must be crushed to such a fineness that all or most of the gold is liberated, the final size being decided by economic considerations. If the bulk of the gold is liberated by fairly fine crushing, it may not pay to introduce fine-crushing plant to extract the small amount of gold remaining in the ore. Coarse crushing was long carried out by stamp batteries, first used early in the 15th century. A series of heavy stamps is raised by cams on a rotating shaft and then dropped on to the ore, held in a mortar box. Usually water is added, and the pulp flows over either an amalgamation plate or corduroy strakes, which collect most of the coarse gold in the valleys of the corduroy. Stamp batteries continued in use at some mines where it would be uneconomical to scrap old plant, after the introduction elsewhere of rock breakers of the Blake moving jaw type and the Symons cone crusher, which has a gyratory motion.

Ores containing only 2½ to 8 pennyweights of gold per ton, and tailings containing similar small amounts, could not be worked economically until the introduction of the cyanide process (*q.v.*) on the Rand, S. Africa, in 1890 and at about the same time in New Zealand. This process depends on the fact that gold and silver are readily soluble in dilute solutions of potassium cyanide. For the process to be effective, the

ore must be crushed more finely than before, and for this various types of rod mill and ball mill are used. The pulp from these can then either be classified to give fine material or "sands" and very fine material or "slimes," or it can all be ground to slimes. Details of methods used are described under Mineral Dressing. Sands are usually treated by some form of gravity concentration in classifiers, vanners, or vibrating tables. The concentrates can then be treated with mercury in an amalgamation barrel.

Sands separated from the slimes by settling are cyanided in large vats, made of concrete or mild steel, and holding up to 1,000 tons each. The vats have false bottoms so that suction can be applied by means of pumps. They are nearly filled with sands, and then strong cyanide solution, containing 0.05 to 0.10 and rarely up to 0.5 p.c. of potassium cyanide, is run on top. The solution is then sucked through. The process is repeated several times with progressively weaker solutions, until all the gold and silver, or as much as can be extracted economically, have been dissolved. The gold-bearing solution is then pumped to zinc boxes, where it comes into contact either with zinc shavings or zinc dust, which precipitates gold and silver electrochemically, so that they can be filtered off. Aluminium or charcoal may be used as alternatives to zinc. The precipitate is treated for recovery of bullion.

Filtration of Gold Slimes

Slimes are so finely divided that they cannot be separated from the solution except by filtration under pressure. Before cyaniding, lime must be added, usually at the crushing stage, to form a protective alkali to prevent destruction of the cyanides by acids, formed from the various constituents of the ore, such as sulphides. The slime is then submitted to the action of the cyanide either by decantation or, more commonly, by agitation. Some excess water is removed from the slime which is then pumped to an agitator, such as the Pachuca or Brown tank. This consists of a tall cylindrical tower with some means of pumping air into the bottom, so that the slime, mixed with the cyanide solution, is simultaneously agitated and aerated. After between 3 and 24 hours' agitation the pulp is pumped out and filtered under pressure, the solids being washed with water. The auriferous solu-

tion is then passed to the zinc boxes. The barren solution after removal of the gold is not discarded, but made up to strength and recirculated until it becomes too foul for further use.

Flotation (*q.v.*) was introduced for concentrating the very fine particles of gold. The precious metal particles adhere to the froth and so become separated from the gangue. The process is particularly useful for recovering very fine particles produced inevitably during crushing and missed by gravity methods, and for the treatment of complex ores containing elements which interfere with cyaniding.

Purifying and Refining

The crude bullion is melted and cast into bars, which are assayed to determine the quantities of base and precious metals present (*see Assaying*). Some purification is effected during melting by the addition of nitre. Refining can be effected by the electrolytic, the sulphuric acid, or the chlorine process. Electrolysis is carried out in a gold chloride solution by a process due to Wohlwill (*q.v.*). The process is slow and necessitates a heavy "lock-up" of gold. In the sulphuric acid process, the alloy is "inquarted" with silver; that is to say, sufficient silver is added to produce an alloy from which the silver can readily be dissolved by the acid, to leave an insoluble gold residue. Acid consumption is high and the process is therefore expensive. In the Miller chlorination process, the gold is melted down and gaseous chlorine under pressure is forced through the metal. Silver and the base metals form chlorides which float to the top of the crucible as a slag that can be easily removed. When the gold contains appreciable amounts of the platinum metals, a wet chlorination process must be used.

The production of proof or fine gold is very laborious. The refined gold is dissolved in aqua regia, the excess of acid driven off by heating, and the solution, after dilution, is allowed to stand to precipitate silver chloride. After some days it is decanted, diluted, and again allowed to stand. This process is repeated until there is no further precipitation of silver chloride. The gold is then precipitated from the solution in a very fine form by sulphur dioxide, oxalic acid, or some other reducing agent.

Gold is the most malleable and ductile of all the metals and it may be beaten down to leaves less than 0.000005 inches thick (*see Gold Leaf*). It has a tensile strength of

about 7 tons per sq. in. with an elongation of 30 p.c. It is not such a good conductor of heat or electricity as copper or silver, the electrical conductivity being 67, as compared with silver's 100. The metal is not attacked by hydrochloric, sulphuric, or nitric acids individually, but mixtures of hydrochloric acid with sulphuric or with nitric acid (forming aqua regia) dissolve it readily to form auric chloride. Chlor-auric acid is also formed, and this is used in photography for toning. Gold is non-corrosive and does not absorb gases by heating in air or hydrogen.

The price of gold varies, but in 1946 it was in the neighbourhood of 175s. per fine ounce. It is used mainly for jewelry, where its colour and ease of working are its chief assets. Gold is used in the form of fine suspensions in oils as liquid gold, or as potter's gold for the decoration of pottery. By varying the amounts of gold in potter's gold, which is an amalgam with mercury and certain fluxes, lustre colours, varying from red to blue, can be produced. Gold is used widely for plating articles and instruments for use under corrosive conditions. It readily forms alloys with most metals, but, apart from the amalgams already mentioned, the only ones of commercial importance are those with silver and with copper. The alloy used by the Greeks and Romans, *electrum*, contained between 15 and 35 p.c. of silver. Standard gold in England contains 83.4 parts of copper. 22 carat gold contains 22 parts of gold in 24, the other 2 parts being copper. *See Carat.*

Emmons, 1937; Fire Assaying, O. C. Shepard & W. F. Dietrich, 1940; Albite and Gold, D. Gallagher (Economic Geology, Vol. 36), 1941.

Gold and Silver Wyre Drawers' Company, THE. A London city livery company.

Gold and Silver Wyre Drawers' Company arms

Incorporated in 1693, it is first mentioned in 1461. Offices, 10, Ironmonger Lane, E.C. *Consult History, H. Stewart, 1891.*

Goldau. A village of Switzerland in the canton of Schwyz. Situated between the lakes of Zug and Lowerr, 8 m. W.N.W. of Schwyz, on

the St. Gotthard rly. (Arth-Goldau station), it is a junction for Zug and Einsiedeln-Wädenswil, and the starting point of the Arth-Rigi rly. On Sept. 2, 1806, the former village of this name at the base of the Rossberg, with three other villages, was destroyed by a landslide, the track of which can be seen from the rly.

Gold Coast. British colony of W. Africa, situated between French Togoland to E. and the French colony of the Ivory Coast to W. With Ashanti (q.v.) and the protected Northern Territories it forms a compact country stretching from the Gulf of

Gold Coast
arms

Guinea to French Sudan, 480 m. from N. to S. Along the coast it measures 334 m. The area of the colony proper is about 24,000 sq. m.; with Ashanti, the Northern Territories, and British Togoland it comes to 91,843 sq. m.

The colony is divided into Western and Eastern provinces. From the lagoons of the coastal regions the country rises gradually towards the interior, being crossed by numerous small streams and by one large river, the Volta. The country is inhabited by a large number of tribes, governed by their chiefs, and each more or less independent of the others.

The river-deposits of gold, from which the Gold Coast derived its name, were worked by the natives prior to the advent of the Portuguese and French navigators in the 14th century. The first European settlement was made in 1482, when Fort San Jorge de Mina (Elmina) was built by the Portuguese. Subsequently other nations, notably the Dutch, established themselves on the coast, building castles and forts, several of which still remain. English expeditions visited the Gold Coast long before the formation of the "Company of Adventurers of London trading into Africa," in 1618, but it was not until that year that English traders obtained a definite footing. Among those who established settlements were the Brandenburgers, who during 1682-1720 maintained their position.

Subsequent history of the country until the English forts were definitely occupied by the British government in 1843 is largely that of trading companies, such as the Royal African Company (1672), the African Company of Merchants, and other private

trading corporations. In 1850 the British purchased the forts belonging to the Danes, and in 1871 the Dutch also transferred their possessions. In 1874 the Gold Coast became a separate colony. It is administered by a governor and a council of 18 elected and 12 nominated members with a majority of Africans. Conscription was introduced during the Second Great War, and the Gold Coast Regiment served with distinction in E. Africa and Burma. The governor and council offered the Imperial government £500,000 for buying aircraft in 1940. From the port of Takoradi thousands of aircraft for the N. Africa campaign were flown to Egypt. (For later events see N.V.)

The climate of the Gold Coast, though hot and damp, has been rendered less unhealthy by improved sanitation. The chief products are palm oil and kernels, kola nuts, rubber, cocoa, lumber, manganese ore, and gold. Such progress has been made in the

Gold Coast. Map of this British colony in West Africa, on the Gulf of Guinea

cocoa industry that this stands second to gold by value of exports. Gold mines lie mainly in the Tarquah and Prestea districts. There are rlys. from Accra, the coastal capital, and Takoradi to Kumasi in Ashanti. Other seaports are Axim, Secondee, Cape Coast, Saltpond, and Winnebah. The pop. may be 2½ millions. Consult The Gold Coast Yesterday and Today, P. Redmayne, 1938.

Goldcrest (*Regulus regulus*). Smallest British bird. Though sometimes called the golden-crested wren, it is not a true wren, but is nearer to the warbler group. It is common in the pine forests in most parts of Europe, where it feeds on insects

Goldcrest. The smallest bird found in Great Britain, sometimes called the golden-crested wren

and constructs its tiny nest of moss and lichens underneath a bough. It is 3½ ins. long and has a crest of yellow feathers.

Golden Age. In classical mythology, the period when Saturn or Cronos, after being dethroned by Zeus, reigned in Latium as king. Saturn taught agriculture and the arts of civilization to his people, and the period of his reign was one of peace, happiness, and prosperity. Kenneth Grahame gave this title to his sketches of childhood, 1895.

Golden Arrow. Luxury train between London (Victoria) and Paris. This was inaugurated by the Southern railway in 1929, a special ship (Canterbury) being built for the crossing between Dover and Calais. The daily service was restored after the Second Great War, and timed to take 8½ hours. A similar train in the reverse direction is named Flèche d'Or.

Golden Ass, THE. Name by which The Metamorphoses of Lucius Apuleius (q.v.) is generally known. An allegorical fable in 11 books, much of it is a paraphrase of The Ass of Lucian, which was originally derived from the work of Lucius of Patrae, a Platonist who flourished in the reign of Marcus Aurelius.

Golden Bough, THE. General title for a series of studies in magic and religion by Sir J. G. Frazer (q.v.), first publ. in 2 vols., 1890. In its revised and much expanded edition (11 vols., 1911), the work consists of seven parts: The Magic Art; Taboo; The Dying God; Adonis, Attis, Osiris; Spirits of the Corn and of the Wild; The Scapegoat; and Balder the Beautiful. A 12th vol. is a bibliography and index. The work deals with the history of supernatural beliefs and symbolic rituals, and was inspired by a wish to inquire into the legend of the golden bough utilised by Virgil.

This legend is identified with the mistletoe, which, growing on the

oak, represents the eternal soul of a living sun-god represented by the tree. The Norse myth of Balder (q.v.) had its counterpart in Italy in the *rex Nemorensis*, the priest of Diana in the grove by Lake Nemi, near Aricia. Balder and the priest both personified the oak-spirit, whose life or death was in the mistletoe and who could not be slain so long as that remained intact. The priesthood was gained by one plucking the golden bough and slaying the armed priest in combat, after which the victim was burned at the midsummer fire festival and the victor assumed his place and title until in turn displaced by a stronger.

Golden Bull (Lat. *bullā*, knob, seal). Name given to a charter of unusual importance, sealed or stamped with a golden seal or bull. Many were issued in Germany in the Middle Ages, but the name is specially given to the document that regulated the election of the German kings from 1356 to 1806.

To end the disputes as to who were entitled to elect the kings in Germany, the emperor Charles IV ordered a bull to be drawn up, and after some alterations the princes, meeting at Metz, accepted it in Dec., 1356. Written in Latin, this Golden Bull contains 31 chapters which fix the numbers of electors at seven—the king of Bohemia, the rulers of the Palatinate, Saxony, and Brandenburg, and the archbishops of Cologne, Mainz, and Treves—and prescribe their respective precedence and duties. Frankfurt is decided upon as the seat of the elections, the regulations for the coronation are declared, and further clauses deal with such matters as the rights of the cities and of the king of Bohemia.

In general the bull greatly strengthened the power of the electors, that of the minor princes and the cities being correspondingly reduced. It remained operative until the dissolution of the Empire in 1806. Various copies are in existence in German cities, and there is an Eng. trans. in E. F. Henderson's *Select Historical Documents of the Middle Ages*. See *Electors*; *Empire*, *Holy Roman*.

Golden Calf. Image made by Aaron, in response to popular appeal, in the absence of Moses on the mount (Exodus 32). It was in the form of a young bull and made from earrings of gold. Divine honours were paid to it, but it is doubtful if it involved a breach of the first or the second command-

ment. Jeroboam set up similar images at both Dan and Bethel (1 Kings 12). See *Aaron*; *Idolatry*.

Golden Eye (*Bucephala clangula*). Wild duck found in the northern districts of both hemi-

Golden Eye, a winter visitor to the British Isles

spheres. It visits Great Britain in the winter. The plumage is black on the back, with white beneath, and the drake has a bright green head. The name, derived from the yellow colour of the eye, is sometimes also applied to the tufted duck.

Golden Fleece. In Greek mythology, the object of the quest of Jason and the Argonauts. When Phrixus and Hellē, children of Athamas, king of Thebes, and Nephele, were about to be sacrificed, owing to the intrigues of Ino, his second wife, a ram with a golden fleece and wings appeared, and bore them away through the air. Hellē fell into the sea, but Phrixus arrived safely at Colchis, where he sacrificed the ram. Aëtes, king of the country, hung up the fleece in the sacred grove of Arēs. See *Argonauts*; *Jason*.

Golden Fleece, ORDER OF THE. One of the premier European orders of knighthood. It was

Golden Fleece. Badge of the order

founded Jan. 10, 1430, by Philip the Good, duke of Burgundy, on his marriage with Isabella of Portugal, and dedicated to the Virgin Mary and S. Andrew. Its title, recalling the voyage of the Argonauts, probably alluded to a projected crusade. The grand-mastership passed by marriage to the Hapsburgs. When the Hapsburg dynasty in Spain came to an end in 1700, it was claimed by the emperor Charles VI, who established it in Vienna in 1713. Since then the order has existed independently in both Spain and Austria.

The Austrian branch has adhered to the original limitation of membership to noblemen of R.C. faith, the single exception being George IV of England, by papal dispensation. The badge is a golden fleece suspended from a collar of alternate fire-steel and flint stones, emitting flames. For less ceremonial use it has been suspended from a red ribbon.

Golden Gate. Channel connecting San Francisco Bay, California, U.S.A., with the Pacific Ocean. It is 5 m. long and from 1 m. to 2 m. broad, and has bold and rocky shores, rising on the N. side to 200 ft. The bridge spanning the Golden Gate, opened 1937, has the world's longest single span (over 4,000 ft.). It crosses a waterway of 6,200 ft.; the towers are 746 ft. high; and the roadway is 200 ft. above high water level. It was begun in 1933 and completed in 1937 at a cost of £7,000,000. See *San Francisco*; also *Bridge* illus., p. 1424.

Golden Hind. Ship in which Sir Francis Drake sailed round the world. One of five frigates which

Golden Hind. Model of the ship in which Drake sailed round the world, 1577-80

left Plymouth late in 1577, the *Golden Hind* (originally *Pelican*), navigated by Drake himself, was the sole survivor of the fleet to pass through the Straits of Magellan (Aug.-Oct., 1578) and into the Pacific. The *Golden Hind* ended her voyage on Sept. 26, 1580. Queen Elizabeth came to Deptford and there knighted Drake. On her command the ship was at first preserved, but 100 years later had to be broken up. From the sound timber was made a chair, presented by Charles II to Oxford University.

H.M.S. *Golden Hind* is the name given to the Royal Navy barracks, 480 acres in extent, established at Sydney, New South Wales, in 1945.

Golden Horde. Name given to a body of Tartars who invaded Europe in the 13th century. They

belonged to a branch of the race known as Kipchaks. Led by Batu, a grandson of Jenghis Khan, they crossed Russia into Hungary about 1237. Attempts to stop them failed until 1241, when they were checked, and settled on the Volga.

Under Batu's son the empire, or khanate, was consolidated. The race became Mahomedan, but soon their power began to fail. About 1395 they were defeated by Timur, and by about 1500 they had disappeared. The name golden horde was due to the splendid camp (Turk. *ordu*) set up by Batu.

Golden Horn. THE. Narrow inlet of the Bosphorus (*q.v.*) which divides the main port of Istanbul from the Galata and Pera quarters. See Istanbul.

Golden Legend. THE. English title of a collection of lives of the saints, *Legenda Sanctorum*, compiled by Jacobus de Voragine, archbishop of Genoa (d. 1298). The first Latin edition was printed at Basel about 1470, and an English translation, made from the French by Caxton, was printed by him in 1483 (ed. F. S. Ellis, 1900). The *Legenda Aurea*, as it was soon popularly known, in recognition of its great worth, was translated into most European languages, and frequently reprinted during the first half of the 16th century. The standard edition of the Latin text is by J. G. T. Grässe, 1846. The Golden Legend is also the title of a dramatic poem by Longfellow on which an oratorio was based by Sullivan.

Golden Number. Number used in calculating the dates of Easter, possibly so called because it was engraved in golden letters on marble pillars in various Greek cities, and marked in gold in the ancient calendars. The golden number is the number of any year in the Metonic cycle, which consists of 19 solar years containing 235 lunations, and was discovered c. 432 B.C. by the Greek astronomer Meton. To find the golden number add 1 to the year and divide by 19; the remainder is the golden number. If there is no remainder the golden number is 19. See Calendar; Easter.

Golden Rain. Popular firework which emits a shower of sparks. It may be used either in a set piece or as the charge for a rocket, func-

tioning when the rocket reaches the highest point of its trajectory. The mixture employed consists of crushed iron or steel turnings and gunpowder, the oxidation of the iron yielding brilliant sparks, while some of the potassium nitrate in the gunpowder is replaced by sodium nitrate to intensify the yellow colour. See Fireworks.

Golden Rod. Flower-heads of the wild species

Golden Rod (*Solidago virgaurea*). Perennial herb of the family Compositae. A native of Europe and N. America, its rootstock is stout, and the stems erect and slightly branched, clad with narrow lance-shaped leaves, and terminating in clusters of small yellow flower-heads. It grows on stony banks and dry ground. The golden rod of gardens (*S. canadensis*) is a N. American species, with taller stems and the flowers in long pyramidal sprays.

Golden Rose. Rose of wrought gold with jewelled petals, blessed by the pope and either presented to some favoured individual or preserved in the Vatican. The custom of blessing roses on the 4th Sunday in Lent, hence called *Dominica rosa*, originated early. Consecrated roses, as symbols of silence, were set over the doors of confessionals, and from this practice arose the phrase *sub rosa*, under the rose, meaning in confidence. A golden rose was presented to Fulk VI of Anjou by Urban II when the first crusade was being organized in 1095, and from about the middle of the 14th century the custom was observed annually. Henry VIII was the recipient of three of these beautiful specimens of the goldsmith's art. In 1906 Pius X presented one to Queen Victoria of Spain.

Golden Rule. Term often applied to the precept of Christ in the Gospel (Matt. vii, 12), "Whatsoever ye would that men should do to you, do ye even so to them"; often contracted into "Do as you would be done by."

Golden Square. London square, between Bridle Lane and Warwick Street, Regent Street, W. Formed soon after 1688, and a fashionable place of residence in the 18th century, it has been of recent years a centre of the woollen cloth trade. The statue in the centre, of George II habited as an ancient Roman, was originally at Canons, Edgware. Bolingbroke, Mrs. Cibber, Angelica Kauffmann, John Hunter, and Cardinal Wiseman lived here. Here De Quincey took leave of Ann. The square also figures in Smollett's Humphrey Clinker, Thackeray's Esmond, and Dickens's Nicholas Nickleby.

Golden Treasury. Short title of an anthology of poetry collected and arranged by F. T. Palgrave (*q.v.*), in full The Golden Treasury of the Best Songs and Lyrics in the English Language. This volume, which appeared in 1861, became a standard work, ranging over lyrical poetry from Nashe to Wordsworth and Rogers. A second issue, 1897, included the work of later Victorians. Further editions up to 1928 were extended to include contemporary lyrics.

Golden Wedding. Fiftieth anniversary of a wedding. The term arose from the golden present which is regarded as the most suitable offering from the husband to the wife. The other principal wedding anniversaries are the twenty-fifth, silver; thirtieth, pearl; fortieth, ruby; and sixtieth, diamond. In the U.S.A., trade associations have sponsored the celebration of many more wedding anniversaries with their appropriate gifts.

Golders Green. Residential district of Middlesex, England. Lying in the S.E. of Hendon borough, it is 1½ m. N.W. of Hampstead on the Northern Line. Adjoining West

Golden Rose given by Pius II to Siena in 1455

Heath, Hampstead, is Golders Hill Park, 36 acres, purchased in 1898 from the executors of Sir Spencer Wells for £38,500, with mansion, lakes, enclosures for red deer, wallabies, peafowl, etc. The mansion was destroyed by a German bomb. About ½ m. from the rly. station is Golders Green crematorium, to the N.W. of which is Hampstead Garden Suburb. Golders Green rly. station is a busy omnibus terminus. Pop. 17,835.

Goldfinch (*Carduelis carduelis*). Common British and Continental song-bird. About 5 ins. long, its plumage is handsomely marked with black, crimson, white, and yellow. It eats grubs, aphides, and small seeds, and is useful in keeping down the growth of noxious weeds, especially thistles. It nests in trees about May and lays four or five eggs. See Eggs, colour plate.

Goldfinch. Song-bird of the British hedgerows
Bertridge

Goldfish (*Carrasius auratus*). Small fish of the carp family. It is a native of China and Japan. Originally brown, the golden hue and the various strange and even monstrous types are the result of selective breeding. It is said to have been introduced into Great Britain about the close of the 17th century. Its handsome appearance and hardy constitution make it a favourite species for the aquarium. A specimen has been

Goldfish. Specimen of the variegated kind of this small carp

known to live 29 years in a tank, being fed three times a week on tiny scraps of raw meat. A more convenient food is finely crushed vermicelli, sprinkled on the water in moderate quantities.

The aquarium for goldfish should be more wide than deep, so as to present a large surface for the absorption of air; and be supplied with growing weeds. If the fish are seen gaping at the surface, it is a sign that the water is not sufficiently aerated. They will breed in a large tank, but may do better in a small pond. See Carp. Consult Goldfish Culture for Amateurs, A. E. Hodge, 1939.

Golding, Louis (b. 1895). A British author. Born of Jewish

Louis Golding,
British author

stock in Manchester, he was educated at the grammar school there and at Queen's College, Oxford. His first book, a volume of

poems, *Sorrow of War*, appeared in 1919; *Shepherd Singing Rag-time*, 1921; his first novel, *Forward From Babylon*, 1920. Of his powerful fictional studies of Jewish life the best known is *Magnolia Street* (1932, dramatised 1934) in which Manchester figured as Doomington. Other novels are *Five Silver Daughters*, 1934; *The Camberwell Beauty*, 1935; *Mr. Emmanuel*, 1939 (filmed 1944); *The Glory of Elsie Silver*, 1945. Golding also wrote biography and travel books.

Goldingen. German name of the Latvian town noted under Kuldiga.

Gold Lace. Ornamentation employed on uniforms and ceremonial dress. It is particularly used upon the uniforms of naval officers, soldiers in some regiments, ecclesiastical and theatrical garments, and liveries. The term denotes braid or cord, though gold pillow lace is also made. The gold thread for making the lace is drawn out so thin that from 1,100 to 1,400 yds. will weigh 1 oz. It is then flattened by steam rollers and wound by machinery round a strand of silk. A finer thread up to 2,000 yds. per oz. is made by drawing it through holes in a diamond or ruby. Some so-called gold lace is made of mixed copper and silver, or of gilded copper, Dutch metal, or lacquered brass. In cheap varieties the core is of cotton thread instead of silk.

Gold Leaf. Thin sheet of gold chiefly used for gilding. The process is of great antiquity, and was probably first carried out in the Far East; but the early Greeks were able to produce leaf not much over 1/100,000 inch in thickness, about three times the thickness of fine modern leaf. The Hebrews and the Egyptians were acquainted with the art, fine specimens of leaf having been found in several ancient Egyptian mummy cases.

Gold leaf is today prepared by first casting the metal in small ingot moulds, using extra high temperature to increase fusibility, followed by annealing the ingots in hot ashes to clean them from grease and improve malleability; rolling down the ingots between hard, highly polished steel rolls, each into a ribbon 10 ft. in length by 1½ ins. wide to the oz. of metal; again annealing after cutting the ribbon into small pieces; piling

the little squares between sheets of special paper in a *cutch*, 150 at a time, and beating with a heavy hammer till each piece is about 4 ins. square; cutting these each into four; piling and beating again in a *shoder*, with lighter hammers, the separating material at this stage being gold-beaters' skin; removing from the shoder, cutting again into four; piling in a final shoder and beating till the pieces are 3 ins. or 3½ ins. square.

Thus the 150 original small squares become 2,400 leaves, which are finally trimmed and packed, 25 at a time, in "books" between thin paper which has been rubbed with ochre to prevent the leaves adhering. The final thickness is usually about one 290,000th of an inch. The finest leaf is produced from pure metal, but gold for common purposes may be alloyed with silver or copper or both. See Gold.

Goldmark, KARL (1830-1915).

A Hungarian composer. Born at Keszthely, May 18, 1830, he

Karl Goldmark,
Hungarian composer

studied music at the Vienna conservatoire, afterwards playing in theatrical orchestras in Hungarian towns. Fame came to him through his overture *Sakuntala*, produced in Vienna in 1865, and this was greatly enhanced by his opera *The Queen of Sheba*, 1875. His compositions, which include the operas *Merlin*, 1886, *The Cricketer on the Hearth*, 1896, and some orchestral pieces, are distinguished for their rich orchestral colouring. Goldmark died Jan. 2, 1915.

Goldoni, CARLO (1707-93). Italian dramatist. Born at Venice,

Carlo Goldoni,
Italian dramatist

Feb. 25, 1707, the son of a physician, and intended for the law, he joined a company of actors, took to play-writing, and in a quick succession of comedies revolutionised the Italian stage. Facile in composition, fertile in invention, with a gift for writing animated dialogue, and an abounding sense of humour, he wrote many works more remarkable for their wit than their morality, such as *The Twins of Venice*, *The Weak-Headed Lady*,

The Lady of Merit, The Obedient Daughter, and The Landlady; comedies that, at least, reflected much of the lighter life of his time.

A dispute with his rival, Count Gozzi, who provoked him by parody, led Goldoni to leave Italy for Paris, where he became attached to the court and received a pension from Louis XVI. Having suffered privation during the Revolution, he died Feb. 6, 1793. *See Italy: Literature; consult also* Memoirs, reissued in English, 1926; G. and the Venice of his Times, J. S. Kennard, 1920.

Golds. Primitive tribe on the banks of the lower Amur, Sungari, and Usuri rivers, E. Siberia. Allied to the Tungus in race and speech, and preserving primitive Altaian characters and shamanism, they and their swine and dogs subsist mainly on river fishes. They practise a skilful decorative art.

Gold Salts. Gold unites directly with chlorine to form gold dichloride, which when brought in contact with water is decomposed into aurous chloride (AuCl) and auric chloride (AuCl_3). Auric chloride or gold trichloride is, however, usually made by dissolving gold in aqua regia, a mixture of four parts of hydrochloric acid and one part of nitric acid. Gold trichloride is used in photography for toning silver prints, a process which replaces the silver of the photography by metallic gold.

The oxides of gold are prepared from the chloride, and from gold trihydroxide is made the form of metallic gold used in miniature painting. *See Gold.*

Goldschmidt, MEIER ADOLF (1819-87). Danish author. He began his career as contributor to *Nestved Ugeblad*, later *Corsaren*, the Danish Punch. His first novel, *The Jew*, 1845, provided him with a theme that he made his own among Danish novelists, and to which he returns in many of his Tales, 1846, and later books. He started two journals: *North and South*, 1847, a monthly magazine written entirely by himself; and *At Home and Abroad*, 1861, to which he contributed brilliant articles on life and politics. Among his novels may be mentioned *Homeless*, 1853-57, Eng. trans. by the author, 1861; *The Heir*, 1865; *The Raven*, 1867; *Avrohmche Nattegal*, 1871.

Goldschmidt, VICTOR MORITZ (1838-1947). A Swiss chemist. Born at Zürich, he studied mineralogy, geology, and chemistry at Oslo, Vienna, and Munich. In

1914 he was appointed director of the mineralogical institute at Oslo, and during 1917-30 was director of the Norwegian government's raw materials laboratory. Professor of crystallography, mineralogy, and petrography at Göttingen, he resigned in 1935 as a protest against the Hitler regime. Goldschmidt was sent to a Norwegian concentration camp by the Germans in 1942, but escaped to Great Britain, where he worked for the agricultural research council. Returning to Oslo in 1946, he died there March 20, 1947. He laid the foundations of geochemistry by studying the laws of distribution of chemical elements as a function of their atomic or ionic properties and their nuclear stability.

Goldsmith. One who works in gold. The term is also applied to workers in precious metals generally and to dealers in gold and silver plate. Goldsmiths were among the earliest of craftsmen and are referred to in the O.T. (Neh. 3; Isaiah 40, 41, 46).

The craft was brought to a high perfection in Italy, France, and

him to beat out the two bronze gates for the baptistery at Florence which Michelangelo declared were worthy of Paradise. (*See Door illus.*) Goldsmiths were also bankers. *See Banking; Goldsmiths' Company; Hall Mark; Jewelry; consult also* The Art of the Goldsmith and Jeweller, T. B. Wigley, 1898; English Goldsmiths and Their Marks, C. J. Jackson, 1905; Goldsmiths' and Silversmiths' Work, N. Dawson, 1907.

Goldsmith, OLIVER (1728-74). Irish writer. Born at Pallas, co. Longford (or possibly at Elphin, co. Roscommon), Nov. 10, 1728, the son of a clergyman, he spent the greater part of his boyhood at the little village of Lissoy, Westmeath—Sweet Auburn of The Deserted Village. Neither at school nor at Trinity College, Dublin, where he went in 1744, did Goldsmith give promise of future greatness. Successive attempts to get him into the Church and the legal profession having failed, Goldsmith's relatives sent him to Edinburgh to study medicine in 1752, with equally unsatisfactory results. During 1754-56 he visited Holland, ostensibly studying at Leyden, Belgium, France, Switzerland, Italy, and Germany, journeying on foot from place to place. Sometimes he enjoyed the hospitality of universities which welcomed peripatetic scholars to their disputations; more often he was dependent for food and lodging on some humble wayside cottage whose inmates he repaid by a tune on his flute. Goldsmith's experiences during these years are reflected in his poem *The Traveller*.

Settling in London in 1756, Goldsmith tried many ways of earning a living, including acting and teaching, but always without success. Failing to pass the examination for surgeon's mate in the navy, he determined to settle down as a bookseller's hack, writing on an amazing variety of subjects of which he had no particular knowledge. This class of work he continued more or less all the rest of his life. A book on *Natural History and histories of England and Rome* are the most notable of his hack productions.

His first real contribution to English classics was the *Letters of a Citizen of the World*, 1762, originally issued serially in *The Public Ledger*. The Letters professed to be from the hand of a Chinese philosopher on a visit to England, and contain diverting comment on contemporary life

Oliver Goldsmith
From the portrait by Reynolds in the
National Portrait Gallery

Germany. In England more attention was paid to silver plate, though the goldsmith's craft was not neglected. Owing to the great value of gold, artists chose bronze for the bulk of their grander conceptions, but many of the greatest painters and sculptors began their art education in the goldsmith's shop.

Francina signed several of his pictures "Francina the goldsmith." Ghirlandaio, Michelangelo's teacher, was goldsmith as well as painter. Verrocchio, the master of Leonardo da Vinci, practised the art. Ghiberti acquired as goldsmith the skill which enabled

and manners. By this time Goldsmith had written for periodicals, including *The British Magazine*, started by Smollett, with whom Goldsmith was on friendly terms. He had also published *An Inquiry into the State of Polite Learning in Europe*, which had a favourable reception. In 1761 Goldsmith became friendly with Dr. Johnson, and was soon a regular member of the Johnsonian circle, which included Burke, Reynolds, and Garrick.

Fortune, long so unpropitious, now began to smile on him. In 1764 appeared *The Traveller*, which in Johnson's opinion gave Goldsmith a high place in English literature. This was followed by that inimitable story, *The Vicar of Wakefield* (1766), and *The Deserted Village* (1770), one of the most charming of English poems. He also essayed writing for the stage with *The Good Natured Man* (1768) and *She Stoops to Conquer* (1774), successful on its production and a favourite to this day. His last piece of work was the satirical poem *Retaliation*, written shortly before his death. Notwithstanding the comparative affluence of his later years, he died in London, April 4, 1774, £2,000 in debt. A memorial in the Temple churchyard, since destroyed, marked the approximate position of his grave; and there is a cenotaph to him in Westminster Abbey with an inscription by Johnson.

As a poet Goldsmith will always command a high place. Though under the influence of the school of Pope, he shows a humanity and breadth of feeling not usually associated with that school. His prose is marked by simplicity, clarity, and singular charm. The Vicar of Wakefield, notwithstanding its faults of construction, shows great skill in characterisation and is a notable landmark in the evolution of the novel.

Personally Goldsmith was one of the least favoured of men, shy, awkward, and sadly marked by smallpox. His associates regarded him with mingled respect and contempt, for if he was vain and feckless he was warm-hearted. Johnson said that as a writer he touched nothing that he did not adorn; Garrick, that he "wrote like an angel and talked like poor Poll." The best biography is by J. Forster, 6th ed., 1877; others are by W. Irving, 1849; W. Black, 1878; A. Dobson, 1888; F. F. Moore, 1910; S. Gwynn, 1935. *Collected Letters*, ed. K. C. Balderson, appeared 1928.

Goldsmiths' Company. Fifth of the twelve great London city livery companies. The Worshipful

Goldsmiths' Company arms

Company of Goldsmiths received its first royal charter in 1327, but a guild of fraternity of Goldsmiths was in existence by 1180. One of the craft guilds formed for the mutual benefit of members and the regulation of their crafts, it has, more than any, retained its connexion with its own industry.

Goldsmiths' Hall has always stood on its present site in Foster Lane, E.C.2. The present building, by Philip Hardwick, 1830, is the fourth hall. The livery hall was undamaged, but the drawing and dining rooms, with their rich sculptured ceilings, were destroyed by a German bomb, April 16, 1941.

Wares in gold and silver are delivered at Goldsmiths' Hall and after being assayed are impressed with the London hall mark. The company has since the Middle Ages been responsible for checking the coinage of the realm. It has a unique collection of silverwork by the best craftsmen.

The company's funds have been largely used for educational endowments, hospitals, scientific research etc. Goldsmiths' College, a technical institute, with teachers' training dept. and art school, at New Cross was endowed in 1891.

Gold Standard. Financial term meaning that the value of goods, services, currency, etc. is related directly to gold, which through custom has come to be accepted as having a stable value. A country is on the gold standard when its standard coin is of gold, and its citizens may, at their own option, make payments at home and abroad either in their own currency or in gold of the same value by weight. If all countries were on the gold standard, the purchasing power of their currencies would be proportional to the gold content of their respective standard gold coins. For the establishment of the gold standard all over the world, each country would have to possess and maintain a stock of gold, and allow a free market in it. Because of the unequal ownership and distribution of gold, such a condition has never existed, though certain countries (e.g. Great Britain from 1816 to 1914) have been from time to time on the gold standard. See Exchange.

Gold Stick. A British court official. In England the appointment is held in turn by the colonels of the regiments of household cavalry, each of whom is in waiting for a month at a time. The captain-general of the Royal Company of Archers is Gold Stick for Scotland. The officer in waiting walks behind the sovereign on state occasions.

Gold-thread (*Coptis trifolia*). Perennial evergreen herb of the family Ranunculaceae. It is a native of N. America and N. Europe. The rootstocks are bright

Gold-thread, a perennial herb whose roots are used medicinally and for dye

yellow and bitter, the leaves divided into three oval leaflets, and the white flowers have both sepals and petals coloured. The roots are used as a tonic, and for dyeing.

Goldwyn, SAMUEL (b. 1882). Polish-born American film producer. Born in Warsaw, Aug. 22, 1882, he emigrated and became a glove manufacturer in New York. He was co-founder of the Jesse Lasky Feature Photoplay Co., 1913, and in 1918 started the Goldwyn Pictures Corporation, absorbed in the Metro-Goldwyn-Mayer company in 1924. Elected owner-member of United Artists Corporation in 1927, Goldwyn resigned his interest in 1940. One of the most outspoken personalities in the cinema business, he introduced many players who became stars, e.g. Ronald Colman, Gary Cooper, Danny Kaye.

Goletta OR LA GOULETTE. Port of Tunisia, on the Bay of Tunis. Formerly the port of Tunis, which lies 7 m. W., it is now connected with the city by a ship canal through Lake El-Bahira. Since the cutting of the canal and the deepening of the harbour at Tunis, Goletta has lost its former importance. Many of its buildings are constructed of stone from the ruins of Carthage. It was taken by Charles V in 1535, but regained by the Turks in 1574.

GOLF: THE ROYAL AND ANCIENT GAME

Robert H. K. Browning, Editor of Golfing

A game of great antiquity, golf has changed more in the twentieth century than in several centuries before. Here is its history and a description of the points of play by an expert. See also Ryder Cup; Walker Cup; and biographies of Braid; Cotton; Jones, R. T.; Vardon, etc.

Golf is a game played over open country, in which a small, hard ball has to be struck by means of clubs of various designs up to and into a succession of holes of a regulation diameter of $4\frac{1}{4}$ ins., the object of the player being to hole out at each hole in the smallest possible number of strokes.

The governing body of the game in Great Britain is the Royal and Ancient Golf Club of St. Andrews, founded in 1754, and given its present title by William IV in 1834. Its code of rules (provisionally revised Jan. 1, 1950) is now accepted almost universally.

Development of Links

Originally golfers found their courses by the seashore among sand dunes, which provided the necessary obstacles to give variety to the play, or on waste land or village commons, which afforded other natural difficulties; but since the inauguration of the Royal North Devon club at Westward Ho! in 1864, the majority of golf courses have been artificial creations, laid out on terrain of many different types, the chief hazards taking the form of bunkers, that is, of shallow pits filled with sand, the difficulty of playing out of the pit being usually enhanced by the construction of a steep bank or parapet on the side nearest to the hole. Originally, also, the spots chosen for the various holes were where some natural plateau or hollow of finer turf suggested itself as particularly suitable for the task of holing out. In present-day golf each hole is surrounded by a green of carefully prepared turf kept closely mown to facilitate the final putts by which the ball is guided into the hole.

In imitation of St. Andrews, eighteen has been universally adopted as the standard number of holes for a round (though courses sometimes have only nine holes and a round is achieved by playing them twice over); but this number is not obligatory. The earliest codes of rules of the game show that it was at one time customary for the player to place, or tee, his ball close to one hole when striking off to the next, but today a prepared starting point, or teeing-ground, is pro-

vided for each hole. The custom of the game permitted the player to tee the ball for the first stroke by placing it on a pinch of wet sand, usually replaced nowadays by a peg of wood or plastic. The distance from teeing-ground to hole may be anything from 90 to 600 yards or even outside these limits, but as the ingenuity of the manufacturers of balls and clubs has enabled players to hit the ball farther and farther, the tendency has been for courses to become correspondingly longer, and no course is considered first class which has a total length for the eighteen holes of less than 6,000 yards; while for championship play the best courses are 7,000 yards or more. The length of the individual holes, however, ought to be as diversified as possible. Between teeing-ground and hole is a prepared fairway, on which the grass is kept short, bordered on either side by an expanse of uncut grass, known as the rough.

A typical eighteen-hole course would be made up of three or four short holes of from 130 to 230 yards, at which the player would hope to put his ball on the green with his first stroke; a similar number of long holes of 500 yards or more, at which even a first class player would expect under normal conditions to require two full shots and something more to reach the green; and the remainder two-shot holes of from 280 to 460 yards providing tests of varying degrees of difficulty, and of the player's ability to cover the distance in two strokes.

Opening and Approach Shots

The play to a typical two-shot hole consists of an opening shot, or drive, from the teeing-ground, by means of which the player tries to send the ball as far on its way as possible; a second shot or approach by which he endeavours to combine direction and distance with such nicety of judgement as to place his ball on the green; a long putt which rolls the ball up to within three or four feet of the hole, and another putt which rolls the ball actually into it. A good player will expect to complete the round of eighteen holes in an average of four strokes per hole.

The fundamental simplicity of the game lends itself to a great variety of methods of determining the result of the play. Those in most general use are:

(a) **STROKE PLAY.** In this form of the game each player's score is determined by adding together the number of strokes he has taken to hole out at each of the eighteen holes, the aggregate forming his score for the round; the player with the lowest aggregate for the round (or rounds because championships and other big tournaments are usually decided over four rounds) is adjudged the winner. This method of scoring is the most satisfactory for all events in which large numbers of players compete.

(b) **MATCH PLAY.** In this, the oldest and for long the only form of the game, the result is decided by holes, the player or side holing out in the fewer strokes at each hole being the winner of that hole, and the player or side winning the greater number of holes over the round being the winner of the match. When both players hole out in the same number of strokes, the hole is said to be halved; when both players over the round win an equal number of holes, the match is also said to be halved or to finish all square.

Usual Types of Match

The most usual forms of match play are (i) between two individual opponents, in which case the match is called a single; (ii) between two sides of two players each, the partners on each side using one ball and playing alternate strokes, in which case the match is referred to as a foursome; and (iii) between two sides of two players each, each of the four players playing his own ball, but the better score of each pair being regarded at each hole as the score of the side. This form of play is called a four-ball match. In the U.S.A. the second of these forms of match-play is seldom seen, and a four-ball match is regularly described as a foursome.

(c) **BOGEY PLAY.** This is an attempt to combine the chief features of methods (a) and (b), to allow of a large field competing by holes play. Each player engages in a match by holes against the same imaginary opponent whose bogey score for every hole is formulated in advance.

One of the greatest attractions of golf is that it readily lends itself to matches between players, and to competitions among fields of players, of very different degrees

of skill, by the allotment to each player of a handicap of so many strokes per round, based on a standardised system. In handicap events, each player in stroke play deducts his handicap from his aggregate for the round; in match play the handicap takes the form of deducting a stroke from his score at each of a number of previously specified holes.

HISTORY. The earliest reference to golf occurs in an Act of parliament of the reign of James II of Scotland, dated March 6, 1457, by which it was decreed "that the Fute-ball and Golf be utterly cryit downe and nocht usit" in the interests of archery practice for the national defence. There is no evidence of any kind to support the suggestion that the game was brought to Scotland from outside. The oft-quoted theory that the game was brought from the Netherlands has its origin in the resemblance to golf of the Dutch game of *kolven*, as depicted in some of the winter scenes in Dutch paintings of the earlier half of the 17th century. But *kolven*, which is still played in the Netherlands, is not a field sport at all, and has little in common with the Scottish game. The Belgian cross-country game of *chole* does indeed bear some resemblance to golf, but a vital point of difference is that the opposing sides both strike at the same ball. The essential features of golf, the combination of hitting for distance with the nicety of the final approach to an exiguous mark, and the independent progress of each player, free from any interference by his opponent, belong to Scotland alone. Yet as long as the game

was played by Scotsmen only, little progress was made either in the evolution of the equipment of the game or in the scientific study of golfing style.

In the first half of the 19th century the golf ball was of leather stuffed with feathers, of which it was said that as many as would fill a tall hat were forced into the neatly stitched cover. These balls were highly resilient, but in other respects they were not satisfactory; they were costly, did not stand up to wear and tear, quickly lost their shape in wet weather, and were too easily destroyed by a chance hack from the blade of an iron club, which allowed the feathers to escape through the gaping wound. The introduction of balls of gutta percha in 1848 was the first step in the evolution of the modern game.

The only defect of the gutta percha ball as compared with the feathery one was its lack of resilience, which made it difficult to get the ball up into the air; but it was a long time before golfers realized the necessity of modifying their style to suit. Even as late as 1890, when the golf boom was starting in England, golfers were still clinging to the wide, flat, sweeping swing which had come down to them from the days of the feathery, and Horace

Hutchinson, winner of two of the first three amateur championships, could lay it down that the correct attitude for the drive was with what would now be called a closed stance, with the left foot forward and the right drawn back, and the ball opposite the left heel. A

revolution in style, however, followed the victories of Harry Vardon in the open championships of 1896, 1898, and 1899. His swing was so smooth and easy that it seemed easy to imitate, and within a few years he became the model for the whole world. His method of holding the club, with the Vs formed by the forefinger and thumb of each hand on top of the shaft, and the little

finger of the right hand riding in the hollow between the forefinger and second finger of the left, has ever since been adopted by the majority of first class players and is everywhere known as the "Vardon" grip, though it was in fact used by John E. Laidlay, the Scottish amateur, for many years before Vardon adopted it. With Vardon also came in the vogue of the open stance, with the right foot advanced and the left drawn back and the ball opposite a point almost midway between the heels. The finger grip, the open stance, and the upright swing all helped to get the solid ball into the air.

Golf. The Vardon overlapping grip, illustrated by a direct plaster cast from Harry Vardon's hands. Reproduced from the original at South Herts Golf Club, by courtesy of the Committee.

Golf. Multiple flash photographs of Bobby Jones driving. Above, swing with a wooden club, showing transference of weight from right to left foot, to keep club head in widest possible arc. Right, swing with iron club, to obtain accuracy rather than power.

The next great change came with the introduction of the rubber-cored ball at the beginning of the 20th century. This soft, resilient ball made golf much easier and pleasanter for ladies, young players, and old men; but as manufacturers year after year increased the resilience and travelling power of the ball, the problem became not how to get the ball into the air, but how to keep it from soaring, and golfers went back, if not to the closed stance, at least to a square stance with the feet equally distant from the intended line of play, and the ball again well forward opposite the left heel.

Development of the Swing

The invention of the cine-camera made possible a more detailed analysis of the swing, and between 1921 and 1933 the successes of the American players, which culminated in 1930 in "Emperor" Bobby Jones winning the British and American open and British and American amateur championships all in the same year, encouraged the general acceptance of a simplified and more scientific conception of the swing, the chief features of which are:

(a) the straight left arm, which keeps the head of the club travelling in as wide an arc as possible, and allows the player the time and space in which to work up to the maximum of speed at the moment of striking;

(b) the grooved swing, which keeps the club throughout the stroke as far as possible in one plane of movement.

The swing of the present day players is much shorter than the swing favoured by their forefathers, but that is partly due to the fact that so much extra power is now supplied by the resilience of the ball and the whip of the steel shaft. So much, indeed, has the golfer been aided by successive improvements in the weapons of the game that the rules of golf committee has been forced to restrict the ingenuity of the manufacturers, by the limitation of the ball to a maximum weight of 1.62 oz. and a minimum size of 1.62 ins. in diameter, by forbidding any substantial departure from the traditional and accepted form and make of clubs, and by restricting the number of clubs a player may carry to fourteen in all.

The development of approach play has been even more remarkable. Originally all the clubs used for normal strokes had heads of

wood, the player using spoons designed with different angles of loft according to the extent to which it was desired to raise the ball in the air. For the typical approach shot in which the ball had to be tossed high in the air in order to clear a bunker or other hazard between the player and the green, and yet stop quickly on coming to earth again, the player made use of a baffling stroke in which the bottom or sole of the club head struck the ground a fraction of a second before the face made contact with the ball, the result being to toss the ball up with the desired lofty, lifeless flight. At this period the only clubs with iron heads were the track irons designed for playing the ball from roads and similar hard surfaces which might have damaged the wooden-headed clubs.

The Rev. Dr.

J. G. Macpherson, who was one of the greatest golfers at St. Andrews when he was a student there in the middle of the 19th century, records that it was Allan Robertson, the first of the great professional players, who introduced the idea of using the iron for the approach shot. "Young Tom" Morris, another hero of the game, who won the Open Championship on four successive occasions, took the process of development a stage further by playing the pitch shots with his niblick, which in those days had a very small head, being designed for playing the ball from cart-ruts and similar difficult positions. In a challenge match played at St. Andrews when the links were covered with snow and play was possible only by sweeping a narrow circle round each of the holes, it is recorded that at hole after hole, Young Tom was able to pitch the ball into the circle and make it stop there, "as if it

Golf. Exponents of correct stance and of ease and smoothness in swing. 1. Walter Hagen demonstrating straight line putting. 2. Joyce Wethered at the finish of a drive. 3. Bobby Jones at the top of a swing for an iron shot. 4. Harry Vardon at the finish of an approach shot with the mashie

had a string tied to it." The small head of the niblick, however, made it unsuitable for this purpose, and in its place the manufacturers designed the mashie, with a similar degree of loft but a wider and deeper blade.

The acknowledged master of this club was J. H. Taylor, who in 1894 became the first English professional to win the open championship. He introduced the cut shot, which was played by standing to the ball with the right foot much advanced and swinging the club so as to draw the blade from right to left across the under side of the ball. This was then thought to be the easiest method of imparting the back spin needed to make the ball draw up quickly on landing, but the method had the defect that the drawing of the blade across the ball tended to produce a side spin that made the ball swing in a

Golf. Set of modern clubs: 1-4, related iron heads; 5-6, mashes; 7, mashie-niblick; 8, niblick; 9, putter
Courtesy of A. G. Spalding & Bros., Ltd

curve towards the right, and players were advised to aim to the left of the flag to allow for this drift. It was left for Ted Ray, the winner of the open championship of 1912, to demonstrate that the cut constituted a needless complication, and that the same result could be achieved by using a still more lofted club and hitting the ball straight. The cut shot came to be used only when it was desired to make the ball rise very steeply in order to clear a tree or the bank of a bunker or some other obstacle immediately in front.

Matched Set of Irons

Approach play has been greatly simplified by the creation of matched sets of irons of similar weight and balance and carefully graded degrees of loft. The normal set is numbered from one to eight, corresponding roughly to the old nomenclature as follows (in increasing order of loft): No. 1, cleek; No. 2, long iron; No. 3, mid-iron; No. 4, lofting iron; No. 5, mashie; No. 6, spade-mashie; No. 7, mashie-niblick; No. 8, niblick. With the exception of the No. 1, which is a distance club used in much the same fashion as the wooden clubs, all these clubs are played with the same restricted swing, the only variation being that as the distance to be covered becomes shorter and the club selected correspondingly more lofted, the player stands slightly closer to the ball (the lengths of the clubs' shafts being also graded to suit) and slightly more open, in order to adapt his swing to the fact that as less power is required the club is not taken so far round. When it is desired to make the ball draw up more than usually quickly, the amount of back-spin can be increased by using a more lofted club and standing slightly further forward so as to hit down on the ball, which is thus squeezed out between the blade of the club and the turf.

In the art of holing out, the steady improvement in the tex-

ture and quality of the greens has led to a corresponding rise in the standard of accuracy expected from the players. The American golfers, with Walter Hagen as their great example, have taught the world that the simplest and most scientific method of putting is to keep the head of the club travelling backwards and forwards in a straight line through the ball, with the blade of the club kept at right angles to that line throughout the stroke. Generally speaking the golfer of today has a much smaller variety of strokes than his grandfather had, but by way of compensation has to play this limited variety of strokes with greater nicety of judgement.

Golgi, CAMILLO (1843-1926). An Italian physician. He was born near Brescia, July 7, 1843. As resident physician at a provincial home for incurables, he wrote the early scientific papers that made him famous and discovered a method of staining nerve cells. By this discovery the histology and physiology of the central nervous system were first placed on a sound foundation, and for this Golgi received, conjointly with Ramon y Cajal, the Nobel prize for medicine in 1906. He was later

professor at Siena and at Pavia. In pathology Golgi is best known for his work on malaria and on the parasites of tertian and quartan fever. He died Jan. 21, 1926.

Golgotha (Heb., skull). Hill outside Jerusalem where Christ was crucified. See Calvary.

Goliath. Philistine of Gath. He was a man of gigantic stature who challenged Saul's soldiers to single combat, and was slain by David with his sling. There appears to have been another Goliath of Gath who was killed by Elhanan, one of David's men (1 Sam. 17-22).

Goliath Beetle (*Goliathus*). One of the largest tropical beetles.

Found in Cent. and S. Africa, it frequently measures 4 ins. in length. Its colour is usually black, but it is often variegated with white. It is said to live on the sap of forest trees. See Beetle; Insects.

Gollancz, SIR ISRAEL (1864-1930). A British man of letters. Born in London, July 13, 1864, and educated at the City of London School and Christ's College, Cambridge, he became professor of English literature at King's College, London, 1906. He was also secretary of the British Academy from its foundation in 1903 until his death, June 23, 1930, and knighted in 1919. An authority on early English texts, he edited The Pearl, 1891; The Exeter Book of Anglo-Saxon Poetry, 1897, etc.; The Temple Shakespeare, 1894-96;

Goliath Beetle of tropical Africa

Sir Israel Gollancz, British man of letters
Russell

the Caedmon MS., 1927; and was general editor of *The Temple Classics*, and the *King's Library*.

Gollancz, VICTOR (b. 1893). British publisher and publicist. The son of Alexander Gollancz, he was born in London, April 9, 1893,

Victor Gollancz,
British publisher
and publicist

and educated at St. Paul's school and New College, Oxford, where he was Chancellor's prizeman for Latin prose. For some years managing director of Ernest Benn, Ltd., in 1927 he founded the publishing firm bearing his own name, of which he was chairman and governing director. In 1936 he founded the Left Book Club. He became well known for his support of various humanitarian causes. Among his writings are *The Betrayal of the Left*, 1941; *Russia and Ourselves*, 1941; *Shall Our Children Live or Die?*, 1942; *Let My People Go*, 1942; *In Darkest Germany*, 1947.

Golosh OR **GALOSH** (Fr. *galoches*). Vulcanised rubber overshoe. An American invention, it was introduced into Great Britain about 1847. Originally golosh signified any kind of boot or shoe, but more especially a wooden clog or patten. The word is ultimately derived from Gr. *kálopodion*, diminutive of *kálopous*, a shoemaker's last.

Golovnin, VASILII MIKHAILOVITCH (1776-1831). Russian seaman. In 1805 he commanded a vessel named the *Diana*, with the object of exploring the coastlands of Russia and making a voyage round the world. He was seized and imprisoned for two years by the Japanese (1811-13), but made another voyage. Afterwards he wrote an interesting account of his experiences.

Goltzius, HENDRIK (1558-c. 1617). Dutch engraver. He was born at Mulbrecht in the duchy of Jülich, and died at Haarlem, possibly Jan. 1, 1617. As a painter he never achieved great distinction, but his engravings rank with the best of the German school of the 16th century, showing immense virility and technical skill, although fre-

Hendrik Goltzius,
Dutch engraver
Self-portrait

quently erring in taste. He engraved nearly 300 portraits and miscellaneous subjects after his own designs and those of Italian, Flemish, and German masters.

Gomal OR **GOMUL**. River and pass of Afghanistan. The river rises some 50 m. S. of Ghazni and winds through the Suleiman Mts. Except in the rainy season, when it flows into the Indus, its waters are lost in the sands. The pass is a route between Afghanistan and India.

Gomara OR **KAFFA**. Dependency of Abyssinia. Situated in the S.W., it is noted for its coffee, which takes its name from this district. It is a lofty tableland, watered by the river Omo, and inhabited by people of Hamitic stock.

Gomberville, MARIN LE ROY DE (1600-74). French author. His prolix *Polexandre*, with its extravagant adventures and high-flown sentiment, is a typical example of the *roman galant* popular in the aristocratic circles of the time. He was one of the original members of the Academy.

Gomel. Town of White Russia S.S.R. It is situated on the Sozh, at the junction of two rlys., 112 m. S.S.E. of Mogilev. Formerly it had large rly. repairing works, sugar refineries, and oil mills. The Russians evacuated Gomel Aug. 21, 1941, after heavy fighting with the Germans, who turned it into a "hedgehog" of their defence system. The Russians retook it Nov. 26, 1943. Pop. 144,169.

Gomera. One of the Canary Islands in the Atlantic Ocean. Separated from Teneriffe (to the E.N.E.) by a channel 13 m. wide, its length is 20 m. and breadth 10 m., area 143 sq. m. Of volcanic origin, with steep coasts, it rises in the interior to an alt. of 4,400 ft. Wooded and well watered, its fertile valleys produce potatoes, fruit, sugar, and cotton. Silk is manufactured, and dromedaries are reared. San Sebastian, the capital and port, has an excellent harbour. Columbus called at the island in 1492.

Gomez, JUAN VICENTE (1859-1935). Venezuelan dictator. Born at San Antonio de Tachira, of mixed blood, he was a rancher, and then a soldier. He entered politics in 1892 and played a leading part in the abortive "legalistic" revolution organized by Cypriano Castro (*q.v.*). Fleeing with Castro to Colombia, he remained in exile until 1899, when a successful counter revolution allowed him to return. Having been

vice-president under Castro, he assumed control of affairs Dec. 19, 1908, and was virtual head of the administration until his death at Caracas, Dec. 17, 1935, though for different periods calling himself president-elect or commander-in-chief. This oppressive rule was marked by extreme cruelty, but he reorganized the country's finances, extinguishing by 1930 the foreign debt; improved legislation, and built universities, hospitals, and a fine system of roads.

Gomez, MAXIMO (1836-1905). Leader of Cuban insurgents. Born at San Domingo, Nov. 18, 1836, his full name was Maximo Gomez y Báez. He drifted to Cuba, where in 1868 he joined the insurgents; ten years later, having taken part in the unsuccessful revolt, he had to seek safety in flight. When affairs between the Cubans and Spain again reached breaking point he returned and, in 1895, was made commander-in-chief of the Cuban forces. In June, 1896, he gained a notable victory at Puerto Principe, and remained one of the three principal leaders of the Cubans until the close of the war, 1898. He strongly opposed the cession of the island to the U.S.A. He died June 17, 1905.

Maximo Gomez,
Cuban insurgent

Gomez Carrillo, ENRIQUE (b. 1873). Spanish-American author. He was born in Guatemala, his father being a distinguished Spanish historian and his mother of French origin. Early in his career he settled in Paris, and there most of his extraordinary volume of work was achieved. The Spanish world accepts him as a master of prose, and his work is familiar to the readers of the leading Spanish and South American periodicals. He is seen at his best in his numerous works of travel, such as *From Marseilles to Tokyo*, 1905; *The Soul of Japan*, 1906; and *Greece*, 1907. His wife, Raquel Meller, made a great success interpreting Spanish dramatic song.

Gomme, SIR GEORGE LAURENCE (1853-1916). British antiquary. Born in London, he was educated at the City of London School. He entered the Metropolitan Board of Works, and was transferred later to its successor, the London County Council. In 1891 he was made statistical officer to the council,

and in 1900 became its clerk, resigning 1914. He was knighted in 1911 and died Feb. 23, 1916. Gomme was one of the founders of the Folklore Society, and edited *The Antiquary*, *The Archaeological Review*, and *The Folklore Journal*. His published works include *Primitive Folk Moors*, 1880; *Ethnology in Folklore*, 1892; *The Governance of London*, 1907.

Sir George Gomme,
British antiquary

Gomorrah. With Sodom, one of the two cities of the plain (Gen. 18, 19). See Abraham; Sodom.

Gompers, SAMUEL (1850-1924). American labour leader. Born in London, of Jewish origin, Jan. 27,

1850, he went to the U.S.A. in 1863. There he soon helped in founding the union of cigar-makers, to which trade he had been apprenticed in England, and laboured incessantly to organize the working classes. Largely responsible for the formation of the American Federation of Labor in 1881, he became its president the following year, holding this office continuously, apart from a break in 1894-95. This federation drew into itself all the larger unions and did much in carrying reforms through the legislature. Gompers preferred the "craft" principle to Socialism, and denounced all attempts to introduce Soviet ideas into the policy of the American Labour party. He died at San Antonio, Texas, Dec. 13, 1924. His *Seventy Years of Life and Labour* appeared in 1925.

Gomuti (*Arenga saccharifera*). Tree of the family Palmae, native of the Moluccas. The trunk grows to about 40 ft., and the large leaves are divided featherwise into long, narrow leaflets. The flower-spikes are male or female, and down among the foliage. The flesh of the large round fruit is acrid. Horse-hair-like fibres covering the leafstalks are used for thatching and cordage. The juice of the flower-spikes contains much sugar, and can be converted into toddy or vinegar. Sago can be obtained from the trunk of the tree.

Gonad. Generic name for a sex organ, male or female. With the development of the study of gonadotropic hormones, several of them have been isolated. Some are known to be elaborated by the pituitary gland. From the urine of pregnant women is recovered a hormone which has a stimulating effect on the interstitial cells of the male and female sex glands; it also causes the descent of the testis from the abdomen into the scrotum when this is delayed in the adolescent. In the serum of pregnant mares is found another gonadotropic hormone which stimulates the follicles of the ovary and the sperm-forming cells of the testis.

Gonaïves. Seaport of Haiti, W. Indies. A prosperous town and a bishop's see on the Bay of Gonaïves, 62 m. N.W. of Port-au-Prince, it has a good harbour and exports coffee, cotton, and dye woods. Here, on Jan. 1, 1804, Dessalines (*g.v.*) declared the independence of Haiti. In 1914 it was the scene of two conflicts between government troops and insurgents. The town was nearly destroyed by an earthquake, May 7, 1842. Pop. 10,500.

Between Cape S. Nicolas-le-Mole and Cape Dame Marie, the Bay of Gonaïves is about 100 m. across and penetrates inland about the same distance. *Pron.* Gonah-eev.

Gonçalves Dias, ANTONIO (1823-64). Brazilian poet. Born in Maranhão, Aug. 10, 1823, he was for some time professor at the college of Pedro II in Rio de Janeiro. One of the chief poets of Brazil, he also wrote on ethnographical subjects and compiled a dictionary of Tupi, one of the chief S. American Indian languages. On a voyage home from Europe, he was drowned, Nov. 3, 1864.

Gomuti. A Moluccan palm, yielding fibre, sugar, and sago

Goncourt, EDMOND DE (1822-96), and **JULES DE** (1830-70). French novelists, known familiarly as the brothers De Goncourt. They belonged to a Lorraine family. Edmond Louis Antoine Huot was born at Nancy, May 26, 1822; Jules Alfred Huot in Paris, Dec. 17,

Edmond de Goncourt,
French novelist

1830. Chiefly interested at first in 18th century art and the collection of bric-à-brac, and drawings and pastels of that period — Edmond also became an enthusiastic admirer of Japanese art — they collaborated in books of social history, *e.g.* *Histoire de la Société Française pendant la Révolution*, 1854; *La Société Française pendant le Directoire*, 1855; *Histoire de Marie-Antoinette*, 1858.

As collaborators in fiction (1860-70) each composed the same incident independently, and the two versions were afterwards moulded into one. Chief of their novels were *Sœur Philomène*, 1861, a hospital story; *Renée Mauperin*, 1864; *Germinie Lacerteux*, a study of the gradual degeneration of a servant, 1865; *Manette Salomon*, a story of a Jewish artist's model, 1867; and *Madame Gervaisais*, 1869, reckoned their masterpiece. The brothers collaborated in a play, *Henriette Maréchal*, 1865; and both kept a diary, reproduced in the much-discussed *Journal*.

Edmond, independently, wrote *Watteau*, 1876; *Prudhon*, 1877; *L'Art Japonaise au XVIIIe Siècle*, 1891-96; and the novels *La Fille Élisa*, 1878; *Les Frères Zemganno*, 1879; *La Faustin*, 1882; and *Chérie*, 1885. He edited *Les Lettres de Jules de Goncourt*, 1885, and the *Journal des Goncourt*, 1887-92.

As writers of fiction the brothers were pioneers of the naturalistic school. Having collected their materials with laborious industry, they attempted to set forth the naked facts of life in a style designed with equal laboriousness to arrest attention by its supposed suitability to subject or situation. Their fiction purports to show

Jules de Goncourt,
French novelist

that a life is not a unity but a succession of unrelated incidents. They form a connecting link between Flaubert and Zola. Jules died June 20, 1870; Edmond, July 16, 1896. The money realized by the sale of their art collection was invested to found the Académie des Goncourt, which helps struggling French authors and awards annual prizes. There is a *Life* by A. Delzant, 1889; a monograph by M. A. Belloc-Lowndes and M. L. Shedlock, 1895; consult also *L'Esthétique des Goncourt*, P. Sabatier, 1921.

Gond. Primitive tribe in Central India. Numbering over 3,200,000, two-thirds occupy hill-tracts in the Central Provinces. The Dhur Gonds, dark-skinned, roundish-headed, thick-lipped peasantry, preserve their aboriginal forest life, ceremonial dances, and animism. The hinduised Raj Gonds on the plains claim Rajput descent. Half of them have displaced their Dravidian speech, intermediate between Tamil and Telugu, by Hindi or Gujarati. Four 14th-17th century Gond kingdoms gave this region the name Gondwana.

Gonda. Town and district of India. It is in the Uttar union, in the Faizabad division. Of the total area (2,827 sq. m.) about two-thirds is under cultivation, and of the cultivated area almost half is devoted to rice. Other crops are wheat, maize, and grain. Exports consist principally of agricultural produce; imports include piece goods, salt, and metals. The last raja of Gonda took part in the Mutiny, and his estates were confiscated. Pop., dist., 1,719,644; town, 21,567.

Gondal. A former state of India, now part of the Saurashtra union. Its area was 1,024 sq. m. The ruler was a thakur sahib, entitled to a salute of 11 guns. Products include cotton, grain, and groundnuts. Textiles and gold embroidery are industries. The state was notable for its good educational facilities. Pop. 244,514.

Gondar. Town of Abyssinia, capital of the Amhara prov. of Begemdir. It is built on a hill, at an elevation of 6,000 ft., 24 m. N. of Lake Tsana. At one period a flourishing centre of Abyssinian trade, it has now a pop. of 22,000. In the Second Great War the Italians at Gondar withstood a six months' siege after the capitulation of their main forces in Abyssinia. Their surrender to British Imperial troops on Nov. 27, 1941, brought the campaign in E. Africa

to an end. See Abyssinia; East Africa Campaign.

Gondokoro. Town of the Anglo-Egyptian Sudan. It stands on the White Nile, 1,081 m. S. of Khartum. Navigation to Rejaf, 15 m. S.W. and to Khartum, is carried on by the steamers of the government. Here Sir Samuel Baker established a military station in 1871 and called the settlement Ismailia. Formerly a seat of the slave traffic, it had a large trade in ivory.

Gondola (Ital.). Long, low, narrow, flat-bottomed boat used on the lagoons and canals of Venice. Both prow and stern curve high off the water; each end is decked, the rowers, or gondoliers, standing up to wield their sweeps. Usually, in the centre is a carriage-like cabin, with doors and curtained windows. The prow is sometimes still decorated with a curious imitation battle-axe head, the last relic of the sumptuous decorations formerly so profusely lavished on gondolas that sumptuary laws were passed in the 16th century to prevent such extravagances. Since that time, as a rule, these vessels have been painted black. (See Venice and illus. under Boat.)

The term has also been used for a boat-shaped car fitted externally to an airship, but this is now usually called a nacelle.

Gondoliers, THE. Comic opera in two acts by W. S. Gilbert, music by Arthur Sullivan, with the alternative title *The King of Barataria*. First produced at the Savoy Theatre, London, Dec. 9, 1889, it ran for 554 performances, has been frequently revived, and has remained among the most popular operas in the Gilbert and Sullivan repertory. The scenes are laid in Venice and the imaginary kingdom of Barataria, to the throne of which the extravagances of the plot raise two republican gondoliers. Songs like *The Highly Respectable Gondolier*, *A Regular Royal Queen*, *There Lived a King*, *Take a Pair of Sparkling Eyes*, as well as two dances, *Cachucha* and *Gavotte*, are among the most tuneful and gay of Sullivan's compositions. See Gilbert and Sullivan.

Gondomar, DIEGO SARMIENTO DE ACUÑA, COUNT OF (1567-1626). Spanish diplomatist. Born Nov. 1, 1567, of a wealthy Galician family, he was still young when appointed commander of the Portuguese frontier, and helped to repulse the English attacks on the coast. In 1613 he was sent as ambassador to England where he remained, with a

Count of Gondomar, Spanish diplomatist

brief interval, until 1622, a favourite with James I. He furthered the projected match between the prince of Wales (Charles I) and a Spanish infant, and his influence was largely responsible for the execution of Raleigh. Gondomar died in Spain, Oct. 2, 1626.

Gondwana Beds. Series of sandstones, shales, ironstones, and coal-seams, of Permo-Carboniferous age, typically developed in India. They contain abundant fossil plants, the "Glossopteris Flora," which ranged from Australia through India to Russia, and through Africa to Brazil, marking the former extent of the ancient continent "Gondwanaland." Basement bed, the Talchir conglomerate, is notable for huge ice-scratched boulders suggestive of a glacial epoch of Permo-Carboniferous age.

Goneril. Character in Shakespeare's tragedy *King Lear*. This proverbially unnatural daughter, the eldest of Lear's three children, and wife of the duke of Albany, having received half her father's kingdom, afterwards refuses him shelter. Having fallen in love with Edmund, bastard son of the earl of Gloucester, and poisoned Regan, her younger sister and rival, she stabs herself to death on finding that her lover has been mortally wounded in a duel with his brother Edgar. See *King Lear*.

Gone with the Wind. Novel by the U.S. writer, Margaret Mitchell (1918-49). Pub. 1936, it met with immediate success, and was translated into many languages. The British edition sold 100,000 copies in the first year, and in ten years reached 700,000. The book was over 1,000 pages long; the scene was laid in the Southern states of America at the time of the Civil War, and there were remarkable descriptive passages. The story was filmed in 1939, with Clark Gable and Vivien Leigh as the stars; despite a running time of some four hours the film was enormously popular.

Gonfalon. Banner used in the Middle Ages, and formed after the fashion of the *vevillum*, or standard of the Roman cavalry. It consisted of a flag attached to a cross-bar and suspended by cords at right angles to the pole. Though at first a war banner, it subsequently became

Gonfalon. Banner used by medieval cities

both in camp and council. The older form of the word was gonfalon, a corruption of M.H.G. *gundfano*, battle-standard.

Gong. In music, a percussion instrument, made of bronze. Of Oriental origin, it is a large round plate in form, with turned-up edges, and is struck by a heavy drum-stick with a hard leather knob, producing a deafening crash of indefinite pitch. Gongs are largely used in Eastern temples.

Gongora y Argote, Luis DE (1561-1627). Spanish poet. Born at Córdoba, July 11, 1561, and

Luis de Gongora y Argote, Spanish poet After Velazquez

educated at Salamanca university, he began to write poetry when a youth, abandoning the law for which he was trained. Gongora's manner was simple in the first period, but became pompous and extravagant in his middle age, his style giving rise to the term Gongorism. Late in life he entered the Church, and lived in Madrid, becoming chaplain to Philip III, and the friend of nobles and hidalgos. Lope de Vega was an enthusiastic admirer of Gongora's poetry. The latter died at Córdoba, May 23, 1627. His Solitudes were translated into English verse by E. M. Wilson, 1932.

Goniatites. Extinct forms of shells, belonging to the class Cephalopoda (q.v.). The shells are spirally coiled and divided into chambers connected by a delicate tube, similar to the existing nautilus. They are common in Devonian rocks.

Goniometer (Gr. *gonia*, angle; *metron*, measure). Instrument used for measuring the angles of crystals. One form, the contact goniometer, consists of a graduated semicircular arc, to the centre of which a pair of adjustable slotted bars provided with straight edges are pivoted so that they can be fixed at any angle by a screw.

The reflecting goniometer, an instrument of far greater precision, determines the angle between any two faces on a crystal, by obtaining the reflection of light from a collimator from each of the two faces in succession.

Special goniometers measure growing crystals and cut accurately

Gong. Japanese instrument from a temple at Nikko

plates and prisms from crystals, including precious stones. See Crystallography.

Gonorrhoea (Gr. *gonos*, seed; *rhoia*, flux). A venereal disease caused by the gonococcus. Of great antiquity, it may be the complaint referred to as an "issue" in Leviticus. It affects particularly the sexual organs of adults and of young girls and the eyes of the newly born. The rectum in either sex may be attacked.

In the male the symptoms begin usually 2-8 days after intercourse with an infected woman, and consist of a light itching and burning at the tip of the genital organ, followed by a purulent urethral discharge. Complications may occur in neglected or inadequately treated cases; they include a painful swelling of the testis (epi-

didymitis) which, if bilateral, may lead to sterility; inflammation of the prostate (prostatitis) with perhaps retention of urine; swollen painful joints, with or without inflammation of the eyes. Later may appear a chronic, thin, watery discharge, or gleet, which, though mild in itself, may still transmit the disease.

In the female, gonorrhoea is often less obvious, as the nature of the discharge is not always realized by the patient. The urethra is generally attacked; the neck of the womb commonly (cervicitis). Complications include a painful vulvar abscess (bartholinitis); inflammation of the Fallopian tubes accompanied by severe abdominal pain (salpingitis) which may lead to sterility; less often, rheumatic complications as in the male.

Diagnosis in both sexes can be undertaken only by a doctor and is made by the examination of stained smears of the discharges and also by growing the organism in the laboratory. It is illegal for other than qualified medical practitioners to treat the disease. Cure may be effected by injections of penicillin, though the patient of either sex must remain under observation for some months to ensure that the cure is complete.

Infants of infected mothers may themselves contract infection of the eyes while being born (gonococcal ophthalmia, *ophthalmia neonatorum*). This distressing condition, at one time responsible for much blindness, is now almost totally avoided by the routine practice of nurses and midwives, involving the use of a silver derivative. Young girls may contract genital infection by contact with infected parents or attendants, through clothing, towels, etc., or in lavatories. They usually complain of soreness, and a vaginal discharge will probably be evident on the underclothing. Discharges in all forms may by contact affect the eyes of healthy persons, leading

Goniatites. Left to right, *Pronorites cyclolobus*, *Glyptoceras sphaericum*, both from Carboniferous limestone in England; *Agathiceras Suessi*, from Permo-Carboniferous in Sicily
British Museum

to serious inflammation. For adults prevention really lies in abstaining from casual sexual relationships. See Syphilis.

Gonsalvo de Córdova. Name by which the Spanish soldier Gonzalo Hernandez y Aguilar

Gonsalvo de Córdova,
Spanish soldier

(1453–1515) is usually known. A younger son of the count of Aguilar, he was born at Montilla, near Córdoba, March 16, 1453. In 1495 Ferdinand and Isabella chose

Gonsalvo to command the force sent by them to help Ferdinand of Naples against the French. He remained there until 1498, driving the French from Naples.

In 1501 he returned to Italy to help the French. The allies, however, soon quarrelled, and Gonsalvo's victories, like his first, were over the French. His great achievements were at Cerignola (1503) and on the Garigliano (1504). His influence was strong on the military leaders of the 16th century. He died at Granada, Dec. 2, 1515.

Gonville and Caius College. The official name of the college at Cambridge University usually

Gonville and Caius
College arms

known as Caius (*pron.* Keys). In 1348 Edmund Gonville, rector of Torrington, Norfolk, founded Gonville Hall, near S. Botolph's Church; his executor, Bishop Bateman, in 1351 removed the

college to its present site near Trinity Hall, and called it the Hall of the Annunciation. In 1557 John Caius (*q.v.*) by royal charter refounded the society under its existing name.

The three portals through which the college was entered were named by Caius the gates of Humility, Virtue or Wisdom, and Honour. The first-named gate, removed in 1868, is in the garden of the master's lodge. The much-admired Gate of Honour, leading

into Senate House passage, was designed by Caius. The exterior of the chapel, built c. 1393, was cased with freestone in 1716–26. With the college are associated the names of William Harvey, John Cosin, Jeremy Taylor, Edward Thurlow, Thomas Gresham, J. Hookham Frere, and John Venn. The society includes a master and 21 fellows on the older foundations.

Gonzaga. Name of a princely Italian family which ruled over Mantua from 1328 to 1708. Its members also held the marquise of Montferrat from 1536, and later the duchies of Guastalla and Nevers. It included many distinguished soldiers, notably Giovanni Francesco II (d. 1444); two cardinals, Ercole (1505–63), an active ecclesiastical reformer, and Scipione (1542–93), a patron of letters; and Luigi (1568–91), who was canonised as S. Aloysius (*q.v.*).

Giovanni Francesco III (d. 1519), the husband of Isabella d'Este, was a soldier and a collector of art treasures. Under his son Federigo II (d. 1540) the court of Mantua was famous. A struggle between two branches of the family, the dukes of Nevers and Guastalla, for Mantua, France supporting the former, and Spain and Austria the latter, brought about civil war (1627–30).

The end came in 1708 when Ferdinand Charles IV was deposed by the emperor Joseph I, and died in exile without issue. Austria then annexed Mantua and Savoy took Montferrat. The Guastalla branch of the family became extinct in 1746.

Gonzaga, THOMAZ ANTONIO (1744–1809). A Portuguese poet. Born at Oporto, he was educated at the university of Coimbra, and in 1768 went to Brazil and became a judge of the appeal court at Bahia. In 1785 he was arrested, and later banished to Mozambique, on a charge of conspiracy.

Gonville and Caius College, Cambridge, with the Senate House on the left

His love lyrics and pastorals, *A Marilia de Dirceo*—Dirceo being his pen-name and "Marilia" the lady he married—enjoyed great popularity. They were edited, with a Life, by J. da Sylva, 1845.

Gooch, SIR DANIEL (1816–89). British engineer. Born at Bedlington, Northumberland, Aug. 16,

Sir Daniel Gooch,
British engineer

1816, he began as an iron-worker at Tredgar, and later became associated with the Stephensons and other pioneers in railway construction. His life work was done

on the G.W.R. as locomotive superintendent, 1837–64; he made remarkable improvements in its engines. In 1866 he returned to the G.W.R. as chairman, and, holding this position for 23 years, brought the line from a position bordering on bankruptcy to a high pitch of prosperity. Gooch superintended the laying of the Atlantic cable, 1865–66. He was made a baronet in 1865, and died Oct. 15, 1889.

Gooch, GEORGE PEABODY (b. 1873). British historian. Educated at King's College, London, and Trinity College, Cambridge, he represented Bath as Liberal M.P., 1906–10. One of the chief authorities on modern German history, his books included *Franco-German Relations, 1871–1914*; *History of Modern Europe, 1878–1919* (published 1923); *Recent Revelations of European Diplomacy*; *Frederick the Great, 1747*. Others of his copious publications are *Annals of Politics and Culture*; *History and Historians in the 19th Century*; *Studies in Diplomacy and Statecraft, 1944*. Gooch was joint editor of *The Contemporary Review*; *Cambridge History of British Foreign Policy*; *British Documents on the Origins of the War, 1898–1914*.

Gooch Crucible. Cup of glazed porcelain having a bottom perforated with fine holes for filtration under suction. Finely divided asbestos in suspension is poured into the crucible to form a thin pad on the bottom. The crucible is then attached to a vacuum flask in which low pressure is maintained by a filter pump.

Goodall, FREDERICK (1822–1904). British artist. The son of an engraver, he was born Sept. 17, 1822. He studied art and soon

began to paint, exhibiting his first picture, *Card Players*, at the Royal Academy in 1839. In 1853 he was elected A.R.A. and in 1863 R.A. He died July 28, 1904. Many of Goodall's best pictures have Egypt and the desert for their scene. They include Hagar and Ishmael, Rachel and Her Flock, The Return from Mecca, and The Finding of Moses.

Good Companions. THE. Novel by J. B. Priestley. Published in 1929, at the end of a decade in which novelists had tended to over-exploit the subjective and humourless, it attracted immediate attention by being objective and humorous, and representing in its generous length, as well as its picaresque method, a return to older traditions in English fiction. This light-hearted story of the formation and adventures of an itinerant concert party was not only the best-selling book of its year but created some demand for longer and more objective novels.

A stage adaptation, by Priestley and E. Knoblock, was produced at His Majesty's Theatre, London, 1931, with Edward Chapman as Jess Oakroyd, and John Gielgud as Inigo Jollifant. In a film version, 1933, Edmund Gwenn (Oakroyd), Gielgud (Jollifant), and Jessie Matthews (Susie Dean) were the leading players.

Good Conduct Medal. British medal instituted by William IV in 1830 for award to soldiers of irreproachable character who had served for 21 years in the infantry, or 20 years in the cavalry. The design of the medal and the conditions of its award were subsequently altered, and in 1902 its title was changed to Long Service and Good Conduct Medal (*q.v.*). A similar medal was instituted in 1831 for petty officers and ratings of the Royal Navy completing 21 years' service with good conduct; this, too, was replaced by the Long Service and Good Conduct Medal (Navy). See Medals colour plate.

Goodenough Medal. A prize founded in memory of Captain J. G. Goodenough, R.N. (1830-75), who died Aug. 20, 1875, from wounds inflicted with poisoned arrows by the natives of Santa Cruz. The fund consists of a sum of about £800, with the interest on which a gold medal is presented yearly to the sub-lieutenant who has taken a first class in

J. G. Goodenough,
British sailor

seamanship, and in the examination for lieutenant passes first in gunnery.

Good Friday (Gr. *Pascha Stanorosimon*, Pasch of the Cross; *paraskeuē*, Holy Friday; Lat. *dies absolutiois*). Name given in the R.C. and Anglican Churches to the Friday in Holy Week (*q.v.*) on which the Crucifixion is commemorated. In England, to which the name was for a long time peculiar, it superseded that of Long Friday, an allusion to the fast. The name pascha, afterwards appropriated to Easter (*cf.* Acts 12, v. 4), derives from the association of the day with the time of the Jewish Passover.

In the Anglican Church special collects, epistle, gospel, lessons, and psalms are appointed for the day, which is frequently observed by the Three Hours service, from noon to 3 p.m., during which the attention of the congregation is specially directed to the Seven Last Words: it was for this service that Haydn's Seven Words from the Cross was written. Among old English customs was that of the royal blessing of cramp rings (*q.v.*) for prevention of the falling sickness.

In the R.C. Church the altar is at first bare, no candle is lighted, and the officiating priests wear black vestments. After the altar has been covered with a white cloth and special prayers have been said, there follows The Adoration of the Cross. Communion is forbidden except in case of sickness. In the R.C. and Greek Churches, for the ordinary Mass the Mass of the Presanctified is substituted: in this the priest receives as communion a Host (*q.v.*) consecrated on the previous day. The Roman office known as *Tenebrae* (Lat., darkness) and observed on the Wed., Thurs., and Fri. of Holy Week, is so called from the gradual extinction of the lights in the church during the service, in commemoration of the darkness that covered the earth at the time of the Crucifixion. For this office, which has been introduced of recent years into some Anglican churches, music has been composed by Palestrina, Salvatore, Michael Haydn, and others. In England for many purposes Good Friday is observed as a Sunday. See Easter.

Good Hope, CAPE OF. The S.W. extremity of Africa is described under Cape of Good Hope.

Good Neighbour Policy. Phrase coined by President F. D. Roosevelt when addressing the Pan-American Conference at

Buenos Aires on Dec. 1, 1936. The conference was representative of all nations of the American continent except Canada, and its keynote was struck by Roosevelt declaring that the U.S.A. interpret the role of "good neighbour" as one forbidding a nation to interfere forcibly in the affairs of another. See Pan-American Conference.

Good Parliament. Name given to the parliament that met in April, 1376. To reform the gross mismanagement of national affairs towards the end of the reign of Edward III, the commons resolved to withhold all grants until their grievances were redressed. Through Sir Peter de la Mare, who thus founded the office of Speaker, they presented a list of petitions to the king, set up a council of 12 peers to advise the sovereign, and imprisoned and deprived of their lands two of his ministers, Lords Latimer and Lyons, who had been guilty of corruption and general malpractice. The parliament, which was dissolved July 6, holds an important place in the history of the constitution.

Goodrich, EDWIN STEPHEN (1868-1946). A British zoologist. Born at Weston-super-Mare, June 21, 1868, he was educated in France and studied zoology at University College, London. In 1891 he became junior assistant to Lankester at Oxford, and later travelled in India and Ceylon. As Linacre professor of zoology and comparative anatomy at Oxford from 1921, he added to the buildings of his department and the scientific collections of the university museum. His books include *Vertebrata Craniata*, 1909; *Living Organisms*, 1924; *Structure and Development of Vertebrates*, 1930. He died Jan. 6, 1946.

Goodrich Castle. Ruined castle of Herefordshire, England. It stands on the right bank of the Wye, above the village of Goodrich, 3 m. W. of Ross. The remains include a gateway and ruins of two towers, the keep, and the chapel. As a defence against the Welsh, there was a fortress here before the Norman Conquest, but the existing parts are of later date. The keep dates from Henry II's time. The castle was once held by the earls of Pembroke, to which family it was given by Henry III; afterwards it passed to the Talbots, earls of Shrewsbury. It was held for Charles I during the Civil War, but after a siege lasting eighteen weeks the parliamentarians captured it in 1646, and dismantled

it. There is an interesting old church in the village, near which is Goodrich Court, a modern residence formerly containing a noted collection of armour.

Good Templars. THE INTERNATIONAL ORDER OF. Society for the purpose of inculcating total abstinence and abolishing the sale of alcoholic liquors. Founded in Utica, New York, in 1851, it spread rapidly in N. America, and in 1868 was introduced into Great Britain by Joseph Malins. The ritual, which is secret, and contains passwords and signs, was translated into 18 languages, and the society established lodges throughout the British colonies and in most European countries. Organized in lodges, it has British headquarters at Birmingham. The international membership of the order in 1949 was 300,681. See Friendly Societies.

Goodwill. Term used for the advantages, other than the material assets, buildings, furniture, etc., which go with a business or profession. It is regarded as property, and stamp duties must be paid when it is transferred from one person to another. It is also valued for death duties, and, moreover, a person is entitled to compensation if the goodwill of his business is injured. Lord Lindley defined goodwill as "the benefit arising from connexion and reputation," and its value "what can be got for the chance of being able to keep that connexion and improve it." It frequently includes the name of a business. The Landlord and Tenant Act, 1927, provides for compensation for loss of goodwill by tenants compelled to give up possession of premises at which they have carried on a business.

Goodwin, THOMAS (1600-80). English puritan divine. He was born at Rollesby, Norfolk, Oct. 5, 1600, and educated at Cambridge, where he became a university preacher. Owing to disputes with his bishop, he resigned, and was for a time a pastor at Arnhem, Holland. Having returned to England in 1640, he preached with success in London, and became a member of the Westminster Assembly, 1643.
